THE WINNER of the July prize, Lewis C. Mayer, has been chief engineer of the York Railways, York, Pa., since 1903 and has had the added duties of vice-president since 1909. This railway operates 85 miles of city and suburban electric railway and Mr. Mayer has full charge of the location, design, construction and maintenance of the track, overhead lines, central power stations, substation buildings, carhouses, shops and yards.

His experience on track construction work began in 1892 with the Pittsburgh division of the Baltimore & Ohio Railroad. For six years he was rodman, transitman and draftsman in general maintenance work of this railroad. Then he served on relocation and construction work for the Pittsburgh & Western Railway, and in 1899 began similar work for the Tennessee Central Railway. Mr. Mayer's electric railway experience began in 1901 as assistant engineer to R. B. McKinnon, practicing engineer on location, design and construction of city, suburban and interurban electric railways. Mr. Mayer received his education in the public schools of Baltimore, where he was born, and later at the University of Kansas.

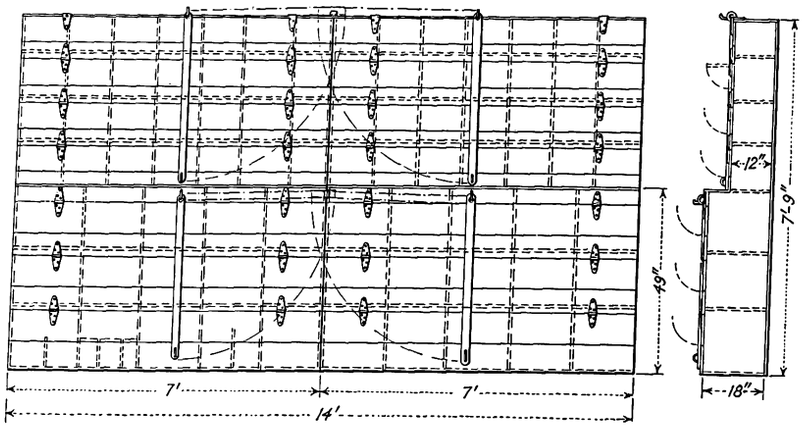
ROLLING STOCK—MACHINE SHOP—4

Bins for Pipe Fittings*

By J. B. Blaiklock
Master Mechanic Washington Railway & Electric Company

IN ORDER to give the workmen ready access to all pipe fittings and at the same time have them stored neatly the Washington Railway & Electric Company, Washington, D. C., has installed wooden bins at the pipe bench, as shown in the accompanying sketch. The bins are 12 in. x 10 in. x 10 in. on the upper section and 12 in. x 18 in. x 15 in. on the lower section.

Fittings are arranged horizontally by types, each different size being kept in a separate bin. Where the fittings are small the bin is divided into two sections by a small partition. The size and kind of fitting are marked plainly on the outside of the lid of the bin. Lids are hinged at the top and are locked shut by means of an iron bar 1½ in. x ⅜ in. This bar is hinged at the top and locks into a staple at the bottom with a padlock. The bar can be rotated and held open in a horizontal position by means of a small iron bracket which is fastened to the top of the bin with the ends of the bars resting on the bracket.



Parts of bin for pipe fittings as used by the Washington Railway & Electric Company

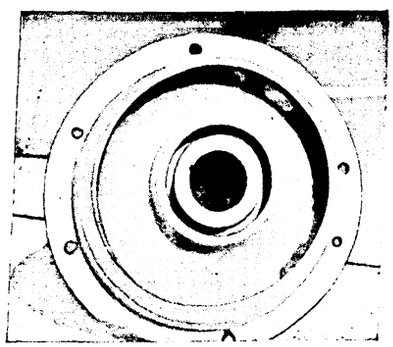
Building Up and Remachining Armature Bearing Housings*

By R. T. Chiles
Master Mechanic Cumberland County Power & Light Company, Portland, Me.

SOME time ago we experienced difficulty with worn bearing fits in GE-258C motor pinion end armature bearing housings. As this type of motor is provided with ball bearings, it was necessary to replace the frame head or devise some way of bringing the bearing fits back to the manufacturer's standards. An attempt was made first to build up the bearing fit in the frame head by electric arc welding and then remachine it. As the amount of wear was small, it was found that a good job of machining could not be obtained, as the metal was too thin.

Bearing fits in frame heads were then counterbored to a diameter $\frac{3}{16}$ in. larger than standard and the frame head at the bearing fit was heated with a large gasoline blow torch so as to get all oil and other impurities out of the metal. The bearing fit in the frame head was then built up by electric arc welding, making certain to add sufficient metal so that a smooth job of machining could be obtained.



Armature bearing housing built up by arc welding and remachined

The results were satisfactory and this practice is now being followed for all our box frame motors, which include GE-201G, 203A, 247B and 258C. All bearing fits are kept to manufacturer's standard and considerable expense of replacing frame heads is prevented.

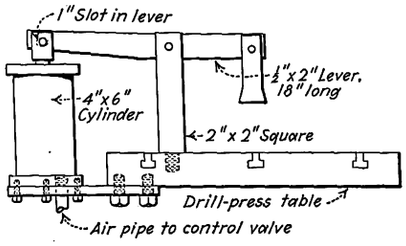
ROLLING STOCK—MACHINE SHOP—5

Air Clamp for Drill Press*

BY CHARLIE HERMS
General Foreman Fifteenth and L Streets Shop, San Diego Electric Railway, San Diego, Cal.

AN AIR clamping attachment has been added to the table of a 22-in. drill press in the shop of the San Diego Electric Railway which has produced a saving of at least 10 per cent in drilling time as compared with the previous method used. Previous to the installation of this clamping attachment bolts and C clamps were used for holding the work. The air clamp is instantaneous and positive in operation and work does not slip. Accidents are prevented with the new device, since the operator is protected, whereas with the old method when drilling odds and ends for miscellaneous jobs the operator was frequently tempted to hold some small part with his hand. This sometimes resulted in an accident.



Air-operated drill press clamp as used in the shops of the San Diego Electric Railway

We use two shapes for the holding jaws. One is flat for holding flat surfaces and the other a hollow jaw for holding round stock. The clamping mechanism is not pivoted to the drill press table, since the table is adjustable to the drill and, therefore, the whole assembly acts as a unit. A 4-in. x 6-in. cylinder is fastened to one side of the drill press table. The piston of the cylinder acts through a lever arm to furnish the desired clamping pressure.

For controlling the air a General Electric Company's type "S" straight air valve is mounted alongside the air cylinder on the drill press table. The air connection from the shop supply is made by means of a flexible hose and carries 80 lb. of air.

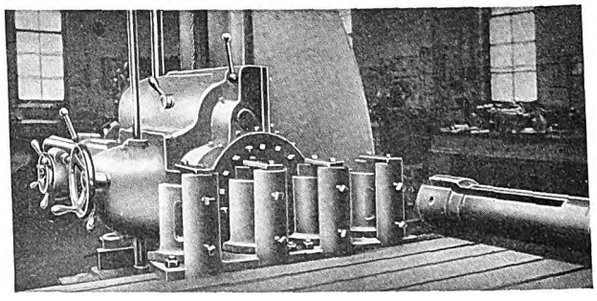
Inserted Tool Milling Cutter for Finishing Axle Bearings*

BY EQUIPMENT DEPARTMENT
Georgia Power Company, Atlanta, Ga.

DUE to a decrease in the size of wheels used from 33 in. to 26 in. and to an added amount of equipment, our axle bearing work increased beyond the capacity of the shaper used for finishing. Axle bearings operating with 26-in. wheel equipment have shorter life than have those with 33-in. wheels due to the higher accelerating speed and the increased axle speed.

To take care of the increased work we designed and built a multi-tool milling cutter and jig for use with a horizontal boring mill. Eighteen tool steel cutters are inserted through a disc and are held in place by set screws. The use of this large number of cutting tools allows increased speed with less work per tool.

The jig for holding the bearings consists of a cast-iron frame bolted to the table of the boring mill. Axle bearings are slipped into the jig against a vertical leg having a radius of the bearing. Set screws in the back of the frame are tightened against the back of bearings so as to clamp them securely. Four half bearings are faced at one time. After the carriage has run out in one direction it is reversed so as to mill another set of bearings on its return.



Set-up for finishing axle bearings on horizontal boring mill with inserted tool milling cutter

A complete bearing, that is two halves, were faced on the shaper in 30 minutes. This includes the time for setting up. It requires but eight minutes on the boring mill with the new method, which is a saving of 22 minutes, or 73.4 per cent increased production.

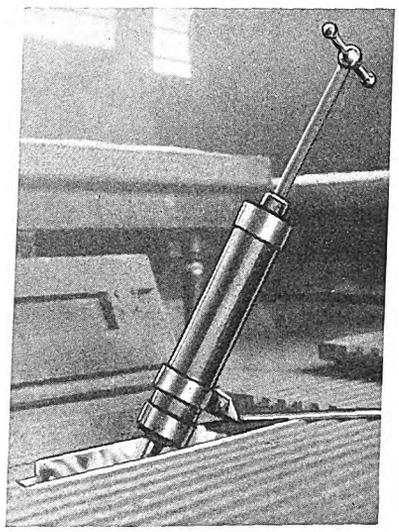
Grease Gun for Gear Lubrication*

By C. W. Wood
Master Mechanic Virginia Public Service Company, Hampton, Va.

GREASING of gears is no longer guesswork in the shop of the Virginia Public Service Company. A grease gun similar to the Alemite gun, but larger, is used. This is made of a piece of 3-in. iron pipe, fitted with caps on each end. One cap is drilled and tapped for a $\frac{5}{8}$-in. screw and the other for a $\frac{3}{4}$-in. pipe. The screw has a "T" shaped handle and cup leather plunger.



Gun in position for greasing gears through car floor

The gun holds several pounds of grease, so that it is possible to grease a large number of gears with each filling. After ascertaining the number of turns per pound, the exact quantity of grease desired may be inserted with ease. The gun is fitted with a bracket which rests on the car floor and is held in position by the foot of the operator. The accompanying illustration shows it in position.

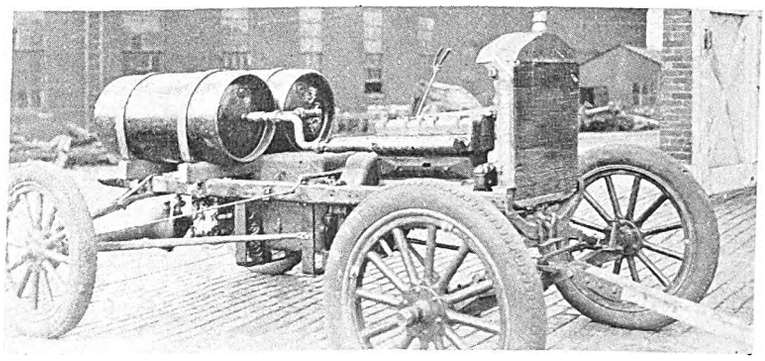
TRACK AND WAY DEPARTMENT—7

Compressor Made from Roadster Engine*

By N. E. Ferguson
Superintendent Railway Circuits West Penn Railways, Pittsburgh, Pa.

DUE to the rough country in which track repairs are made on the lines of the West Penn Railways, an air compressor of extreme portability was required. From an obsolete type 5½-hp. 600-volt compressor motor and a scrap Ford roadster equipment was constructed that would furnish an air delivery of 40 cu.ft. per minute which is about one-third that of heavy-duty commercial compressors.



Ford engine used as part of electrically driven compressor

The engine of the roadster was left in its position on the chassis with the fan assembly and radiator for cooling purposes, but the body, transmission gears and magneto were removed together with the camshaft and exhaust valves. Check valves were installed in the exhaust ports and these were connected to a common manifold, which in turn was connected directly to two air compressor tanks.

The head of the Ford motor was removed and was filled to a close clearance with Babbitt metal in order to increase the compression. The 5½-hp. compressor motor was connected directly to the crankshaft of the Ford engine. This motor operated the Ford engine at 750 r.p.m. and was governed by an automatic device that connects or disconnects it from the trolley as the pressure falls and rises.

Grinding and Welding Wheels at the Same Time*

By J. A. Duffy
Superintendent of Equipment Monongahela West Penn Public Service Company, Fairmont, W. Va.

By means of the special machine shown in the accompanying illustration steel wheels are ground while the automatic electric welder is in operation building up the flanges. By this arrangement one man can grind wheels, weld them with the automatic head and at the same time do hand welding. This method of grinding and welding at the same time eliminates the wheel lathe and speeds up the work considerably. A saving of about three hours per pair of wheels in machinist's time has resulted.

The grinding wheel is the width of the tread of the steel wheel, and while welding up the flanges on one wheel the opposite wheel is being ground. The special shaped grinding wheel shapes the flange properly. A variable speed motor is used to drive the wheels. The speed is 900, 1,200 and 1,800 r.p.m. connected to a speed gear reduction box which gives 5, 7 and 13 in. of periphery speed per minute. The machine and gear reduction box were made in our shop.

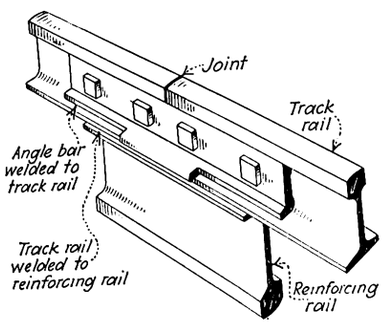
TRACK AND WAY DEPARTMENT—8

Scrap Rail Used to Reinforce Joints*

By Louis T. Botto
Superintendent Maintenance of Way San Antonio Public Service Company, San Antonio, Tex.

During the past year the maintenance of way department of the San Antonio Public Service Company has rebuilt 3½ miles of gravel ballast track. A rail joint made of an 18-in. length of scrap rail and an old pair of 60-lb. angle bars cut out at the end to make up the joint has proved particularly beneficial as well as cheap. The scrap rail was inverted, placed immediately under the joint and welded to the running rail, which in turn was welded to the angle bars.



Joints on track reinforced by using old rail

Prior to the use of this method joints in track required raising after each heavy rain. This was very expensive from a maintenance standpoint. Since the installation of the new joints no more work has been done on them and the track has held up well.

Circuit Breaker and Hand Brake Provide Car-Backing-Up Device*

By L. Tait
Manager London Street Railway, London, Ont.

DUE to increasing auto traffic and because the London Street Railway, London, Ont., turns cars at Y's on several of its lines, some plan to back up single-end safety cars from the rear was desirable. The plan adopted includes the installation of a circuit breaker and hand brake at the rear of the car. A National Brake Company's Peacock staffless brake was placed between the back cross seat and the small seat on the side of the car so that no seating space was lost. The circuit breaker was installed directly above the hand brake on the side of the car.

Wiring between the front of the car and the rear circuit breaker is carried through the roof and along the top of the car in conduit. A knife switch on a slate base inclosed in a wooden box is placed on the side of the car to the left of the controller. This switch is connected at the top terminal to the front circuit breaker and the bottom terminal to the controller. The bottom terminal also has a wire connection through the conduit to the circuit breaker at the rear. The accompanying diagram shows the connections.

To operate a car from the rear end the knife switch is opened and the controller handle is placed in the first running position, the deadman release being hooked down, and the reverse handle in position for backward movement. The car can then be operated from the rear by closing the circuit breaker with the left hand and operating the hand brake with the right hand.

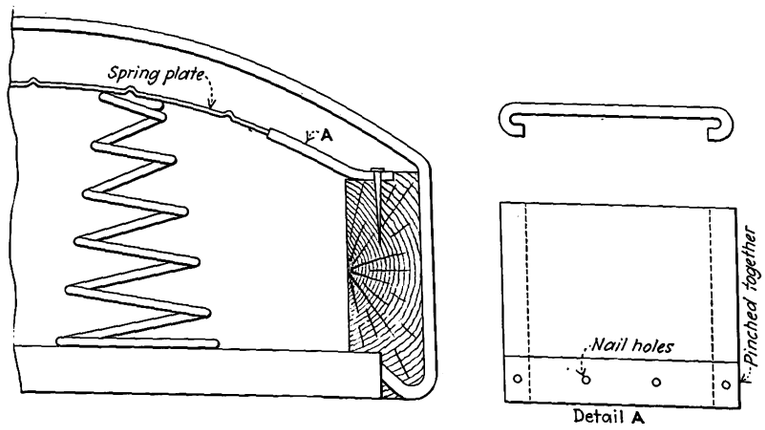
Repairing Rattan-Covered Seat Springs*

BY TOM STANDARD
Seat Repairman Omaha & Council Bluffs Street Railway, Omaha, Neb.

RATTAN-COVERED street car seat cushions have given trouble on lines of the Omaha & Council Bluffs Street Railway, as the flat spring plates break near the ends. When this occurs the seat becomes hard riding and the broken spring plates gouge holes in the rattan covering.

In the method of repairs used in the shops of the railway the roughly broken end of the spring plate is first cut square. A square piece of sheet steel which has been previously shaped to fit over the spring plate is slipped over the squared end, while the other end of the sheet steel is nailed to the seat frame. The spring plate is thus spliced and a sliding joint is provided.



Method used in repairing broken seat spring plates

BUSES AND TRUCKS—6

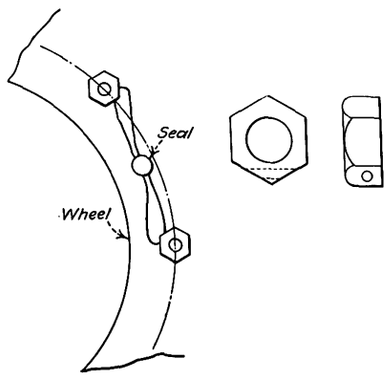
Simple Method of Keeping Accurate Bus Tire Records*

BY GLENN S. REEVES
Assistant Master Mechanic Omaha & Council Bluffs Street Railway, Omaha, Neb.

SEALING of wheels is used for keeping bus tire records in the bus department of the Omaha & Council Bluffs Street Railway. Mistakes are eliminated in reporting the numbers of the tires removed and applied and the wheel location and the speedometer reading is given, which data are usually taken at the time tires are changed. Responsibility for reporting tire changes correctly is not divided and there are no conflicts in tire data when the tire mileage reports are made out.

A seal is put on the wheel which must be broken before the tire can be removed. When a seal is found broken the tire number on this wheel is recorded on the daily bus report. In the case of a dual rear wheel both tire numbers are reported.

The night inspector each night checks each wheel for broken seals. His report goes to the office clerk, who then records the change on the office tire record cards which show where each tire was before the change was made. If a report shows a tire of a different number on this wheel the clerk knows which tire has been removed and which tire has replaced it.



Method of sealing bus tires as used by the Omaha & Council Bluffs Street Railway

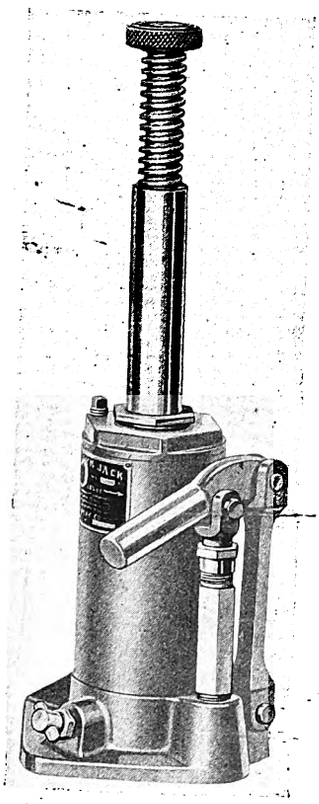
Hydraulic Oil Power Jacks Improved

HYDRAULIC oil power jacks, improved and standardized after five years of testing, are being introduced by the Blackhawk Manufacturing Company, Milwaukee, Wis. Improvements provide a simplicity of the operating mechanism with lifting power far beyond rated capacity. A twin check valve unit is located below the pump in an accessible position where removal for cleaning or replacement requires but a moment. A long bayonet-grip handle holds and places the jack at long range. Short strokes raise the ram with positive lift and hold it in position. Lowering is done automatically with the control release valve, the speed being governed by the operator. The handle is used to open the release valve for lowering, to control the drop and to withdraw the jack. It can be used in a horizontal position for forcing operations provided the jack is operated with the pump side down.



This jack has a capacity of 7 tons and a lift of 5¼ in. It weighs 15 lb.

The complete line of Blackhawk hydraulic oil power jacks includes ten models in nine capacities. The automotive models embrace single and double lift models, light and heavy duty, low and high built jacks and floor-lift jacks.

Dick Prescott Awaits Developments

and Shorty Green Does Some Thinking

DICK PRESCOTT, assistant superintendent in the Consolidated Railway & Light Company's shop, had decisively won the first skirmish with the disgruntled men in the truck shop. He felt that he had used good judgment in meeting the situation openly by calling for a showdown from the ringleaders before the other men. He had, of course, taken chances in following that procedure. But when none of the men answered his challenge to accept individual responsibility for the disaffection, he knew that he had won a strong moral victory, which would have an immediate effect on the rank and file of the workmen in the shop.

Every man, no matter how limited his judgment, instinctively recognizes and admires a good sport. That the young assistant superintendent, even though somewhat lacking in experience, was a "square shooter," as the men would say, was quickly evident to every one of them after Dick had confronted the entire group. Even Shorty Green, henchman of Pete Welcher, the envious shop inspector, who had sworn to "show up" the young assistant superintendent, began to feel some doubts after Dick had dared him to step out of the crowd and state his grievances. Shorty had only seen Dick in the shop as he went his rounds and had never spoken to him. He had accepted without question and without personal knowledge Steve's appraisal of Dick as an upstart and a four-flusher. But now, as Shorty soberly reflected the morning's incidents, he realized that the assistant superintendent was a far different individual than Pete Welcher had pictured him.

"That guy ain't no dub," reflected Shorty Green. "He won't stand no foolin' and all that, but he'd give a bird a square deal. I'm kind of sick of listenin' to Steve's line of guff anyhow. Dat guy's goin' to get fired if he don't watch his step, and what good is it goin' to do to stick my head in a sling? I've been ridin' for a fall and not knowin' it."

While Shorty Green was thus indulging in unpleasant reverie, Dick Prescott, back in his office, felt none too comfortable. Of course he had won a temporary victory, but he knew that the matter was not settled, and he wondered how far the dissatisfaction penetrated among the men and just what was the explanation for the morning's outbreak. The thought of personal jealousy because of his own rapid progress did not enter his mind. Dick felt that he had worked hard for his advancement and that every one in the shop would recognize that favoritism or "pull" had nothing to do with his progress.

Thus the morning wore away without particular incident, and as the noon hour approached, Dick wondered what would happen. He had invited the men to select a committee of three to call on him with their grievances.

It was only a few minutes before noon when Shorty Green walked over toward big Pete Thompson, the man who had suggested they go back to work.

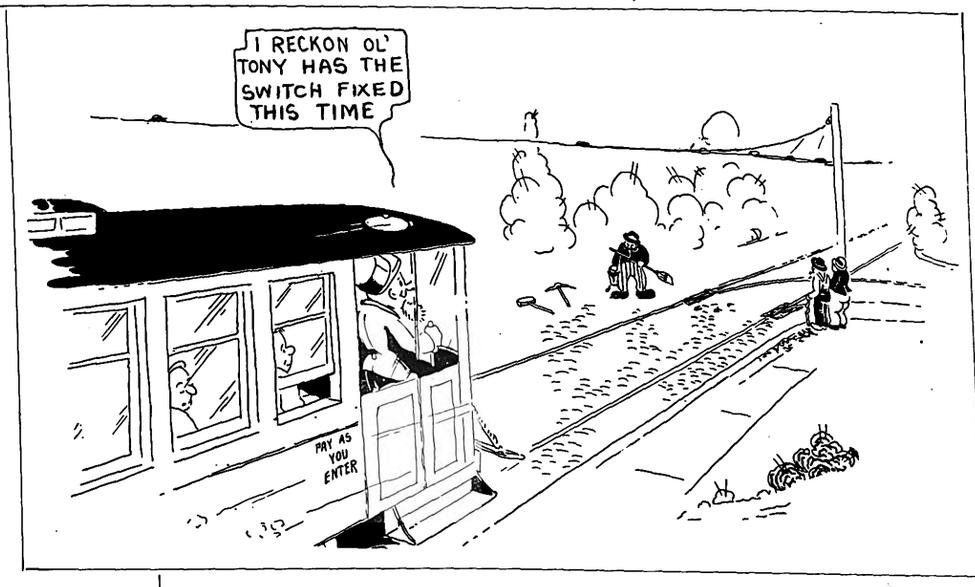
Adventures of

Old Man Trouble

on the Hicksville Railway

Even though switches are maintained in time

Only a reckless motorman tries to cross on "Nine"



Disastrous traffic tie-ups can be traced both to careless maintenance of switches and to careless operation of cars. Regardless of how well special work is maintained, a careless motorman can do much damage to this expensive construction and to the car he is operating. Slower speeds across switches will reduce switch maintenance, reduce tie-ups and increase safety.

ELECTRIC RAILWAY JOURNAL will be glad to furnish press proofs of this page for posting on bulletin boards and will supply electrotypes of this series at cost for use in company publications.

Association Activities

Attainable Average Speeds in City and Interurban Service*

By Dr. Friedrich Lademann
Operating Manager Berlin Street Railways

THE increasing surface congestion of traffic demands the greatest attention toward higher running speeds from the rail-bound vehicle. Factors that affect such running speed, regardless of layovers, are:

Character of special work, their curves and radii; elevation or lack of elevation at curves; possibility of parked reservations for trackways only; use of electric car-controlled or tower-controlled switches instead of hand, etc. The influence of track on speed has not received sufficient attention in the past. Its effect can hardly be overestimated.

On the other hand, the influence of stop spacing has been long appreciated. The answers to the data sheet reveal that the average stop spacing on 79 street railways is 375 m. (1,230 ft.) and on seventeen interurban railways 2,700 m. (8,856 ft.). The stop spacing on street railways could hardly be increased without lowering their value for short-haul riding.

Owing to the interference of foreign vehicles, particularly on busy streets, it is desirable to shorten passenger interchange time at stops by means of safety isles. A very favorable change has been made at Spittelmarkt, Berlin (a heavy traffic intersection), due to arrangements which permit simultaneous passenger interchange of several electric trains at different platforms.

The data sheet also developed that the average length of stop ranges from ten to 30 seconds. Berlin averages only fifteen seconds with its 3,000 stops, but efforts will be made to reduce the time still further.

Schedule speed in Germany is affected also by governmental regulations which fix the maximum free running speed as 30 km. (18.6 miles) per hour. The street railway, however, has within its own control such delays as are due to poorly arranged headways and the type of car or train used. Each operator must find for himself the correct relation between the speedier motor car and the cheaper trailer.

Last, but not least, speed is also affected by the character of car design and equipment. Rapidity of passenger interchange may be defined as a function of car capacity, the order of in-and-out movements, seat layout, center or end platforms, width of doors, heights of steps, joint or separate passages for entrance and exit, character of stop and start signals, etc. This class of items has made considerable progress in recent years, and their betterment can do much to accelerate traffic movement.

The type of current collector, rolling or sliding, also enters because trolley derailments must be considered a factor in the speed problem.

All the conditions mentioned heretofore lie within the control of the operator and are capable of improvement by him to a certain extent. Other causes of delay are less controllable because they are due to the use of the streets by other vehicles, to street traffic signals and to various governmental regulations.

Since the public always prefers the fastest vehicle, the question of speed cannot be separated from that of competition. The least that the street railway car can do to win out against the motor bus is to equal the latter in speed.

Finally, the higher the speed the less the requirements in personnel and rolling stock.

There are a number of possible measures to be taken to secure higher speeds. These may be classified as "operating" and "regulatory," as follows:

1. Rerouting to decrease congestion at the heaviest points.
2. Parked reservations for street railways.
3. Limitation of stopping places and use of safety isles for passenger interchange, preferably in tandem. It is suggested in this connection that stops on main streets should not be directly at the intersections, but several train lengths back, from which locations the trains are better able to start with the "Go" signal.
4. Raise permissible maximum free running speed.
5. Analyze time-tables to secure most favorable headways on track used jointly by several routes.
6. Analyze service to determine most favorable operating combinations of single motor cars or of trains with trailers.
7. Improve car design.
8. Raise trolley voltage; increase rates of acceleration and retardation.
9. Improve the skill of the operating personnel.
10. Educate the public toward more skillful use of the facilities.

Regulatory Measures for Improving Speed

1. Retain the right of way for street cars.
2. Secure police regulations compelling other vehicles to halt on approaching a street railway stop in use. The present Berlin regulation merely calls for a 1 m. (3.28 ft.) detour or clearance from a standing car. The author recommends the full-stop practice of the United States.
3. Adjustment of traffic control signals to the conditions of street railway operation.

It has been reported here that the original use of synchronous signals in the United States had lowered street railway schedule speeds by 20 per cent, but this had been overcome by the co-ordinated system in which allowance was made for variations in the traffic of intersecting streets and for the customary speed of trolley cars.

About half a year ago the synchronous system installed on Potsdamer and Leipziger Streets, Berlin, caused a 30 per cent speed reduction in trolley cars. After fourteen days of this, change was made to a co-ordinated system based on a speed of 20 km. (12.4 miles) an hour. Not only did this restore the original schedules, but it made an increase possible. About 20 per cent of the automobile traffic left these main streets to use highways without traffic signal control, thereby affording further relief.

The number of automotive vehicles in Berlin has increased from 10,000 in 1925 to 50,000 in 1927.

Range of Speed on Routes of Berlin

In conclusion, the variation of speeds on various Berlin routes may be cited as examples of how outside conditions may control. The 89 routes in the city show a range of 11.8 to 17.4 km. (7.3 to 10.8 miles) per hour, exclusive of layovers. One route, a downtown belt, has the

Digitized by Google

lowest speed, although equipped in the most up-to-date manner. Another has the maximum speed, despite old equipment, because it is operated under suburban conditions.

Owing to the effort made along the lines indicated in the paper, Berlin's speeds had gone up 20 per cent in recent years. Nuremberg and several other cities had enjoyed like success. The minimum speed for cities of more than 1,000,000 inhabitants should be 14 km. (8.68 miles) per hour. Cities of that size either have or will have motor bus operation, so that the street railway cannot afford to be slow. Incidentally, it may be said that the Berlin motor buses average only 0.3 km. (0.186 mile) higher speed than the cars. "Speed" must be the watchword of the street railway which wants to retain its primacy in city service.

Decreasing the Cost of Way Upkeep*

By Nicolai Hansen
Chief Engineer Copenhagen Tramways

THE importance of way upkeep can be measured by the fact that it equals 30 to 40 per cent of the total operating expenses. At Copenhagen this includes the obligation to pave between the rails and for 0.628 m. (2 ft.) on each side thereof. The character of paving is determined by the city. At present 42 per cent of the 185 km. (114.7 miles) single track is in asphalt or granite block on concrete base.

The main resource left to the way engineer is to find means for reducing the upkeep cost of these undesired constructions. Improvement of drainage, as by means of tile laid under the space between the rails, is of first importance, aside from caring for the run-off of the water that collects in the groove of the rail.

At Copenhagen water which seeps through the granite block and concrete paving is led to a sub-base of broken stone which is pitched toward the central tile drain. About 2.5 cm. (1 in.) of asphalt composition is poured around the rails. Pumping of the rails is minimized by installing two foundation bolts clamped to the rail base at intervals of 2.5 m. (8.2 ft.).

Changes which have reduced Copenhagen way maintenance costs are as follows:

The substitution of electric service cars for horse vehicles for 25 per cent of the material conveyed.

The use of Thode's automotive corrugation grinders in place of hand filing.

The installation, since 1923, of pneumatic hammers for breaking up concrete. With two hammers and three men this outfit does the work formerly requiring eight men.

Replacement, since 1923, of worn rail of 42 kg. (92.4 lb.) Phoenix section 25-B by sections 102-104 and 102a-104a standardized by the German Street Railway Association. These are stronger, cost less and require smaller stores investment because of quicker delivery. In a pinch, standard rails can be bought from or sold to other railways.

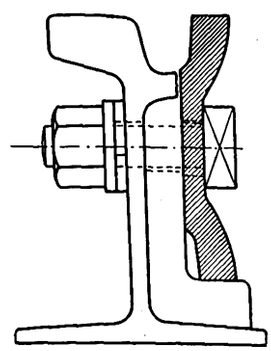
Thermit rail welding, in use since 1912, is considered ideal.

Standardization Permits More Manganese Special Work

In Copenhagen track on curves equals 15 per cent of the total. The special work comprises about 600 switches and 1,400 intersections. The maintenance of this special work amounts to 35 per cent of the total way cost.

Manganese special track work undoubtedly gives 2½ to three times the life of ordinary built-up work, but the cost of patterns for individual pieces is too high; in fact, it amounts to between one-third and one-half the entire cost. The economical application of manganese special work has therefore to be confined to busy intersections in expensive paving.

It follows that more extended use of manganese must depend on standardization. In this respect Copenhagen has made good progress. The 1,400 intersections have been divided into five classes. In Class I are 250 inserts for which only one pattern is needed; in Class II, involving curves and branch-offs, there are 448 inserts for which 48 patterns were required. It was practicable to standardize 80 per cent of the pieces in this group. In Class III 36 pieces called for thirteen patterns, but 64 can be handled with three patterns. In Class IV there are 268 pieces capable of standardization but used in service for which built-up work would be satisfactory. Class V, with 300 inserts in a diversity of branch-offs, was not readily standardized.



Copenhagen method of providing alloy steel guard for rail on curves

In general, where feasible, the use of standardized manganese has saved 25 to 40 per cent, the maximum saving occurring in asphalt.

The use of a portable electric welder to prolong the life of special work one to two years costs only 10 to 20 per cent of the replacement price of the special work.

The life of curves had been increased 100 to 200 per cent by using a guard rail of "Tornado" steel in which the lip of the running rail is first cut off, as illustrated. This construction has also saved 25 per cent of the paving expense because cheaper material can be used. The life of a guard rail of alloy steel exceeds that of the Phoenix 25-B running rail.

"In Situ" Rail Hardening Value in Doubt

The Sandberg "In situ" rail hardening process had been applied to about 4,000 m. (13,120 ft.) of Copenhagen track. The work was done by the railway forces with the equipment of the manufacturer. The latter guaranteed to make good within three months any damage to track or thermit welds.

On an average, three to four men in the four-hour night shift were able to harden about 8.5 m. (27.9 ft.) of track in an hour, the work being chiefly in concrete with asphalt paving except for wood filler block. The rails were either Phoenix 25-B or German Street Railway Association standard section No. 4.

To avoid breaks at the welds, in view of Copenhagen temperature range, the manufacturer suggested that no hardening be attempted for a short space on each side of a rail joint. The railway feared that this would result in soft spots or dishing, but so far this effect has been only faintly noticeable.

The tests proved that "In situ" hardening must not be attempted until the hard skin due to the rolling of the rail at the mills has worn off, and only if the thermit welds are perfect. On a 150-m. (492-ft.) stretch where defects were present 50 per cent of the welds broke. Only four broke on the remaining 675 m. (2,214 ft.), and of these two were defective before hardening began. There were also a few cases of minor cracks after the hardening process.

There were five rail breaks, three of which were due to faulty hardening. The cause of the other two breaks is unknown.

Backfire of the hardening flame is indicated by the frequent appearance of dark transverse stripes. These are sometimes accompanied by hairline cracks which are likely to develop into ruptures later. Many little transverse cracks are noted, particularly in the groove. These tend to spread and join, whereupon they may cause a light shelling. It is doubtful whether these cracks deepen.

The hardened portion may shell or peel in flakes on the head, or in shards or strips on the groove. One rail may be defective in this way while the adjoining length is free. Corrugation has not followed hardening. The track also seems to be less noisy than untreated rail.

Measurement of wear has been too scattered to be conclusive, but the management believes that resistance to wear is raised 90 to 100 per cent. However, the "In situ" process subjects the rail to a certain risk. As far as Copenhagen results go, there is no strong temptation to continue the work.

**Abstract of paper read before the Copenhagen convention of the Internationaler Strassenbahn- und Kleinbahnverein (International Street and Interurban Railway Association), June 22-24, 1927.*

Digitized by Google

During 1926 the Copenhagen management ordered 2 km. (1.24 miles) of German standard section No. 102, surface-sorbitized rail, chiefly for curves on which the lip of the inner rail has been cut off for use with "Tornado" guard rail. The rest of this sorbitized rail is for straight track at places where wear is severe because of frequent stops.

Two-Day Meeting for C.E.R.A. Master Mechanics

SEPT. 8 and 9 the next meeting of the Central Electric Railway Master Mechanics Association will be held at the Hotel La Salle in South Bend, Ind. The first day will be occupied with a discussion of reports and other business of the association, and the second day, Friday, will be taken up with an inspection of the South Shore Railway shops. A special car will take the party to Chicago for this inspection.

N.E.M.A. Policies Division Meets Sept. 1-3

THE program of the coming meeting of the Policies Division of the National Electrical Manufacturers Association at Association Island, Sept. 1-3, will center around three subjects: economics, commercial development, and competitive relations.

Addresses will be delivered by Prof. Thomas N. Carver of Harvard University; Magnus Alexander, president of the National Industrial Conference Board; C. L. Collens, W. E. Sprackling, Leonard Kebler and W. G. Merritt.

American Association News

More Foreman-Conference Registrants

REGISTRATIONS for the training course for foreman-conference leaders to be held at Cleveland, Oct. 3 to 8, continue to come in. In addition to the list of twelve men published in the Aug. 6 issue the following names have been received:

W. H. Becker, instructor Pittsburgh Railways.

D. D. Brimhall, supervisor Utah Light & Traction Company.

R. Z. Burns, superintendent of school, Pittsburgh Railways.

W. E. Ford, superintendent road construction Pittsburgh Railways.

H. R. Horton, mechanical engineer Pittsburgh Railways.

T. J. Madden, instructor Pittsburgh Railways.

Mack E. Murphy, instructor Pittsburgh Railways.

E. B. Stover, assistant to assistant general manager Chicago, South Shore & South Bend Railroad.

E. H. Tingley, secretary National Association of Foremen.

The Cleveland Railway also will have several representatives in the course.

Luncheon Conferences Announced

FOURTEEN "Round Table Luncheon Conferences," each devoted to a subject of major interest, and each limited to an attendance of 50, will be a feature of this year's convention at Cleveland. The luncheons will be strictly informal, with no set speeches or papers. Only cross-table questions, expressions of opinion and exchange of practical experience will be included.

This will be an unusual opportunity to find out what other operating men have done, what they think about any particular problem, and an opportunity to give others the benefit of experience accumulated in successfully working out the subject problem. There will be an opportunity for younger and older executives and small-property and big-property executives to get acquainted and to profit by a better understanding of common and peculiar problems and advice on how to tackle them. The leaders of the industry have promised to be in attendance at the luncheons. An executive especially qualified on the subject will act as sponsor at each conference.

The Round Table Luncheon Conferences will begin at 1 p.m. and continue until 2:30, or as long as interest holds attention for those who do not have other afternoon engagements. Affiliated association meetings will not start until 3 p.m.

Those who wish to attend should send check for tickets desired, at the rate of $2 for each luncheon, to J. W. Welsh, executive secretary.

President Proctor Appeals to Claims Men

PRESIDENT PROCTOR is endeavoring to secure good attendance of claims men at the Cleveland convention. Accordingly he has written the following appeal for publication in ELECTRIC RAILWAY JOURNAL:

"This year we convene at Cleveland, Ohio, Oct. 3. I wonder how many claim agents other than the 'Old Guard' have seriously considered the advisability of attending the convention; not only attending themselves but bringing their chief surgeons and attorneys.

"Our program has been arranged by outstanding men in our field and contains subjects of great interest to claim agents, surgeons and attorneys. The papers and discussions will be both interesting and instructive. Much new blood has been injected. Many new faces will appear on the floor. One special feature will be an informal luncheon and round-table discussion, Wednesday, Oct. 5, at which all attending will be asked to bring up any subject in which the speaker is interested.

"The joint meeting of the Traffic and Transportation Association and Claims Association on Oct. 4 will be of interest to both, as subjects of mutual interest will be discussed. Your officials will endeavor to make the 1927 convention a record breaker, both as to attendance and interest. We need your help and think we can help you.

"Your absence and the old excuse of lack of interest on the part of your manager will not do. When you have failed to attend, was it not on account of a lack of interest on your part? Your manager cannot be expected to be interested unless you interest him; until you show him where the company will get a return on the investment. Of course, he is not interested merely to give you a vacation at the company's expense. It is up to you to show him the benefit to be derived from the meeting, rubbing elbows and discussing your problems with men who have had the same troubles as yourself, men who can give you a new slant on things, who can give you new ideas, who will send you back better equipped to tackle your job and cut down your per cent of gross earnings expended for claims. To make this convention what it should be a large attendance of its members is necessary.

"There will be no advance publication of papers. That makes your attendance all the more necessary. Otherwise, you will know nothing of the proceedings until the minutes are published. Furthermore, the personal contact is necessary if we are to derive any benefit the one from the other.

"Now I beg you to be with us this year. Help us by your presence and participation in the proceedings. We, on our part, will do our best to help you. Make your reservations early. There will be a big crowd. Here's hoping to see you all in Cleveland.

"C. B. PROCTOR,
"President American Electric Railway Claims Association."

News of the Industry

Higher Fares to Be Sought in Ottawa

The Ottawa Electric Railway, Ottawa, Canada, has formally notified the city that it proposes to make application for an increase in fares for the five years beginning Aug. 14, 1928. Instead of a 5-cent fare, as now provided in the agreement, the company proposes a 7-cent fare or four tickets for 25 cents for adults, from 6 o'clock in the morning until midnight. For children, instead of the 3-cent fare, the company proposes a 4-cent fare or seven tickets for a quarter. No change is suggested for the after midnight fares, 10 cents cash.

Under the agreement with the city, the company was required to give notice of any application for increased fares before Aug. 14 this year. The application will then be made to the Dominion Board of Railway Commissioners. The agreement, as regards fare, provided 5 cents for the first five years, and for the second five years any increase would have to be approved by the Railway Commissioners.

Back in 1923 the city called into consultation Robert M. Feustel to investigate the railway problem. In his report to the Council, Mr. Fuestel recommended a number of extensions to existing lines, opening up new districts, and also prepared an estimate of earnings in the years immediately ahead. The company's franchise was extended upon the understanding that it would carry out the suggested improvements. This was agreed to, although at the time no reference was made to an increase in fares to take care of these extensions, a 5-cent rate continuing to the present.

During the past year or two, the railway has spent more than $2,000,000 in carrying out its part of the program. It is now claimed by the city, however, that proposed improvements are not up to schedule and there is evidently a concerted move to make the company grant further concessions before extending the agreement. The company, on the other hand, claims that it cannot carry out this program without an increase in fares.

Franchise Negotiations in Akron Likely

Negotiations will be started soon regarding a new railway franchise for the Northern Ohio Power & Light Company. The principal matter to be decided will be the rate of fare. The present rate is 7 cents, four tokens for 25 cents or seventeen tickets for $1, with free transfers. Company officials have indicated they will ask an increased fare to bring the rates in Akron to a parity with those in other cities. Whether higher fares will be asked will depend largely upon the company's ability to keep down operating costs of its combined railway and bus system, it was intimated. The question of improvements and extensions demanded by the city also will play a part in determining what the fare shall be under the proposed new agreement.

A. C. Blinn, vice-president and general manager of the company, says he anticipated no trouble in framing a new agreement satisfactory to the company and the city. Mr. Blinn said:

> The N.O.P. is three years ahead of its schedule expansion in the power and light department. We are so far ahead of the city's normal demand for electric current that we are able to meet almost any emergency here, making our service in this field practically perfect.

Rock Island Fare Increase Still Opposed

The city of Rock Island, Ill., will continue to oppose the proposed increase in fares by the Tri-City Railway on the Illinois lines, according to members of the City Council. City Attorney R. R. Reynolds, who represented the city when the Illinois Commerce Commission met July 28 at Chicago to take up the petition of the railway, gave a brief report of the hearing, which was postponed until Sept. 7. This is to permit examination of the exhibits introduced into the testimony pertinent to operation deficits of the company.

One-Man Cars an Issue in Washington

William McK. Clayton on Aug. 15 challenged the right of the Public Utilities Commission of the District of Columbia, under the law which created it, to permit the electric railways to operate one-man cars in the District without charging less fare than on cars manned by two trainmen. He appeared before the commission to make a last plea in behalf of the Federation of Citizens' Associations in opposition to the reported decision of the commission, all but promulgated, to permit the Washington Railway & Electric Company to buy 30 one-man cars to replace thirteen old ones and seventeen old two-man cars. Mr. Clayton is chairman of the public utilities committee of the federation.

Chairman John W. Childress, of the commission, said it was not admitted that one-man car service was inferior to the two-man type of conveyance. He also said that so much had been said at the semi-public hearing on Aug. 15 that he thought the commission would throw the whole question open again.

Providence Company Pleads for Abandonment of Freight Service

The United Electric Railways, Providence, R. I., has petitioned the Public Utilities Commission for authority to abandon trolley freight service. Some of the firms that would be adversely affected have retained counsel to oppose the petition. It is claimed that a decision favorable to the railway will handicap certain manufacturers.

Instruction Classes in Salt Lake City

Training classes for railway operators were held recently by the Utah Light & Traction Company, Salt Lake City, Utah, to demonstrate and instruct the trainmen on the proper operation and care of the new cars. These classes were in charge of one of the company's supervisors, who has made a study of the new equipment. The classes were shown the workings by means of large blackboard drawings and were instructed after a close study was made of the cars while in operation. A miniature car was also used for demonstration purposes, this car being a perfect model of one of the cars.

Interurban Rate Increase for Gary Railways

A 33⅓ per cent increase in rates for commutation tickets on the interurban line of the Gary Railways between Gary and Valparaiso, Ind., has been authorized by the Indiana Public Service Commission. The order specifies a new ten-ride bearer ticket at the rate of $4 and cancels the former tariff providing for the sale of 25-ride tickets for $7.50. The new rate became effective on Aug. 19.

In its petition for the higher fares, the company pointed to the heavy operating losses suffered on this line due to automobile competition. The line serves a large number of summer resorts in the vicinity of Valparaiso.

Baltimore Fare Hearing Expected Early in September

The hearing on the application made to the Maryland Public Service Commission by the United Railways & Electric Company, Baltimore, for increased emergency fare pending the hearing of the company's application for a 10-cent fare probably will open on Sept. 1. It has been announced that the commission will take up the emergency application as soon as it can clear its docket of other emergency cases. Both sides are now busily engaged in preparing the data that will be submitted to the commission.

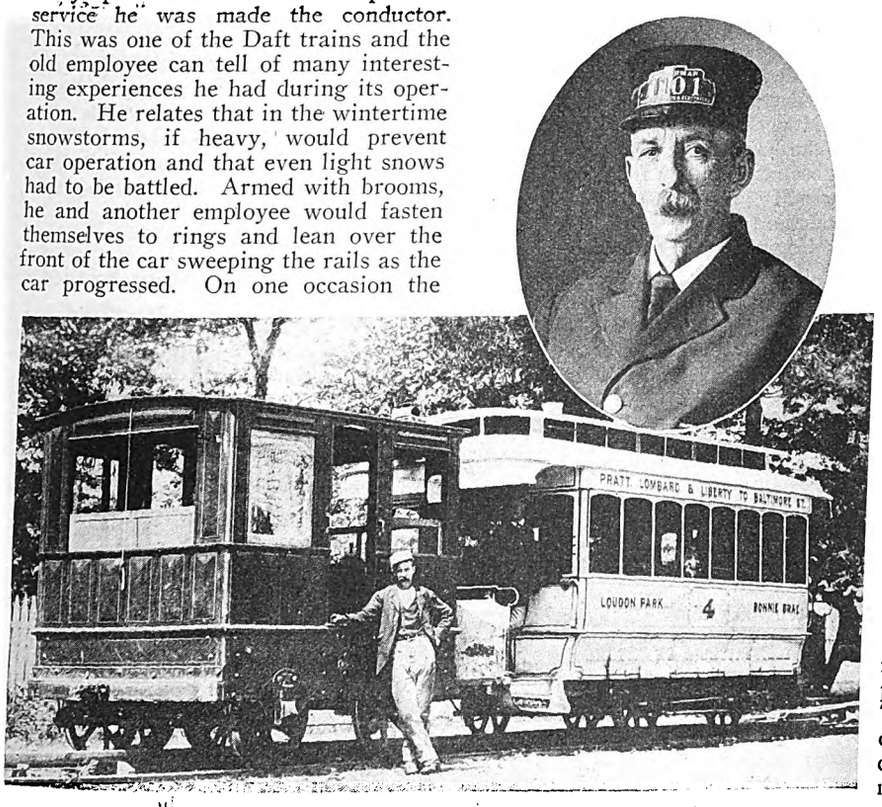
Fifty-Year Man Honored at Baltimore

Joseph Evoy, conductor of the first commercially operated electric street car in America, is still in the employ of the United Railways & Electric Company, Baltimore, Md. He was honored on July 13 by C. D. Emmons, president of the company, who paid high tribute to the old employee and presented him with a gold medal set with diamonds and inscribed "Fifty-Year Man."

Mr. Evoy was conductor on the Baltimore & Hampden line, a third-rail system that was started on Aug. 10, 1885. He went with the company, however, on July 13, 1877, as groom and caretaker of sixteen horses used to draw the street cars. He received several promotions and when the first commercially operated electric car was put into service he was made the conductor. This was one of the Daft trains and the old employee can tell of many interesting experiences he had during its operation. He relates that in the wintertime snowstorms, if heavy, would prevent car operation and that even light snows had to be battled. Armed with brooms, he and another employee would fasten themselves to rings and lean over the front of the car sweeping the rails as the car progressed. On one occasion the president of the company saw this performance and questioned the men's safety. Evoy's sweeping partner relieved the executive's mind with this reply, "How the hell can we get run over? If we fall off here the car will stop."



Operator of line started in Baltimore in 1885 honored

New Jersey Board Approves Ordinance

The Board of Public Utility Commissioners of New Jersey approved on July 14 an ordinance of the town of Phillipsburg, N. J., on application of the Phillipsburg Transit Company. The ordinance adopted by the town on May 25 grants to the transit company a franchise to operate cars upon certain streets of the town for a period of 25 years.

A section of the ordinance concerning stopping of cars upon the approach of fire engines was not approved for the regulation appeared to be against the mandate of the traffic act of New Jersey as to municipal legislation.

The section prescribing certain details of service was deemed "reasonable" and was approved since the board is vested with authority to order electric railways to provide safe, adequate and proper service.

Changes Sought in Salt Lake City to Reduce Costs

The Utah Light & Traction Company, Salt Lake City, Utah, has applied to the Public Utilities Commission of Utah for permission to substitute bus service on certain sections of its street car lines in Salt Lake City and outlying districts, the abandonment of one line and the rerouting of another line to permit partial abandonment. If permission is given to substitute buses service will be provided, according to the application, to take care of the entire requirements of the company's patrons in these localities, at the same rates as have been in effect for street car service, with no change in zone termini. Discontinuance of the company's Mill Creek bus line is also asked, because of lack of patronage. Where abandonment of certain sections of line is proposed, it is stated that this service is no longer required because of the proximity of other lines.

These changes, the management states, have been requested with the idea in mind of reducing operating costs and at the same time providing adequate service to meet the requirements.

$190,000 Improvement Budget for Wheeling Traction

The Wheeling Traction Company, Wheeling, W. Va., will spend this year approximately $190,000 in Martins Ferry and Bridgeport, Ohio, just across the river from Wheeling, where a method of co-operation has been worked out to the mutual advantage of both the city and the company. In Bridgeport, through the co-operation of the state, the county, city of Bridgeport and the company, Main Street is to be reconstructed from the Wheeling-Belmont bridge to the Brookside line. This is the National Pike.

In Martins Ferry work is already far along on the Marietta-East Liverpool Highway. This is a stretch of 11,900 ft. and if the weather permits this work will be finished this year. It is also planned to reconstruct the track on Hanover Street between Fourth and Fifth Streets, a project made possible through the co-operation of the city of Martins Ferry and the company under an arrangement by which both parties gain.

The general principle was recognized in the Martins Ferry and Bridgeport work that conditions under which railways operate with respect to their responsibilities for paving are not the same as in the past.

Southern Against Piedmont & Northern Extension

A series of objections to the application of the Piedmont & Northern Railway for permission to extend the electric railway from Spartanburg, S. C., to Gastonia, N. C., and from Charlotte to Winston-Salem, both in North Carolina, have been placed before the Interstate Commerce Commission by the Southern Railway. Approximately 128 miles of new construction is contemplated by the Piedmont & Northern. The objections of the Southern were incorporated in the brief placed before the commission to supplement the oral argument. As a primary ground of opposition to the Piedmont extension, the Southern's brief declared that the Duke Power Company, the estate of the late J. B. Duke, and a series of affiliated power and utilities corporations controlled the Piedmont system. All of these affiliated corporations co-operated to bring about an artificial control of traffic, the brief continued, by reason of their own requirements for coal and for intershipment of other commodities. The brief says:

The Piedmont & Northern as now constructed has been a predatory enterprise from the time of its construction. The proposed line would closely parallel the lines of the Southern Railway and would depend for traffic upon that which could be taken away from existing lines. The construction and operations proposed would deprive the Southern Railway of more than $10,000,000 gross revenue in the first year and larger amounts in subsequent years, and would impair the ability of the Southern Railway to serve the public.

North Shore Line Issues Book on Service Ideals to Employees

One of the first volumes of practice for personal service to patrons ever issued by an electric railroad has been distributed recently to employees of the Chicago, North Shore & Milwaukee Railroad. This book, containing in concise form the best methods of handling customer situations, was compiled from suggestions made by employees of the Illinois road during conferences in connection with the service improvement program now being conducted. It is a new departure in the field of public service and is expected to be of invaluable assistance in promoting better relations with the public.

Indiana Interurban Under Three-Cent Mileage Rate

The basic passenger rate of the Chicago, South Bend & Northern Indiana Railway was 3 cents a mile beginning on Aug. 8, instead of 2½ cents. The new rate, authorized by the Indiana Public Service Commission, puts practically all interurban lines in Indiana under the 3-cent rate. Until a year ago the Chicago, South Bend & Northern Indiana Railway also was charging this rate, but the rate was lowered to combat bus competition. It has failed, however, to draw sufficient patronage to make the passenger department pay. The sale of books, containing $5 worth of transportation for $3.75, will be continued, and commutation books at the rate of 1⅞ cents a mile which can be used by the entire family also will be sold.

Advertising Invites Riders in Evansville

"Ride the street cars and save the difference," a slogan adopted by Frank J. Haas, vice-president and general manager of the Southern Indiana Gas & Electric Company, Evansville, Ind., has proved most effective advertising for the company. In spite of the fact that the number of automobiles in Evansville has steadily increased during the past year or two, the traffic on the city lines also has held up exceptionally well. Mr. Haas says he has observed during the past few years that among the best patrons of the street cars are people who own automobiles.

Annual "No-Accident" Get-Together in Salt Lake City

Thirty-one trainmen were guests of the management of the Utah Light & Traction Company recently at the annual "No-Accident" dinner, held at the Newhouse Hotel, Salt Lake City, Utah. The guests were all trainmen who have qualified by having no accidents during the preceding year. F. E. Hansen, head of the claims department, acting as toastmaster, impressed upon the men the necessity of carrying out the "safety first" idea to the utmost. A number of the men made short talks, relating incidents occurring in the daily routine of their duties. The keynote of the meeting was the emphasis laid on a satisfactory mental attitude on the part of the trainmen in the successful prevention of accidents.

Virginia Railway Fares to Be Cut

Extensive reductions in fares between Washington and Alexandria and Washington and Fairfax have been announced by the Mount Vernon, Alexandria & Washington Railway and the Arlington & Fairfax Railway, the two companies now operating the lines of the old Washington-Virginia Railway. The reductions also apply to intermediate stations on both lines and to the Mount Vernon, Alexandria and Washington Railway's line to Mount Vernon.

The reductions will become effective on the Mount Vernon line on Aug. 22, and on the Fairfax line the first week in September, at the expiration of the 30-day period from the date of the filing of the reductions with the Interstate Commerce Commission and the Virginia State Commerce Commission at Richmond, unless they should be protested.

The most drastic cut is in the round-trip rate between Washington and Alexandria. This has been reduced to 25 cents. The straight fare rate will be 20 cents. The rate was formerly 24 cents straight and 40 cents for the round trip. The 25-cent round-trip rate applies to all stations between Washington and Alexandria except those to which the straight fare is only 10 cents. The round-trip rate to these stations is 20 cents.

On both lines the fares have been reduced from 3 cents a mile to approximately 2½ cents a mile, except the Alexandria - Washington round - trip rate, which represents a reduction of about 40 per cent. The new rate to Mount Vernon is 45 cents straight.

The new rates on the Mount Vernon line run from the south end of the Highway Bridge and on the Fairfax line from Rosslyn, Va., over Key Bridge.

At the same time the reductions were made public the two companies announced that they had increased the wages of their conductors and motormen 2 cents an hour. These increases become effective with the new rates.

Additional cars have been put in operation between Washington and Alexandria, the cars now running every 20 minutes. The new policy of the companies as outlined by M. E. Church, president of the Fairfax line, and J. W. Rich, general manager of the Mount Vernon line, is to speed up operation and reduce fares as much as possible over the more congested parts of the lines, principally between Washington and Alexandria.

The successor companies began operation on Aug. 1. They are directed entirely by Virginia men.

Wage Scale Continued in Worcester

The Worcester Consolidated Street Railway, Worcester, Mass., has announced an agreement with the employees which continues for another year, effective Oct. 31, the existing wage scale, which has been in force since 1925. The wage scale gives two-man crews 68 cents an hour and one-man operators 76 cents an hour. Carhouse employees and other workers have a varied scale which has been in effect for the past two years.

The union has initiated a move whereby uniformed employees can go on a six-day week by sacrificing the day's pay for the seventh day. In the case of two-man crews the difference between the six-day-a-week and the seven-day-a-week schedule is $6.04. The plan is similar to that adopted by the Boston Elevated Railway.

The committee representing the employees of the Worcester Consolidated Street Railway sought to have the present wage scale renewed for two more years. Officials of the company were satisfied to have it renewed for one year.

Illinois Traction System Service Made Still More Attractive

New train schedules on the Illinois Traction System, main division, effective recently, contain a number of additions and refinements to the passenger service that appeal to the traveler in the Illinois Traction System territory.

The "Illini," a sleeping car train connecting Champaign, Decatur and St. Louis, is now operated on a nightly schedule instead of alternate nights as previously.

A new parlor-buffet car is added to the de luxe service on the main division, leaving Springfield each noon at 12:07 o'clock and arriving in St. Louis at 3:20 p.m. This car is attached to the "Tangerine Flier" and has been reconstructed and redecorated at the Decatur shops so that it harmonizes with the tangerine color treatment of these popular fast trains.

In addition to this parlor-buffet car there is, of course, the regular parlor and diner service provided by the "Capitol Limited," operated daily between Peoria and St. Louis. There is no change in the schedules of either the "Capital Limited" or The "Owl," sleeping car trains connecting St. Louis, Springfield and Peoria, except that the running time of the latter is lessened by a few minutes.

There are several slight changes in the running time of other trains that permit of improved connections by trains of the Illinois Traction with steam railways at junction points.

An intensive advertising campaign has been planned and is being carried out by the company for the popularizing of these improved passenger trains with the public.

"For the Joy of the Working" on J. M. Symington

He could not be painted "wart and all" as there are no warts—not even the faint vestiges of the wounds he received in the World War. Instead, an arresting profile, aquiline nose, arched brow, keen eye, cigarette and chevron are the conspicuous concomitants of James M. Symington, Public Service Railway official, as he appeared to the world in the Aug. 13 issue of the *Saturday Evening Post*. Whether this subject was querulous, garrulous or just plain docile, the artist, Joseph Cummings Chase, author of "The Adventure of Being Painted," does not make plain. Speaking generally, he states that the male of the species comes to the ordeal of being painted with the frank admission that the sooner finished the better.

To the reader of the *Saturday Evening Post*, whose wandering eye must light on Mr. Symington after a tender glance at "The Kingsford Children" and a lingering look at "Mrs. Torok," it should be told that he is well known in the railway field. He entered the employ of the Public Service Railway in July, 1916, as a cadet engineer, following his graduation from Yale University. Late in November, 1925, he was appointed division manager of the Essex division and prior to that promotion he had been assistant to the general superintendent. For meritorious services during the World War he was cited, later receiving an honorable discharge.

Celebrate Rehabilitated System in Rockford

The Rockford, Beloit & Janesville Interurban Railway made an event of the first run of its new cars on the rehabilitated system and a group of Rockford, Ill., officials and newspaper men were aboard the "Winnebago" when it made the initial trip from Rockford to Janesville. Al Olson, for 26 years in service of the Janesville division, was motorman for the trip. Motion pictures were taken of the party as it left Rockford and W. H. Dougherty, Janesville attorney for the system, was host at a dinner for 31 at his cabin on the Rock River. A. P. Lewis, superintendent for the Rockford Public Service Company; C. C. Shockley, passenger and freight agent; John Lewan of the General Electric Company and W. G. Bracken, superintendent of the Roscoe Electric Company, were among the officials on the trip.

Aurora-Elgin Rate Boost Effective

Passenger commutation rates, ranging from 15 to 20 per cent higher than former fares, were put in effect on Aug. 1 by the Chicago, Aurora & Elgin Railroad.

The company was authorized several months ago by the Illinois Commerce Commission to increase commuters' rates after evidence had been presented that operating costs had climbed 110 per cent since 1914, compared with a gain in fares of only 24 per cent.

Men Who Move Cars in Pittsburgh

The Pittsburgh Railways, Pittsburgh, Pa., has a corps of men to expedite the movement of its cars. At a recent luncheon held in the Chamber of Commerce the members of this traffic department got together for the first time in the history of the company, to see what they looked like in their brand new whipcord uniforms and caps, with their black ties and shoes, and to hear short addresses made by Vice-President Thomas Fitzgerald, General Manager W. T. Rossell, Superintendent of Transportation J. M. Loftis and Commercial Manager William H. Boyce. A. J. Fink, superintendent of traffic and schedules, presided. All of the speakers sought to impress the traffic "movers" with the necessity of co-operating with the motormen and conductors to the end that the best of service might be provided for the patrons of the company. The uniform was adopted at the instance of the men themselves and patterned along lines they selected.

Buffalo Believes in Signs

The International Railway, Buffalo, N. Y., is focusing public attention on its track improvements and repaving by placing signs at all points where men are working. Such signs read: "Danger, Men Working, I.R.C. Repairing Tracks and Repaving."

SEEKS TEN-CENT RATE.—The Kansas City, Kaw Valley & Western Railroad applied recently for authority to raise the rates for city fares in Lawrence to 10 cents. The interurban company's line runs from the eastern edge of North Lawrence to the downtown district.

FREE RIDES CONTINUED.—By a vote of six to three, the City Council of Seattle, Wash., has decided to continue the policy of free rides on the cars for policemen and firemen both on and off duty. The repealing bill, drawn last year, was taken from the files by Councilman Oliver T. Erickson.

PRICE FOR POWER SET.—The Utility Commission of Kingston, Ont., and the Kingston, Portsmouth & Cataraqui Electric Railway, operating in that city, have reached an agreement as to the price to be paid for power during the life of the railway franchise. The railway had threatened to close its service if terms could not be arranged suitable to the company.

TAKES PUBLIC INTO CONFIDENCE.—So that commuters would not be discommoded by the change the Cincinnati Street Railway, Cincinnati, Ohio, resorted to a regular referendum in making a decision relative to changing the leaving time on one of its interurban runs to Milford, Ohio. The vote was limited to the one run affected, and it resulted in a decisive majority in favor of the five-minute change. The car was scheduled to leave Government Square, the center of downtown Cincinnati, at 5:10 p.m. By check, J. R. Ong, transportation engineer, found that a five-minute earlier leaving time would result in an improvement. This car, which runs express to the city limits, would be placed just ahead of a local city car and would be able to make better time.

Recent Bus Developments

Five-Cent Bus Route Over Delaware River Suspends

The Delaware River Bridge plaza-to-plaza bus service operated by the Penn-Jersey Rapid Transit Company, a subsidiary of the Philadelphia Rapid Transit Company, will be discontinued after midnight on Aug. 21, according to an announcement by J. A. Queeney, vice-president of the subsidiary.

In a letter to Joseph K. Costello, general manager of the Delaware River Bridge, Mr. Queeney stated that the bus line between the Philadelphia and Camden plazas had been operated as an experimental venture and the increase in tolls did not warrant its continuance.

For the month of July, 1927, the gross revenue was $5,809. Bridge tolls, because of the increase effective July 1, amounted to $4,531, or 78 per cent of the entire gross revenue.

The short line began operation under the administration of former Mayor Victor King of Camden, following his threat to establish a municipal bus route between the two plazas for a 5-cent fare, unless a private transportation company made such provision.

The Philadelphia Rapid Transit Company has applied for permission to build trolley tracks on the bridge for the operation of a short line at a 5-cent fare, paying the Bridge Commission ½ cent for each passenger. The project will be delayed until January owing to the failure of the State of New Jersey to appropriate the necessary funds for that state's share of the construction costs.

Buses Between New Rochelle and Stamford

Twenty-five double-truck interurban cars operated by the New York & Stamford Railway between New Rochelle and Stamford, Conn., were replaced on Aug. 18 with 50 motor coaches. A twenty-minute headway by bus will be maintained between Atlantic Square, Stamford, and Deane Place, New Rochelle, with ten-minute service during rush hours. The fare is to be reduced; instead of eight zones each with a 7-cent fare, there will be five 10-cent zones.

For several years the New York & Stamford Railway has been in the hands of Receiver L. S. Miller, president of the New York, Westchester & Boston Railroad and of the County Transportation Company. The latter company, which operates a system of bus lines, took up the franchise of the New York & Stamford Railway when the substitution of buses for trolleys was first considered.

Since the inception of the New York & Stamford Railway this system has taken over the old Consolidated Railroad, operating between the Byram River at Port Chester, N. Y., and the Mianus River at Riverside, Conn., the Larchmont Horse Railway, operating in the village of Larchmont, and the Port Chester Street Railway, which also operated horse-drawn cars over the streets of that village.

Buses in Lake Charles

Electric cars of the Louisiana Electric Company, Inc., made their last run recently in Lake Charles, La. Buses have replaced them, serving sections which had not been touched by the railway lines. This company was formerly known as the Lake Charles Electric Company, Inc. It acquired the property of the Lake Charles Railway, Light & Water Works Company and is controlled by the Eastern Texas Electric Company of Delaware. It operated 7 miles of line.

Buffalo Interurban Bus Line Project

The Buffalo & Williamsville Railway, which operates a single-track interurban line between the Main Street city line at Buffalo and the village of Williamsville, has given a 90-day option on its property to a committee of five Williamsville and Snyder business men. If the committee carries out its present plans the line will be scrapped and a new interurban bus company will be formed to give transportation to residents of Williamsville and Snyder up to the Buffalo city line. Justice Ouchle has outlined to the town board of Amherst a comprehensive plan of bus service for rural residential communities north of the Buffalo city line. Application already has been made to the Public Service Commission for permission to establish a bus line between Williamsville and Buffalo, but no application has yet been made for the abandonment of the Buffalo & Williamsville Railway.

Application Stirs Ire of Texas Independents

Sixteen bus lines of Fort Worth and Dallas are opposing the application of the Northern Texas Traction Company, now pending before the Texas Railroad Commission, for a permit to establish and operate a bus line between these two cities, which are situated 30 miles apart. The opposing bus lines already render adequate service between the two terminals, it is asserted. The Northern Texas Traction Company operates an electric interurban railway between Fort Worth and Dallas. The competition of the bus lines has made it necessary for the company to put on its own buses as a supplementary service to the interurban line, it is explained.

More Buses in Massachusetts Suburban Service

The Springfield Street Railway, Springfield, Mass., announced that it would discontinue railway service on the Palmer-Worcester line on Aug. 14. Patrons of the line were informed that hourly bus service would go into effect on Aug. 15, connections for Worcester being made at Southbridge. Transportation of mail matter by the street railway company will be discontinued between Palmer and Brimfield when the electrics are taken off. This stretch of about 40 miles is the longest yet to be converted from trolley to bus service by the Springfield and the Worcester Consolidated, which are under one control. Schedules will be arranged in co-operation with other intercity bus lines to avoid conflict.

Injunction Against New York Awards Denied

The application for an injunction to restrain the city from carrying out the award of a bus franchise for Manhattan, Brooklyn and Queens to the Equitable Coach Company and to prevent Mayor Walker from signing the franchise voted by the Board of Estimate, brought by Stewart Browne, president of the United Real Estate Owners' Association, has been denied by Supreme Court Justice Curtis A. Peters.

Immediately after receiving word officially of Justice Peters' decision, Mayor Walker signed the franchise. The Mayor several days ago signed the contracts for the Surface Transportation Corporation, a subsidiary of the Third Avenue Railway, for the bus franchise in the Bronx and of the Tompkins Bus Corporation for the bus franchise in Richmond.

Although Mayor Walker had signed the franchise contract, Mr. Browne said that he intended to appeal from Justice Peters' decision, and had served a notice of appeal on the Corporation Counsel. He said:

> We did not receive notice of the decision until after 3:30, the time at which I am informed Mayor Walker signed the franchise. We will ask the court for a stay in the morning. I suppose the Mayor by signing the franchise contract has complicated matters. I am not enough of a lawyer to say.

Justice Peters held that Mr. Browne had failed to prove his charge that Mayor Walker had denied a public hearing on the Equitable Company's amended application for a franchise and said the preponderance of the evidence was that the Mayor had not, as alleged by Mr. Browne, called the item on the Board of Estimate calendar in "a low tone of voice." Justice Peters also ruled that Mr. Browne had failed to prove that the offer of the Equitable company was less favorable to the city than the offers of other companies, and that in any event he had not made any charge of fraud against the Mayor and other city officials, who were vested with a certain amount of discretion.

Digitized by Google

Individual routes in the franchise granted to the Equitable company are still subject to approval by the Transit Commission in the hearing on the application which the company will have to make for certificates of convenience and necessity, and it is understood that the Brooklyn-Manhatttan Transit Corporation will oppose certain routes in Brooklyn on the ground that they would compete with existing surface lines.

Applies for Bus Permit in Millville

The Millville Traction Company has applied to the City Commission of Millville, N. J., for permission to discontinue service and to substitute buses with a similar schedule and rate of fare. The company asserts that thousands of dollars have been lost annually in maintaining railway service, and that while fares have been doubled wages and costs of upkeep have advanced also, and with one-man cars the heavy losses continued. Bus lines and private automobiles have almost depleted the ranks of trolley riders. The commission laid the application over.

Right to Substitute Bus Service Secured in Lincoln

Following a dispute with the City Council at Lincoln, Neb., which sought to compel it to contract to assist forever in the maintenance of a portion of a viaduct, the Lincoln Traction Company won out. By the payment of $3,200 to repave that portion occupied by tracks of the Lincoln, Capital Beach & Milford, which it operated, the company has secured permission to substitute a bus service. The Beach Railroad had asked the State Railway Commission to permit it to take up the tracks. It said it owed the Lincoln Traction Company several thousand dollars, had no money to pay it, no cars to run itself, and wanted to quit.

The commission called in the City Council, suggested it withdraw an ultimatum that would stop all bus service to the Beach and suburb of Lakeview, and then issued an order allowing the abandonment of the track, contingent on the payment of the $3,200 and the substitution of adequate bus service. The money was paid, the tracks will soon come up and buses will do all the work.

The company has been authorized by the State Railway Commission to abandon the use of street cars in giving service between midnight and 6 o'clock in the morning. The railway is required by the commission to substitute a bus service of similar adequacy and to extend it so as to give service hourly between the city and the Burlington roundhouse and stockyards, 3 miles west. The commission held that this arrangement might bring enough traffic for the company to break even on the entire owl service.

Bus Line to Care for Traffic

The Chattanooga Traction Company, Chattanooga, Tenn., seeks to discontinue passenger service on its Red Bank branch from the Signal Mountain lines, according to petitions filed recently with the Railroad and Public Utilities Commission. The railway company would contract with F. S. Wingate, bus line operator, to care adequately for the passenger service on his bus line. The bus lines parallel the traction line and makes it unprofitable to continue the service, the petition sets out. The freight service to the manufacturing concerns in that section will be continued, the petition declares.

Capital Traction to Operate Parlor Car Coach Line

Permission to establish a new 25-cent parlor car coach line from Cleveland Park to the downtown section was asked by the Capital Traction Company, Washington, D. C., in a recent letter to the Public Utilities Commission.

Parlor car rights with a special rate of fare were sought by this company several years ago, when it started the coach line which runs from Chevy Chase to the Capitol.

The recent application for another parlor car line is somewhat similar to the request made by the company in December, 1925, but which was refused by the former Utilities Commission. For a part of the distance the new route would cross the path of the original parlor car line and would issue free transfers to it. The new line would be operated on a twenty-minute schedule, with extra service as required.

J. H. Hanna, president, said that experience had shown that the operation of service of this character did not seriously compete with parallel street car or bus lines operated at a lower fare; that the character of the territory through which either of the proposed routes would operate was of such a nature as would prove exceedingly attractive for a high-grade parlor car bus line.

Buses May Succeed Cars on Montrose Line

Engineers of the Public Service Railway, Newark, N. J., are making a survey of the Montrose line, which operates between the Erie Railroad station in West Orange through Orange Valley to the Lackawanna Railroad station in South Orange, to determine whether the line has outlived its usefulness. No trolleys have been operated over the route since a recent storm, considerable damage having been done by washouts. If it is found that continued operation of the line is impracticable a move will be made by the Public Service to substitute buses which have been serving the territory. The Montrose line was built in 1897 by the South Orange & Maplewood Traction Company. It was taken over by the North Jersey Street Railway in 1906 and leased to the Public Service when the North Jersey lines were taken over. Before the line can be abandoned or buses substituted for the trolleys the Public Service Railway will have to obtain the consent of the stockholders of the old companies.

Chicago Surface Lines Starts Feeder Bus Service

Entering the field of motor coach operation for the first time, the Chicago Surface Lines on Aug. 11 established a new bus line on Diversey Parkway, Chicago, in co-ordination with the street car service. The new line extends from Laramie Avenue some 1½ miles east to Crawford Avenue, where connection is made with the Diversey car line terminating there. The 7-cent fare charged on the buses includes transfer privileges to street cars operating to all parts of the city.

The application of the Chicago Surface Lines for a bus certificate has been before the Illinois Commerce Commission for more than a year, but an order was issued only a short time ago. Objections to such a grant have been filed from time to time by the Chicago Motor Coach Company and the final order is now being appealed by the coach company.

Three new street car type twin coaches were purchased of the Frank R. Fageol Company by the Chicago Surface Lines and are now in operation on the new bus route. Two additional coaches of the same type are now on order and will be assigned to this service when delivered next fall. The present schedule calls for a six-minute headway.

NEW LINE PLANNED.—The Eastern Massachusetts Street Railway has been granted permission by the City Councils of Lawrence and Lowell, Mass., to operate a bus line via Shawsheen Village and Tewksbury. No opposition is expected when these towns vote on the matter.

BUSES WOULD RUN OVER ABANDONED LINE. — The United Traction Company, Albany, N. Y., has asked permission to abandon certain lines on Fifteenth Street in Troy. The Capitol District Transportation Company, its subsidiary, would serve the abandoned portions if the certificate is granted.

BUSES MUST CARRY FIRE EXTINGUISHERS.—Following the ruin of one or more buses by fire in Tennessee an order was issued recently by E. M. Gillenwaters, Commissioner of Labor and State Fire Marshal, stating that all buses operating in the State of Tennessee must be equipped with fire extinguishes "that the lives of their patrons may be safeguarded and at the same time should a fire occur, that this class of conveyance might be saved." Failure to comply with the rule will subject the violator to a fine of from $10 to $50 for each and every offense.

Financial *and* Corporate

Brooklyn Company to Appeal Commission's Bond Order

Appeal will be taken by the New York Rapid Transit Corporation from the decision of the New York Transit Commission in barring its application for permission to issue $20,000,000 in bonds to be sold to the Brooklyn-Manhattan Transit Company for $16,000,000. The Transit Commission in denying the application of the Rapid Transit Company held that the sale of the bonds to the B.-M. T., which is the parent company, was among other things prejudicial to the interests of the city of New York because of the city's partnership with the company in the routes on which the cars are to be used.

The Rapid Transit Corporation proposed to issue the bonds in order to comply with the Transit Commission's order directing the purchase of a number of new steel cars. Compliance with this order will be held up by litigation over the bond issue.

Under the rules of the commission the company has thirty days in which to decide if it will obey an order or take the matter to court. It was said, unofficially, that the New York Rapid Transit Corporation had decided to challenge the commission's denial of the bond issue application on the grounds that the commission had not made reasonable objection.

Omaha Bonds to Be Extended

A proposal of the Omaha & Council Bluffs Street Railway, Omaha, Neb., for the extension of its 5 per cent bonds, due Jan. 1, 1928, for three years, the bonds to bear interest at 6 per cent for the period of extension, has been approved by the bondholders' protective committee. In a formal announcement the committee sets forth that "under present conditions and pending the obtaining of a new franchise upon satisfactory terms from the city of Omaha, the company is unable to pay or refinance its bonds at maturity, Jan. 1, 1928." Recommendation is made by the committee that bondholders deposit their bonds with the New York Trust Company, New York, or with the Omaha National Bank, Omaha, depositories.

Railway Traffic on Increase in Richmond

While the number of bus riders of the Virginia Electric & Power Company, Richmond, Va., decreased nearly 40,000 from June to July, the number of railway passengers showed a gain, and the total number of riders for the month of July was 2,581,830, compared with 2,544,000 in June, according to a statement issued by Thomas P. Walker, vice-president, at Norfolk. In July there were 1,945,147 street car riders, compared with 1,870,000 in June, and 636,000 bus riders, compared with 673,000 in June. Of the July riders, 15 per cent of the total paid the cash fare of 10 cents, 58 per cent bought tokens at the rate of 8⅓ cents, 25 per cent bought weekly commutation passes, riding for an average of 4½ cents, and 2 per cent used school and excursion tickets. An average of approximately 3,900 passes are sold weekly, and a check by the company shows that each pass is used on an average of a little better than five times a day, or 26 rides a week. In July 394,000 street car transfers and 104,986 bus transfers were given free.

Another Move in Akron Tax Suit

Temporary restraining orders from the U. S. District Court have been served on county treasurers of Summit, Portage, Medina, Stark and Tuscarawas Counties preventing the collection of 1926 tax claims against the Northern Ohio Power & Light Company, Akron, Ohio. The court's order will remain in effect until a final hearing is held. Approximately $500,000 is involved. Company officials state they will fight the 1926 tax valuation in nearly every county of Ohio in which the company operates. Assessments are on the average 35 per cent too high, they say.

The significant points at issue were discussed in the ELECTRIC RAILWAY JOURNAL, issue of Jan. 9, 1926, page 88. At that time discrimination was charged by the company and uniformity sought in the method of assessment.

St. Louis Sale Confirmed

Court sanctions disposal of United Railways' property to the reorganization committee—Objections by city rejected

FEDERAL JUDGE FARIS on Aug. 17 approved the sale of the United Railways, St. Louis, Mo., to the reorganization committee, rejecting the city's objections, and gave the municipality four months to elect whether it will settle the mill tax judgment of $2,396,321 on the basis of one-third cash or the alternative offer of two-thirds preferred stock of the company. The court allowed the city interest only to the date of the receivership in 1919, or $35,545, making the total claim $2,431,867. The city may be limited to the cash offer, as legally under its charter it cannot hold stock in private corporations.

Judge Faris held the offer to the city was fair when compared with the settlement made with stockholders of the old company. He figures preferred stockholders get $21.75 on each $100 of their claim and common stockholders only 75 cents compared to the offer of $33.33 cash or twice that in stock offered the city. As a member of the Missouri Supreme Court Judge Faris once gave a minority opinion ruling against the validity of the mill tax. This was later sustained by the United States Supreme Court. Shortly thereafter the company went into the hands of receivers.

In discussing the financial difficulties of the company Judge Faris said that its troubles were due largely to overtaxation, citing that no other corporation or individual in Missouri has such a tax burden. He stated any suggestion of a return to the 5-cent fare is not even respectable nonsense, pointing out that while fares have advanced from 5 to 7½ and 8 cents the expenditures for wages, equipment and materials by the company in the same period advanced 81 per cent. The city probably will appeal to the United States Circuit Court of Appeals.

The agreement for the settlement of unsecured claims against the United Railways, St. Louis, Mo., was attacked in a brief filed with United States District Judge Faris on Aug. 15 by Associate City Counselor Dolan on behalf of the city of St. Louis. The city objected to the sale unless it is paid in full a claim of approximately $3,500,000 in delinquent mill tax with interest to date. The brief held that from every point of view the offer of the reorganization committee for the railway properties failed to measure up to the standard demanded by the United States Supreme Court because it did not give precedence to full claims of the creditor over every interest of the stockholder. It drew a comparison between the offer made by the reorganization committee to holders of preferred stock in the United Railways and to the holders of unsecured claims. The city was placed in the latter class.

Steam Roads to Acquire Central California Traction

The Interstate Commerce Commission on Aug. 16 authorized the Southern Pacific Company to acquire by capital stock purchase the control of the Central California Traction Company, a 55-mile electric road through the fruit growing region, extending from Sacramento to Stockton, Cal. The permission was conditioned upon the Southern Pacific's admitting either the Western Pacific or the Santa Fe, or both, to participation equally in joint control of the acquired carrier. The commission denied the application of the Western Pacific to build a branch line from Villinger to Lodi, 11 miles, in San Joaquin County, to furnish transportation in the same manner.

Digitized by Google

The Southern Pacific and the Santa Fe each asked the commission for authority to acquire exclusive control of the electric railway, which is owned by Herbert Fleishhacker, San Francisco. The price of the line was understood to be $3,000,000. In its decision the commission said that the railroads in seeking exclusive control had not in mind the financial building up of the short line itself, but that the joint control provision would fulfill this purpose. Because of the arrangement on the Central California Traction System the necessity of the Western Pacific to build was eliminated.

Sale of Washington-Virginia Road Confirmed

Justice Jennings Bailey in Equity Court has signed a decree confirming the sale of the District of Columbia assets of the Washington-Virginia Railway and the subsidiaries of this line. This decree conforms with a similar document which has been confirmed by Judge Brent at Fairfax, Va., which affects the Virginia holdings of the company.

The assets of the Mount Vernon line, which runs through Alexandria, were sold to a committee of bondholders for $300,000 and the assets of the Falls Church line were sold to a committee of bondholders for $150,000. The rolling stock of these lines brought $125,000—making a total of $575,000.

The new Mount Vernon, Alexandria & Washington Railway will operate the Mount Vernon line and the new Arlington & Fairfax Railway will operate the Falls Church line. Both are expected to use the Washington terminal at Twelfth Street and Pennsylvania Avenue northwest.

Miss Bessie W. Allender, a bondholder, objected to the confirmation of the sale, but Judge Bailey ruled that if the commission made any errors in lining up the assets of either subsidiary line for sale, the matter should be taken up with the State or the federal courts in Virginia, as the local courts have no jurisdiction over any Virginia trackage, even though some of it runs through a federal reservation at Arlington.

On July 26 the State Corporation Commission granted a charter to the Mount Vernon, Alexandria & Washington Railway. The company, which is a reorganization of the Mount Vernon division of the former Washington & Virginia Railway, has a capital of 5,000 shares of no par stock. The officers of the new company are: Gardner L. Boothe, Alexandria, president; Lewis H. Parson, Philadelphia, vice-president; Harrison Emhardt, Alexandria, secretary; George E. Warfield, Alexandria, treasurer. The board of directors is composed of these officers and the following: William G. Baker, Baltimore; J. W. Rich, Washington; Samuel F. Steele, Philadelphia.

The Arlington & Fairfax Railway, which was recently formed by the citizens of Arlington and Fairfax Counties to purchase the Falls Church division of the Washington-Virginia Railway, will take over the railroad at once. According to President M. E. Church, the board of directors of the new company has filed with the Interstate Commerce Commission a schedule of fares showing a material decrease in the present fare. Commutation patrons of the road still will benefit by the Highway Bridge ½-cent refund, but the trouble occasioned by the refund will be eliminated. This will be calculated in the new rates, which become effective 30 days after filing. Temporarily there will be no change in the operation of the road.

News from Maine

THE Biddeford & Saco Railroad, Biddeford, Me., paid its regular semi-annual dividend of $1.50 a share on its common stock on Aug. 1. This marks the twentieth year in which this road, operating on a 5-cent fare system, has forwarded dividends to its shareholders. Operating 8.5 miles of line, the railway connects Biddeford, Saco and Old Orchard.

Key System-Southern Pacific Compact Unlikely

Although the Railroad Commission of California, in a recent report indicated the economies that might be expected from a pooling of the interests of the Key System Transit Company and the Southern Pacific Company at Oakland, Cal., it is understood that the arrangement has been discounted by officials as an early eventuality, and the Key System, under its new management, which represents security holders direct, proposes to proceed on its own initiative and without regard to the Southern Pacific Company.

Maine Lines to Cease Operation

The York Utilities Company at midnight Sept. 6 will cease operation of its Sanford-Biddeford railway line, Town House-Kennebunkport line and Town House - Kennebunkport - Cape Porpoise bus line. These lines have been discontinued because of lack of patronage. Application has been made for a permit to run a bus line between Kennebunkport and Biddeford via Kennebunk.

The York Utilities Company, successor of the Atlantic Shore Railway, formerly operated a large system in York County, Me., running over the border into Portsmouth and Dover, N. H. These lines have been discontinued little by little until now there remains fewer than 5 miles of line in Sanford where there is a very good passenger business and also a large amount of interchange freight.

The management plans to replace all of the old cars with Birney cars and is now moving the shops from Town House, where they have been located since 1907, to Sanford. Extensive changes are being made in the carhouse at Sanford, including much concrete work and the installation of a modern heating system. The company has moved its general offices from Town House, Kennebunk, to Sanford, Me.

Would Free Manchester and Derry Property from Tax

The New Hampshire Public Service Commission has recommended in a certification to the State Tax Commission that the Manchester & Nashua Street Railway, Manchester, N. H., and the Chester & Derry Railroad, Derry, be exempt from taxation for the year 1927. The company, it is said, failed to pay operating expenses for the year 1926, and no better results are thus far anticipated for 1927. Action was taken as allowed by the state laws.

Receiver Sought for Pennsylvania Line

The Pennsylvania & Maryland Street Railway, Elk Lick, Pa., more recently known as the Meyersdale Electric Light, Heat & Power Company, which has been carrying passengers, mail and freight for a quarter century between Meyersdale and Salisbury, has discontinued service. Bondholders of the corporation have asked Judge John A. Berkey of the Somerset County Court for the appointment of a receiver. The line extended a distance of 12.5 miles.

Earnings Increase in Evansville

Transportation earnings of the Southern Indiana Gas & Electric Company, Evansville, Ind., for the year ended Dec. 31, 1926, were $811,317, against $779,718 for the year previous. In the annual report to the stockholders B. C. Cobb, president, states that the gross revenue of the company did not decrease because of slight increases in rates of fare charged from time to time. The number of revenue passengers decreased 462,426 over the previous year. This falling off in the past five years was due to increased use of private automobiles. Comparative figures showing revenue passengers carried since 1923 follows:

1922	13,318,196
1923	13,935,605
1924	12,931,255
1925	12,030,431
1926	11,568,005

To improve further the transportation service in the city of Evansville the company placed in operation thirteen modern light-weight, noiseless cars with features of the newest type. Ten buses of modern type to supplement the city railway service were also placed in

Digitized by Google

operation. Of the $754,379 expended during the year for additions and improvements 50 per cent was used in the transportation department.

During the year the company's funded indebtedness was reduced by the redemption at 104 per cent on Oct. 1 of first lien and refunding mortgage gold bonds, series A, 7½ per cent, of which there were $853,300 outstanding. These bonds were due on April 1, 1941, but on account of their high interest rate it was deemed advisable to retire them and in due course to issue bonds bearing a lower interest rate. A total of $578,400 of preferred stock was sold on the customer-ownership plan by employees to 667 individuals in 1926.

Orders Line Between Bradford and Salamanca Scrapped

Supreme Court Justice Thomas H. Noonan has issued an order authorizing Frederick W. Kruse, Olean, former judge of the appellate division and receiver for the Olean, Bradford & Salamanca Railway, Olean, to discontinue operations of the interurban line between Bradford, Pa., and Salamanca, N. Y., and scrap the properties. There was practically no opposition to the application which was made some time ago by the receiver. Justice Noonan, the receiver, and representatives of various interests affected by the order will hold a series of conferences to discuss methods of carrying out the order authorizing the scrapping of the road which extends a distance of 85 miles.

RENTAL DIVIDEND DECLARED. — Directors of the Interborough Rapid Transit Company, New York, N. Y., declared on Aug. 3 a rental dividend of $1.25 on the Manhattan Railway's 5 per cent modified guaranteed stock on account of accumulations in the year ended June 30. This clears up all accumulations on the stock. The full 5 per cent has been paid for the last two years.

BOND SALE TO MEET CAPITAL EXPENDITURES.—The Key System Transit Company, Oakland, Cal., has been authorized by the Railroad Commission in a supplemental order to use the proceeds from the sale of $228,935 of bonds to reimburse its treasury for capital expenditures.

EQUIPMENT ISSUE APPROVED. — The Chicago, South Shore & South Bend Railroad, Michigan City, Ind., has been authorized by the Public Service Commission of Indiana to issue $710,000, par value, of equipment trust certificates for the purchase of new cars and equipment. The original plan was to have the certificates mature over a period of ten years, with interest varying from 4½ to 5½ per cent.

SUSPENSION AUTHORIZED. — Discontinuance of local electric railway service in Watertown, Wis., by the Milwaukee Electric Railway & Light Company has been approved by an order of the Wisconsin Railroad Commission.

Personal Items

Changes in North Shore Accounting Department

Reorganization of the accounting department of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., has been effected in an order issued by C. R. Mahan, comptroller, and approved by Charles E. Thompson, vice-president. The changes are as follows:

William W. O'Toole, formerly auditor, has been appointed general auditor, with jurisdiction over the disbursement accounts, freight accounts, passenger accounts, capital expenditures, general bookkeeping and joint facility accounts divisions.

Robert E. Keefe is appointed auditor of disbursement accounts, with jurisdiction over all receipts and disbursements.

The title of William J. McNanly, Jr., is changed from auditor of merchandise despatch accounts to auditor of freight accounts.

Lambert J. Wertzler, formerly assistant auditor of passenger accounts, has been appointed auditor of passenger accounts for both railroad and motor coach lines.

The title of Philip M. Cornes is changed from valuation engineer to auditor of capital expenditures.

The title of Mitchell M. Boyer, engineer auditor, is changed to joint facility accountant.

Lee Abegg is appointed chief clerk, auditor of disbursement accounts division, succeeding Mr. Keefe.

New Hampshire Elections Announced

At the recent annual meeting of the Chester & Derry Railway Association, Derry, N. H., H. L. Grinnell was elected vice-president and A. H. Wikaub secretary.

Henry R. Hayes Slated for Head of Investment Bankers' Body

Henry R. Hayes of Stone & Webster and Blodgett, Inc., is slated to succeed Pliny Jewell of Coffin & Burr, Inc., Boston, as president of the Investment Bankers Association of America. Mr. Hayes, who has been active in the association for several years, is now a vice-president and a member of the business conduct committee. The association will meet on Sept. 24 in Seattle and will adopt a new constitution and by-laws. Mr. Hayes was for several years chairman of the committee on finance of the American Electric Railway Association.

W. B. RENSHAW, assistant district engineer of the Westinghouse Air Brake Company at Wilmerding, has been advanced to the position of representative for the Westinghouse Traction Brake Company, maintaining his headquarters at Wilmerding. Mr. Renshaw entered the employ of the Air Brake Company in 1913. After filling various positions in the shop and experimental department, he was transferred to the commercial engineering department in 1922. He was appointed assistant district engineer in 1925.

N. M. FORSYTHE has been appointed representative of the automotive division of the Westinghouse Air Brake Company, with headquarters at Pittsburgh. After he was graduated from the University of Michigan Mr. Forsythe entered the service of the company as inspector in the automotive division at St. Louis, which position he held until his new appointment.

HOWARD ELLIOTT, chairman of the Northern Pacific Railway and at one time operating head of the New York, New Haven & Hartford Railroad, owning the Connecticut Company, received the honorary degree of Doctor of Laws at Carleton College, Northfield, Minn., on June 13. He was graduated from Harvard in 1881 and is now president of the board of overseers of Harvard. Mr. Elliott received honorary degrees from Middlebury College in Vermont in 1916 and Trinity College at Hartford in 1924.

H. B. GARDNER has been appointed assistant to the resident vice-president of the Westinghouse Air Brake Company at New York. Mr. Gardner was graduated from Union College, Schenectady, N. Y., as a mechanical engineer in 1916. He served several years with the Locomotive Stoker Company in mechanical and commercial activities and entered the employ of the Westinghouse Air Brake Company in 1923 as representative. In 1926 Mr. Gardner was made vice-president of the Westinghouse Friction Draft Gear Company with headquarters at Chicago. He leaves this position to accept the new appointment in the parent organization.

J. F. CRAIG, for four years representative of the Westinghouse Air Brake Company at New York, has been promoted to the position of assistant Eastern manager. Mr. Craig was graduated from Cornell University with the mechanical engineering class of 1912. He entered the experimental department of the Westinghouse Air Brake Company in 1913, but left the employ of the company in 1916 for a time, engaging in engineering work and serving in the army during the World War. He re-entered the service of the Air Brake Company in 1920 as special engineer, with headquarters at Pittsburgh, and was transferred to the New York office as representative in 1923, which position he held until the time of his recent promotion.

OBITUARY

Judge E. H. Gary

Chairman of United States Steel Corporation served as executive 25 years—Built up huge industry

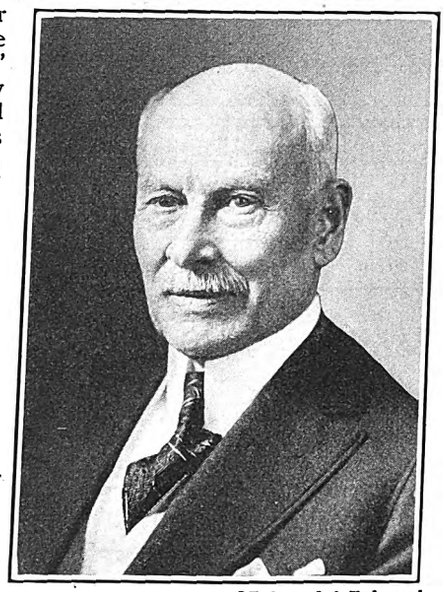
JUDGE ELBERT H. GARY, chairman of the board of directors of the United States Steel Corporation and one of the outstanding leaders of American industry for many years, died early on Aug. 15 at his home in New York. He was in his 81st year.

The history of a man like Judge Gary is more than a record of dates and places, arranged chronologically. Naturally the press is filled with encomiums well deserved. It is always so in the case of a national figure. It does seem, however, that the accomplishments of the man were best characterized by President Coolidge when he said that Judge Gary stood "foremost among those who find the great private enterprises of our country an opportunity for public service as well as a medium for financial profit." As the president indicated, Judge Gary upheld the best ideals of commerce and industry and proved that success is attained in largest measure through adherence to the highest standards of American business.

One thing more than any other about the man stood out in bold relief. That was his optimism. Critics of Judge Gary were wont to chide him for this, not realizing that it was one of the man's greatest assets. No man is without limitations and free from idiosyncrasies, but in the case of Judge Gary they were so insignificant as to be quite negligible. Of course, the man was in the limelight. It could not be otherwise. He was not impervious to public opinion, but he did have fixed policies and he adhered to them. Neither the bellowing of the economic firebrand nor the bulldozing of the financial fanatic could move him. He had a very pronounced code of business ethics, succinctly stated as a matter of public record, and when the clamor grew strong for greater participation on the part of the stockholders in the prosperity of his company, he stood out against that clamor until he was convinced that the course of action upon which he entered was fully justified. He was concerned for his stockholders, not the speculators, and the employees were numbered by the thousands among the stockholders.

It would be easy to go on piling incident upon incident. It certainly was no small accomplishment that where others proved vulnerable to attack, the chairman of the United States Steel Corporation could show that instead of injuring his competitors, he had stabilized the steel market. In so doing he made others sharers, sometimes in spite of themselves, in a position of security such as organized Germany did not attain and the adventurous steel manufacturers of Britain never even approached. One of the last things that Judge Gary did was to prepare for *Coal Age*, a McGraw-Hill publication, an article in which he recounted the progress of his company since 1906 in safeguarding its employees from accidental death. The critics to the contrary, his concern was ever for the rank and file, but there was nothing maudlin about that concern.

The Bacons and others may have achieved fame by working sedulously in seclusion, but it is not possible for the master of modern business quite to do that. And are the achievements of the industrialist or the financier any less far reaching than those of the savant when it is considered that in the hands of men such as Judge Gary the economic destiny of thousands rests at the moment and for the future? The work of the engineer and the industrialist is our heritage no less than is the heritage handed down by the savant. A money motive does not necessarily mean the thing is mercenary. Often the reward is second to the joy of accomplishment. It is incompatible to accord the cross of merit to the creative artist and to deny it to the industrialist of the type of Judge Gary. Each may work sincerely in his own field. Let us not measure one man in terms of another.



©Underwood & Underwood
Elbert H. Gary

Judge Gary rose to be head of the United States Steel Corporation by reason of his legal as well as his business ability. As general counsel for and director of the Illinois Steel Company in 1899 he was in charge of the organization of the Federal Steel Company, formed by an amalgamation of the Illinois and other steel companies. In these negotiations he had his first contact with the elder J. P. Morgan, whose financial support was being sought in the merger. Judge Gary was picked by Mr. Morgan and his associates to head the merger after he had shown his ability as an organizer and an executive.

Judge Gary has always been credited with having first visualized the larger possibilities of the steel industry, and with having outlined these possibilities to Mr. Morgan. Then when it became known that Andrew Carnegie wished to withdraw from the steel industry and devote his vast fortune and the rest of his life to philanthropies and world peace, Judge Gary found more ready support for his plans. He hoped to organize a corporation that would be able to compete with the steel industries of Germany and Great Britain, then dominating the international market. He won Mr. Morgan's support for the proposed steel merger.

Elbert Henry Gary was born on Oct. 8, 1846, on the farm of his father, near Wheaton, Ill. He was educated in the public schools of Wheaton, at Wheaton College and at the University of Chicago, where he received a degree of LL. B. in 1867. He was admitted to the Illinois bar in 1867 and in 1882 he was admitted to the bar of the United States Supreme Court. He entered politics as a young man and his fellow-townsmen conceded that he was a young man of promise when they elected him for three terms as president of the town of Wheaton. When the town became an incorporated city he was elected its first Mayor. Afterward he served two terms as County Judge of Dupage County, Ill., and acquired the title of Judge. Judge Gary went to Chicago, where he practiced law for twenty-five years. He was president of the Chicago Bar Association from 1893 to 1894.

Willard F. Graves

Willard F. Graves, chief engineer of the Terre Haute, Indianapolis & Eastern Traction Company, Terre Haute, Ind., and third vice-president of the American Electric Railway Engineering Association, died suddenly in that city on Aug. 16.

Mr. Graves's railway interests were diffused throughout the United States and Canada. Before his affiliation with the Indiana property late in 1923 he was for nine years chief engineer of the Montreal Tramways. His career began as assistant engineer of construction on the South Side Elevated Railway in Chicago, now a part of the Chicago Elevated Railways system. During that period he had charge of the reconstruction work and at the expiration of that assignment he was engaged as superintendent of track in the reconstruction and maintenance of the tracks of the Chicago City Railway.

Among his many accomplishments is the part he played in the track valuation work of the Detroit United Railway and subsequently of the Halifax Tramways & Power Company and the Quebec Railway, Light, Heat & Power Company. This valuation work was undertaken while Mr. Graves was chief engineer of the Montreal Tramways.

His association activities were referred to in detail in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 1, 1923.

Manufactures *and the* Markets

Big Bus Tool and Parts Display Scheduled for Cleveland

Plans have been perfected by the A.E.R.A. exhibit committee looking to a large exhibit at Cleveland by the manufacturers of automotive tools and parts in the section devoted to buses and trucks. The assignment of 15,606 square feet of floor space has already been made for this type of display and according to Fred Dell, director of exhibits, there are only three spaces unsold in the section.

Preliminary announcements of the manufacturers as to the nature of their exhibits include grinding machines, power driven machine tools and reamers, hydraulic jacks, all styles of brakes for buses and trucks, crank case oil reclaiming outfits, spray paint equipment, high pressure guns, socket wrenches, magnetos, spark plugs, abrasives, engine bearing brake linings, service jacks, transmission clutches and controls, and malleable iron fittings for use in bus and truck construction.

Work on New Orleans Cars Progresses

Twenty new cars ordered last year are expected to be delivered to the New Orleans Public Service, Inc., New Orleans, La., within the next 90 days. The cars will be shipped by the St. Louis Car Company and the Perley A. Thomas Car Company. They are all

15,606 Sq.Ft. of Space

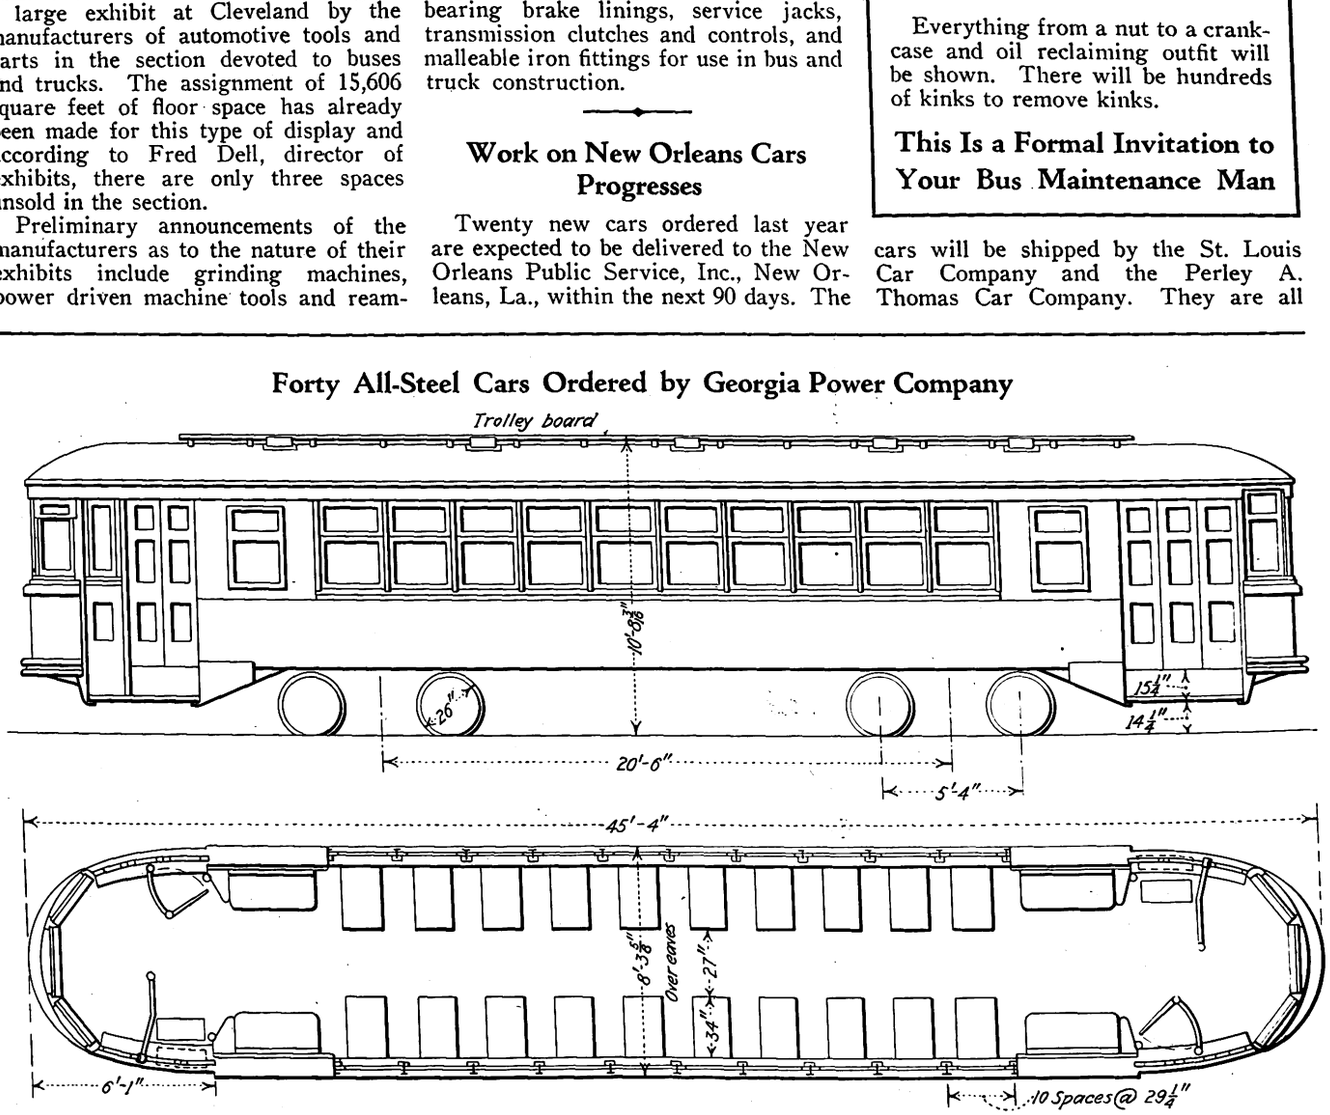
Will be occupied at the Cleveland Exhibit by

Automotive Tool and Parts Manufacturers

Everything from a nut to a crank-case and oil reclaiming outfit will be shown. There will be hundreds of kinks to remove kinks.

This Is a Formal Invitation to Your Bus Maintenance Man

Forty All-Steel Cars Ordered by Georgia Power Company



F. L. Butler, vice-president Georgia Power Company, Atlanta, Ga., reports the placing of a car order for 40 one-man, passenger, city type, double-end units, each with a seating capacity of 48 passengers. The contract, awarded in April to the Cincinnati Car Company, Cincinnati, Ohio, calls for delivery in August and September. All-steel construction has been specified and the cars will have an over-all length of 46 ft. 4 in. Ten of the units are to be equipped with Timken roller bearings. A natural cherry interior trim and a painting scheme of green and cream colors have been chosen. Preliminary specifications follow:

Number of units	40
Type of unit	One-man, motor, passenger, city, double end, double truck
Number of seats	48
Builder of car body	Cincinnati Car Company
Date of order	April, 1927
Date of delivery	August-September, 1927
Weights: Car body	16,660 lb.
Trucks	10,700 lb.
Equipment	9,640 lb.
Total	37,000 lb.
Bolster centers	20 ft. 6 in.
Length over all	46 ft. 4 in.
Length over body posts	33 ft. 2 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 3½ in.
Height, rail to trolley base	11 ft. 8 in.
Window post spacing	29¼ in.
Body	All steel
Roof	Arch
Air brakes	Westinghouse safety devices
Armature bearings	Plain
Axles	A. E. R. A. specifications E-5-24
Car signal system	Electric Service Supply
Compressors	Westinghouse DH-16
Conduit	Flexible
Control	K-75 and No. 98 cut-out switch
Curtain fixtures	Curtain Supplies Company
Curtain material	Pantasote
Destination signs	Keystone
Door mechanism	National Pneumatic
Doors	Sliding
Energy-saving device	Economy meters
Floor covering	Rubber tiling
Gears and pinions	Tool Steel, long and short addendum
Glass	Plate in vestibule, D. S. A. in car
Hand brakes	Peacock staffless
Hand straps	Rico retrieving type
Heat-insulating material	1-in. cork insulation
Heaters	Consolidated No. 321 Thermostat control
Headlights	20 cars Crouse-Hinds, 20 cars Golden Glow
Headlining	3–16-in. Haskelite three-ply veneer
Interior trim	Cherry
Journal bearings	Ten cars Timken roller bearings, 30 cars plain
Journal boxes	Brill and Timken
Lamp fixtures	Electric Service Supply Company
Motors	Four G.E. 265-A, inside hung
Painting scheme	Green and cream
Registers	Ohmer
Roof material	Poplar
Safety car devices	Westinghouse and National Pneumatic door interlock
Sash fixtures	Curtain Supplies Company
Seats	Hale & Kilburn
Seat spacing	29½ in.
Seating material	Canvas lined, cane panels
Slack adjusters	American, Form E
Steps	Stationary
Step treads	Kass
Trolley catchers	O.B. No. 13,141
Trolley base	O.B., Form 4, Timken bearing
Trolley wheels	Moccasin 6-in., 1¼-in. axle
Trucks	Brill 177 E-1
Ventilators	Nichols-Lintern Type C
Wheels, type	Cast chilled, diameter 26-in.
Wheelguards	H-B

modern steel cars with a seating capacity of 52 passengers and are equipped with four motors. They are also fitted with the latest safety devices and treadle-operated doors designed for one-man or two-man operation.

Johnson Fare Boxes for Albany

Bertrand T. Fay, assistant to the vice-president of the United Traction Company and the Capitol District Transportation Company, recently announced that 247 Johnson automatic fare boxes had been ordered for the United Traction Company and 80 for the Capitol District Transportation Company.

Consider the Purchasing Agent

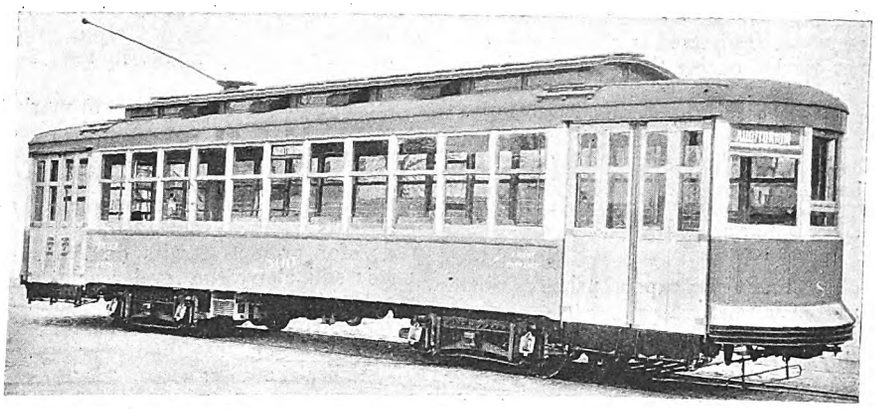
"The Functions of the Purchasing Agent" is the title of the seventh Business Organization Series issued by the Policyholders Service Bureau of the Metropolitan Life Insurance Company, New York, N. Y. The material for the booklet, which is illustrated with purchasing organization charts of various companies, was gathered from the experiences of 30 organizations throughout the country. In the foreword W. L. Chandler, secretary of the National Association of Purchasing Agents, Inc., said that more and more it was being realized the profits of the next few years would to a considerable extent be in proportion to the intelligence which was displayed in purchasing, a matter that included consideration of the rate of turnover of materials and finished products.

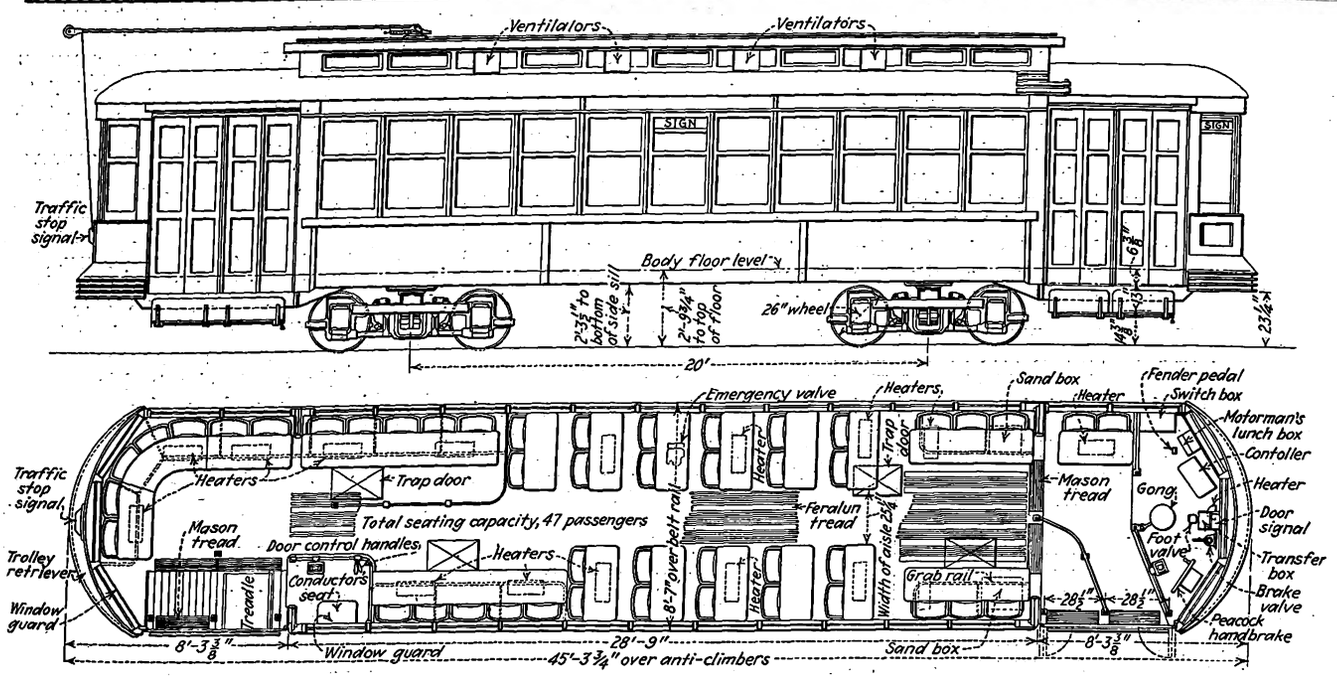
Indiana Coal Strike May End

It is rumored that most of the large union coal mines in southern Indiana will resume operations before the first of September. The strike, which started on the first of April, has caused a large decrease in freight business for the traction companies of the district.

Coal haulage is a big item in the course of a year and traction companies will welcome the reopening of the mines.

Twenty One-Man, Two-Man Cars Ordered by Ottawa Company





Twenty one-man, two-man city type units will shortly be added to the rolling stock of the Ottawa Electric Railway, Ottawa, Ont. Major F. D. Burpee, vice-president and manager of the Canadian Utility, has just announced specifications for the order, which was placed with the Ottawa Car Manufacturing Company, of the railway company's home city. The cars, with a seating capacity of 47 passengers, will be all steel, and 45 ft. 3¾ in. long. Delivery is expected within two months.

Official specifications are as follows:

Number of units	20
Type of unit	One-man, two-man, motor, passenger, city, single-end, double-truck
Builder of car body	Ottawa Car Manufacturing Company
Date of order	Feb. 1, 1927
Date of delivery	August and September
Weights:	
Car body	19,000 lb.
Trucks	11,400 lb.
Equipment	7,700 lb.
Total	38,100 lb.
Bolster centers	20 ft. 0 in.
Length over all	45 ft. 3¾ in.
Length over body posts	28 ft. 9 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 8 in.
Height, rail to trolley base	11 ft. 6½ in.
Window post spacing	2 ft. 6 in.
Body	All steel
Roof	Monitor
Air brakes	Westinghouse, safety car type
Armature bearings	Plain
Car signal system	Consolidated
Compressors	Westinghouse
Conduit	Metal
Control	K
Couplers	Hovey
Destination signs	Keystone
Door mechanism	National Pneumatic
Doors	End, folding
Fare boxes	Cleveland No. 5
Finish	Lacquer
Gears and pinions	Nuttall
Glass	Non-shatterable in door; sash, 21 oz.
Hand brakes	National
Heat-insulating material	Cork
Heaters	Consolidated
Headlights	Special
Headlining	Agasote
Interior trim	Birch, stained
Journal bearings	Plain
Journal boxes	Canadian Car & Foundry, 3½ in. x 7
Lamp fixtures	Benjamin
Motors	Westinghouse No. 510-A2, inside hung
Painting scheme	Red and cream
Roof material	8-oz. duck
Safety car devices	Westinghouse
Sash fixtures	Metal
Seats	Cross
Seat spacing	30 in.
Seating material	Leather
Slack adjusters	Westinghouse
Steps	Folding
Step treads	Mason
Trolley catchers	Earl
Trolley base	Nuttall
Trucks	Canadian Car & Foundry
Ventilators	Nichols-Lintern
Wheels, type	A.E.R.E.A., 26 in.
Special devices	Treadle, National Pneumatic equipment

Metal Prices Weaken Both Here and Abroad

Prices for all of the major non-ferrous metals were lower on Aug. 17 than they were on Aug. 10. The change is not great either in lead or zinc; and although copper is quotationally off 17.5 points in the domestic market, it is significant that the sales were exceptionally small and the principal producers are uniformly out of the market. Prices in London are generally down.

Second-hands and custom smelters for the most part have done what little business was transacted in a very dull copper market during the week ended Aug. 17. The larger selling agencies realized 13⅜c. in Connecticut on Aug. 11 and 13.50c. at high freight-rate points as late as Aug. 13. Occasional sales have been made at 13.30 and 13.25c. Valley, since then. Prices on Aug. 17 were as high as 13.125c., Valley, and as low as 13.125c. in the so-called Middle West. The export price continues at 13.65c. c.i.f.

Though no change has been made in the American Smelting & Refining Co.'s contract price for New York lead, which remains at 6.75c., the market is distinctly weaker. This tendency has manifested itself particularly in the West, where dealers and small producers have cut the prices asked by the leading interests. Over Aug. 16 and 17, one of the principal producers was firm at 6.40c., St. Louis, though other sellers were willing to accept orders at 6.35c., and in one direction, 6.30c. might have been done. In the East, though, the usual contract lead went out at the Smelting company's price. September and October metal was available at from 5 to 10 points concession, though the actual business done was not large.

Zinc has been quiet during the week, with only a slight easing in the price from 6.375 to 6.35c. Despite the fact that producers of concentrates in the Joplin district maintain that $44 per ton is the minimum price at which they can realize any profit, and the further fact that the price is still under that figure, output has been creeping up and is now around 14,000 tons per week. This is not calculated to help the market for slab zinc; but aside from this the situation seems balanced. High grade is quoted nominally at 8c. in the New York district.

Most of the activity in the tin market during the week ended Aug. 17 has been between dealers, but there have been only one or two days when the total tonnage reached good proportions. The price has reacted somewhat, reaching 63¾c. for prompt Straits on Aug. 17, but is still above the level reached last month. There is but little premium on prompt delivery over September. October is about ¼c. less than near-by, and November about ½c. less.

ROLLING STOCK

ARKANSAS POWER & LIGHT COMPANY, Little Rock, Ark., is in the market for two flat cars.

BOSTON ELEVATED RAILWAY, Boston, Mass., has placed an order with the Laconia Car Company, which was the lowest of half a dozen bidders, for ten No. 5 cars of the one-man, two-man type for use in South Boston, where they will replace the old box cars. The price to be paid is about $12,000 each. This order was forecast in the JOURNAL for Aug. 6.

ILLINOIS TRACTION SYSTEM, Springfield, Ill., has placed orders for 200 composite gondolas and 50 composite gondola bodies with the American Car & Foundry Company.

RICHMOND-ASHLAND RAILWAY, Richmond, Va., is reported as being in the market for two interurban cars. This company operates a high-speed service between the Old Dominion's capital and Ashland, a suburb 16 miles north of the city.

TRENTON & MERCER COUNTY TRACTION CORPORATION, Trenton, N. J., has been authorized by the Board of Public Utility Commissioners to offer $18,000 in notes to pay in part for the purchase of snow-fighting equipment.

NORTHERN TEXAS TRACTION COMPANY, Fort Worth, Tex., will supplement its service in Fort Worth with five new 21-passenger buses. Four buses of this kind already are in service in this city. A request for a permit to operate buses between Fort Worth and Dallas is now before the Texas Railroad Commission.

CAPITOL DISTRICT TRANSPORTATION COMPANY, bus-operating subsidiary of United Traction Company, Albany, N. Y., has asked the Public Service Commission of New York for approval of the purchase of twenty Mack buses.

PUBLIC SERVICE TRANSPORTATION COMPANY, a subsidiary of Public Service Corporation of New Jersey, has placed orders for fifty new gas-mechanical buses. Twenty of the new buses will be supplied by the American Car & Foundry Company; twenty by the Yellow Truck & Coach Manufacturing Company and ten by the White Company.

ELECTRIC RAILWAY MATERIAL PRICES—AUG. 16, 1927

Metals—New York

Copper, electrolytic, cents per lb.	12.875
Lead, cents per lb.	6.70
Nickel, cents per lb.	35.00
Zinc, cents per lb.	6.713
Tin, Straits, cents per lb.	64.25
Aluminum, 98 or 99 per cent, cents per lb.	26.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.325
Somerset mine run, Boston	1.85
Pittsburgh mine run, Pittsburgh	2.02
Franklin, Ill., screenings, Chicago	‡
Central, Ill., screenings, Chicago	‡
Kansas screenings, Kansas City	2.675

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, 5/16 in. and larger, cents per lb.	2.85
Tie plates (flat type), cents per lb.	2.35
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.80
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb.	3.00
Sheet iron, galvanized (24 gage), cents per lb.	3.85
Galvanized barbed wire, cents per lb.	3.25
Galvanized wire, ordinary, cents per lb.	2.40

Waste—New York

Waste, wool, cents per lb.	12–18
Waste, cotton (100 lb. bale), cents per lb.:	
White	12–17.50
Colored	7-14

‡ Quotations withdrawn because of strike.

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	11.5
White lead in oil (100 lb. keg), cents per lb.	13.75
Turpentine (bbl. lots), per gal.	$0.64
Putty, 100 lb. tins, cents per lb.	5.25–5.50

Wire—New York

Copper wire, cents per lb.	15.25
Rubber-covered wire, No. 14, per 1,000 ft.	5.55
Weatherproof wire base, cents per lb.	5.20–5.70

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.85
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.00
Light copper, cents per lb.	9.50
Heavy yellow brass, cents per lb.	7.00
Zinc, old scrap, cents per lb.	3.875
Lead, cents per lb. (heavy)	5.50
Steel car axles, Chicago, net ton	$18.25
Cast iron car wheels, Chicago, gross ton	14.75
Rails (short), Chicago, gross ton	16.25
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.75

TRADE NOTES

W. W. WIXSON of the Bonney Forge & Tool Works, Allentown, Pa., has been appointed district sales manager of the central district. Mr. Wixson has long been connected with the company.

EARLE GEAR & MACHINE COMPANY, Philadelphia, Pa., anounces the opening of a New York district office at 95 Liberty Street, New York City. C. N. Walsh and George E. Barrett are in charge. The company also maintains a district office at 110 State Street, Boston, Mass., in charge of W. H. Allen.

O'FALLON COMPANY, 1418-24 Arcade Building, St. Louis, Mo., has been appointed direct sales representative of the Hyatt Roller Bearing Company, Newark, N. J. The O'Fallon Company will handle exclusively the Hyatt railroad journal box and roller bearings for steam railroad and electric railway use. The territory to be covered is the central southwest territory. The new representative will handle all solicitation and sales work from its St. Louis sales office.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review
Published by McGraw-Hill Publishing Company, Inc.
CHARLES GORDON, *Editor*

Volume 70 New York, Saturday, August 27, 1927 *Number 9*

Newspaper Comment Favorable to Electric Railways Grows

PUBLICITY of a kind favorable to the electric railways continues to pile up in an unending stream in the daily press and in many of the magazines. This symposium is characterized by an intelligent discussion of what electric railways are trying to do. The New York *Times,* for instance, commented recently on the statement made by Lucius S. Storrs, managing director of the American Electric Railway Association, to the effect that during the past ten years more electric railway track has been built than abandoned; that there are many more cars in use today than there were a few years ago, and that cities like Des Moines, Akron and Bridgeport have gone back to trolleys after experimenting with buses. The *Times* even referred to the recent parade in Kansas City of refurbished cars, painted in gay colors and equipped with "noise absorbers," and ended with a plea to the effect that the alleged slowness of the trolley car was not an indictment of that vehicle, but only went to show that there are some conditions to which it is not well adapted.

Comment along similar lines was also contained in recent issues of the Cincinnati *Enquirer,* the Jacksonville-Florida *Times Union,* the Kansas City *Star* and the Louisville *Courier-Journal,* the last of which, reproduced in the JOURNAL for July 16, page 121, was particularly pertinent. In addition, the electric railways are more and more being made the subject of constructive criticism in the financial journals, notably the *Times Annalist,* the *Financial World* and the *Magazine of Wall Street,* and have come in for more and more attention on the part of writers dealing with the subjects of advertising and selling. Only recently J. C. Royle, a New York financial writer, said that the electric railways of the United States are spending $1,000,000 a day in extensions, improvements, betterment and new equipment. That fact was not new to the electric railway industry, but it was a point new to the clientele to whom Mr. Royle addressed his remarks. Its reiteration must necessarily be helpful. He was not content merely to set down the facts, but said that the record of expenditures made by the electric railways was one of the most conclusive answers to their future in this country. As he interpreted these figures, they gave evidence that the corporations themselves are confident of the ability of the roads to make money. They indicated to him that the financiers of the country agreed with the operators to the extent of being willing to underwrite the new financing necessary, and that the investing public saw sufficient safety and profit to buy the securities offered.

Not the least significant appreciation, of course, is the recognition of the excellent work in publicity and advertising by the electric railways noted in recent feature articles, notably in *Printers' Ink.* These dealt with the advertising program of the railways in Cincinnati and in Montreal. In still another article in *Printers' Ink* a writer discussed the disposition of the gross sum being spent by the public utilities for advertising. It is true that he referred more particularly to expenditures being made by the gas companies, but he did give full credit for the effective work by the electric railways. Among other companies that have conducted similar newspaper campaigns recently are the Boston Elevated Railway, United Railways & Electric Company, Baltimore; Chicago Rapid Transit Company and the Chicago, North Shore & Milwaukee Railroad.

It is very interesting to note that these programs of publicity and advertising were looked upon not so long ago by many in the industry as a last or a forlorn hope, but that they have now come to be accepted by all the progressive companies as absolutely essential to the proper conduct of their business. It may be many years before the merchandising and advertising efforts of the electric railways are as well organized as those of most mercantile businesses, but the electric railways have made rapid strides along these lines, considering that they were among the last of the major industries in this country properly to appraise the value of publicity and of the truism "It Pays to Advertise."

Training Should Have a Definite Objective

PROGRESSIVE railway executives are coming more and more to believe that it is desirable to secure young engineers and train them for positions of responsibility in the transportation industry. The idea is not new, as certain electric railways have had specialized training of college men for a number of years, but it is gaining ground all the time. The actual training of the young engineers presents no very serious problems. Since they were selected because of their interest in and adaptability for transportation work, the laying out of an apprentice course for these men is largely a matter of detail, with the thought in mind of giving them an inclusive picture of the workings of the entire organization. The day for specialization in a particular line of work will come soon enough—suffice it for the present that the student become familiar with the wheels which keep the tokens dropping in the fare boxes. But after that, what? The question remains as to just what is to be done with these earnest young college graduates after they have gone through the mill and are no longer cadets.

It is the height of folly to spend thousands of dollars in conducting such a course unless there is fair assurance that the best if not all the cadet engineers will remain with the company upon the completion of their training period. Obviously the company is giving all and receiving nothing during this course. From "green" college graduates, equipped with a mass of theoretical knowledge but with little or no practical training, the cadets are converted into engineers with a fair working

Digitized by Google

knowledge of electric railway practice. At the end of the course their services will have a market value and there will be other companies quick to seize upon the erstwhile cadets and thus to profit by the knowledge which they have absorbed, unless the railway which gave the course has succeeded in painting a sufficiently promising future in its own fold.

Working in close touch with department heads, the director of the cadet course should aim to have definitely in mind specific jobs for his charges when they have completed their period of training. In some instances it might be well to choose the ultimate occupations of the engineer graduates according to the subjects of specialization during college courses. A civil engineering graduate would be a promising candidate for maintenance of way work, while electrical and mechanical graduates may be similarly allocated to activities with which they are familiar. While the enrollment each year in the cadet course may be selected to some extent according to requirements for engineering talent in various technical departments, the transportation department offers a broad opportunity for young engineers irrespective of their particular specialties. The main thing is to discover the bent of the individual during this course of training and see that he has a fair chance to do the kind of work he likes after its completion.

One Contented Passenger Is Worth Six Comely Ones

SOME few years ago, when the theory was advanced that riding the street car would cure insomnia, public acceptance of the idea, though negligible, was quiet in its reception and response. Later, when the quasi-scientists declared that vibration of the trolley car promoted better hearing, doubt and denial became more articulate. More recently another strain has been put on normal credulity with the announcement that the trolley is an aid to pulchritude—that a beautifying "current" enters the bodies of the passengers. From many quarters comes the loud cry—Bunk! Hokum!

In the ensuing discussion whether a daily ride in an electric-propelled conveyance enhances beauty and pep one comment ascribed to a Chicago railway official seems peculiarly pertinent: "It seems to me that 'L' riding should be the ideal cure for an ingrowing grouch. We've tried to demonstrate it many times. But there doesn't seem to be enough escaping electricity." Curing an ingrowing grouch or developing contented passengers by selling a real service seems to come more nearly within the province of railway merchandising than promoting the use of railway cars as beauty parlors.

A daily ride on an electric railway line will never serve as an instrument of beauty until it first injects into the rider the serum of contentment, satisfaction and pride in himself and in his public utility. Clean, freshly painted vehicles running on regular schedules with courteous and efficient crews are a more potent influence in the beautifying of passengers than all the electric currents running through the human body. In the last analysis a smiling passenger is a comely one, and all the mystic powers of stray electricity can't convert a disgusted and disgruntled rider into a thing of beauty. Beauty within will not beguile all men, though its expression is evident to the discerning eye. One of its alluring features is contentment. If more beautiful women are seen riding on the street cars today than in former times, an opinion held by some observers, the welcome change is directly attributable to the positive and concerted efforts on the part of far-seeing railway managers whose code for selling transportation recognized the rights of the rider to travel comfortably, conveniently and quickly.

The prophecy for electricity preventing milk from souring may yet be realized, but it will never convert a dour passenger into a satisfied customer. That's the job for a transportation salesman, not an electrical wizard.

Union Takes Its Fellows to Task in Unusually Frank Statement

SOUND reasons are advanced by the Amalgamated Association at Chicago in a protest against the general tenor of resolutions pertaining to the local franchise situation adopted by the Chicago Federation of Labor. In short, the organized railway men call into question the wisdom and justice of the federation's continuing to attack the local railways, particularly as no practical constructive alternative suggestion has been advanced. The Amalgamated was moved to do this in the best interests of the more than 20,000 union employees of the companies and in justice to employers who have had contract relations with the union for more than 25 years.

The protest of the men characterizes the trade union as an opportunist movement. It then says that it is only natural to expect that the railways when seeking franchises will try to get the best legislative deal they can, "just as our unions get the best conditions we can when negotiating contracts with them." If the public needs to be protected the Amalgamated would put the problem up to the elected representatives of the citizens. Incidentally, the primary lesson is read to its fellow federationists by the Amalgamated that the railway workers can hope to profit only as the railway for which they work profits.

In the wording of its protest the Amalgamated Association acknowledges that the management is merely the agent of the trinity of the public, the investor and the employee. The document sees the electric railway executives striving earnestly to operate on a legitimate business basis, and it says so to the apparent confusion of its less sober thinking affiliated labor body. Of course, the companies have their objectives, among them co-ordination, but that does not necessarily imply the preservation of an entirely selfish viewpoint. The Amalgamated asks for the industry by which its members gain their livelihood only the same fair play and consideration shown by the federation to other union industries. That certainly is reasonable.

Perhaps more than anything else does the present document serve to make plain the reason for the opposition to unionism so often publicly expressed. There is no quarrel with unionism, *per se*. Its tenets are good, but too often, far too often, unionism is insincere and destructive in its purpose. The present instance of the federation's position is certainly a striking case in point. The very fact that the Amalgamated found it necessary to take the stand it did emphasizes how the tenets and practices of unionism often part company.

The statement of the Amalgamated of its position in the matter is a rebuke of one union by another well deserved. It could not have been administered half so well

Digitized by Google

by any other agency. But above that, and far more important, is the generous recognition by the union of the mutuality of interest existing between employer and employee, the acknowledgment made of the accomplishments of the Chicago railway management and the tone appreciative of the economic hardships of the industry of which the men are a part. Truly, the statement of the union is in many respects an unusual document.

Sale of Oklahoma Railway Significant

GREATER import than appears on its face attaches to the recent purchase of the controlling interests in the Oklahoma Railway from the Southwest Securities Company by H. B. Wright and his associates. First, the consummation of the deal is a tribute to the successful management of the company by the receivers and to plans laid carefully by the late John W. Shartel, who before his death in April, 1926, mapped out a campaign for restoring the railway to prosperity. Second, it confirms the fact that increasing attention is being paid to the electric railway on the part of bankers convinced of the possibilities of the securities of these companies when intensively conducted.

It is a great work that has been done in Oklahoma City in restoring this road. The facts about its purchase substantiate this, but the most tangible record of evidence is furnished by the results of operation during the last few years. It is expected that the net income of the property this year will be about $200,000. This compares with $50,000 last year and with earnings in 1925 that failed by $20,500 to meet operating expenses, interest and taxes. Of this record the receivers may well be proud. It shows what intelligent application of modern ideas will do toward the restoration of a property that a few years ago gave very little evidence of attaining so soon the degree of relative prosperity which has evidently been reached. There have been many other similar cases in the past showing the growing appreciation on the part of bankers of the potential possibilities of roads similarly situated, but the latest one is unusually significant because of the trials and tribulations which beset this particular railway.

Europe Offers Suggestions on Hiring and Housing Transportation Employees

THOSE who are unacquainted with European electric railway practice should find much of interest in the series of articles on that topic now appearing in the JOURNAL. Fundamentally, the character of equipment used abroad is very much like that in America, the resemblance being closer in the case of electric railways than with the steam railroads. The problem facing railway managements on the two continents also is the same, namely, first to attract passengers and then to carry each of them safely, comfortably and quickly to his journey's end.

In working out this problem many European companies have developed methods which are different from those followed in this country. Some are necessarily so, because the circumstances here and abroad are not the same; others constitute simply another way, sometimes a shorter way, of reaching the same goal. It is these latter methods particularly which may offer suggestions of a practical nature to American railway and bus operators.

The article in this week's issue relates to the engagement of transportation employees and their relation to the operating property after they have joined its forces. In some respects, particularly in connection with psychological examinations of this class of employee, several of the European electric railway systems have made marked progress. Their records also indicate that definite benefits follow examinations devised to test such applicants for the special qualities required of motormen and bus drivers.

The extensive housing program conducted in Berlin probably is less susceptible of application in this country. As the Berlin Street Railway is owned by the city and as municipal housing undertakings are not uncommon in Europe, it has proved practical in Berlin to carry on electric railway housing to a very large scale. Nevertheless, as the article explains, some rather extensive buildings of this kind have been erected by private companies also.

The practicability of similar plans under American conditions is open to question. It may be argued that the average transportation employee here would prefer to select the locality of his home himself, even if it meant living in quarters not so desirable. But if such extensive housing plans seem somewhat too ambitious, it may be that the method followed by a great many European roads of having certain responsible officers live near large operating carhouses is not out of the question. There are precedents, of course, among professionals, notably physicians and clergymen, whose homes adjoin or form part of the building in which they perform their duties. In such cases, the opportunity of occupying a parsonage or rectory or having living quarters in a hospital where one has to work is considered a privilege. Why should it not be the same in connection with electric railway operation?

Celtic Courtesy on a New York Street Car

IT OCCURRED on a 42d Street crosstown car of the Third Avenue Railway, New York. Two friends had boarded, the first of whom dropped fare for both in the farebox. The second did not notice this and therefore dropped a third nickel for himself.

Thereupon passenger No. 1 expostulated with passenger No. 2 on his unwarranted generosity in giving the railway double pay. That third nickel was deemed as lost to them forever, since neither passenger expected the conductor to violate the rule against fishing in the farebox or handling any money intended to pay fare.

But they reckoned without the Celtic wit of the conductor. He had heard their colloquy about the extra nickel, but had offered no remarks. He just bided his time. A minute or two later when a patron of obliging mien came along he must have been accosted with: "Don't drop your nickel in the box. Please give it to that chap over there. He overpaid." And the patron of the obliging mien did so!

Here is a case where a nimble mind leaped over the barriers of formal, though necessary, regulations. The Third Avenue Railway System is to be congratulated on having a man of this type. Here's wishing the company many more of them, whether they are selected by intelligence tests or by shrewd employment directors who disbelieve Shakespeare's statement that "There's no art to find the mind's construction in the face."

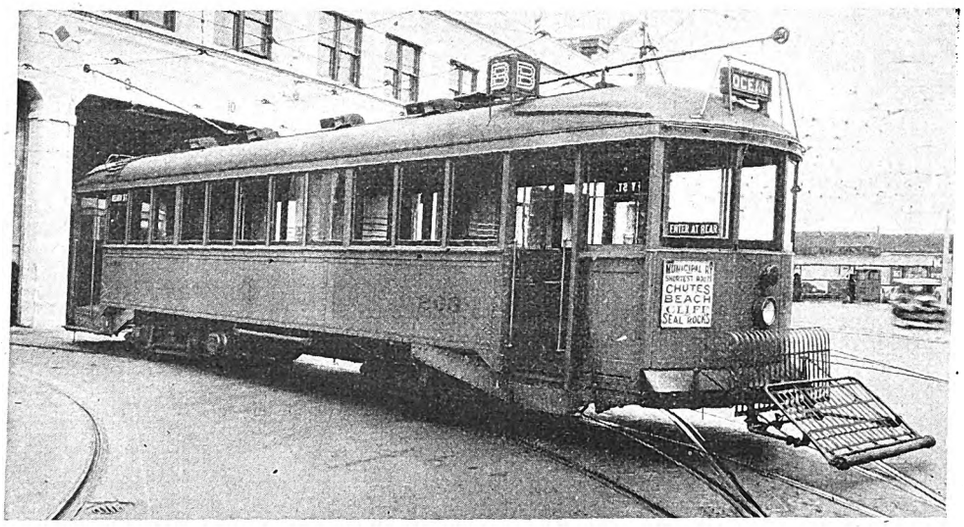
Seven Months of
CAR BUILDING

Trend is toward de luxe equipment, easier riding and noise reduction. Definite effort to improve the lines and appearance of the new cars is being made

By G. Watson James, Jr.
Assistant Editor *Electric Railway Journal*

Mr. James, who has followed closely the activities and developments in new electric railway equipment in connection with his work as editor of the Manufactures and the Markets section of Electric Railway Journal, *presents here an analysis of car building activities and possible trends in construction as revealed during the last seven months.*



Fifteen of these units have recently been delivered to the Municipal Railway of San Francisco. They have a seating capacity of 50 passengers. An order for ten additional cars of the same design was placed in June

ACCORDING to a recent survey conducted by Electric Railway Journal, twelve of the leading car builders in the United States and Canada report a total of 308 electric railway cars for city and interurban service (including trailers) as ordered to June 1, 1927, as against 649 units ordered up to June 1, 1926. In its forecast for 1927 this paper predicted an approximate car budget of $55,000,000, which was an increase of $15,000,000 over that spent in 1926. At the time of making this forecast, opinion was expressed that the greater portion of the $55,000,000 would be expended for new cars.

With these data as of June 1 available, a general survey of the car building situation can be made to determine the trends and the prospects for the immediate future. The latter already show a distinct tendency toward increased activity when the figures from June 1 to July 30 are first considered.

Since June 1, 1927, Detroit has ordered 125 Peter Witt cars; San Francisco ten new cars in addition to the units recently delivered; the Chicago, North Shore & Milwaukee Railroad ten one-man, two-man, 51-ft., 40,000-lb. units, seating 56 passengers each, two of the cars to be equipped with Timken bearings, and the Chicago, Aurora & Elgin fifteen de luxe semi-steel units. Coupled with definite orders are rumors of imminent orders from Seattle and other cities, depending on removal of civic and other difficulties. In this picture, the Boston Elevated looms up with an inquiry for ten convertible cars, Pittsburgh is preparing specifications for ten light-weight interurban units, and persistent rumors center around the Cleveland Railway as the purchaser of 100 units.

Car purchase figures for this year are further reinforced by the 60 electric passenger units and 30 trailers now being turned out by the American Car & Foundry Company for the Long Island Railroad, as part of that carrier's extensive all-steel car program.

Some Deliveries and Orders Since Jan. 1

The new year had hardly taken its first breath before Birmingham received sixteen single-end, double-truck center-exit units, conspicuous for their decorative and noise-reducing design. Then came the five light-weight cars for Williamsport, Pa. Tampa was next reported as having received ten cars. During January, also, was reported an order for twenty units by the Chicago,

Digitized by Google

South Shore & South Bend Railroad, 50 de luxe units for the Eastern Massachusetts Street Railway, nine lightweight cars and one interurban unit for the Gary Railways; the delivery of twelve one-man, 35,000-lb. units to the Scranton Railway, and of seven new interurban 46-passenger, double-end, one-man-operated units for the Gary Railways was also noted. With February came the Rockford & Interurban Railway's order to the American Car Company for seven semi-steel interurban cars seating 52 passengers each, specifications for which were announced in the July 30 issue of ELECTRIC RAILWAY JOURNAL. In this month the Chicago, Aurora & Elgin announced an order for fifteen new de luxe all-steel interurban units weighing 102,000 lb. for one-man, two-man, double-end operation and having Baldwin equalizing trucks, straight and automatic air brake systems, plush seats with leather trim and 37-in. wheels. Chicago received 33 cars for multiple-unit operation, and the Cincinnati, Hamilton & Dayton launched its rehabilitation program with orders for ten all-steel high-speed interurban cars, which have been described in recent issues of the JOURNAL along with a subsequent order for ten double-truck, de-luxe, one-man cars. From the South come advices that the Mississippi Valley Public Service Company has added two one-man cars to its equipment. In the small order class during this month were four double-truck 26,000-lb. one-man cars for the Fitchburg & Leominster Street Railway, Fitchburg, Mass., and five 50-ft. passenger and smoking car bodies for the Philadelphia & Western Railway. In this month also there was the first news that the Montreal Tramways was to purchase 25 motor and 25 trail cars. These cars, subse-

SOME IMPORTANT REHABILITATIONS REPORTED SINCE JAN. 1

Name of Company	Number of Units Rebuilt	Nature of Work
Newport News & Hampton Railway, Gas & Electric Company, Hampton, Va.	45	Remodeled two-man cars for one-man operation, platforms changed, equipped with National Pneumatic and safety car devices.
Eastern Massachusetts Street Railway, Chelsea, Mass.	50	De luxe type reconstruction details not given.
Reading Rapid Transit, Reading, Pa.	1	Rebuilt two steel frame cars.
Market Street Railway, San Francisco, Cal.	73	Cross seats, leather cushioned, smoking compartment glassed one side, open on the other.
Southern Public Utilities Company, Charlotte, N. C.	6	Built 18-ton, 40-passenger car body.
Western Ohio Railway, Lima, Ohio	1	Chair car, bucket type chairs, plush covered. Smoking compartment chairs finished in Spanish leather. Reconstruction plans call for one rebuilt car a month.
Memphis Street Railway, Memphis, Tenn.	65	Redesigned front platforms, low line type folding steps, treadle-operated doors, single and one-man operation, front and rear exit doors. $130,000 outlay. Rebuilt units purchased in 1914 and 1923.
Cincinnati Street Railway, Cincinnati, Ohio	21	Remodeled 21 P.A.Y.E. Installed cross seats, leather upholstering, mahogany and cream color cheme, Railway Utility Chromalox heater under seats, painted trucks, and roof. Electric Service Supplies air-operated sand valves.
Williamsport Railways, Williamsport, Pa.	32	Rebuilt to conform with the five new 42-ft. 2-in. one-man, two-man double-end operated cars, described in the JOURNAL Jan. 8 issue, page 103, also see April 23 issue.
Atlantic City & Shore Railroad, Atlantic City, N. J.	Several, exact number not given.	Plush seats for cane. Step brought within body width, O. M. Edwards drop step, new Pant sote curtains, refinishing cherry woodwork. Sash in monitor deck sealed and Garland ventilators installed. Magnesite flooring laid over old wood floor, laid on wire mesh. No. 16 sheet steel placed over original wood sheeting, 1,000 lb. increase in weight of car.
United Electric Railways, Providence, R. I.	Number not given.	Extensive work on all old cars. Suburban cars—refinishing woodwork, seats upholstered in Spanish leather, white enameled Rico hand strap, cross seats for longitudinal.
East St. Louis Railway, East St. Louis, Ill.	6	Completely stripping cars, welding and replacing defective side plates and underframes, old mahogany finish refinished, natural color headlinings installed, metal trimmings refinished, new seats, spring cushions and backs covered with green Kemi-suede, new motors, rewiring, full safety apparatus including LD-4 devices for operating line switches, four air-operated doors, steps lowered, 12 to 13 in. streamline effect by painting.
Detroit, Monroe & Toledo Short Line Railway, Detroit, Mich.	All rolling stock	Individual automobile seats.
Public Service Railway, Newark, N. J.	24	Bucket leather seats replacing longitudinal cane seats, spring hand straps, 12 ft. well in front of car. New color scheme of maroon, and cream.
Northern Ohio Power & Light Company, Akron, Ohio.	115	Remodeled 41 composite city cars to Peter Witt type, front entrance door enlarged, emergency exit provided operated by separate engine, full safety appliances installed and center door cut in units. Step arranged to act as treadles, rear platform cut off 3 ft., circular seat installed around rear end. Rattan seats padded and covered with leather. Trucks overhauled, gear ratio of motors reduced and helical gears installed. 74 Peter Witt cars arranged for one man operation safety appliances. Oskelite equipment treadle door.
Rochester & Syracuse Railroad, Syracuse, N. Y.	5	Seats upholstered in leather, trucks overhauled, rubber tile flooring, 5 ft. plate glass windows, maroon gray striped velour chair covers. Leather, deep cushioned chairs in smoking compartment.
Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.	1	Remodeled interurban coach in company's shops, special reading lamps, air cushioned non-reversible chairs covered with moiré plush, battleship linoleum, four 100-hp. motors.
Virginia Electric & Power Company, Richmond, Va.	16	Modernized sixteen of its double-truck cars from two-man to one-man operation to conform with ten new cars recently delivered. Leather upholstered seats, safety car appliances, new platforms, piping for door control concealed, rubber tile flooring, porcelain hand-hold strap, sixteen single-coil cylinder-type heaters in car body and two double-coil heaters in each vestibule—$100,000 program.
Chicago, South Shore & South Bend Railroad, Chicago, Ill.	2	48 Hale & Killburn bucket type seats upholstered in brown and gray striped velour, replacing old hard leather seats of reversible type. Pullman type dome lights, cabinets for hot water heaters, multiple-unit control apparatus.
Kansas City Public Service Company, Kansas City, Mo.	746	Extensive modernization. Linoleum tile flooring cemented to a base of builder's felt and canvas covering for floors, except in aisle, flexible composition matting in aisle, seats upholstered in maroon Kemi-suede placed over felt padding, aluminum seat end brackets. Frosted lamps directly over seats. Streamline exterior, sanitary hand straps. Improved controller equipment, air rectifiers to prevent freezing. Thermostatic control for heaters. K-35 controllers replace K-14 previously used.

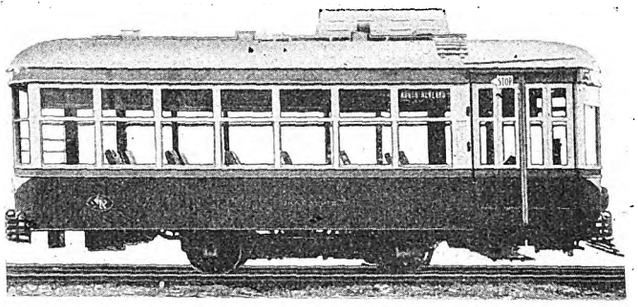
six-wheel trucks, glass-inclosed observation platforms, built-in lavatories, writing desks, magazine tables and a complete kitchen for buffet service.

At the same juncture the Twin City Rapid Transit Company announced that 25 noiseless cars were being built in the St. Paul shops at a cost of $155,000. Then came the inauguration by the Washington, Baltimore & Annapolis Railroad of a high-speed service between the capital of the nation and Baltimore, made possible by ten articulated units. These cars, with a combined section length of 97 ft. 4 in. and a total seating capacity of 96 passengers, represent the first extensive application of articulated car construction to high-speed interurban service. They are of center-door exit and entrance type, each section with 35-ft. 10-in. truck centers and 36-in. diameter wheels. Each unit averages 58⅓ tons, which is a saving in weight of 27 per cent over the old 40-ton equipment. Three trucks against four and one set of motors and control equipment as against two made a substantial saving in first cost and are expected to reduce both equipment maintenance and track maintenance. The month closed with the placing of an order for eight

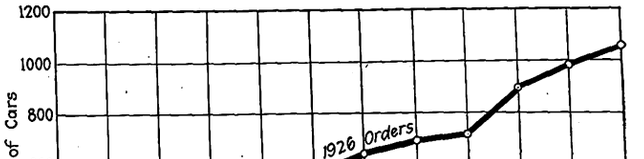


Eight 30-passenger safety cars, weighing 19,000 lb., of de luxe type were the recent choice ot the Jamestown (N. Y.) Street Railway when considering new rolling stock

double-truck, one-man cars by the Beaver Valley Traction Company.

In the March 26 issue of the JOURNAL the previously rumored order for 100 double-truck, city-type, lightweight, one-man, two-man cars for the Worcester and Springfield properties was announced, 50 cars for the Worcester company going to the Osgood-Bradley Company and 50 for the Springfield utility to the Wason Manufacturing Company. These units represent an expenditure of $1,650,000. They are 40 ft. 8 in. x 8 ft. 4 in. and will seat 48 passengers each.

In April, twelve double-truck interurban units of dimensions corresponding to the recommendation of the A.E.R.A. committee on essential features of modern cars were delivered to the Berkshire Street Railway. The Southwest Missouri Railroad ordered one 50-ft. double-end car and the Fitchburg & Leominster Street Railway received the four cars previously mentioned in this article. Six two-man, single-end cars 45 ft. 11 in. long, weighing 29,000 lb., were delivered to the Porto Rico Light & Power Company by the Perley A. Thomas Car Works; also ten cars of the one-man, two-man, single-end, double-end type were delivered at Norfolk, Va., to the Virginia Electric & Power Company. These units are 48 ft. 8½ in. by 8 ft. 5 in. In April the Georgia Power Company placed a 40-car order with the Cincinnati Car Company. These units are to be of the one-man, city-type, all-steel, 48-passenger design, 46 ft. 4 in. long. Ten cars will be equipped with Timken roller bearings. This contract was followed by orders

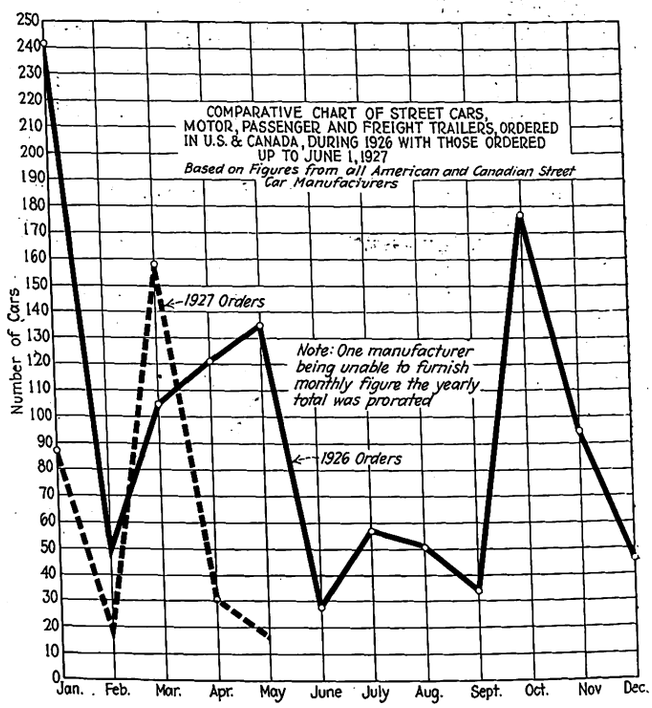


Cumulative orders of street and interurban cars in the United States and Canada, 1926 and 1927

from the El Paso Electric Company for seven 39-ft. 11½-in., single end cars, six interurban one-man, two-man, double-truck cars for the Interstate Public Service Company and four 44-ft. 11½-in. double-end units for the Galveston Electric Company. Contracts were signed with the American Car Company, G. C. Kuhlman Car Company, and the J. G. Brill Company respectively. Delivery was made in April and May of eight one-man two-man units to the Honolulu Rapid Transit Company, Ltd., on an order placed in December.

Included in the car picture for June were the eight de luxe safety cars built by the St. Louis Car Company for the Jamestown Street Railway, Jamestown, N. Y. These units, weighing 19,000 lb., seating 30 passengers, 27 ft. 7 in. x 8 ft. 8⅜ in., with 26-in. wheels, are of the noise-absorbing design. The floors are covered with inlaid rubber tiling, each unit has an operator's double-heated cab, and the motor rheostats usually installed beneath the car floor are located on the roof.

With a final delivery date set for June 15, the complete specifications for the 50 de luxe semi-convertible semi-steel cars ordered on Jan. 5 by the Eastern Massachusetts Street Railway were announced in the JOURNAL for June 11. These units are 43 ft. 9 in. x 8 ft. 2 11/16 in.

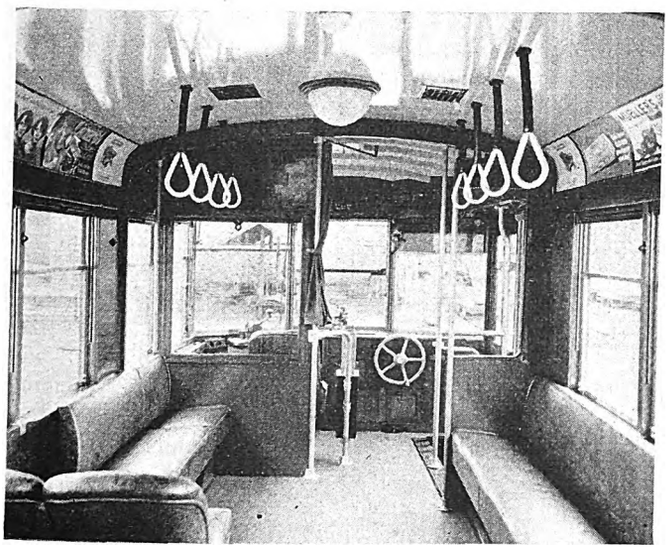


Comparison of monthly orders of street and interurban car orders, 1926 and 1927

Digitized by Google

They are equipped with four GE-265 motors, Westinghouse SM-2 air-brakes with safety features and variable load devices. Heywood - Wakefield deep - cushioned divided-back seats, battleship linoleum floor covering, Economy meters with inspection dials, and Timken roller bearings on two of the units, are some of the other interesting design items. The Wason and Osgood-Bradley companies shared this order.

In June also specifications were reviewed for two one-man, city-type, double-end, 32-passenger cars for the Mobile Light & Railroad Company and two one-man, two-man, semi-steel interurban cars for the Greenfield & Montague Transportation Area. The latter are equipped with Westinghouse 510-E, inside-hung motors and are 39 ft. x 8 ft. $2\frac{11}{16}$ in. On July 9 specifications were released by the East St. Louis Railway for six one-man, two-man cars, these units to supplement its recently rebuilt rolling stock. July brought advices that the Ottawa Electric Railway had ordered twenty one-man, two-man, single-end cars, weighing 38,000 lb. and seating 47 passengers.



Looking toward motorman's position in the new Dayton cars of the C., H. & D. The steel panel affords privacy for the operator without destroying the passenger's view

The new car situation just reviewed does not include the twenty high-speed units which have been delivered to the Chicago, South Shore & South Bend Railroad, nor does it take cognizance of the design of the fifteen 50-passenger semi-steel cars recently delivered to San Francisco.

Trends in Design

Trend in design as shown by the car specifications of 1927 and by several experiments, notably those on the Springfield and Joliet properties, point to the light-weight, noiseless, de luxe-appointed units. The articulated car for heavy interurban and rapid transit service has become an important factor, due to the evident success of the Washington, Baltimore & Annapolis installation and the large scale application of this type of construction by the Brooklyn-Manhattan Transit Corporation. Here, light weight and noise reduction, speed, power economy, conservation in motors and control, combined with improved riding, are the objectives sought. Both for interurban and city service there is a strong tendency toward the use of seats upholstered in leather or plush, and designed for the maximum of passenger comfort. In many instances the trend is toward individual seats or revolving chairs. The recent installation in Pittsburgh of luxurious individual chairs on an experimental car for city service is a particularly noteworthy departure. Many recent cars are characterized by attractive fittings, treadle doors, safety appliances, lower level steps, more artistic color schemes, streamlines, and attention as never before to the elements of appearance and attractiveness.

No discussion of trends is complete without considering the epoch-making experiments of the Springfield Street Railway and the Chicago & Joliet Electric Railway. As stated in the Journal for March 19, precedent was cast aside in the Springfield design. Briefly, this car, which was successfully tested in May, embodied an inclosed automotive type worm drive, internal expanding brakes, four Westinghouse V-91B high-speed, 300-volt motors, two connected in series and full spring suspended in the truck frames. Removal of the motor from the car axle permitted the use of armature speeds that made possible a substantial reduction in motor weight for a given output. Total weight of one truck and two motors was only 5,650 lb. Unusual success attended the effort to improve the appearance and lines of the body design. Test of this car revealed a decided reduction in noise, not only along straight track, but around curves and over special work. As was pointed out at the time the new car weighs only 25,300 lb.

Pictures reproduced in this article are worthy of considerable study by those interested in body trends.

Almost simultaneously with the Springfield experiment was the one undertaken by the Joliet company when worm-drive trucks surmounted by a regular city car body were tested, as a preliminary to their being mounted with a duralumin body now being manufactured by the Cummings Car & Coach Company. When this car is assembled it will embody the following features: Gear reduction of $8\frac{1}{2}$ to 1, truck completely equipped with two Westinghouse V-91B motors having a one-hour rating of 35 hp., and with brake apparatus will weigh only 5,328 lb. The unit is designed for one-man, two-man operation and to seat 51 passengers. The body is estimated to weigh 14,000 lb. with all equipment. With the two trucks, this will bring the total weight to 24,600 lb. Instead of a floating bolster as employed on the Springfield car, the Joliet trucks have a stationary bolster. In the test of these trucks with the old body, there was developed a maximum speed of 34 m.p.h.

In so far as trends and actual car building are concerned a new note of optimism is being sounded in the preliminary announcements of car exhibitors at the coming American Electric Railway Association convention at Cleveland in October. In this particular there seems to be general activity among car builders, and some operators as well, looking to fundamental developments in design which will improve street car performance. The objectives appear to be a reduction in unsprung and total weight, less noise and pounding on special work. Scientific painting is utilized to emphasize the streamline effect and add attractiveness to the transportation vehicle.

Rehabilitation Work Reported in 1927

To this record of complete car construction must be added the tabulation of rehabilitated rolling stock which points conclusively to the wide and rapidly increasing interest being taken in the improvement of the industry's cars.

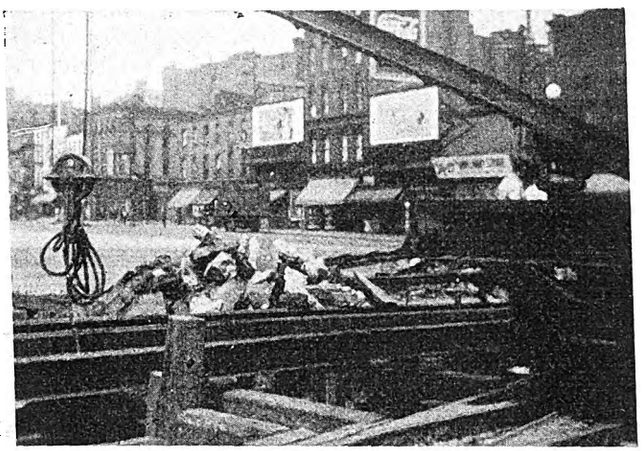
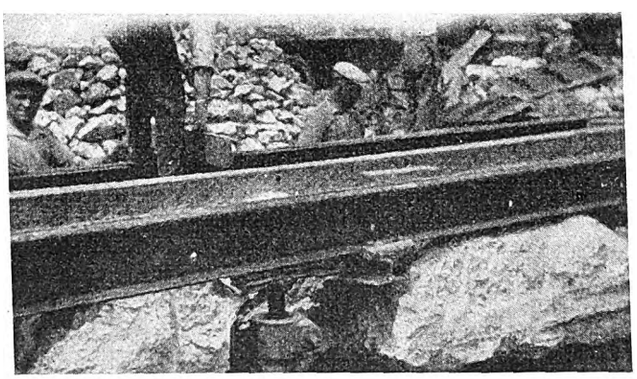
Track Raised to New Street Level

RAISING a 200-ft. length of underground conduit track crossing a busy street in New York City and removing the track paralleling this was the problem confronting the New York Railways when the city decided to place new paving over the old on West Street, raising the street level approximately 12 in. The line which crossed West Street was a double-track spur along Christopher Street, terminating at the Hoboken Ferry depot of the Lackawanna Railroad, on the opposite side of West Street. The yokes with the girder rails and the conduit were imbedded in concrete and, to make the problem more difficult, a double cross-over in the middle



Portion of the raised track held in place at the desired level by wood blocks, ready for filling in. Track to be removed with service car and crane in the foreground



Blocks and screw jacks were used to raise the track to the new level. Concrete between the yokes was not removed unless loose

of the street had to be contended with. Since rail traffic on the spur no longer warranted a double track to the depot, only one of the tracks across West Street was raised, the other being removed entirely.

The track which was to be removed was used for a service car with a crane and other compressed air equipment and was not removed until the other track had been aligned in its new position.

The track to be raised was separated from the street by using concrete breakers and excavating underneath the track its full length. The concrete was removed entirely at each yoke, but where it hung to the rails between the yokes it was not broken. This will be seen in an accompanying illustration. Screw jacks were used to raise the track and wood blocks to hold it at the new level. Jacks were also used to straighten the track when raised and to level the rails previous to filling in. The pieces of concrete removed were used as filler and were tamped thoroughly to make the base sufficiently solid. Fresh concrete completed the fill and was used to form the tube. The new paving has an 8-in. concrete base upon which will be set 4-in. granite blocks.

Economic Protection Assured

Novel group policy in Cleveland includes life and disability insurance, retirement pensions and benefits for sickness or injury

BY MEANS of a comprehensive system of life insurance the 5,000 employees of the Cleveland Railway, Cleveland, Ohio, are covered by protection from nearly every angle with the sole exception of unemployment. The plan recently adopted provides life insurance, double indemnity in case of accidental death, a lump sum for dependents of employees who are maimed, financial assistance in times of sickness and accident and establishes a pension system enabling old employees to retire. The contract, underwritten by the Metropolitan Life Insurance Company, will be paid for by the Cleveland Railway. The rest of the program is co-operative, with the cost being shared by the corporation and participating employees.

For the purpose of the insurance, the employees are divided into five salary classifications, styled A, B, C, D and E. Employees in class A are those receiving an annual salary or wage of $1,500 or less; class B includes workers receiving from $1,501 a year up to $2,100; class C consists of employees getting between $2,101 and $2,700 a year; class D is composed of those receiving between $2,701 and $4,500 annually, while employees in class E are those who receive $4,501 or more a year.

Under an earlier contract the employees were covered by group life insurance. The new contract provides employees in all classifications with the same amount of additional life insurance, each receiving $500, the entire cost of which is being paid by the Cleveland Railway.

Employees in class A receive $1,500 accidental death and dismemberment insurance, sick and non-occupational accident benefits of $12.50 a week for a specified maximum number of weeks, and retirement benefits, or pensions, commencing after 25 years of service at the age of 65, amounting to $1.20 for each year they have been with the company. Disability benefits, under the retirement plan, are payable in case of total and permanent disability, after twenty years of service. They will total $1.20 a month for each year of service up to the time of disability.

In all the other classes, the sick and non-occupational accident benefits are $20 a week, while the accidental death and dismemberment insurance is uniformly fixed at $2,000. The pension benefits, at the age of 65, after 25 years of service, range from $50 a month for employees in class B to $120 a month for those in class E, while the disability benefits under the pension arrangement, payable if total and permanent disability develops after twenty years of service, range proportionately for each year of service up to the time of incapacitation.

Employees in all classes, except class A, also are covered by an occupational accident provision. If an employee is injured while at work benefits will be paid similar in amount to those provided under the non-occupational accident clause, the difference between them and the benefits established by the workmen's compensation act being paid by the insurance company.

Increasing Speed with Safety

By E. J. McIlraith
Staff Engineer Chicago Surface Lines

The author, speaking before the meeting of the Transportation Section of the Wisconsin Utilities Association held at Milwaukee on Aug. 18-19, points out that many sources of delay to public transportation vehicles are within the control of the operating company. These can be reduced and many of them can be eliminated by closer attention to details. The average speed can thus be increased without any change in the maximum speed and without introduction of an added accident hazard.

SPEED seems to be in great demand today, and safety may be important to some of us. But our habits today are to drive automobiles for our personal convenience, and we are just as likely to use an automobile when a street car would serve as well or better as is any other citizen. Use of a luxury as if it were a necessity is a common extravagance.

Now I am to talk of increased speed as if we are vitally in need of greater speed to keep up with the procession. I would rather turn it around and get the same result by calling the subject "Reducing Waste of Time," or "Cutting Down Street Delay," or, perhaps, "Improving Street Usefulness."

Today, especially in the larger cities, there is real necessity for more adequate regulation of street use. The volume of traffic has grown tremendously, and our impatience over the waste of time is enormously greater. Our vehicles will go fast enough, but there is little open road in city streets, and the hoped-for speed today is measured by what an automobile could do with free running.

Street railways must compete for business with frugal pedestrians and spendthrift automobile owners. A few can show a profit from the use of an automobile in city business, but only a few of the many who drive. In order to compete, the service rendered must be attractive from the standpoint of speed between the points where the customer starts to walk to a car line and where he wishes to go after his trip. The maximum speed does not worry him, although it may be of some interest in helping sell the comfort of the ride. The real point is the elimination of delays and, therefore, the saving that is made in time. Here is where the railway's greatest job comes in.

Many Sources of Delay

What delays are likely to happen to the customer on his trip? Let us list them:

1. Car arrives behind schedule time and keeps him waiting.
2. Cars on too long headway.
3. Car brakes slowly to rest.
4. Car stops in wrong place.
5. Doors on the car not open by the time the car stops.
6. Car slow in getting started due to slow conductor or motorman, to interlocking door and car control, to slow operating doors or slow release of brakes, to small platforms, to narrow doors, to slow fare collection system or slow transfer issuing.
7. Car accelerates slowly due to low voltage, small motors, heavy car, slow motorman.
8. Car held by traffic lights.
9. Car held by vehicles, street obstructions, street repairs, or other street abuse.
10. Car delayed en route by too much coasting.
11. Car delayed because brakes not quick enough to let car travel close to other traffic.
12. Car operating on too slow schedule speed.
13. Car delayed by too frequent stops.
14. Car slow in braking.
15. Car crew stops to buy lunch, to get a drink of water or get transfers or change.
16. Trolley pole comes off.
17. Crew has trouble throwing switch.
18. Car develops a defect.
19. Car must take curves slowly.
20. Car moves over special work slowly.
21. Car weaves, jerks or pounds low joints so as to make slow speed necessary.
22. Route of car indirect.
23. Street used for convenience of car operation rather than for convenience of passenger delivery.

That is a long list and yet probably not all the sources of delay. Some customers in certain cities honestly believe they meet each one of these delays on each trip. Are we as operators really alive to our jobs to cut down these constant delays and aggravations? I do not know your cities and your methods of operation, so I may freely challenge your attention to these common faults without a chance that you feel I am getting too personal. Can you sit down with this list and cheerfully check off each item and say it doesn't apply to you? If you give serious attention to each of these items will your speed be increased and would you sacrifice safety? If somewhere you did leave a little more opportunity for slight hazards, would that possible danger be large enough to worry over in view of the increased satisfaction to your customers? Could you afford to spend a dollar more per car per month in maintenance or repairs to collect one more fare for each trip, or a total of probably $35 per month? As a specific example, one property is actually losing customers and friends by its closed door operation in order to avoid trivial accidents that it can be proved cost less than $1.50 per car per month.

If each of the 23 items were changed to get faster operation would the highest speed be higher than the highest now used, or would it merely result in fewer delays, continuity of movement, a more uniform and steady progress that would be safer in the long run? Is it necessary to sacrifice safety to increase speed? Is low average speed improving safety or merely chasing away customers? It is impossible to discuss each of these in detail in the time available. I sincerely hope each operator will seriously discuss each of these with himself to see if he can approve of his present procedure.

In the item of brakes, electric cars are not modern. Many cars have a type of brake rigging with slack so maintained that it takes three seconds to get the brakes fully applied. In three seconds at 25 m.p.h. a car travels 112 ft. Then the car may travel 75 ft. more before it gets to rest. Yet we are competing with automobiles that can stop in 40 ft. when going 25 m.p.h. We must change our brake design, but before we can scrap the old we must improve what is worth improving during its life by getting such devices as auxiliary quick action valves, we must keep a better standard of rigging maintenance and higher brake pressures so the cars can

Digitized by Google

stop really as they should. Railway practice must come closer to automobile practice.

Schedule speed is entirely too low on most properties. The crew loafs on its job when it should be alert to give snappy service that pleases by prompt, efficient activity. Haste isn't needed or wanted, but care to avoid delay—promptness to save movements. The operating speed is purely the result or lack of careful supervisory methods. First comes the building of the schedules, and this is not a simple job, particularly in the larger cities. The improved scheduling methods in Chicago as developed in the last few years have cut the costs $3,500,000 per year, as compared to what would have occurred had the old procedure been retained and the present standard of service rendered. Yet previously the Chicago system was as efficiently managed as in most cities. That is a direct measure of the importance of trained schedule makers and skilled analysis of the problem. Is sufficient specialized and competent attention being paid to the planning end of the business?

Speed Doesn't Increase Accidents

Cars in Chicago operate on the busiest streets, yet day in and day out the average street car speed between terminals is 11.2 m.p.h., and it is increasing. How many of the smaller cities have such average speeds in spite of their more open streets? Yet the accidents and the accident cost in Chicago are phenomenally low. High average speed can be attained with safety.

Many cars in this country are equipped with too small motors or else with two large motors, where there should be four smaller ones. A four-motor car can be operated faster and more dependably in bad weather than a two-motor car. Higher schedule speeds are difficult to make on slippery days when two-motor equipment is used. There has been too little careful investigation to determine the true economic picture when deciding on the purchase of equipment. It may not always be best to buy four-motor equipment, and some cars with four motors are not adequate to the job they are given. But I want to express a word of warning that the choice should be carefully planned by investigating the results to be accomplished. In Chicago we can give higher schedule speeds, more uniform speeds regardless of weather, can buy more expensive cars, but need a smaller number of them and hence less storage space, can use more electrical energy but less employees' pay hours and can operate to give better service, greater satisfaction and hence collect more fares while spending less total money in operating costs and interest, if we use appropriate four-motor cars instead of two-motor cars. Other situations may check out differently where wages are lower and charges for energy are higher, but the question needs careful search.

I will close by discussing traffic control briefly. This is more important in large cities, where the buildings are so much higher and relation between ground area for buildings and that for streets is substantially the same as in small towns. The only factor preventing hopeless congestion is that people are not all willing to insist on driving their personal automobiles on each trip. Some dislike the odor on busy streets, some prefer to read while they ride, some prefer to save the difference in cost, some know the difficulties of getting parking space, some can save time by using street cars, some know they have less nerve strain by traveling on street cars. The larger the city the larger the proportion of street users who ride electric cars or trains.

Even in smaller cities the control of street use is very important. To give the detail of it alone would take a long speech. I do want to say that it is such a highly important factor in the railway business today that each railway must be prepared to become thoroughly informed on the technique of traffic control. It is a specialized business calling for skill and knowledge. The ordinary man doesn't understand it, and most city codes and signal systems of today are seriously inadequate to provide the best usefulness of the streets or the least delay to movement. The railways serve the majority of those using the streets and should be competent to represent this majority in preparing the plans for traffic control. Even elected city officials cannot claim to represent a greater share of the citizens than can the railway management. If correct traffic control methods are developed all street users will benefit. There is under way now an active program to develop a model city code for traffic control. This is a committee of probably 50 members appointed by, and working under the direction of, Secretary Hoover. Such work will be a material help for those features, but in signal control or signal arrangement you should be very sure of finding trained engineering skill and experience to check up the installations. The great majority of signal installations today are failing badly to accomplish maximum traffic relief.

It is difficult in so short a time on so broad a subject to give actual specific plans or proposals that each man may take away to apply on his own job. I have not really attempted to do so. If I have aroused your interest and desire to give your work more intensive scrutiny to see if your methods are sound and defensible, I am sure I have not wholly wasted your time. It is absolutely impossible for any of us to be above criticism or beyond need of correction. Will you go back to your properties to search for ways of improving speed with the idea of gaining customers, increasing your net receipts and improving the usefulness of your service to the community? Will you also determine to give close attention to becoming a leader in the problem of moving traffic on the street? That means study, care and the obtaining of expert advice and others' experience. But as a railway operator you owe it to your patrons, who are the majority of the citizens and who have no better champion or representative than you, to protect their interests and provide a greater saving from time waste without undue sacrifice of safety. You also owe it to yourselves to grow into active leadership as the most competent authorities on matters of street traffic control.

Formula Omitted in Car Calculation Article

IN THE article by H. S. Williams, "When Is a Car Not a Car?" which appeared in last week's issue of the JOURNAL, one of the two formulas for calculating when a car should be retired from service, was omitted due to a printer's error. The formula which is the expression representing the annual cost of the old car is:

$$y = [(c - b) + (e - d)]\, f/g$$

in which y = Annual cost in dollars of the old car.
b = Maintenance cost per year of new car.
c = Maintenance cost per year of old car.
d = Operating cost per year of new car.
e = Operating cost per year of old car.
f = Seating capacity of new car.
g = Seating capacity of old car.

The Müllerstrasse apartment house for transportation employees is the latest development of this kind in Berlin. It supplies the men with comfortable and attractive housing close to their work

Labor Conditions

on European Local Transportation Systems

Extended psychological tests are conducted on applicants for employment and to some extent for older men. Great progress made in housing. Wages not so high as in United States

By Henry W. Blake
Senior Editor *Electric Railway Journal*

IN GENERAL, the methods of recruiting the transportation staffs on the large surface line and bus properties in Europe are more elaborate than in the United States.

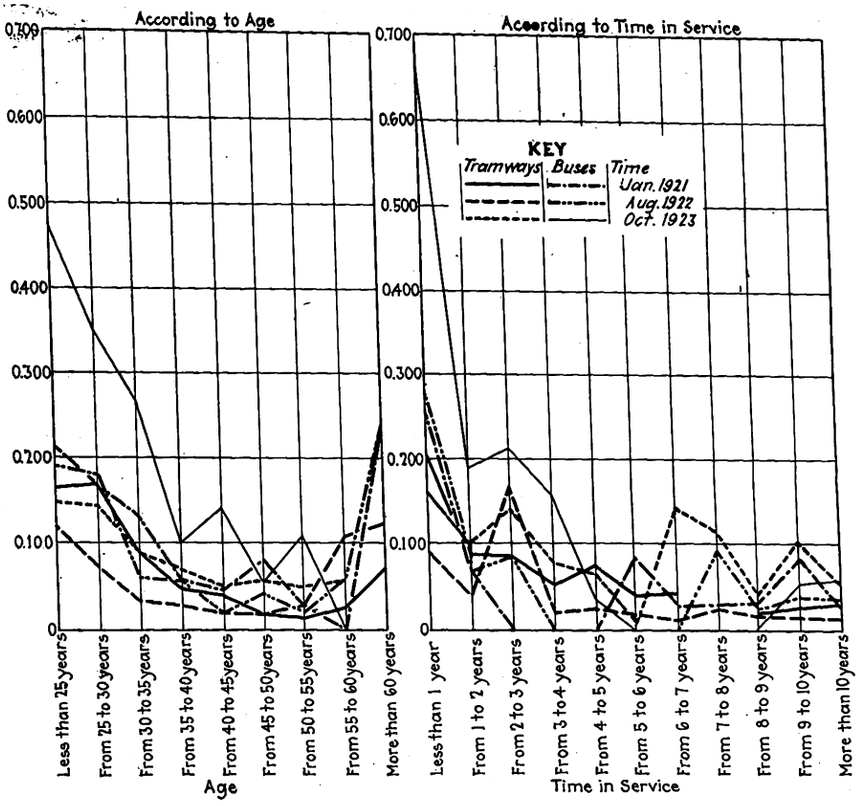
An applicant for employment has to present the usual testimonials as to character and pass the standard physical and intelligence tests. But in addition a constantly larger number of companies are subjecting all of their prospective employees to a series of so-called psychological tests to determine their special adaptability to electric railway and bus service. Both physical and psychological tests are not confined to new men, but are often applied periodically to the men in service. Thus the practice of the S.T.C.R.P., the company operating the electric railway system in Paris, is to give a physical and psychotechnical examination, although not necessarily as extensive as to new men, to all motormen in the service every five years up until they reach the age of 45; then to repeat it every three years between the ages of 45 and 54, and then every year thereafter. Similar examinations are also often given to an enrolled employee after every accident in which he may have been involved as well as after every case of severe illness which he may have had. According to studies made by the Paris company in three successive years on both its railway and bus system, there is a tendency, after a motorman or bus driver reaches the age of 55 to 60 years, for his liability to accident to increase. The charts showing these records are reproduced. The company hopes by this frequent checking of the older men to overcome this trouble.

Psychotechnical Laboratories Common

Of the many laboratories conducted by electric railway companies in Europe to test applicants for employment psychologically as to the qualities especially required by motormen, probably those in Paris and Berlin are the most extensive.

Full particulars of the Paris system of psychological tests as employed in 1924 were published in the issue of this paper for Aug. 23, 1924. At that time the company reported that the records of 100 motormen who had been employed after the test had been established showed they had 16½ per cent fewer accidents than the same

Digitized by Google



Monthly accidents per motorman and bus driver, according to age and length of service, Paris bus and surface line system

number of men who had been engaged before the tests were begun. This corresponded on the Paris system to an annual saving of approximately $52,000.

During 1926, with considerably more men in service who had passed these tests, there was a reduction in accidents over the preceding year on both the omnibus and railway systems, although the records of the police department show an increase in accidents among other vehicles using the streets. While all of this better showing by the railway and bus system cannot be attributed to the psychological tests, the management believes they have had a good deal to do with it.

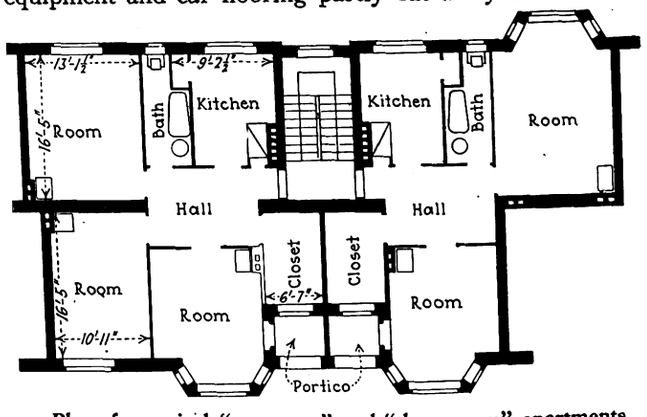
One change made in the Paris tests since the publication of the article in 1924 mentioned has been in the trial of judgment on speeds and distances. In this test the subject is shown various objects representing cars and other vehicles moving at different speeds on a skeletonized table and is obliged to indicate which of these objects he thinks will collide with any of the others. It was found that some men taking this test so instinctively understand the laws of the rates of speed that they can answer correctly, whereas others will wait until the objects come almost in contact. Now, this test is arranged so that certain of the moving objects pass behind a screen after they have been visible for what is thought to be sufficient time for the person under test to estimate their speed.

Another test now conducted not mentioned in the article is carried out with the help of a moving picture film. This film shows a crowded street in which pedestrians and various types of vehicles pass by and cross in front of the person under test. He views this picture while on a stand equipped with controller and brake handle to represent a car platform and mounted on springs so as to have a sort of rocking motion to make the resemblance more exact. While watching the picture he is expected to make the necessary movements with the controller and brake handle required in the conditions as they arise. When he applies the brake handle the picture also slows down. All movements by him of brake and controller are automatically recorded on a chart for comparative purposes. A similar platform, but equipped with steering wheel, service brake and emergency brake, has been arranged to provide a corresponding test for applicants for the position of bus driver with this company.

The satisfactory results obtained in the laboratory in testing prospective motormen and bus drivers has decided the company to employ similar, though of course not the same, methods for testing candidates for conductors and apprenticeship courses at its repair shop. These tests have been begun, but the results from them are too recent yet to give any definite information.

The Berlin psychological tests were also the subject of an extended article which appeared in the issue of the JOURNAL for Jan. 28, 1922. Since that time they also have been modified somewhat, principally in the direction of simplification, except in the hearing test, which has been somewhat amplified. At present the applicant for employment has not only to pass a test to determine whether he can hear sounds of various volumes, but also a directional hearing test. In this, sounds come from one and then another sound box set in different parts of the room and the applicant has to identify the direction from which the sound comes. The psychological tests in Berlin last a whole hour and are given not only to new men but to any motormen in service who may be sent to the examination room by the chief instructor. This is usually done with any man who has had an accident. The Berlin company finds that from 20 to 30 per cent of the men who pass the physical tests preliminary to engagement fail in these psychological examinations and believes their continuance reduces accidents.

The European schoolrooms for motormen, bus drivers and conductors have the usual models for illustrating the working of the apparatus. In the rooms for student motormen there is often a truck with complete electrical equipment and car flooring partly cut away to show the



Plans for typical "two-room" and "three-room" apartments in combined car and apartment house in Berlin

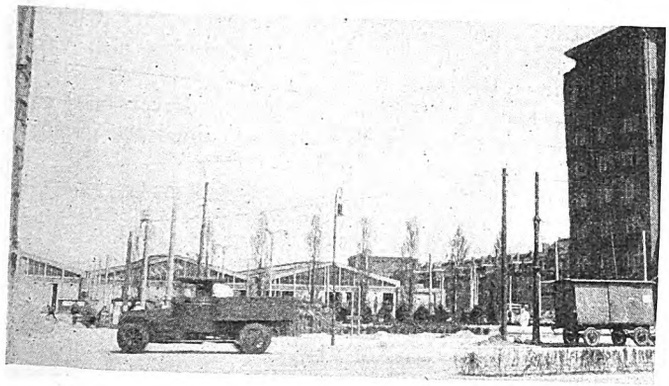
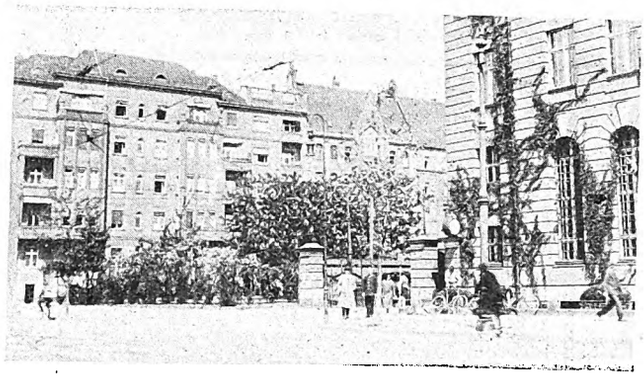
Housing Accommodations for Employees in Berlin

The Berlin Surface Lines has erected housing accommodations for employees and their families adjoining eight of its carhouses. These are various views of the Müllerstrasse carhouse, the latest building of this kind, where there are accommodations for 247 families.





attachment of motors to axles, etc., and a large chart of the various electrical connections, outlined with lamps which light when the controller on the truck used for demonstration purposes is turned. In the rooms for student bus operators there is a corresponding set of equipment.

Views are shown of two models used in the bus instruction room at Hamburg. One illustrates the full-sized bus chassis used. In this chassis the engine can be revolved slowly by means of an electric motor. The sides of the hood are glazed with transparent celluloid so that the movement of all parts can be seen with the hood down, and the casings of the gear shift and differential are partly cut away to expose the construction of those parts. The adjoining view shows a wooden model used in the schoolroom to explain the operation of the internal combustion engine. An account of the method used in the electric railway instruction room to explain the operation of an electric car controller was published on page 234 of the issue of the JOURNAL for Aug. 6.

Probably the most extensive school for bus drivers is that of the London General Omnibus Company, which operates 4,000 buses. To insure thorough training under service conditions the company has constructed adjoining its shops at Chiswick a series of test roads embracing acclivities, declivities, hidden turns, broad thoroughfares, narrow winding lanes, congested crossings, greased roads with obstacles to avoid and grades coated with grease. These tests are followed by still a second series given under the direction of Scotland Yard, because a police certificate is necessary before a driver can assume charge of a bus in London.

After a man has been accepted for employment and trained, the next important matter on a European railway property is believed to be to make his working conditions such that he can perform his duties in the best possible manner. This means, of course, comfortable employees' rooms, sick and death benefit funds, pensions and other practices with which American operators are familiar. The European properties have all these too, but in addition on nearly all properties there are arrangements by which at least some of the employees may live close to their place of work. This not only cuts down the time required by them to travel between their homes and place of employment, but is of value to the company as it makes them more easily available in cases of emergency.

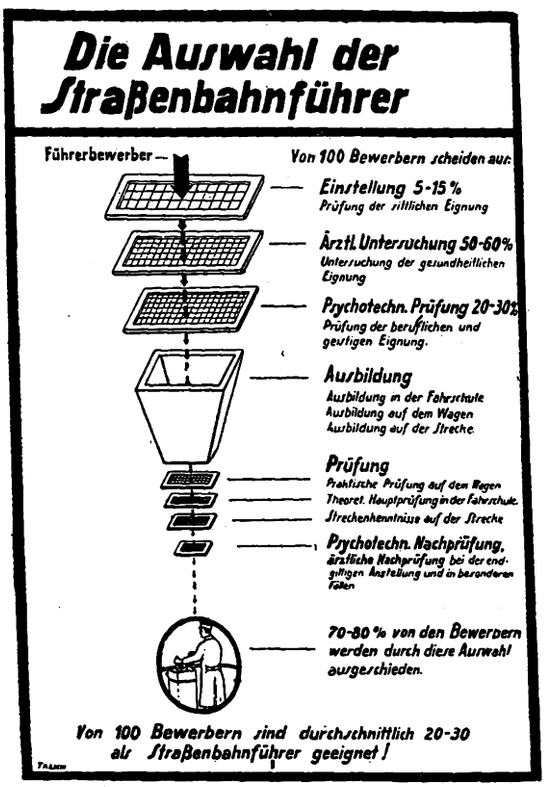
The most common form of providing for this condition is to build with each carhouse two or three regular family apartments which are generally near the entrance and on the second or third floor of the carhouse. One of these apartments is occupied by the superintendent of the carhouse or division and his family. If there are other apartments, they are occupied by the superintendent's assistants and their families, one usually by the transportation assistant and the other by the mechanical assistant. This practice is so common in continental Europe that it may almost be called universal. Occasionally, the general manager will be found occupying a house directly adjoining the main depot and repair shop, as in Dortmund.

To carry this plan still further, some properties have undertaken housing developments for their transportation employees adjoining the carhouses from which the men operate. One apartment house of this kind, erected by the Lombard Electric Traction Company of Milan, Italy, was illustrated in the issue of this paper for July 30, 1927.

The most extensive undertaking of this kind, however, is undoubtedly that of the Berlin Surface Lines. This company has erected apartment buildings adjoining eight of its carhouses, the buildings having from 58 to 247 sets of apartments each. The largest of these employee

Digitized by Google

apartment houses is one completed during the last six months adjoining a 300-car capacity carhouse on Müllerstrasse. This structure occupies an entire block with the carhouse in the middle of one side, and it contains ten single-room apartments, 165 two-room apartments and 72 three-room apartments. In this classification only living rooms are counted, i.e., not the kitchen, bath or hall. Thus, a "two-room" apartment would have besides these three rooms two good-sized rooms suitable for general purposes in the daytime and for sleeping at night. The sizes of these rooms in the two-room apartment illustrated are 16 ft. 3 in. x 13 ft. 6 in. and 12 ft. 2 in. x 12 ft. 6 in. In addition nearly every apartment has a balcony. All the way in front of the apartment building toward the center is space for flower beds. Half of the cost of these buildings was furnished by the Berlin Street Railway, which is owned by the city. The other half of the cost was furnished at low interest terms by another department of the city government, known as the Wohnungsfürsorge Gesellschaft.



Poster used by Berlin Surface Lines to show that of 100 applicants for the position of motorman only from 20 to 30 finally qualify

These apartments are rented to employees at a rate which is considerably less than would have to be paid for corresponding accommodations in an outside apartment house. There is also the understanding that they are primarily for employees of the company, and while a tenant is not obliged to vacate if he ceases to remain in the employ of the company, his lease provides that he shall then pay a higher rental. The aggregate rentals are based on providing a sinking fund of 1 per cent a year on the cost of the buildings after paying maintenance and interest on the investment.

In connection with these housing projects, it should be said that the rate of labor turnover in the European tramway systems, at least those on the Continent, is less than that on many American roads. Men who accept employment seem to do so with the idea of remaining indefinitely in the service. This condition, obviously, simplifies the question of the erection of housing accommodations.

Wages

The wages of transportation employees in Europe, as one would expect, are considerably lower than those in the United States, but the same is also true of all payments for personal service, and applies to the salaried officials of the companies as well as to the wage earners. As in the United States, also, the rates vary with the locality and presumably the cost of living also varies in very much the same ratio.

The basic wages paid to motormen, drivers and conductors on the Paris trolley and bus lines are given in Table I.

TABLE I—BASIC YEARLY WAGES OF CONDUCTORS AND MOTORMEN, PARIS SURFACE LINES

	Francs	
Begin at	737	$303
End of first year	767	307
End of next 1½ years	787	315
End of next three years	807	323
End of next three years	827	331
End of next three years	857	343
End of next three years	887	355

In other words, a motorman or conductor on the Paris Surface Lines does not begin to receive his maximum pay of $355 a year until he has worked with the company 14½ years. The hours are 48 per week and each employee receives two uniforms a year with hat and coat. He also receives certain bonuses, including an allowance based on the size of his family, a division among all employees of 4 per cent of the gross receipts of the company, payments made by it into the employees' sick benefit, pension and other funds, etc. These additional receipts of the employees in some recent years have been equivalent to a considerable percentage in addition to the amounts actually received by them as wages.

The practice of making extra allowances to employees, based on the size of their families, is common in France, indeed to some extent throughout continental Europe. Thus, the Metropolitain Company, which operates the principal rapid transit system in Paris, has a monthly wage rate of from $32.80 to $39 for the conductors on its trains and from $30.60 to $33.20 for its train guards. But various bonuses can raise these wages 36 cents a day for the guard to 40 cents a day for the conductor, while the monthly allowance for children per employee varies from $2.40 to $4.68 per child, depending on the number in the family.

On the Berlin Surface Lines the wage schedule for

The Hamburg Surface Lines has simplified models of bus and electric railway equipment in its student training rooms

motormen and conductors prior to Oct. 1, 1924, called for the maximum rate of pay after six months service. On Oct. 1, 1924, this period was increased to one year. On Nov. 1, 1925, it was increased to two years, and on Oct. 1, 1926, it was again increased, this time to five years. Besides their rates of pay, married employees receive a further allowance, according to the size of their families.

Table II shows the average rate of pay of those employees in the different groups receiving the maximum rate. It is given in pfennigs per hour (10 pfennigs = 2.4 cents). As will be seen, there has been a continuous increase in all departments during the past three years. There has also been an increase in the cost of living in Berlin, as shown by the Reichsindex, which is also given in the table, but wages have increased more rapidly than this index figure. The wages paid to conductors in 1914 before the war (the time at which the Reichsindex was 100) was as follows: After the first year of service 40 pfennigs an hour, after the second year 42 pfennigs and after the fifth year 44 pfennigs. Compared with this maximum rate figure before the war, the wages of the average maximum rate conductor now are 95.4 per cent higher, although the cost of living in Berlin has gone up during the same period only 44.3. In December, 1926, the Berlin Surface lines had 3,327 motormen and 5,401 conductors. The greater number of conductors is due to the large amount of trailer operation on the system.

A table showing the wages paid on the Rome (Italy) tramways was published on page 950 of the issue of this paper for May 28, last.

In London the wages are somewhat higher on both bus and tram lines than in the continental cities mentioned. The wages paid by the London General Omnibus Company at present for driver is $20\frac{3}{8}$ pence ($40\frac{3}{4}$ cents) an hour during the first six months and $21\frac{7}{8}$ pence ($43\frac{3}{4}$ cents) an hour thereafter. The rate for conductors is $18\frac{5}{8}$ pence ($37\frac{1}{4}$ cents) an hour during the first six months and $20\frac{1}{8}$ pence ($40\frac{1}{4}$ cents) an hour thereafter. The company has an agreement with its men, however, that if the government cost of living index should fall to 75 or less, these hourly rates would be reduced by a farthing ($\frac{1}{2}$ cent).

A further explanation should be made, also, that the rates for overtime and special wage rates on this London transportation system are quite liberal. Thus, on all services at night, on Sunday and Good Friday, and for all time worked by a man voluntarily on an appointed rest day, the company pays time and a quarter. It pays time and a half on public holidays and it pays double time on Christmas Day. It also pays time and a quarter for the first two hours worked in excess of the 48-hour week and time and a half thereafter.

In the way of uniforms and clothing, the company agrees besides wages to give to every conductor a cap every year and three suits of uniforms every two years. The arrangement with the driver is that he gets a cap and two summer linen coats every year and a heavy winter coat every two years. Every driver and conductor also is entitled to an eight-day holiday with pay during the year provided he has completed twelve months service with the company.

London bus drivers have to pass non-skidding tests on greased pavement. This testing field adjoins the company's shops at Chiswick in the suburbs of London

Maintenance Methods and Devices

Testing Axles in London by the Magnetic Method

MINUTE cracks in car axles of the London County Council Tramways, London, England, which would not be found by ordinary observation, even with the aid of a magnifying glass, are being located in the overhaul shops by an ingenious method. The principle is first to magnetize the axle by means of an electro-magnet, then to pour over the axles kerosene in which iron filings are held in suspension. If the axle is intact, the kerosene and iron filings will run off. If, however, there is a small crack in the axle there will be a local north and south pole at that point and some of the iron filings will remain on each side of the crack. It is necessary then only to look over the axle to find the location of the defect.

The first illustration shows the form of axle tester of this type used in the shops of the London County Council Tramways. It consists of a horseshoe magnet with concave terminals so as to fit a 5-in. diameter axle. Where the axle is smaller than this diameter a small make-up piece of steel is used, as shown in the illustration. A container holding kerosene and iron filings may be seen directly in the rear of the axle and a pail to receive the mixture after it has been poured is underneath.

The apparatus used for the same purpose in the repair shop of the London Underground Electric Railway Company, Ltd., is of somewhat different design in that the vertical end supports for the axle are part of the magnetic system. The axle is brought by a crane and set in the machine shown in the illustration. The magnetic core is underneath and the pail to receive the solution as it is poured on the axle is in a tray between the two vertical supports.

While the method has proved very satisfactory, it has been found necessary to demagnetize the iron filings after they have been used for this purpose for some time. This is accomplished by a coil of wire wound around the container through which alternating current is allowed to pass. To keep moisture out of the solution, a small amount of calcium chloride is added to it.

Incidentally, this same process, which was devised by W. E. Ireland, rolling stock engineer London County Council Tramways, is also used in England for testing turbine blades and for other industrial purposes.

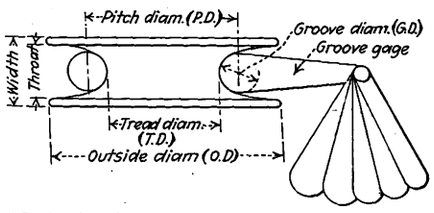
Groove Gage for Sheave Treads

By WALTER VOIGTLANDER

Rope Engineer American Cable Company, Chicago, Ill.

PERHAPS no single element can be more detrimental to wire rope than an improperly fitted sheave. One that pinches will do more damage to a wire rope in an hour than a properly grooved sheave could in an entire week. One with too soft a tread will increase abrasion and the grinding action to an extent that will cause premature breaking of the outer wires and loss of rope strength.

Engineers and operators sometimes forget that by the time it becomes necessary to install a new rope the old sheave will have become worn to such an extent that it will cause serious loss to the service of new rope. When installing a new rope it is economy to gage both the rope and the grooves of all sheaves and drums. If the groove diameter of any sheave is less than the actual calipered rope diameter decreased service will result.

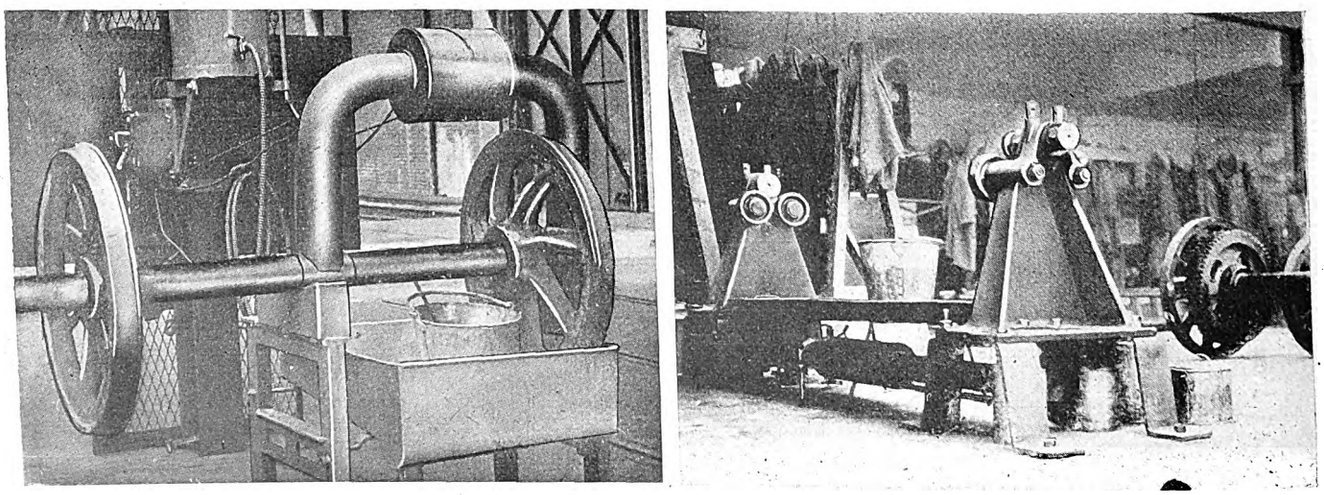


Method of calipering sheaves to insure proper groove diameter

One of the simplest and most accurate methods of gaging sheave treads is by the use of a groove gage as indicated by the accompanying illustration. The following tolerances should be adhered to:

Diameter of Rope	Tolerance of Groove Diameters Minimum, Inches	Maximum, Inches
½ in. and smaller	+1–32 to	+3–32
9–16 in.-1 in.	+1–16 to	+1–8
1–16 in.-2 in	+3–32 to	+3–16
Over 2 in.	+1–8 to	+1–4

At the time that attention is given sheaves it is well also to check up on alignment as considerable wear to both rope and sheaves may result.



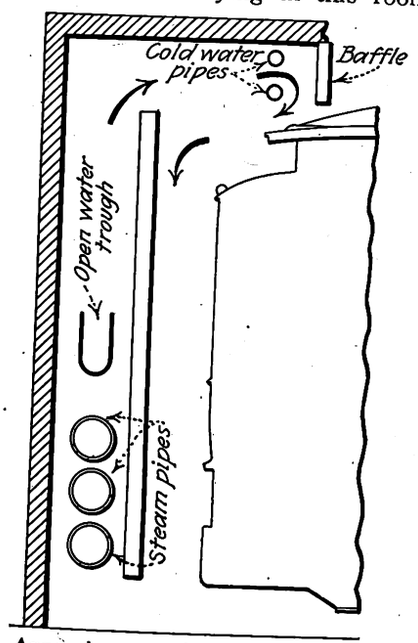
London companies test axles by the electro-magnetic system

Digitized by Google

Particularly in high-speed work it is necessary to maintain proper alignment of all equipment and to balance all sheaves.

Dortmund Uses Drying Room for Painted Cars

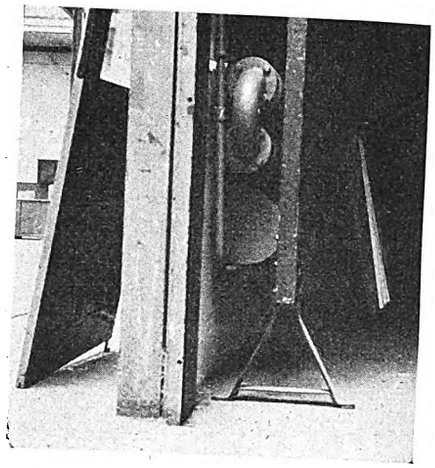
DRYING of freshly painted cars is expedited in the paint shop of the Dortmund Street Railway, Dortmund, Germany, through the use of a special drying room. While a freshly painted car is drying in this room,



Approximate section of side wall and partition in drying chamber

the temperature is kept continuously at 35 deg. R. (112 deg. F.) and at 70 per cent humidity. There is also a constant circulation of air.

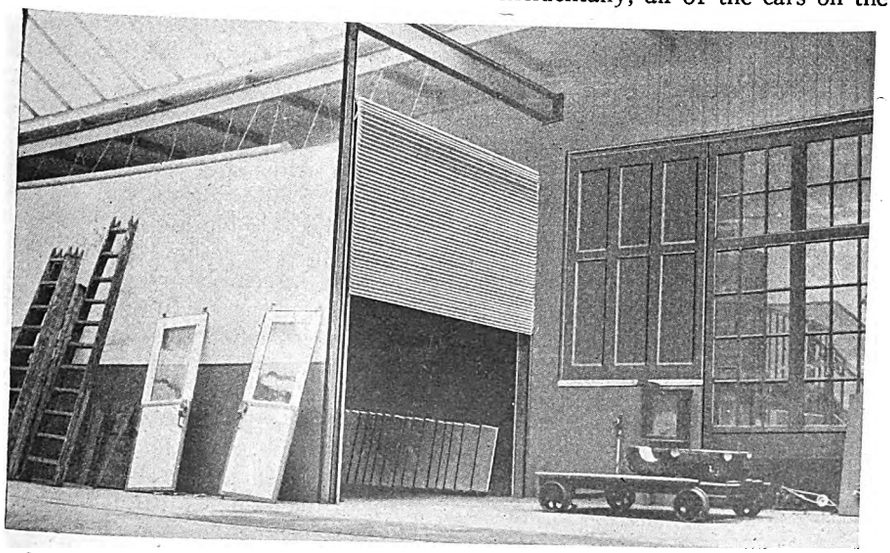
The requisite heat and humidity in the room are obtained through steam pipes and water pans on each side of



Interior of one side of drying chamber

the drying room, but the direct heat from these pipes and pans on the side of the car is cut off by a partition, open at the bottom and top, between them and the sides of the car. The general construction of one side of the room is shown in one of the accompanying illustrations. Briefly, there are on each side, in the open chamber shown, three rows of steam pipes with one open trough for water above them. The heat from these pipes draws air from the lower part of the room up between the side wall and the partition. After passing over the steam pipes, this air circulates around an open trough of water, then passes over the top of the partition toward the center of the ceiling. Over the nearer side of the car it strikes two pipes of cold water and a baffle, which caues it to flow down over the side of the car. It is then exhausted out of the room. The time required to dry a car in this room is about four hours as compared with twelve hours outside.

Incidentally, all of the cars on the Dortmund system are painted white for city service so that they present a very handsome appearance. The motor cars have monitor roofs and the trail cars arch roofs. The ceiling of the cars is white and is of composition board 5 or 6 mm. (0.2 in.) thick. The interurban cars are very similar in coloring.



Exterior of drying chamber, Dortmund. There is a constant regulation of air of the proper temperature and humidity

Car Color Change Provides Greater Attractiveness

By Robert Harris
Master Mechanic New Brunswick Power Company, St. John, N. B.

A VERY intensified rehabilitation program is being carried out on cars of the New Brunswick Power Company, St. John, N. B. As a part of this the selection of color has proved a very important factor. Consideration has been given to high visibility and to providing a more attractive appearance. The exterior color scheme consists of Persian scarlet enameled body and letterboard, and Pullman cream trim for window sills, grip rails and perpendicular posts. Sash on doors are cherry red enamel. A slate color is used on the roof and this paint is a canvas preservative type. Trucks and miscellaneous fittings such as headlights, trolley catchers, bases and poles are black. All window guards, panels, etc., are aluminum.

On the interior of the cars all trim and sash are of light cherry stain varnished. Seats are oiled and varnished on natural wood. Headlinings are of Pullman cream enamel, paneled. Pipe stanchions, hand rails, etc., are finished in aluminum. The floor is painted a pearl gray.

The cost of painting varies greatly with the different styles and size of cars in service on our system and also to the volume of work done and method of application. The cost for painting a car 31 ft. long has averaged about $68. This includes cleaning, varnishing interior with one coat of enamel on the headlining, one coat of enamel on the exterior, where the color scheme has not been changed, and one coat of surfacer on the main body. Two coats of enamel are applied to the letterboard, where the color scheme has been changed. This has been found necessary due to the change from the dark green to bright red. Letters and numbers are of imitation gold paint. No striping is used. Detail costs are, for material, $25.38; labor, 76 man-hours, $36.96; taking out sash and replacing, $6.

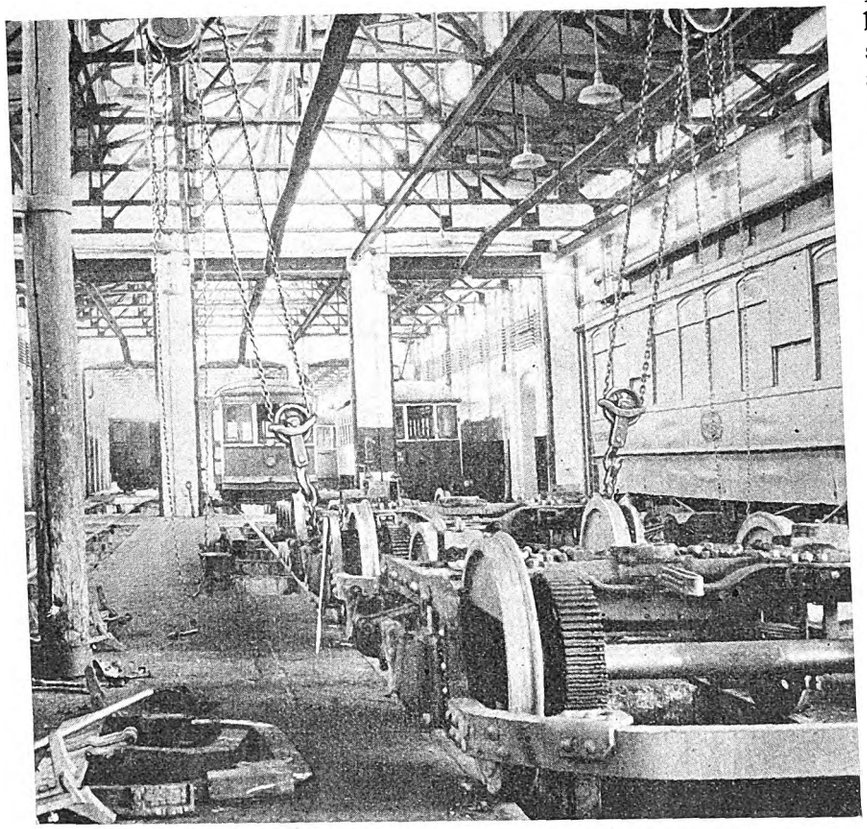
Double Hoist Lifts Truck Frame Evenly



Hoists on both sides of the overhaul track raise truck frames evenly in the Waterbury shops of the Connecticut Company

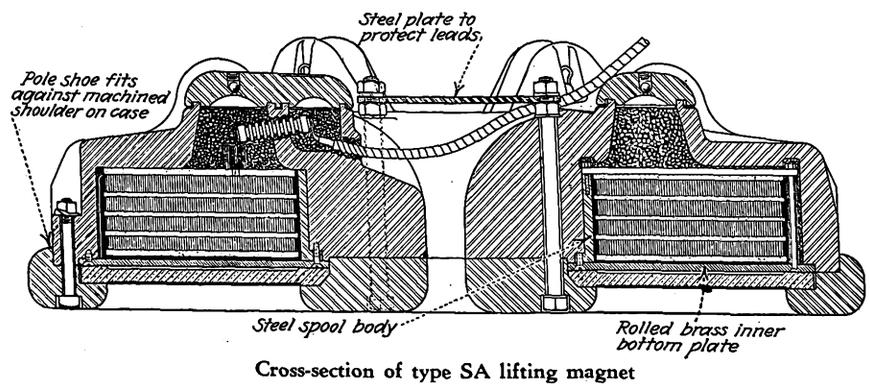
DOUBLE chain hoists are provided for raising truck frames in the overhaul shops of the Connecticut Company at Waterbury. Each hoist is of 5-ton capacity and is suspended by rollers from the roof girders. To raise a truck frame one hoist is fastened by chains to each side of the truck frame. The two hoists are operated at the same time with a man at each. Operation of the hoists thus serves to lift the frame evenly. This practice has been found to be more convenient than the former practice of raising one end of the truck frame by means of a single chain hoist. Accurate lifting is also of advantage to prevent binding at the pedestal jaws and journal boxes.

New Equipment Available

High-Strength Lifting Magnet

LIFTING magnets of an improved type are now in production by the Electric Controller & Manufacturing Company, Cleveland, Ohio. The new type has a coil spider of composite construction with the body of cast steel and flange of cold rolled brass. Great strength and increased lifting capacity are the advantages claimed as compared with the one-piece cast-brass spider previously used.

The outer pole shoe is extended upward to fit against a machined surface on the outside of the magnet housing. This gives increased strength to prevent pole shoe breakage. A steel plate ½ in. thick is bolted in place at the top of the magnet to prevent injury to the incoming lead wires from the crushing effect of the crane hook and chains.

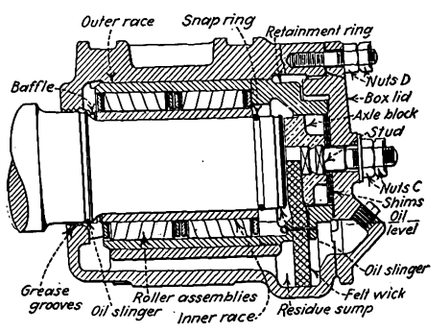


Cross-section of type SA lifting magnet

Cheap waste for bearing lubrication is a cheap way to waste your company's money.

Improved Roller Bearings for Railway Service

ROLLER bearing service on railroads has given experience, as a result of which the design of the railroad journal box furnished by the Hyatt Roller Bearing Company, Harrison, N. J., has been modified. In the improved design oil leakage is obviated through the use of a system of grease grooves which are just back of a baffle wall. These catch the oil passing through the bearings and divert it to an annular groove,



Improved type of railway roller bearing

which carries it back to the oil reservoir at the bottom of the box.

Various methods of closing the box at the front have been tried. In the improved design the box lid is separate from the spacer casting which holds the axle block in place. A spacer casting separate from the box lid assures that the lateral play of the axle will bring the end square against the axle block.

In the original design the axle block was held insecurely by offset bolts and locking devices. In the improved design it is a floating element held securely against rotation by its square section and laterally by locking.

Shims interposed between the axle block and the cover lid permit precise adjustment of the lateral movement of the axle. Adjustment of the blocks to compensate for wear should be necessary only at shoping periods of cars for heavy repairs.

Association Activities

Speed with Safety the Topic at Wisconsin Association Meeting

Possibilities of bending every effort toward increasing the speed of car and bus operation without sacrifice of safety occupies attention of the Transportation Section

THAT the spirit of the new day in the electric railway industry has permeated into the rank and file of the actual operating men was eloquently symbolized at the annual convention of the Transportation Section of the Wisconsin Utilities Association in Milwaukee, Aug. 18 and 19. This section, which was the first state organization to abandon the name "Electric Railway" and substitute therefor the more significant term "Transportation," lived up to and exemplified in its convention the modern conception of the industry's obligation to its stockholders and its patrons.

The broad, dominating theme which ran through the convention papers and discussions in many forms and variations was greater speed with safety for all kinds of traffic in the interest of motorists, pedestrians, transportation patrons and companies. Of the 88 delegates registered, about 67 represented transportation companies and the others manufacturing and supply institutions. Attendance at sessions, however, ran as high as 150 persons.

The consensus of opinion was that electric railway managements should become authorities on traffic control and regulations in their local communities. Encouragement of cross-breeding, as Henry Cordell termed it, between street cars and buses, so as to glean the best features in each, was declared to be the need of the hour.

A resolution was adopted calling for the appointment of a committee to work out a plan which will enlist the active co-operation of all citizens in reducing the increasing number of all forms of street accidents. A strong sentiment prevailed that automotive-dealer and motorist associations were neglecting public safety considerations and that consequently it would be a timely good-will promoting activity if the organized transportation companies took the lead in building up a militant public opinion against all form of recklessness on streets.

Service Must Be Paid For

W. H. Sawyer, president of the A.E.R.A., who was the banquet speaker, climaxed the outspoken character of the meetings by stating emphatically that progressive transportation companies have done more than their share in expending money to provide improved facilities at big sacrifices in earnings and that now it was time squarely to ask street car riders to pay a fare that will be adequate to meet the costs of better trolley service.

He advocated asking the public for a 10-cent cash fare with a lower ticket rate at some figure that will produce a profitable return. He asserted that communities must be asked to assist car riders with such definite legislative measures as preferred right-of-way for trolleys, elimination of free riders and unjust paving charges and eradication of exorbitant tax collection through car fares.

"Transportation management cannot much longer keep up street railway organizations that do not earn a reasonable return," said Mr. Sawyer. "The issue must be faced. In most cases it is the fault of the managements themselves that car riders do not understand they are being discriminated against in so many ways, and, with traffic conditions getting worse, this discrimination is being aggravated. It must also not be forgotten that our industry is a business of increasing unit costs. Companies should present the facts of the situation to the public through consistent advertising and by any other means at their command, because public transportation is a vital necessity. It must and will go forward. If we do not do the job right, somebody else surely will."

J. H. Lucas, general superintendent of rolling stock of the Milwaukee Electric Railway & Light Company, was unanimously elected chairman of the section, succeeding C. L. Hedges. Henry Cordell, master mechanic, Chicago, North Shore & Milwaukee Railroad, was elected vice-chairman.

Knowledge Gained at Conventions Should Be Used

In his opening address, Chairman Clyde L. Hedges, La Crosse, stressed particularly that the person who fails to take advantage of the knowledge and experience which can be gained at the convention is not only derelict in his duty toward his company but also toward the public. He called attention to the change in attitude reflected in the change of name of the association. The change was made to reflect and symbolize the broadening of the field. Utility operators, as transportation men, through long experience are best equipped to supply public transportation in any form, whether it be by street railway, bus, taxi or airplane. Mr. Hedges also made reference to the passage by the Wisconsin Legislature of the bill to place bus companies under the jurisdiction of the Wisconsin Railroad Commission, calling it one of the greatest milestones of progress in the orderly development of the bus business. As a result of the bus law the public will be assured more dependable, safer, better co-ordinated and more uniform bus service. Wildcat competition will be eliminated, but the bus company that is willing to serve the public will be assisted.

Safety work, Mr. Hedges pointed out, should be directed to the benefit of the 70 to 80 per cent of the people who use the street cars. Patrons of public transportation systems, instead of being rewarded for making the most economic use of street space, are being penalized by most of the traffic regulations that have been established. Everything possible is being done to permit speedier motion of the private automobile, but practically nothing is being done to give the street car the opportunity to speed up schedules. He urged transportation men to take the lead in arousing a strong, active and militant public spirit against recklessness and carelessness on the highways. In conclusion he recommended the appointment of a committee to consider and work out a comprehensive state-wide plan to make streets safer for every person. Such a committee should consider:

1. The advisability of organizing citizens' safety committees in each city.
2. Advisability of having these committees work for the passage of a law which will make it compulsory for a person to prove that he is capable of driving an automobile.
3. Advisability of a law to compel the automobile owner to carry liability insurance.
4. Advisability of a law calling for dead stops for motorists on the principal street railway lines as well as at railroad crossings.

Papers on "Speed with Safety" from different viewpoints were presented by E. J. McIlraith, staff engineer Chicago Surface Lines, and Thomas R. Tate of the Milwaukee Traffic Survey. These are abstracted elsewhere.

C. M. Larson, chief engineer Wisconsin Railroad Commission, defined the conditions of safety that must be provided. A workable definition of the phrase "safe service," he said, would probably be about as follows: Service that is safe if the patron, the operator and all others concerned exercise rea-

Digitized by Google

sonable care. If everybody would exercise such care at all times there would be few accidents. It is, however, becoming more and more customary for the public to look on the operators of public conveyances for protection, even against their own unreasonable acts. The attempt is made to hold the carrier responsible, though the occurrence of an accident involving a bus or a street car is by no means evidence of unsafe practices on the part of the operators. Usually, however, somebody has violated some rule of safe practice.

There must be a reasonable balancing of safety and service, said Mr. Larson, and the best thought of the management must be enlisted to work out the proper proportion of each element. We have taken the lead, according to Mr. Larson, in the promotion of safety, and whether we will or no, the public looks to us to carry on. In a sense we have undertaken a service, that of safety, and our example as well as our precepts should be designed as a guide to those who do not yet see the need of everlasting care and caution when in contact with their fellow men.

R. M. Howard, vice-president Mississippi Valley Public Service Company, Winona, Minn., reported on accident experience of the Wisconsin electric railways. He showed that with but a small increase in car-miles operated from 1918 to 1926, inclusive, transportation accidents have increased slightly, while automobile collisions have more than doubled. In the same period the motor vehicle registration has increased from 196,844 to 662,282, or 3.3. times. He pointed out that local governing bodies need the wholehearted support of the general public in all matters pertaining to traffic rules and public safety before any substantial improvement can be effected along the lines of accident reduction. How to secure that support is a problem for the future.

Designing and Operating Cars and Buses for Greater Safety

A considerable portion of the Friday morning session was given to a discussion of increasing co-ordination of car and bus for greater speed with safety. Papers on design were presented by J. H. Lucas, Milwaukee, and J. R. Blackhall, Joliet, Ill. The former will appear in a future issue.

Mr. Blackhall told of the worm drive car which is under construction by his company. The trucks have already been described in this paper. The body will be of aluminum alloys, reducing the total weight to 21,200 lb. for a car 41 ft. 2½ in. over all, or 424 lb. per seat as compared with 900 lb. for the present type. The trucks, now being tested under a standard car body, have run some 10,000 miles without failure of any kind. Wheel wear, is partially eliminated by the differential axles. Variations of wheel diameter make no difference, nosing is eliminated and flange wear is materially reduced. Elimination of nosing has reduced oscillation of the car body, and any slight tendency to oscillate is overcome by the fixed bolster.

Judging from the first 10,000 miles the speaker said that approximately nine times more mileage may be expected from the brake shoes, which are of the automobile type. No adjustments have been made, whereas the ordinary brake shoes must be adjusted about once a week. It is estimated that a total of 400,000 miles may be obtained from each brake drum of the new truck, and that the wheels will last for 150,000 miles, as compared with 50,000 miles with brake shoes rubbing on the treads.

The accelerating characteristics of the new car were 25 per cent better than for a similar car with maximum traction trucks. The coasting was improved 10.5 per cent and the braking rate was 11 per cent higher. The free running speed with the temporary body was 12 per cent higher, and with the new aluminum body it will probably be 30 to 40 per cent higher than for the ordinary car and trucks.

Henry Cordell, master mechanic Chicago, North Shore & Milwaukee Railroad, pointed out the lessons taught by modern transportation vehicles. The public, he said, is no longer content with slat seats nor even moderately comfortable upholstering. What is wanted today is speed, power, short and smooth stops and long life. Roller bearings should help reduce friction and should also help the lubrication problem. Differential axles should reduce energy consumption, decrease noise, lengthen the life of wheels, reduce track wear and carhouse labor. Master mechanics, however, do not appreciate the fine adjustment that is required to obtain maximum life of such power transmission units, so that a campaign of education may be needed. Automobile type brakes decrease noise and may be advantageous, although the speaker was not ready to give an opinion on this point.

The remarks of F. M. Holaday on co-ordinating rail and bus lines for greater safety and increased operating efficiency are published elsewhere.

Three papers were presented on the subject of maintenance of way. These were by F. J. Kramer of the North Short Line, E. J. Archambault of Milwaukee and A. A. Oldfield, engineer maintenance of way Wisconsin Power & Light Company, Fond du Lac. Mr. Oldfield pointed out the difficult conditions due to the World War and the period of financial stringency that followed. Railways are still laboring under the same difficulties, he maintained. The deferred maintenance of way is, however, being absorbed and the tracks are being restored to good operating condition. Mr. Archambault's paper, in abstract, will be published in a later issue of the JOURNAL.

The final papers presented were one on advertising and selling transportation, by Fred. E. Eriksen of Milwaukee, and one on popularizing safety among platform men, by Chester K. Thomas of the Chicago, North Shore & Milwaukee Railroad. Abstracts of these papers appear elsewhere.

In connection with the meeting a series of inspection trips over the property of the Milwaukee Electric Railway & Light Company were held Thursday afternoon. These were well attended. One party was taken to inspect tracks, paving and overhead and the other to inspect the Cold Spring shops and the Fond du Lac Avenue car shops. Both were taken in buses as the guests of the railway.

Getting Speed Despite Traffic*

By Thomas R. Tate
Of the Milwaukee Traffic Survey

WE HAVE developed the automobile, the electric street railway car, the motor bus, the high-speed railway and the electrified suburban and interurban railways to such a point that the speed limit under present conditions appears almost to have been reached, and we are now forced to turn our attention to the improvement of these conditions of operation and the improvement in the methods of controlling and regulating traffic, of reducing traffic interference, delays and stops and of providing for a separation of the kinds of traffic and a separation of traffic of different speeds.

There are several methods of accomplishing these results, some of which are more or less permanent, others semi-permanent, and still others of a temporary nature. One of the first remedies to apply is police regulation. This includes traffic control by officers for the most congested and the busiest intersections, patrol of important traffic arteries and the enforcement of all traffic regulations and parking restrictions. The traffic officer can do much to improve the speed of traffic, clear up congested intersections and enforce traffic regulations.

Some cities of fairly large size handle practically all of their traffic by traffic officers, and few, if any, automatic or semi-automatic control lights are used. Kansas City, Mo., is a notable example, the officers being selected for their task and trained and instructed so that there appears to be co-ordinated movement with practically no delays, the signals being changed every ten to 40 seconds. Here there is also a spirit of co-operation between the traffic officers and the street railway and bus operators to such an extent that movement through the congested center is considerably speeded up and the public transportation agencies are given the signal to proceed practically as soon as loading has been completed.

Whether the hand-operated semaphore, with or without lights at night,

*Abstract of a paper presented before the Transportation Section, Wisconsin Utilities Association, Milwaukee, Wis., Aug. 18-19, 1927.

Digitized by Google

or the whistle is used is perhaps a matter of opinion in which we may differ, but to the average observer it appears that some sort of signal to proceed or stop is essential, and that the traffic officer or signal be so stationed and illuminated that he or it is at all times clearly visible.

Traffic officers on motorcycles or in automobiles can do much to enforce the rules of the road in keeping slow-moving vehicles to the right, clearing up traffic blockades and in preventing reckless driving; they are, therefore, indispensable in any system of traffic control.

Patrolmen and mounted police can effectively enforce traffic regulations and parking restrictions. Without the enforcement of them and without prosecution and penalization of offenders the best traffic regulations are of little value.

Use of traffic control lights to speed up traffic movements has become so general that many of our small villages throughout the country have installed one or more at busy intersections to enable pedestrians to cross the street with safety. Certainly the traffic on some of our important highways, especially during periods of maximum movement, is so great that without the use of either traffic control lights or traffic officers it is almost impossible for a pedestrian to cross the street with safety or for crossing traffic to break through without danger of accident. The installation of traffic control lights at the busiest intersections would break up the traffic flow into a platoon or wave movement so that it would be possible for cross traffic to proceed across the highway during the gaps in the movement on the principal highway, even though not controlled by traffic lights at the intersection.

Traffic control lights have come to be recognized as a necessity in our large cities. The speed with traffic control lights depends on their method of operation. Synchronous control until recently was used almost universally, but it has several disadvantages and delays traffic unduly. The reciprocal system, where red and green lights are alternated, has some advantages, but may actually slow down the movement of street cars and buses through the congested area. The progressive or co-ordinated system may be worked out so that if set for a given speed for street cars and buses vehicular traffic can move at higher speeds where safety zones are provided and where there is sufficient room between the safety zone and the curb.

The fault to be found with most existing automatic traffic control systems is that when there is little traffic flow the lights are unnecessary and could very well be dispensed with. This is particularly true in some of the smaller towns and villages located on important highways which are crowded to capacity on Sundays and holidays, but have perhaps practically no traffic flow during the remainder of the week, and this is also true of some of the locations in our larger cities at intersections where there is little movement after midnight or between 1 and 6 a.m.

***Oct. 3-7*—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

Traffic Regulation Must Be Reasonable

Of paramount importance in the control of traffic is the necessity of proper regulation. The public in general will not support the enforcement of a law or ordinance of which it does not approve, nor can we expect traffic officers to enforce any traffic code with which the public is not in sympathy. Many of our city ordinances and state laws regulating the movement of vehicles are antiquated and need frequent revisions. No one could be expected to observe the following sign:

State Law
Speed Limit
5 Miles Per Hour

Similar signs may be seen all over the country, some specifying 10 miles an hour, some 12, others 15, but any one who observes such a sign, although conforming to the law, may be obstructing traffic and, if so, ought to be forced to move faster or get off the highway or street.

With the degree of perfection attained in the modern automobile, with four-wheel brakes properly adjusted, speeds of 25 m.p.h., and, in some cases, even 30, 35 to 40 m.p.h. on arterial highways of sufficient width with proper paving free from holes, bumps or obstructions of any kind, where the vision is unobscured, and taking the weather and conditions of the pavement into consideration, could be permitted with safety. Under other conditions speeds of even 15 m.p.h. might be excessive or dangerous. More attention should be given by our cities, counties and states to the widths of streets and highways, the character and type of paving and its condition, and to the removal of obstructions to both movement and vision.

The removal or increase of the speed limit on street cars would also speed up street car traffic somewhat, as a street car can operate at 25 to 35 m.p.h. with almost the same safety as an automobile, as it can start just as quickly and under most conditions can in an emergency stop more quickly, but is forced to operate on tracks and cannot swing out to avoid a collision as can an automobile. For this reason more care should be taken by vehicles crossing street car lines than in crossing an important traffic artery. The protection of traction lines by stop signs, caution signs or flasher warning signals would assist materially in improving the speed of operation and would be of as much if not more benefit to the general public than the designation of certain streets as arterial highways provided with stop signs for all crossing traffic.

Parking Restrictions and Widths of Streets

Parking restrictions also have definite effect upon speeds, the less time allowed for parking the more cars that can be theoretically parked in a given block, the more backing in and out there will be obstructing traffic lines, and the more difficult it is to enforce parking restrictions. The parking of vehicles on a traffic artery, which is not wide enough to accommodate moving traffic also, should be prohibited altogether, restricted to one side of the street, or restricted to the hours of the day when it does not interfere with freedom of movement.

Ten feet should be provided for each moving lane of traffic and at least 8 ft. for parking automobiles parallel to the curb. This necessitates a 36-ft. roadway for two traffic lanes (one in each direction) and a 56-ft. roadway for four traffic lanes (two in each direction) without street cars. With street cars the width should be increased by 20 ft. in order to provide for freedom of movement for both kinds of traffic.

Where, for certain reasons, parking cannot be eliminated or restricted and the street or highway is insufficient to accommodate the traffic, the streets may be made one way thoroughfares and traffic movement speeded up, as more traffic lanes may thereby be made available and where there are street cars the entire right-hand side of the block may be roped off and used for a loading zone. The disadvantages offered by one-way streets, especially in the central business district, make their adoption without thorough study open to question.

The elimination of left-hand turns, of U turns and of the stopping of vehicles in the traffic lane for loading and unloading on the busy and more congested streets is one means of speeding up traffic, although not always adopted or enforced.

Digitized by Google

Streets occupied by street car lines usually develop into business districts and may become important highways leading into the city or connecting different centers in the city. Because of the business fronting on such streets and the through traffic making use of such streets considerable congestion results, especially on streets of insufficient width to accommodate both kinds of traffic. Finally, the situation reaches such a state that street cars cannot be operated with any speed nor can vehicular traffic where they interfere with each other. The final solution of this problem is either the prohibition of parking altogether, partial elimination during periods of maximum movement, or the widening of the street. The latter is the remedy of a permanent nature, while the former is more or less a temporary expedient. Separation of street car and vehicular traffic, by setting aside some of the streets for vehicular traffic, does not solve the problem altogether, and while it may divert most of the through traffic it does not remedy the condition brought about by the vehicular traffic of the local business districts.

The average speed of the street car systems in most of the large cities of our country is not over 10 m.p.h. for the system as a whole, gets down to 3 m.p.h. or less in our central business districts and does not exceed 12 or 15 m.p.h. in our outlying residential districts or suburbs. There are several ways in which the average speed may be increased, such as partial elimination of stops, use of safety zones for loading and unloading, two-car or train operation, and rapid transit on private right-of-way.

The final solution of the transit problem for our large cities, after they have reached a population of 1,000,000 or more, is rapid transit on private right-of-way, elevated structure or subway, or a combination of any two or of all three. This permits of a complete separation of passenger traffic from vehicular traffic, and both express and local service can be furnished with train operation. Average speeds of 18 to 25 m.p.h. may be obtained and outlying sections and suburban communities brought nearer to the business center by reducing the time of travel to one-half or less that required by street cars and in our large and more congested cities to less than that which could possibly be obtained by buses or automobiles operated on the city's streets.

Advertising the Transportation Business*

By Fred E. Ericksen
Advertising Manager the Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

WHY advertise? There is so much to tell in the transportation business, and since advertising in its simplest definition is telling, need we ask the question? Tell your transportation story over and over again with all the means and mediums at your command. But tell your story truthfully. Omit any bunk. Don't camouflage or try to cover up. Surely the simple true story of the transportation business and its intimate relation to a community's economic and social welfare will so keenly interest and impress your readers that much of the distrust and misunderstanding and false conceptions that now prevail in varying degrees will largely, if not entirely, disappear. I cannot conceive of a business where advertising, intelligently employed, can mean so much and accomplish so much good as in the transportation business.

Advertising is a profession and your advertising should be intrusted to those qualified by experience and maturity properly to employ advertising technique, for advertising has its own peculiar technique, like any other profession. Engage the best advertising talent you can get. Give it every opportunity to dig down to rock bottom facts about your business. Let your advertising manager in on all your plans. Work with him. Personally supervise and direct his efforts, and let that supervision and direction come from the biggest man in your organization—one who has intimate contact with the public and whose heart feels the public's pulse. Thoroughly imbue your advertising manager with the responsibility of his position, designating an executive as his immediate superior and not subjecting him to the whims and fancies of committees, conferences and subordinates, all too often aliens to the advertising profession. Lend dignity to his position by the manifested regard you hold for his work and his knowledge of advertising technique.

Don't Spoil Good Copy

Let his inspirational copy appeal stand unspoiled by some one far removed from advertising or who cannot understand that good advertising copy is inspired by public contacts and outside viewpoints. In the transportation business, as in any other business, you cannot hope to produce good advertising copy if it dies aborning, strangled by slide-rule findings and engineering formulas. Advertising must breathe of humanity. It must reach the masses in a language people understand and will respond to. It must carry a message that rings true. It must be simple, direct, sincere and logical. And in transportation advertising especially the more simple and direct the message the greater confidence it will inspire.

On the other hand, I have no patience with ad men and copy writers who consider themselves little gods unto themselves. You who "write your company's advertising" are wise if you draw upon the counsel and experiences and knowledge of others. You are especially fortunate if some one designated company executive is your immediate superior and to whom your department must report directly. I know,in my own case, it is always extremely helpful and encouraging to know that I can always seek the advice and further suggestions of an executive of my company. I know that nothing but the facts will be presented. I know, also, that the criticisms offered will be based on mature judgment, an impersonal viewpoint and a more comprehensive understanding of what our transportation problems are.

Always Have Something to Sell to the Public

Advertising and selling transportation successfully involve two important factors:

1. That you have something to sell which the public needs and ought to have.
2. That you tell about it and keep on telling it in such a manner that the public knows about it and believes it.

What have we to sell in this business? The most dependable, efficient, economical and practical mode of transportation in existence today. Time was when we were an undisputed monopoly, when one either rode the street cars or walked. But today, for example, there are more than 72,000 privately owned autos in Milwaukee alone, with no let-up in the desire of many present non-owners to possess autos soon. Recent models are these autos—precious few of 1910, 1915 or even 1920 vintage. Convenient and fast. Expensive and still an unwarranted luxury to many, regardless of the cleverly worded auto editorials. Unwisely used by most of their owners. A real burden to many. But this is a silk stocking age. It may be fundamentally wrong and economically unsound that high school girls and store clerks wear silk stockings, but "try and tell 'em different." The order changeth, and if you are to sell transportation your advertising appeal must conform to the wishes and demands of the day.

What are we to do about it? What are the leaders in transportation doing? Providing the latest in street car comfort and design—smooth-running cars, speedy, well ventilated, clean and pleasing in appearance. Schedules are being maintained with a reasonable degree of regularity. Service is more frequent. The rolling stock is maintained in shops equipped with the very latest in machinery. Traffic demands are constantly checked. Cars are frequently inspected. The safety factor is diligently observed. Trainmen are carefully selected and trained and supervised. Courtesy is as much a qualification for operators as is personal appearance. Roadbeds are kept to a higher standard. Cars are painted more

Digitized by Google

frequently. Transportation utility executives actually ride in street cars, rub elbows with the daily riders and hear both praises and curses. Economy is eagerly sought for that fares need not be increased. Transportation employees are contented, self-respecting, well paid and loyal. Promises made are kept. Complaints are promptly and courteously answered.

Perhaps you cannot advertise that you do all these things. Perhaps you can offer no immediate prospect of providing even a few of these desirable features. Still, advertising can help you sell transportation by first making friends. But unless you make some effort to be friendly, unless you seek friendship, unless you take folks into your confidence, unless you advertise what your transportation problems really are, you cannot hope to gain friends. Get your story, whatever it is, first to the public. Be on the offensive, not on the defensive. Forced advertising creates doubt and suspicion and a suspecting public is never a friendly public.

Stick Closely to Facts

Tell facts, be they pleasant or otherwise. The problems of a transportation utility are also the public's problems. Only the public doesn't always appreciate this. Don't dodge or belittle complaints. A minor complaint honestly satisfied or promptly answered will often make many stanch supporters. I know of a transportation utility where every complaint received by mail goes to the president, who personally investigates the complaint and answers it. It takes time, but it pays. It helps sell transportation, because such consideration wins friends. Incidentally, it improves service because the knowledge that all complaints go to the boss spurs every employee to watch his step.

Advertising is necessary to selling transportation, that the public may continue to be sold on the merits of the service rendered. The public soon takes good service for granted, and unless it is constantly reminded it quickly forgets or becomes indifferent. There is also the constant influx of new folks in your community who know nothing of your transportation facilities and excellencies. And then there is ever the new crop of potential patrons just reaching their maturity, new workmen, new clerks, new office workers and on down the list of our complex busy civilization. Even the big men in business, driven daily to their plants and factories and stores by private chauffeurs, are deeply concerned about transportation, for it is the dependable, always on the job street car that brings the workers to the places of industry. And forget not that, in this day and age, mother no longer lives all day in the kitchen. She, too, must find conveyance that will bring her quickly, economically and comfortably to the afternoon's destination and back home again. And in your advertising play up to this tremendous potential market.

Advertise not for the sake of advertising, but with a definite objective in mind. Advertise truthfully and fearlessly. Transportation advertising has such a tremendously interesting human appeal it can be made outstandingly successful.

Popularizing Safety Among Platform Men*

By Chester K. Thomas
Division Superintendent Chicago, North Shore & Milwaukee Railroad, Highwood, Ill.

BY POPULARIZING safety I mean making it attractive and practical, energizing it, giving it that human appeal necessary to assure the active participation of trainmen in your program of accident prevention. If we are to succeed in accident prevention, it is highly essential that we secure the whole-hearted co-operation of trainmen. By virtue of their position they always will be the mainstay of any accident prevention program on electric railroads. Trainmen are no different from other people and, like the traveling public, they will discommode themselves to get the things they desire, but cannot be made to take that which they do not want. It necessarily follows that if we are to arouse enthusiasm for safety work among trainmen we have got to make them like it. It must be made to appeal to them as being something they want to do rather than something they are expected to do.

Electric railroad companies have the facilities for providing practical and attractive safety programs for trainmen which cannot fail to produce results even outside the field of accident prevention. Anything which tends to produce safe and careful operation of trains also tends to produce a more reliable and efficient service. It results in more systematic operation, better care of equipment, cuts down delays, improves the morale of the employees, helps to get them to thinking more about things worth while and in many other respects materially benefits the organization. I believe that a safety program if properly organized and carried on will more than pay its way in increased efficiency alone, to say nothing of the improvement in public relations which always follows when accidents decrease. Nothing will produce a hostile public attitude toward a railroad more quickly than a bad accident record.

The question which naturally interests you at this time is, "What can we do to make our safety program attractive to trainmen and at the same time produce the desired results?" The best I can do by way of answer is to give you my own personal opinion based upon experience after about eighteen years of active contact with trainmen.

I believe that the first essential is to get the program started right. In establishing a safety program on a railroad, I believe no mention should be made of the financial outlay occasioned by accidents. It must be given a human appeal right from the start, and the executive who begins by reciting the amount of money spent in accident claims for the past five years is building his safety program upon a foundation that is already beginning to show signs of decay. The trainmen are apt to put two and two together and class your humanitarian interests as fine talk to cover your real purpose, which is to save money for the company.

Unless executives believe in safety from a humanitarian standpoint they should be square enough to say so right off the reel and put their safety on the same basis as any other operating matter, meting out discipline to motormen for striking a tin lizzie as they would to a conductor for stealing a fare. Trainmen would then give you credit at least for being square, but if they have reason to think that you are preaching safety because you want to save money, the best you can ever get is half-hearted participation with the feeling that what they are doing is primarily for some one else's benefit. Then, too, some company officials like to attend meetings such as this and brag about the wonderful accident record on their property, forgetting always to mention that it is the men on the job who have made that record possible.

Let us assume that your safety program is founded on correct principles, that you have started it right, that you have given it the necessary human appeal and that apparently your trainmen are sold 100 per cent on the work you wish to have them do. The question then arises, how long will this continue? How long will this new-born babe live and grow? This question will have to be answered by each company engaged in safety work for itself, because it all depends upon what is done to make it popular and keep it popular after it has been started. I would like to give you a few suggestions which I consider practical to assure the proper growth and development of a safety program with trainmen.

In the first place, you expect them to do the actual work of accident prevention. Then let it be their safety program. Let them have their own chairman, their own secretary, their own program committee. Let them make and execute their own programs. Let them do their own talking. Com-

*Abstract of a paper presented at the annual meeting of the Transportation Section, Wisconsin Utilities Association, Milwaukee, Wis., Aug. 18-19, 1927.

Digitized by Google

pany officials are not noted for their oratorical ability and trainmen can hardly be expected to attend safety meetings forever out of respect for the situation. All too often trainmen are compelled to remain at safety meetings for a couple of hours after the practical work of the meeting has been completed to listen to some company official tell them something they do not wish to hear.

Then, too, company officials quite often avail themselves of the opportunity offered by the safety meetings to get over a lot of information about something far removed from safety work. I do not believe that outside matters should be allowed to creep into the work of a safety organization.

I think, also, that a certain amount of pleasure should be mixed with the work of the safety meeting. A song now and then or some peppy music helps to bring them out to the meeting and send them away happy. This is never difficult to arrange for, as you will always find plenty of talent among the men themselves to provide for this feature of the safety program.

Aside from the actual conduct of safety meetings themselves, there are a great many practical things a company can do to keep up interest in safety work and to get actual carry-over of safety ideas on the job. In the first place, the safety engineer or person in charge of the program should be a practical fellow and, above all else, he should have a friendly, likable disposition. He should understand men and should make a study of trainmen and train service work in order to be able to determine something of their state of mind and their habits of thought and predict what reaction he is likely to get to the various things he will want to do in connection with the carrying out of the safety program.

He should be given wide latitude in the safety work of the company and should be a part of the operating staff of the superintendent's office. I believe he should be empowered to do more than merely make recommendations and should have authority to do whatever seems necessary to promote safety work among the trainmen unless the expense involved is such as to warrant its having to go before the budget and expense committee. I do not mean by this that he should not have the approval of the superintendent in matters of this kind, but rather that the superintendent should be willing at all times to co-operate with his field representative in safety matters rather than advance reasons as to why the proposed measure should not be carried out.

I think, also, that there are many practical things which might be done to assure trainmen that the company's interest in accident prevention is sincere. For instance, if a trainman is seen to be ill or if he has just received some news of a shocking character it would be a good plan to go to him and say, "You had better go home. You cannot do your work safely under the circumstances. Put in a time slip for the remainder of your run." The next day every trainman on the road would know about it and it would be evidence to them that the safety program meant something more than fine talk.

Then, too, the home life and environment of trainmen should be closely watched and whenever a trainman is found to be in trouble because of sickness or something of a similar nature and has become involved in financial difficulties it would be a good plan to advance him a loan to relieve him of his mental worry, telling him at the time you do so that, aside from your desire to help him, you realize that he cannot work safely if he has to worry over a matter of that kind.

The superintendent should commend his trainmen occasionally for their interest in safety work and for the good record they have been able to make. An occasional list should be posted showing the number of men who have been able to go through the period without an accident, making no reference whatever to the ones who have had accidents. It is fatal to discuss a trainman's poor accident record with any one except the man himself.

Most companies have house organs. I believe this is one of the best instruments at their disposal for boosting the safety program among the trainmen. It should always contain a column or two of safety news, showing the pictures of such employees as have rendered distinguished service in accident prevention and featuring the safety program generally. In a very short time trainmen will eagerly scan the pages, hoping to see their names in print or their pictures, and in this way you can reach practically every trainman on the job with suggestions for the betterment of the safety program and can do it in a subtle sort of way that will appeal to them.

Many other things might be done to help maintain interest and keep the safety program popular among platform men, but lack of time prevents me from detailing them further. I wish to leave this thought with you in closing, that the big thing is to start out right, forget about the financial end of it, make your program one of human interest, sell it to the employees right off the reel, let them begin by feeling that it is their program, run for their benefit, and, once you have started, remember that it has to be continually energized if it is to be popular. Use every facility at your command for keeping it alive. Do not feel that all you have to do is start in and then leave it to some one else to carry on. And above all, don't fail to place the credit for success where it belongs, and when you have succeeded in reducing accidents and have hung up a record of which your organization can justly feel proud, go out and tell about it if you want to, but don't forget, when you are doing so, to tell them that the men on the job are the ones who did it.

Bus and Car Co-ordination Promote Safety*

By F. M. Holaday
District Manager Wisconsin Power & Light Company, Oshkosh, Wis.

WHILE all transportation officials are agreed that the bus has a place in the field of passenger transportation, no one has definitely described this field of service. There are a few places where bus transportation will fit into any city in new territory where the travel is light and will not warrant the investment necessary to build track and overhead. In the larger cities the bus can serve as a cross tie to permit the patrons to go to different sections of a city without going to the downtown terminal or transfer point. That is, a passenger in the northeast part of town can board a street car, ride to the crosstown bus line, and transfer to a line going to the northwest part of town. This will cause the passenger to make two transfers, but with properly co-ordinated schedules he will arrive at his destination much sooner than if he had gone downtown and transferred to the northwest street car line. In all of these cases the co-ordinated transportation by bus and car not only gives the patron better service, but decreases the chances for accidents.

Every city has its center point, from a country store in the small town to the Loop of Chicago or Times Square in New York. From this central point the population extends in four ways, and the density of population and vehicular travel decreases in ratio to the distance from the center, and with this decrease in population and travel and with it a decrease in accident hazards. Every car and passenger that can arrive at his destination without going through this zone, reduces the chances of an accident in ratio to the number of other vehicles on the street. One less passenger downtown means that the thousands of automobiles will have one less mark to shoot at. This reduction in passengers can be accomplished by proper co-ordination of bus and street car operation to carry the transfer passengers around the center of town, and transferring them in the less congested part of town. This also will tend to increase the schedule speed, as the time necessary to load a passenger increases very greatly, when a large number try to get on the car at the same time, and hazards increase also. The highway commissions have recognized the soundness of this principle, by building belt roads around a city for the use of through traffic.

*Abstract of a paper presented before the Transportation Section, Wisconsin Utilities Association, Milwaukee, Wis., Aug. 18-19, 1927.

Digitized by Google

In the outlying districts the opposite is true. Where a car is compelled to make frequent stops for one or two passengers, the over all schedule speed is slowed down, and the cost of operation increased out of proportion to the revenue of this line. By using small buses to carry the patrons from the sparsely settled district to a point at the edge of the more densely settled district, the speed of the cars can be increased with respect to the number of passengers carried. In selecting this point, a very careful traffic survey must be made, to decide at what point the car picks up enough passengers to warrant the delay of stopping, and then locate the transfer point as near to that point as possible, taking into consideration the problem of vehicular congestion.

Other Places for Buses

The ideal place for the direct transfer would be on private property, next on a side street, and then at the widest point on a main street, where traffic is lightest. Schedules should be so coordinated that the bus will arrive long enough before the car, for the passengers to be ready to unload when the car arrives, without hurrying, but not long enough to cause the passengers to wait. Also, buses are lighter, more flexible and, consequently, easier to handle in heavy traffic than a street car.

The points which I have mentioned are general and can be applied to most any town or city, and considered as feeder or transfer service. There are, in addition, special conditions where it is advisable to run through bus service. In one city where I became familiar with the situation, the business men in one section of the business district lived in the same section of town that was served by the street car, which came downtown by a rather round-about way. Bus service was started over a direct route but entered the congested section of town from a different side. This served two purposes. It decreased the number of people boarding and leaving at transfer points, and also secured new business of men who would ride a bus but not a street car, leaving their automobiles in the garage, and relieved the vehicular congestion materially.

In another instance a large manufacturing concern employing a large number of men, mostly foreigners, was located on an outlying district and the foreign colony was located quite a distance from the factory. Here bus service was given between these two points, and the street cars were relieved of a large number of passengers who were always mixed up in accidents. The accidents on the street car line were decreased almost 75 per cent, while the number of passengers carried was only reduced about 25 per cent.

I believe that if any management is considering expansion, if it will consider the points brought out and can adopt them through the proper combination of bus, or bus and railway service, the over-all schedule speed can be increased and at the same time accidents can be reduced.

American Association News

Anna Case to Sing at A.E.R.A. Convention

WHEN New York City, for example, gave such an unprecedented welcome to Colonel Lindbergh on his triumphant return to his country, it was Miss Anna Case who was selected to sing the "Star Spangled Banner" from the official reviewing box in City Hall.

Anna Case

It was also Miss Anna Case who sang the national anthem at the formal opening of the Democratic national convention in Madison Square Garden.

Again it was Miss Anna Case who was the soloist at the reception given to the Crown Price and Princess of Sweden at Detroit and it will be Miss Anna Case who sings, on Oct. 4, for the delegates and visitors assembled at the American Electric Railway Association in Cleveland.

Advance Registration and Guest Tickets

FOR this year's annual convention at Cleveland, the American Electric Railway Association will register in advance not only members planning to attend, but also their guests, for whom members desire to provide the complete convention facilities, including the entertainment features. It will be a great convenience to members in saving time at the registration desk, if they see to it that they are registered in advance. There is no commitment in advance registration, and anyone who is at all likely to attend the convention should be so registered. No notice to the association is necessary in case it develops that a member or guest cannot attend. Those who do not register in advance necessarily will be delayed in getting their badges and credentials at the registration desk, and this year a special card is provided for members and guests to present at the desk, showing that they have registered in advance.

Companies in the vicinity of Cleveland which desire to provide for the admission of their employees or others interested in the convention can do so by securing a special guest ticket. This applies particularly where employees will visit the convention for only one day and where it is not necessary to provide for the complete privileges of the convention, including the convention entertainment features. These tickets will be collected at the door and are good during any day the exhibit is open, from 9 a.m. to 6 p.m. Members are requested to order these tickets in advance from association headquarters.

Certificates for Convention Tickets

EACH of the trunk line passenger associations has authorized the sale of round-trip tickets to the convention in Cleveland at the rate of one and one-half the single way fare on presentation of a special certificate on the purchase of the ticket at a local ticket office. One certificate is good for any member of the association, including dependent members of his family. These round trip tickets may be purchased for the going trip beginning Sept. 29 to Oct. 5, inclusive. On the return trip the passenger must reach original starting point not later than midnight of Oct. 13, 1927, and must make this trip by the same route as the going trip. Tickets issued at the reduced fare will not be good on any limited train on which such reduced fare transportation is not honored. Stopover privileges are provided in accordance with certain regulations which can be ascertained from the local agent.

Return tickets will be validated at Cleveland, Ohio, by agents at the regular ticket offices of the lines over which tickets read into Cleveland, Ohio, or at the registration desk, where agents will be available from Oct. 3 to 7.

Certificates may be obtained from Executive Secretary J. W. Welsh, 292 Madison Avenue, New York City.

Addressing Convention Mail

MANUFACTURERS who expect mail or telegrams at the Cleveland Public Auditorium during the convention should see that they are addressed as follows:

Mr. .....
..... Company
Spaces No. .....
Cleveland Public Auditorium, Cleveland, Ohio.

Railway delegates who contemplate receiving mail or messages at the convention hall should have it addressed as follows:

Mr. .....
c/o A.E.R.A. Registration Office, Cleveland Public Auditorium, Cleveland, Ohio.

It also is suggested that return addresses be noted on all envelopes.

News of the Industry

St. Louis Claims Funds from Excess Fares

Approximately $85,000 collected by the United Railways, St. Louis, Mo., during three weeks last February, when an 8-cent fare was put in effect under a federal court order, has attracted the attention of state officials at Jefferson City, Mo., who believe they can annex the cash for the state treasury.

Assistant Attorney-General Smith B. Atwood has been in St. Louis investigating the laws and the facts connected with the $85,000 and is considering filing an intervening petition in the United Railways receivership before Federal Judge Faris. The state will seek an order on the St. Louis Public Service Company, which bought the railway on Aug. 1, to deliver the funds to the state.

The state will take the position that a subsequent ruling by a special court of three Federal judges sitting at Kansas City, Mo., suspending the 8-cent fare order of Federal Judge Reeves, under which the higher fare was temporarily collected, was proof that the railway was not entitled to the money and cannot retain the excess collected even though the car riders did not take the trouble to save receipts for the extra cent paid. Patrons who did demand the receipts were later reimbursed for the excess payment.

Transfer System in Los Angeles Contingent on Fare Settlement

A universal transfer system under which each city bus and street car system in Los Angeles, Cal., will accept passengers from the other will be put into operation provided the State Railroad Commission grants an increase in fares to 7 cents, according to a stipulation revealed at a recent hearing before the Railroad Commission. The transfers would also be good on any of the bus lines operated by either the Pacific Railway or the Los Angeles Railway and also on the Los Angeles Motor Bus Company's local line.

It was suggested that in the event that the commission desires to modify the application for a straight increase in fare, a universal transfer system be tried for six months without fare increase, but with a charge of 2 cents for each transfer.

J. G. Mott, chief engineer of the commission, recommended the use of one-man cars in outer districts during the entire day and in the downtown districts in the evening hours, as a means whereby the company might increase its revenues. Mr. Mott also offered the suggestion that the fares for occasional riders be increased from 5 to 10 cents, but that daily patrons be permitted to buy ten tokens for 50 cents. He also suggested what he called a "one-man, two-man" operation of cars. Under this system the cars in outlying districts would be operated by one man, but in the downtown area, where traffic is congested and the patronage heavy, a conductor would be taken on who would remain only through the business districts.

A zoning system was also mentioned whereby car patrons could ride from any point in the city into the downtown area for a nickel, but a trip through the downtown district, from one end of the car line to the other, would result in an additional fare.

Wage Requests of Seattle Men Denied

Requests of the trainmen of the Seattle Municipal Railway, Seattle, Wash., for wage increases have been denied by the City Council, in preparing its budget for next year. Among the demands made was one from operators of one-man cars. They ask $180 a month; they now get $150 and $155. Platform men on two-man cars want a flat monthly salary of $175 instead of the present rates of 67, 74 and 77 cents an hour. All railway employees have asked for a five-day week, but this was also denied by the Council.

Amalgamated Defends Chicago Companies

Union document unusual in its tenor, extremely frank in what it says and deeply significant because of its recognition of the rights of the employer. Trade union an opportunist movement

THE general tenor of the resolution pertaining to the local railway franchise issue at Chicago, indorsed at a meeting of the Chicago Federation of Labor held on July 17, has moved the Amalgamated Association at Chicago, in justice to the more than 20,000 union employees of the local companies, to question the wisdom and justice of continuing a policy of attack, with no practical constructive alternative, on union employers that have had contract relations with their union employees for more than 25 years.

Two Amalgamated officers were appointed to the committee that considered the resolution of the federation, but it came up for consideration when they were in the midst of contract negotiations and they did not find the time to serve. In addressing the officers and delegates of the Chicago Federation of Labor the Amalgamated reminds them that the proposed franchise is a matter that should deeply concern them, "for the welfare of the 200,000 members of our union who help to operate these properties is directly involved." The Amalgamated officers say it is only natural to expect that the railways, when seeking a franchise, will try to get the best legislative deal they can, just as our unions try to get the best conditions we can when negotiating contracts with them." They then say:

In franchise and other legislative matters, however, we have executives, legislators and Councilmen charged with the duty of looking after the public interest. All are answerable to the voters. It is our belief that it is not within the scope of our trade unions to try to settle all the questions of community or nation. Our efforts, to be effective, are limited to the industrial and economic field. The trade union is an opportunist movement, and recognizing the soundness of this position the Amalgamated employees are about to seek conditions that will serve to protect our unions and benefit of all the multitude of organized workers who are employees in the local electric railway industry in any traction franchise that may be proposed in this city.

As the representatives of more than 20,000 union employees, the Amalgamated officers are tired of being confronted with charges of bad faith by the representatives of these companies as expressed in the hostile attitude of the central body in this and other similar resolutions. They believe the spirit of these resolutions embody a wrong policy and, when properly analyzed, an anti-union policy that has a tendency to promote bad feeling instead of good will between these companies and their union employees. They then say:

As citizens the delegates to this federation have an undoubted right to express themselves on public matters, but as trade unionists looking to the welfare of the organized labor movement in this city judgment should be used in attacking indiscriminately employers who have made contracts continuously with the unions of their employees for more than a quarter of a century.

When we stop to consider that the local traction companies, surface and elevated, employ more union men and women than any other employer of labor in Chicago, it must surely cause us to reflect that as trade unionists we should show a decent regard at least for the long-continued recognition by these employers of the collective bargaining principle on a bona fide trade union basis. For more

Digitized by Google

than 25 years these employers have not only been entering into and carrying out contracts with the Amalgamated Association, but their contract relations extend to other unions of the crafts, so that approximately 25,000 members of trade unions are in the employ of these companies.

Recognition is made that at contract expiration periods the Amalgamated had had its differences with the companies employing its members, and no doubt will continue to have them, but "we have managed to maintain the union relation with these companies for more than 25 years, and we have made remarkable progress." The document then says, in part:

The almost insurmountable difficulties that have confronted everybody allied with the electric railway industry, both executives and rank and file, for many years, and particularly since the World War, are little understood by those not directly connected with it. When war drove costs skyward the revenue possibilities of our industry remained stationary, all law-imposed. The industry suffered and deteriorated and its workers had to bear a heavy burden. Having experienced these hardships, we who follow this industry for a livelihood resent, and we feel justly, the unreasonable attacks upon it. The electric railway industry has had its "barons" in the past and may have some of them now, the same as all other big industries, but the average electric railway executive of today is fighting to overcome the sins of his predecessors and earnestly striving to operate on a legitimate business basis.

Ours is one of the few industries in the nation that is buck-sawed, hemmed in and hamstrung by near statesmen and professional objectors because of its public nature and the legal restrictions surrounding it. Adequate wages depend upon adequate revenue, and under efficient operation adequate revenue is almost wholly a matter of adequate rates. Public commissions establish the fare rates and thus indirectly establish our wage rates. We hope this federation has not forgot the bitter experience we had in 1922 when the Illinois Commerce Commission forced a wage cut of 10 cents an hour on our 20,000 members in Chicago.

Practically every group of workers represented in this federation may agree with their employers on a wage increase, and the cost is passed to the consumer without any public agency interfering. That cannot be done in our industry. The state commission and perhaps the courts intervene and we are subject to their decisions. As a result, under the present unreasonable restrictions that surround the operation of the local railways, it is becoming increasingly difficult to establish an adequate wage for the employees, such as many of you workers enjoy.

We realize the railways are well able to defend their own position. but as trade unionists we ask for fair play from this federation for an industry that is struggling to free itself from the iron-bound restrictions that came from the errors of the past; an industry that is now attempting to meet the needs of a progressive city and to expand on a proper service basis. Chicago is growing and extending by leaps and bounds and our electric transportation system, the best in the world, is remaining at a standstill. This is helpful neither to the public nor employees.

The Amalgamated officers say it is time serious thought be given to the needs of the industry that plays so important a part in the development of the city, with an earnest desire to play fair in giving it the necessary relief, instead of attacking and opposing every move that is made along this line, without giving the question proper study or consideration. Members of the federation are reminded:

How many delegates to this federation realize the hard struggle the railway industry has had to perpetuate itself the past ten years? Automobile, taxi and bus competition has injured our business seriously and in many places has wrecked us.

We say to the delegates to this federation that the franchise matter is entitled to fair and thoughtful consideration. Trade unionism, as we understand it, should certainly assure a feeling of amity for employers who co-operate with their employees on a bona fide trade union basis, and that is the situation with the Chicago companies. All we ask of this federation is the same fair play and consideration for the industry from which we gain our livelihood as is given other union industries. If unionism is to mean co-operation it cannot be one-sided. Our union label is exposed on the breasts of 20,000 car workers in Chicago every day. This federation and its officers helped to place it there. We aim to keep that emblem of freedom—the union button—before the millions of citizens who use daily the union-operated electric railways of this city, and we ask the same consideration for the union label of our industry trade unionism advocates for the union label of all other industries.

In conclusion, the Amalgamated officers request the delegates to the federation in deliberating and passing upon franchise proposals in the future to give reasonable consideration to the long-continued trade union connections of the local railway properties and the welfare of their 25,000 union workers.

They Straighten Out the Kinks

THREE traffic and transportation experts of the Peoria division of the Illinois Power & Light Corporation use motor cycles to flit hither and yon around Peoria and its environs, straightening out traffic congestion, lifting broken down coal wagons off the track, returning lost children to the bosom of their families, getting conductors change for $5 bills and otherwise assisting in maintaining an on-time schedule over the entire system.

St. Paul Electrified to Seattle

With the opening of a 10-mile extension to the western terminal of the Chicago, Milwaukee & St. Paul Railroad, Seattle is now a terminal of the longest electrified railroad in the world. In recognition of this event, Mrs. Bertha K. Landes, Mayor of Seattle, piloted the 260-ton electric locomotive hauling the first train into Seattle from Black River junction, where it formerly had been necessary to change to steam.

All trains, including the two through passenger trains, the Olympian and Columbian, as well as the Ranier Park Special between Seattle and Tacoma, are now drawn by General Electric 260-ton gearless electric locomotives into either Tacoma or Seattle.

This extension brings the total electrification of the St. Paul road to 655 miles. The route is from Harlowton, Mont., to Avery, Idaho, a distance of 440 miles, and from Othello, Wash., to Seattle and Tacoma, a distance of 215 miles. Five mountain ranges are crossed.

The first step in the road's electrification program was taken in 1915 with the application of electricity to the Rocky Mountain division between Three Forks and Deer Lodge. In 1916 electrification was extended to Harlowton and westward to Alberton, and to Avery in the spring of 1917. So successful did this stretch of 440 miles prove that a few years later the Cascade division between Othello and Tacoma was electrified, leaving a gap of only 220 miles between the two electrified zones between the Cascade and Rocky Mountain ranges.

I.C.C. Inquiry Into North Shore Rates

The Interstate Commerce Commission on Aug 19 instituted an investigation into interstate and intrastate passenger fares of the Chicago, North Shore & Milwaukee Railroad in order to ascertain whether the lower interstate rates are affecting interstate commerce. The North Shore petitioned the commission to intercede in ascertaining whether such discrimination against interstate commerce was in effect. It was pointed out that interstate passenger fares in the states of Illinois and Wisconsin over the Shore line are lower than its interstate passenger fares and the carrier is not permitted by authorities of these states to increase its intrastate fares in order to overcome the discrimination against interstate commerce. Hearings have been assigned at Chicago.

Three Federal Judges Will Hear Columbia Railway Argument

Judge Ernest F. Cochran of the United States Eastern district has decided to convene a court of three federal judges to hear the application of the Columbia Railway, Gas & Electric Company, Columbia, S. C., for an interlocutory injunction restraining the South Carolina Railroad Commission from enforcing its order No. 356 requiring the company to restore street railway service discontinued March 11. In his order Judge Cochran refuses to issue a temporary restraining order pending hearing of the application for an interlocutory injunction. After outlining the grounds under which he issued his order, Judge Cochran stated that the application for an interlocutory injunction should be heard before three judges and that the court would call to its assistance two other federal judges.

The motion for a restraining order pending the hearing by the three judges was refused without prejudice, however, to the right of the plaintiff to renew its

Digitized by Google

motion in accordance with the views set forth in the court's decision and the plaintiff will be at liberty to present to the three judges all of its grounds for relief, the same as if the present order had not been made.

In giving his reasons for declining to issue the temporary restraining order Judge Cochran states that the case as presented does not appear to show that the plaintiff will be subject to heavy recurring penalties or to a multiplicity of suits, or to such an exorbitant penalty that it could not safely risk incurring it.

Sunday Pass on Eastern Massachusetts

Since July 10 the dollar Sunday pass has been in vogue on the lines of the Eastern Massachusetts Street Railway, Boston, Mass., established to stimulate riding to the beaches, parks, lakes and other summer resorts. This excursion rate means an unlimited ride over a system of 650 miles and benefits nineteen cities and 54 towns. The tickets are not good on the company's bus lines.

Success was prophesied for the venture when on July 4 there was a traffic block of automobiles for 13 miles on the Newburyport Turnpike. In Revere and other places there were traffic jams. On the second Sunday, July 17, some 600 tickets were sold out of Lowell alone.

To cater to this new service the company has added 100 new de luxe cars with all modern conveniences to its rolling stock.

Safety Provisions in Cincinnati

Passengers on electric railways in Cincinnati, Ohio, are afforded additional protection by an amendment to the city's traffic ordinance made effective on Aug. 19. Under the new rule drivers must stop their vehicles and remain at least 6 ft. behind any street car that has come to rest either to receive or to discharge passengers. These passengers must be permitted free passage to the curb. The vehicles must not be started until the street car is again in motion. Standing street cars can be passed, however, with caution at not more than 15 m.p.h., at safety zones or loading platforms. Further, the City Manager has been authorized "to adopt and install such traffic control devices, signs and safety platforms for the controlling, regulating, directing and moving traffic and for designating any shopping zone, berthing zone, parking space, taxicab stand, bus stop, or any other place or stand upon the streets of the city as interest and convenience of the public may require."

Two Railway Lines in Providence Combined

The Providence-Woonsocket and Providence-Buttonwoods lines will be combined under a new plan to be put into effect on Aug. 28. This announcement was made recently at the offices of the United Electric Railways, Providence, R. I.

The same half-hourly service which has been in effect on both lines will be continued, the only change being that the Woonsocket cars and crews will run through the center of the city to Buttonwoods. The arrangement, it was explained, will not affect the so-called "rush hour" service on either of the lines, extra cars being put on both divisions for heavy traffic.

Consolidation of the two lines has been under consideration for some time, railway officials said, it being the opinion of experts that the two lines, both operating under the block signal system and both being interurban services, should be combined. All cars on the Woonsocket division have recently been completely renovated, officials said, and the new arrangement will afford residents along the Buttonwoods line the better rolling stock instead of the older cars now in service on that division.

Commission Will Not Interfere in Buffalo

The Public Service Commission has denied the petition of the International Railway, Buffalo, N. Y., for a reopening and abrogation of the commission's order of Dec. 23, 1925, directing the reconstruction of tracks in Grant Street and Walden Avenue. The company alleged in its petition that the action by the Buffalo City Council in assuming to annul certain franchises given it made the track reconstruction work inadvisable. In a memorandum, the commission held that the relief asked for was unneceessary as the city had been restrained from taking any further proceedings in the matter. The commission says it does not propose to interfere with the discretion of the city authorities as to the priority in which track reconstruction is necessary.

Free Rides in Kansas City Introduces New Cars

The Kansas City Public Service Company, following a general plan of "educating the public" to its improvement program, has been using its new de luxe cars for a short period on the various lines of the city. On the Argentine-Twelfth Street line they charged no fares for certain periods during the first two days during which the de luxe cars were functioning.

Special considerations granted to the Argentine line were due to the dissatisfaction with the railway service which has been apparent with commuters on that line in the past. On Aug. 7 the 45 modernized street cars, which had been operating on the Country Club line since July 3, were transferred. The company through the newspapers invited every one to ride these cars as its guests between the hours of 10 a.m. and 2 p.m. On the next day, Monday, free fares extended from 10 a.m. to 2 p.m. and from 7 p.m. to 10 p.m. Transfers to other lines were accepted.

The Kansas City Public Service Company will continue to shift the 45 cars from one line to another for a short period until the entire area of the two Kansas cities has been covered.

Pass Included in Oakland's Modified Fare Petition

Officials of East Bay cities are preparing to oppose the request of the Key System Transit Company for an increase in rates. The company's request for a 10-cent street railway fare and a 25-cent ferry fare to replace the present 7 and 21-cent rates has been modified by a proposal to introduce the weekly pass.

According to the Key System plan, evolved after a thorough study by Richard Sachse, noted engineer, weekly passes would be sold to the public for $1, good for an indefinite number of rides within the city's 7-cent zone and transferrable to any member of the purchaser's family. In zones outside the city limits the weekly pass rate would be $1.50. Monthly passes good for unlimited rides on cars and ferries would cost $10.

Key officials estimate the gross revenue increase under the new plan as $893,503 for the first year. Deducting state and local franchise taxes on this increased earning, the net gain would be approximately $844,360. Of this amount $517,123 would be paid by railway patrons and $376,360 by ferry patrons. If these figures should prove correct, they would yield the company a return of 4½ per cent on its investment.

The engineer, in order to promote the adoption of the pass system and secure as many pass users as possible, urges that the Key System be permitted to allow a 3 per cent commission to employees for selling the passes. These commissions, it is estimated by Mr. Sachse, would total about $100,000 the first year. Mr. Sachse, in advocating the new plan, said:

> This departure would be in keeping with the new program of transit companies in "selling transportation." It is believed that the weekly pass presents many possibilities for co-operation between the merchants and commercial institutions of the city and the transportation companies, bringing about a large use and wide distribution.

Commissioner Clyde Seavey continued the hearing until Sept. 16.

The rate hearing has been going on intermittently for more that a year and a half. In 1925 the Key System was granted a temporary raise in rates after carmen of the company had been awarded higher wages by an arbitration committee and after the company had complained that the old rates were inadequate.

Up to the time that Mr. Sachse made the new fare raise proposal most of the testimony had dealt with valuation data based on surveys. Experts of the company and the Railroad Commission disagree about the company's rate base. The company's figures are nearly $4,000,000 higher than those of the experts of the commission.

Washington Office Changes Headquarters

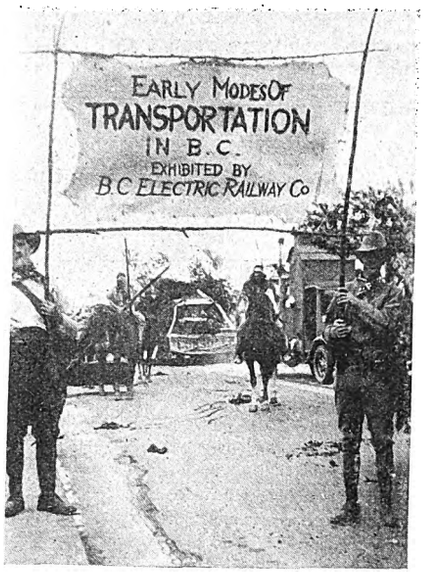
The Washington, D. C., office of the McGraw-Hill Publishing Company, Inc., publisher of the ELECTRIC RAILWAY JOURNAL, was removed on Aug. 25 to the new National Press Building.

Railway Commemorates Dominion Day with Inspiring Exhibit

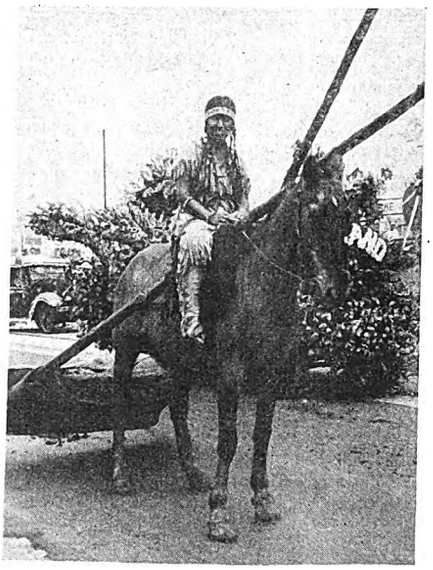
If—a momentous one—H. R. H. the Prince of Wales had embarked on Canadian soil a few weeks sooner than he did he might have abandoned summarily his quest for big game in the happier possession of a smiling squaw. And willingly would she have relinquished "big red man" of unrelenting countenance for a paler idol from across the seas amenable to her progressive ideals. But—again momentous—the *Empress of Australia* docked some three weeks late and the management of the British Columbia Electric Railway, who loaned the Indian maiden in honor of Dominion Day, can continue in the safer if less romantic business of selling transportation and remain content in the knowledge that its contribution to the Diamond Jubilee of Confederation had even more far-reaching effects.

In the winter months that are to come Vancouverites can talk about the difficulties their forebears experienced in traveling about, for they were spectators at the parade in Vancouver on July 1 when the British Columbia Electric Railway gave an exhibit of the early modes of transportation in that province. Here were romance and history—another chapter for an addition to Hilaire Belloc's "The Highway and Its Vehicles."

The men and women who took part were all dressed in the costumes of the periods and with three exceptions were in the employ of the railway. First came two men carrying a sign made in the shape of a rawhide explaining the nature of the railway's part in the parade. Then followed an Indian, squaw and dog, the dog dragging a travois, which is a pair of crossed sticks, used in the days before wheels. The next unit was an Indian mounted, followed by a squaw with a travois on the horse. Later came a white man dressed as a prospector, followed by a packhorse. Another unit was a Red River car, and finally a stage coach. If this historic pageant accomplished nothing more than the dissemination of information on transportation in the Province of British Columbia it might be considered an achievement, but one is inclined to think it was also morally stimulating and inspiring.



A sign separates the past and present



Niagara Falls-Buffalo-Lockport Round Trip Fare 25 Cents

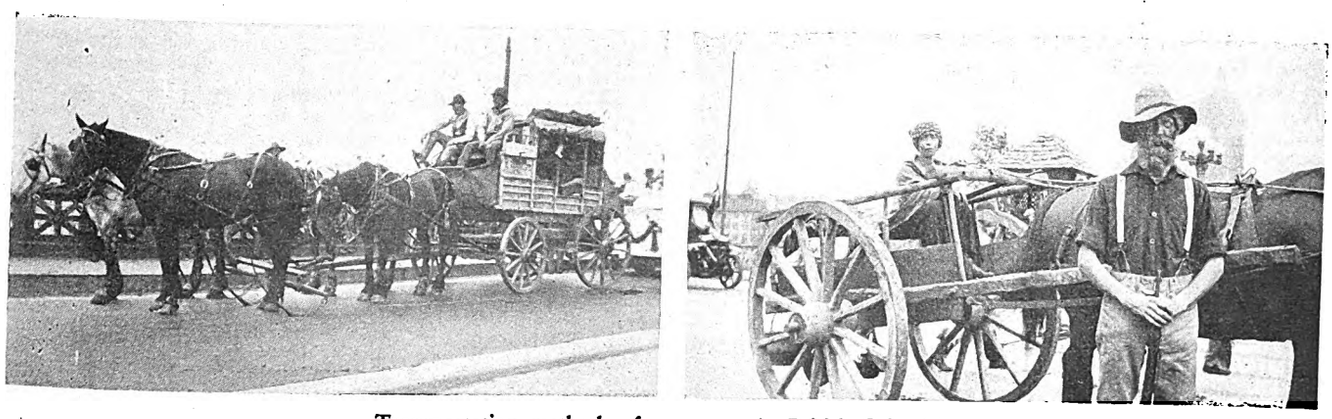
The Public Service Commission on Aug. 23 directed the International Railway, Buffalo, N. Y., effective Sept. 1, to establish a round-trip ticket fare of 25 cents applicable to its Niagara Falls High-Speed and Buffalo-Lockport lines between Buffalo and Englewood stop, each ticket to have similar privileges as now given under the one-way cash fare. The company is also directed to place the tickets on sale at convenient places in Buffalo and at the Englewood stop. The existing fare has been in effect since March 1.

Complaint was made by about 35 residents of the Englewood section, who asked for a reduction in the fare rate in accordance with the terms of a franchise by the Tonawanda Town Board on Sept. 30, 1915. They claimed this franchise was inviolable as to all its terms. The commission, in a memorandum, held that such is not the case, as the Court of Appeals has squarely held that all franchises granted by a municipal authority subsequent to the passage of the public service commission law are subject to regulation under that act.

The complaint also alleged discrimination, it being claimed that Buffalo and Amherst residents who use the Main Street line are enjoying a city fare, while those who ride to Englewood are required to pay more. The commission's memorandum said that although a commutation ticket book good for one round trip daily in the month was sold for $5 and placed commuters on practically a city fare basis, it did not take care of the less habitual rider and the members of his family.

Omaha Franchise Hearings On

Hearings were held on Aug. 1 and again on Aug. 8 on the proposed railway franchise for the Omaha & Council Bluffs Street Railway, Omaha, Neb. The company has stated that it would put its comments and suggestions as to changes and modifications in writing and furnish a copy to each of the Councilmen as well as to the City Corporation Counsel. The meetings are to be continued. The Omaha franchise draft was referred to in detail in the ELECTRIC RAILWAY JOURNAL, issue of July 30, page 206.



Transportation methods of yesteryear in British Columbia

Recent Bus Developments

Double-Deck Buses for Rush Hours in Buffalo

Double-deck, gas-driven buses have been relegated by the International Bus Corporation, a subsidiary of the International Railway, in Buffalo to use during the peak rush hours in the morning and late afternoon. In this place the International Bus Corporation has substituted single-deck gas-electric buses seating 33 passengers. Because of the smaller carrying capacity of the new buses, the company has increased the frequency of the service 20 per cent. Bernard J. Yungbluth, president of the bus and railway companies, explained in a statement addressed to Mayor Schwab:

It is with a great deal of pleasure that I read your constructive and friendly suggestion that I.R.C. serve the Delaware Avenue route with single-deck pneumatic-tired buses such as were used in the Peace Bridge service. I.R.C., gladly co-operating with you, began as soon as your letter was received preparations for the use of single-deck, city type, gas-electric buses on Delaware Avenue. It is my earnest wish that the spirit of good will revealed by your kind letter may develop into full mutual understanding and hearty co-operation for the future improvement of Buffalo's transit service.

Service by Bus Expanded in Norfolk

The third great step in putting into effect in Norfolk, Va., the bus and street car rerouting plan of last December was taken by the Virginia Electric & Power Company on Aug. 21, when buses supplanted street car lines aggregating 11 miles in length.

Buses for New York Suburban Service Approved

The Public Service Commission of New York on Aug. 23 authorized the New York & Stamford Railway to substitute buses for trolley cars on its main line between the intersection of Dean Place and the Boston Post Road in Larchmont and the state line at Byram River, passing over various streets and highways in Larchmont, Mamaroneck, Rye, Port Chester and the towns of Mamaroneck and Harrison, under consents to the substitution, as required by Section 50-A public service commission law, granted by the municipalities.

A new zoning arrangement under which the zones are reduced and the zone fare increased from 7 to 10 cents is provided in the change from trolley cars to buses.

Commissioner Van Namee, in a memorandum, states that in 1926 trolley line fares decreased more than 2,000,000, representing a decrease of between 25 and 30 per cent in revenue, and in the first six months in 1927 there was a further decrease in revenue of from 10 to 15 per cent. Paving obligations in prospect during the next eighteen months will reach between $100,000 and $150,000.

The commissioner stated that there was a general demand for the use of buses except in Mamaroneck, where a sentiment for trolley lines remained, but at a public meeting bus operation was favored without a dissent.

The evidence further showed that since substitution of bus operation between Port Chester and Stamford there had been an increase of from 25 to 30 per cent in riders and an increased service.

Dallas-Fort Worth Lines Merge

Merging of all the bus lines now operating between Fort Worth and Dallas, 32 miles, and their transfer to a new company to be organized as a subsidiary of the Northern Texas Traction Company has been authorized by the State Railroad Commission. The transaction is the outcome of a compromise reached among the Northern Texas Traction Company, the West Texas Coaches and the Red Ball Bus Company. The Northern Texas Traction Company owns the interurban electric railway between Fort Worth and Dallas, and when the Red Ball Bus Company applied recently to the Railroad Commission for a permanent permit to operate buses between Fort Worth and Dallas, the Northern Texas Traction Company and the West Texas Coaches protested.

Robert K. Hanger, Fort Worth, attorney for the Northern Texas Traction Company, said:

The purpose in carrying on the negotiations which have resulted in the acquisition of the permits to operate buses between Fort Worth and Dallas is to institute bus service as good as the best, in order that the people of the two cities, as well as those living along the route, may enjoy the advantages and conveniences sought to be vouchsafed to them by the provisions of the bill enacted by the last Legislature. To do this, a company with adequate capital will be organized; commodious, comfortable buses will be purchased and put in service, and station and terminal facilities in keeping with the high standards and purpose of the company will be provided.

Another Route Sought by Boston & Maine

The Boston & Maine Railroad has petitioned the Public Utilities Department in Massachusetts for permission to operate buses between Cambridge and Fitchburg, Mass. This would not interfere with any lines operated by the Eastern Massachusetts Street Railway, but the new line would compete in part with the Lovell buses, which run from Arlington to Concord. As a general rule the people in Fitchburg desire this bus line to be established by the Boston & Maine. Its establishment, however, is somewhat contrary to the policy of the department to allow no paralleling of the railroad. The matter is now under consideration by the state authorities.

Right of Buses to Operate in Oklahoma City Defined

Buses of the People's Transit Company cannot operate within two blocks of an electric railway line, the Appellate Court at St. Louis ruled recently, thus sustaining the city ordinance of Oklahoma City, by prohibiting bus operation adjacent to and paralleling the electric railway lines.

The People's Transit Company, an independent corporation, established a bus transportation system, operating on the same streets as railway lines. This was not in compliance with Ordinance No. 2,987 passed by the City Council of Oklahoma City on Feb. 9, 1926, which states that "No bus routes may parallel an existing street car line nearer than the third street."

A complaint was filed March 25, 1926, by the receivers of the Oklahoma Railway, Oklahoma City. The receivers in conducting the street cars and operating buses as a part of the general transportation system within the city were complying with all city ordinances. The bill alleged that the People's Transit Company was not complying with city Ordinance No. 2,987 in its bus operation, and that such operation was causing serious loss in revenue to the receivers.

A temporary injunction was granted by the District Court of the United States restraining the People's Transit Company from operating buses in violation of Ordinance No. 2,987 and the bus company appealed the decision of the lower court to the United States District Court of Appeals at St. Louis, maintaining that the Act of 1925 of the State of Oklahoma, permitting railway systems to operate buses, was invalid because discriminatory; that Ordinance No. 2,987 was invalid as enforced; that the appellees had no property right affected entitling them to injunctive relief, and that the appellees had not compiled with the ordinance in the operation of their buses.

In affirming the decision of the lower court, the Appellate Court made the following pronouncements:

1. That the Act of 1927, though favoring the railways, contained provisions that were "reasonable" and therefore not illegal.
2. That the existing railway system was furnishing adequate transportation facilities and that the system was permanent, whereas the bus company might disappear over night.
3. That no new system has a legal right to destroy such an existing system and have the public at its mercy.
4. That no bus line may parallel an existing street car line nearer than the third street.

Digitized by Google

5. That buses of the street railway system must operate in compliance with Ordinance No. 2,987.

6. That the appellees have such property interests as to justify equitable relief and that the appellees have come to equity with clean hands.

Bus Men Attack Ordinance

The validity of a city ordinance in Terre Haute, Ind., prohibiting buses taking on or discharging passengers on streets occupied by car lines was attacked in a petition filed with the Indiana Public Service Commission on Aug. 18 by Joseph H. Gregg and Andrew Carli, operators of the Blue & Gray bus line and the Hoosier Transportation Company. The petition asks the commission to declare the ordinance invalid. It is contended the ordinance is in conflict with the state law. The former company operates between Harmony and Terre Haute, and the latter between Indianapolis and Terre Haute.

First Report on Minnesota Operation

The Minnesota Railroad and Warehouse Commission in its annual report notes the fact that bus transportation really originated in Minnesota on the Messaba Iron Range back in 1913. The service was started with two sedan type cars run over well built highways. In 1925 41 modern buses were in regular service by the company over this route.

The Twin City Motor Bus Company, subsidiary of the Twin City Rapid Transit Company, is second only to the Northland Transportation Company, subsidiary of the Great Northern Railway, in the operation of buses in the state. This company has 102 buses covering 114.7 miles in interurban and suburban business. The Northland company has 133 buses, with seating capacity of 2,325 passengers, traveling 2,393 miles of routes.

Motor transportation companies carried 12,002,648 passengers in 1926, returning a revenue of $4,626,519. Seating capacity was 9,440 passengers. Buses traveled 17,327,736 miles over 4,870 miles of routes. Of 402 buses in operation 283 did no local business. These buses paid $218,660 in license tax to the state and a $63,904 gasoline tax at 2 cents a gallon.

Buses of the Twin City Motor Bus Company traveled 4,997,740 miles, carrying 5,114,834 passengers at a total revenue of $1,204,851. The company paid $52,473 vehicle tax and $17,164 gasoline tax.

The Northland, which does only a through and suburban bus business, in 1926 carried 1,975,024 passengers, 7,391,658 bus-miles returning a revenue of $1.981,628. The company paid the state $99,170.51 vehicle tax and $27,288 gasoline tax.

Buses in Minnesota were placed under jurisdiction of the commission under the transportation act of 1925. In consequence this is the first report of real import on this phase of the commission's work.

Local Operation Planned in Seaside Resorts

The Coast Cities Railway, operating through South Belmar, Spring Lake, Sea Girt, Manasquan and Long Branch, recently applied to the officials of Spring Lake and Sea Girt for permission to discontinue railway service and substitute buses. It is the plan of the company to operate buses locally in the two boroughs only.

Bus Expansion for Louisville in Franchise Draft

A tentative draft of a bus franchise ordinance has been submitted to Mayor J. T. O'Neal, Louisville, Ky., by the Louisville Railway. This ordinance calls for the establishment of nine lines covering suburban territory, with several of the lines looping in the downton section. The franchise will be for twenty years, with a fare rate within the city limits not to exceed 10 cents per passenger, with transfers between bus lines. In the event the franchise is secured by the railway, transfers will be given from bus to rail, on the 10-cent fare basis. The purchaser of the franchise will put up a $100,000 bond to carry out the terms of this contract. An upset bid of $5,000 is provided as the minimum sale price of the franchise, which is to be sold at public auction.

Railway Seeks More Westchester Routes

The Westchester Street Transportation Company, Inc., and the Eastchester Transportation Corporation on Aug. 18 petitioned the Public Service Commision for permission to operate bus line from White Plains to Mount Kisco, Westchester County, and for revocation of the certificate granted to John Fabia for bus operation over practically the same route. The petition alleges that on June 15, 1927, Fabia stopped the operation of buses over the route authorized and that he has disappeared and his former associates are unable to give any information concerning his whereabouts, and that during his operation of the bus route there was continual difficulty between him and the petitioner because he violated the terms of his certificate, particularly on the Silver Lake line.

Buses Substituted on Two Lines in Binghamton

The Public Service Commission has approved the abandoment of the Binghamton Railway, Binghamton, N. Y., of its Rockbottom and Spring Forest lines. The commission has also granted to the Binghamton Railway Bus Lines, Inc., a certificate for the operation of a bus line in the territory formerly served by the street railway.

Muncie Case Again Deferred

After hearing the arguments on a plea in abatement brought by the independent bus operators in Muncie, Ind., and on a demurrer to the plea by the Union Traction Company of Indiana, in the latter's petition for an order restraining bus lines from operating in Muncie, Special Judge A. L. Bales of the Randolph County Circuit Court said he would make a ruling at the next term of court. The judge pointed out that it would take several weeks to scan the briefs and look up the law as cited.

The plea contained six paragraphs in which it denies the jurisdiction of the Indiana Public Service Commission over the streets of Muncie, contending that the City Council holds this right.

The Union Traction is charged with operating buses illegally, because it has failed to comply with the terms of an ordinance adopted by the City Council in 1925. It is also charged that Arthur Brady, who, as receiver for the traction company, brought the action for a restraining order and damages, is not legally capable of so doing.

Camden Line Started

The Public Service Transportation Company, subsidiary of the Public Service Railway, started a bus line between National Park and Federal Street Ferry, Camden, on Aug. 15. Half hourly trips are made and the buses pass through Verga, Westville, Brooklawn and Gloucester. The fare is 15 cents each way. The service was installed at the solicitation of residents of National Park and Verga.

Pneumatic Tires Ordered in Minnesota

On the theory that pneumatic tires are less wearing on state highways than solid tires the Minnesota Railroad and Warehouse Commission has directed that all motor vehicles, including buses, must employ pneumatic tires. This order is an amendment to General Order No. 1 of June 25, 1925.

BUSES IN OTTAWA, ILL.—The Illinois Power & Light Company has been authorized by the Illinois Commerce Commission to abandon its railway service in Ottawa, Ill., and substitute bus lines. Tracks in the city, except those used by the Streator-Ottawa branch of the Illinois Traction System, will be removed within 90 days.

BUS FARE ADVANCED.—The Public Service Commission issued an order on Aug. 4 allowing the Capitol District Transportation Company, Inc., Albany, N. Y., a subsidiary of the United Traction Company, to file a new tariff on one day's notice increasing its fares from 7 cents to 10 cents with the sale of thirteen tokens for $1. This would make the rate the same as that of the parent company, which was recently granted a similar increase.

Financial *and* Corporate

Another Crisis Confronts Seattle Municipal Railway

With interest payments aggregating $289,010 due in New York City on Sept. 1, the Seattle Municipal Railway, Seattle, Wash., faces another of its semi-annual financial "crises." This time, it has become known, the railway will not be forced to go on a warrant basis in order to raise the half year's interest on the $15,000,000 of purchase bonds. In the city treasury, to the credit of the railway, lies the sum of $250,000, part of a $600,000 loan which was made last winter from the city's light funds to tide the railway over a financial emergency. This sum will be used to meet the major portion of the interest due. The City Council has by ordinance repaid $350,000 of the loan from the railway earnings. By this recourse the railway will be tided over the present situation, but the repayment will add strain to the railway early next year, when a large principal and interest payment becomes due.

Omaha Bridge Company Refinances

The Omaha & Council Bluffs Street Railway & Bridge Company, which owns the structure over the Missouri River connecting Omaha, Neb., and Council Bluffs, Iowa, served by the electric cars, announces that it has refunded the $2,000,000 5 per cent bond issue falling due on Jan. 1, next, with an issue of a similar amount of 6 per cent bonds due in 20 years. Their payment is guaranteed by the Omaha & Council Bluffs Street Railway.

As indicated previously in the ELECTRIC RAILWAY JOURNAL the $5,000,000 bond issue of the Omaha & Council Bluffs Street Railway also falls due next January, and an effort to secure a three-year extension on it has been made. In the meantime a protective committee of bondholders is circularizing all other holders asking that they deposit bonds with the Omaha National Bank under an agreement whereby the latter would be extended for that period at 6 per cent. The bonds now bear 5 per cent. This is for the purpose of giving the company a chance to make an advantageous renewal of its franchise.

Attorneys for the company and for the city are still sparring over the contents of the latter's draft of a new franchise ordinance, while several councilmen say they will not treat with the company unless the Guaranty Trust Company, trustee for the bondholders, abandons its claim in federal court that the present franchise is in perpetuity. City Attorney Van Dusen says he will discuss provisions the company contends are objectionable, if it will state what these are, but insists that the franchise restricts the company to the use of street cars and gasoline buses.

Heavy Expenses on Boston Elevated

$482,749 excess of cost of service over receipts. Number of revenue passengers on increase. Bus business grows. Old cars replaced. Reconstruction projects carried out

THE public trustees of the Boston Elevated Railway, Boston, Mass., have submitted their eighth annual report.

The eighth full year of public operation closed on June 30, 1926, with a balance of receipts over cost of service of $22,304. This amount was repaid to the Commonwealth and distributed to the cities and towns that are served by the railway.

The calendar year of 1926 shows an excess of cost of service over receipts of $482,749. In 1925 there was a balance of $502,193. Total revenue from transportation was $34,415,308 in 1926 and $33,833,186 in 1925. Total railway operating expenses increased from $24,405,735 in 1925 to $26,076,268 for the 1926 period. The number of revenue passengers was 371,218,401 against 365,036,286 in 1925.

The cumulative effect of the wage increases since July 1, 1923, beginning with the Mayberry award of that year, has been a heavy burden. A considerable number of employees are members of the so-called building trades crafts whose wages in general in this locality are fixed by agreement with the Building Trades Employers Association, and these wages during the past year reached the highest point they have ever attained. The total payroll cost for the year has been no higher than appears in the following statements only by reason of a

*Increase for nine months.

5-cent fare previous to Aug. 1, 1918.
7-cent fare Aug. 1, 1918.
8-cent fare Dec. 1, 1918.
Pupils' tickets (5 cents) Jan. 1, 1919.
10-cent fare July 10, 1919.
First 5-cent fare line (without transfer) Aug. 23, 1919.
First 5-cent local fare line March 26, 1921.
6-cent local fare Nov. 5, 1924.

Note—Previous to 1908 special car passengers included with 5-cent fare.

‡During the years 1922, 1923 and 1924, one passenger making a single journey for which he might pay two 5-cent fares was counted as two revenue passengers. The substitution in November, 1924, of 6-cent tickets for 5-cent cash fares has often resulted in the payment of a 10-cent fare by such a possenger with a consequent reduction in the company's figures of total revenue passengers carried. though the gross passenger revenue for the year 1925, which increased $371,269.51, would indicate substantially the same number of passengers carried by the railway in 1925 and 1924.

Italics denote decreases.

Profit and loss items not included in above.

substantial reduction in the number of men employed, and the careful exercise of operating economies.

The year 1926 was conspicuous for the extraordinary amount of snow expense, which totaled $484,165 and was the second largest of any year in the history of the railway. Heavy snowstorms occurred in the month of December as well as the early months of the year. These additional expenses appear in the total expenditures under the items of Maintenance, Power, and Accidents, but are impossible of segregation.

While there has been a reduction in some types of accidents, vehicle collisions have increased and there has been an increase in total expense for injuries and damages of $261,000 over the preceding year.

The annual charge for depreciation is $346,000 more than for the previous year due to increase in investment in depreciable property. By far the greater portion of this increase of $346,000 arises from the expansion of bus service and consequent increase in number of buses owned.

Added revenue arising from a greater number of passengers carried and from larger payments from advertising and station privilege contracts has offset some of these increased costs. Effort has been made during the year adequately to meet proper maintenance charges, which had been curtailed somewhat during the previous year.

There was a total increase of 6,182,115 in number of revenue passengers carried. The average traffic on week-days, Saturdays and holidays increased, whereas the Sunday traffic averaged slightly less.

To care for this increase and to provide more frequent trips where there has been increased substitution of one-man cars and buses, 2,385,255 more miles and 338,144 more round trips were operated. Two-man surface car operation was reduced from 24,880,686 miles to 23,653,994 miles, while one-man operation was increased from 13,271,296 miles to 14,419,209 miles and bus miles increased from 2,472,456 to 4,717,900. An increase of 268,122 miles was operated on the rapid transit lines.

Capital expenditures in 1926 totaled about $3,700,000. Contemplated capital expenditures for the year 1927 total approximately $4,000,000.

The depreciation charge during the year provided $2,841,721 toward capital expenditures. The balance was provided for by an increase of $300,000 in short time notes and by sales of real estate and other property, and reduction in amount of materials and supplies on hand.

No new capital obligations have been created in the year, but steps were taken to issue on Feb. 1, 1927, $1,926,000 additional bonds under the authority granted by chapter 288 of the acts of 1924. This amount is only slightly in excess of the cost of the 60 additional cars which have been ordered for the Dorchester rapid transit extension.

The net cost of power for car service per kilowatt-hour was 0.982 cent compared with 1.021 cents a year ago, due to increased efficiency of the new equipment and lower price of coal.

Replacement of the last wooden elevated cars, 100 in number, has been undertaken by an order for a similar number of modern steel cars. Eighty-one buses have been added during the year to cover the lines on which bus operation has been started. About 15 miles of track and special work were rebuilt and 2.6 miles extensively repaired.

Conspectus of Indexes for August, 1927

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Receiver Ordered to Sell Massachusetts Line

The American Trust Company, Boston, Mass., has received notice of an order issued by the Superior Court to sell the property of the Boston & Worcester Street Railway, South Framingham, Mass.

The Superior Court has ordered a hearing in equity session to be held on Aug. 31. The sale date will be fixed shortly thereafter. One of the greatest handicaps in rehabilitating the lines has been the inability to gain authority to install service of a kind that would pay best under present conditions.

INTERBOROUGH REPORTS DEFICIT.—The gross revenue from all sources of the Interborough Rapid Transit Company, New York, N. Y., for July, 1927, was $4,883,900, representing an increase of $867,598 for a similar month the year previous. Expenditures for operating and maintaining the property were $3,248,569, which showed a decrease of $333,196 over July, 1926. Considering the dividend and other rentals a balance available for other purposes was a deficit of $465,310, which was an increase of $1,198,227 for July, 1926.

Personal Items

Samuel Kahn Elected President of Market Street Railway

Samuel Kahn, executive vice-president of the Market Street Railway, San Francisco, Cal., has been elected president. Mr. Kahn has been executive head of the company since the end of 1925, when the Byllesby organization acquired control. He has been connected with the Byllesby organization since 1910, when the utility properties with which he was affiliated in Fargo, N. D., were acquired by the Byllesby interests.

Four London Underground Officers in United States

A delegation of four officers of the London Underground will make a trip to the United States in September and October this year to attend the convention at Cleveland and inspect railway properties in the United States. The men who plan to come are: J. P. Thomas, operating manager of railways of the London Underground Railways; R. H. Pitts, staff officer of the London Underground Railways; W. S. Every, signal engineer of the London Underground Railways; Owen Watson, experimental engineer of the London General Omnibus Company.

The members of the party will travel more than 9,000 miles. They expect to visit Quebec, Montreal, Ottawa, Winnipeg, Minneapolis, Chicago, Detroit, Cleveland, Buffalo, Toronto, Pittsburgh, Washington, Baltimore and Philadelphia.

Their headquarters while here will be the National Railway Appliance Company, Lord Ashfield's representative in this country, 420 Lexington Avenue, New York City.

HOWARD ELLIOTT, chairman of the Northern Pacific Railway and at one time operating head of the New York, New Haven & Hartford Railroad, owning the Connecticut Company, received the honorary degree of Doctor of Laws at Carleton College, Northfield, Minn., recently. He was graduated from Harvard in 1881 and is now president of the board of overseers of Harvard. Mr. Elliott received honorary degrees from Middlebury College in Vermont in 1916 and Trinity College at Hartford in 1924.

JESSE BLYTHE, well-known St. Louis newspaper reporter and advertising man, has been appointed assistant director of the Missouri Committee on Public Utility Information, St. Louis, Mo. Prior to joining the John Ring, Jr., Advertising Company seven years ago, Mr. Blythe was connected with St. Louis daily newspapers as reporter. One of the outstanding things he did while he was with the advertising agency was to handle the municipal advertising campaign intended to bring new industrial concerns to St. Louis.

Walter C. Becker Superintendent of Bus Service in Chicago

Walter C. Becker has been appointed superintendent of bus service of the Chicago Surface Lines, Chicago, Ill., reporting direct to Vice-President G. A. Richardson. Mr. Becker will have charge of the operation and maintenance of buses operated by the company in addition to his duties as assistant superintendent of the utility department.

When a new utility department on the Chicago Surface Lines was established in 1925 to succeed the department of stables, wreck wagons and supply cars

W. C. Becker

Mr. Becker was appointed to take charge of automotive equipment in the new department. Thomas Blakely was made superintendent and David A. Robinson another assistant superintendent. The order carried with it a plan for placing the equipment on a completely motorized basis.

After three years study of electrical engineering in the University of Illinois Mr. Becker entered the employ of the Chicago City Railway under the late A. A. Thurlby, superintendent of wires and cables. A few years later he was made assistant to Mr. Thurlby. Following the unification of the properties in 1914 he was transferred to the electrical department, where he was employed for six years as assistant superintendent of line transmission. In 1920 he was placed in charge of automobiles and other vehicles in that department and within two years all horses in his care had been disposed of and the department completely motorized. This training, together with the fact that Mr. Becker had learned the machinist's trade in his early youth, made him a good choice for handling the automotive equipment.

OBITUARY

J. Ogden Armour

J. Ogden Armour, who died in London on Aug. 16, was never an officer of an electric railway, but he poured his money in a prodigious stream into both the Sioux City Railway, Sioux City, Iowa, and the Metropolitan Street Railway, Kansas City, Mo. In the case of the Metropolitan Street Railway he followed its vicissitudes and the vicissitudes of its successor, the Kansas City Railways, backing his friends with his funds, only to see his unsecured claims of about $2,000,000 disallowed in the final reorganization from which the Kansas City Public Service Company has evolved as the successor company. These and the other interests of Mr. Armour in utilities were overshadowed by the active participation of the man in the packing industry, but his quiet work in utilities as a capitalist was not without its influence.

In many respects Mr. Armour was no less a public character than was the late Judge Gary. There was, however, this difference. The one died at the zenith of his career; the other at the nadir of his. Both men came in for wide publicity because of their prominence. In Mr. Armour's case his personal privacy was often violated in the effort to make copy of the activities of a man who was cautious, modest, conciliatory, well poised and generous, a man devoted to business, but leisure loving.

It is well to remember that Mr. Armour as the son of Philip D. Armour imbibed from his shrewd, hard-headed, hard-working, alert, impulsive father much of his scion's toleration with frail humanity, made immortal in George Horace Lorimer's "Letters of a Self-Made Merchant to His Son," in which everybody who knew the elder Armour immediately identified him with old man Graham of the Lorimer letters. And so the son was well fortified to endure the colossal losses that he did, losses said to have amounted to $1,000,000 a day for a period of about 130 days, sustained because of the relentless working of economic forces the progress of which no man could stay and few could contemplate with equanimity, particularly the desertion of associates. Under the circumstances Mr. Armour probably suffered less than would others, not because he was more callous, but because he was more conscious of man's inhumanity to man.

In 1881 J. Ogden Armour entered Sheffield Scientific School at Yale. For seventeen years after he left college, Mr. Armour devoted his entire attention to the packing business. He had assumed executive responsibilities under his father after an apprenticeship in learning the ropes. Thus it was that after the father's death, in 1901, he was able to step into the place of the founder and build even more rapidly. Under his direction the business of Armour & Company increased from $182,000,000 a year to more than $1,000,000,000.

Manufactures *and the* Markets

Ceremonies Mark Beginning of Buffalo Track Work

The actual start of the track reconstruction and repaving program of the International Railway, Buffalo, N. Y., which will involve an initial expenditure of $250,000 in the next four months, was turned into a community celebration when Bernard J. Yungbluth, president of the company, and William C. Hornung, vice-president of the North Fillmore Avenue Business Men's Association, pried loose the first old cobblestone between the rails of the Fillmore Avenue line while a crowd cheered. The ceremonies marked the beginning of a city-wide improvement schedule.

A new type of track construction for city streets in Buffalo will be undertaken on the Fillmore Avenue line. T-rails will be laid on this route with stone blocks lining the inside of the rails. Asphalt will be used between the tracks and for a foot on each side, in accordance with new specifications which have been approved by the Buffalo City Council.

Metal Prices Sag Slightly

With the exception of tin, the prices of all of the more important non-ferrous metals are somewhat lower in both the American and English markets than they were a week ago on Aug. 16. Considering the quietness in the demand, however, prices have held very well, especially those of copper.

The large producers are asking from 13¼ to 13⅜ cents, delivered, with full realization that these quotations are only nominal and to be obtained only where special conditions apply. Those who make a practice of selling their intake from week to week are quoting from 13.05 to 13⅛ cents for customary Eastern deliveries, but are selling only a very moderate tonnage, there being little interest by consumers just now at any price. Dealers are apparently holding more copper than usual, and several hundred tons have been picked up during the week as low as 13 cents, delivered. The foreign demand has been as quiet as the domestic, though a little more interest was taken abroad on Aug. 23, coincident with a reduction in the c.i.f. price of the export association from 13.65 to 13½ cents.

The week ended Aug. 23 has witnessed a further fall in lead prices, but in spite of the relatively low figure at which the metal was obtainable, consumers have shown little interest and the volume of sales has been small. In accordance with the general downward trend of the market, the American Smelting & Refining Company has reduced its contract price from 6.75 cents to 6.60 cents, New York.

Zinc is only slightly lower than last week, quotations over Aug. 22 and 23 being in the neighborhood of 6.30 cents, St. Louis, compared with 6.35 cents a week ago. Forward deliveries are inclined to be slightly higher than prompt. High-grade zinc is unchanged at 8 cents nominal, for small tonnages of spot metal, delivered in the East. On Prime Western, the New York market is at the customary freight differential of 35 cents per 100 lb. above St. Louis.

The tin market, which is never entirely governed by consumers' demands, remained fairly firm, but most of the sales were to dealers. Consumers, by large forward buying at the low prices which prevailed recently, seem to have provided themselves with most of their immediate requirements.

METAL, COAL AND MATERIAL PRICES

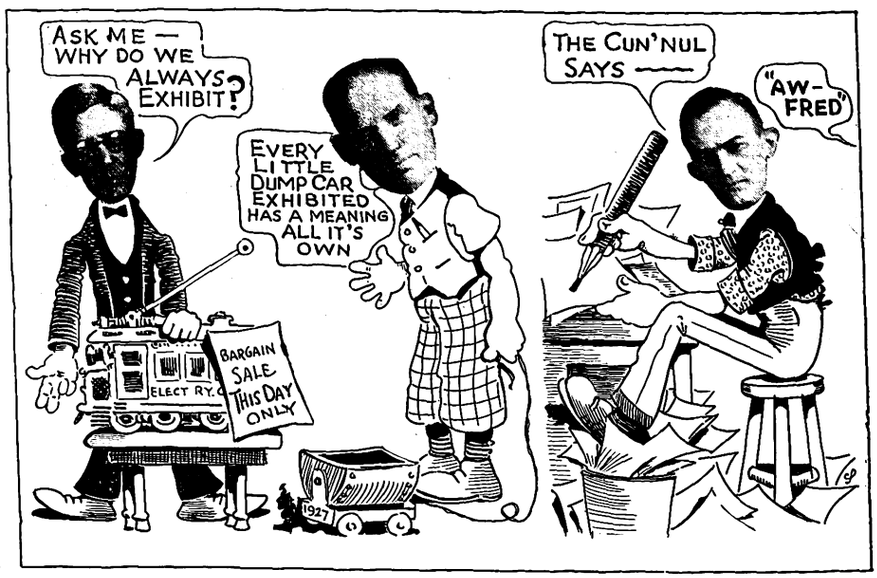
Chicago Rapid Transit Builds New $40,000 Station

A new $40,000 station of the Chicago Rapid Transit Company is being built at Western Avenue, Chicago, on the Ravenswood branch of the system. The new structure replaces an old wooden building which has served patrons of the Rapid Transit Lines since operation was started on this branch in 1908. The building will be modern throughout and will conform with the new standard type of station adopted by the company. It is expected to be completed about Sept 15.

The station is artistically designed in

EXHIBITOGRAPHS—No. 4



Here we have a rare combination of locomotion, elimination and execution. This gentleman on your immediate left, he with the "no pushee-no pullee" apparatus, is none other than Signor Campbell, whose firm, the Baldwin Locomotive Works, has been making machines to overcome inertia since shortly after the days of the "Strowbridge Lion."

Going East, we find a gentleman with a flowery name, although he wasn't born to blush unseen. His middle name implies fortitude against all difficulties, especially those encountered in removing superfluous material from the right-of-way. Oldtimer, you have guessed his name. Newcomer, he's H. Fort Flowers of the Differential Steel Car Company. Like the gentleman on his right, he practices what he preaches. "Exhibit," he advises, and straightaway takes his own advice.

And now our friend at the desk. He is not a movie star answering "mush" notes, but rather Fred Bullock, prime minister to Cun'nel Alexander, who executes rather than talks. What the Cun'nel says is the *sine qua non* to Fred. What a battery for the big game in October—Fred and the Cun'nel, a greased skyrocket and chained lightning.

This recent garage at Berlin will hold 200 buses. Washing and inspection are carried on in the bay shown at the right

Berlin Erects
A 200-Bus Garage

One bay is devoted to the daily cleaning, washing and inspection of every bus operating from the garage. The filling station is fitted with overhead charging pipes and can fill two buses a minute

IN BERLIN co-ordination of the bus, street railway and rapid transit service of the city has progressed much farther than in either London or Paris. In the German capital the city exercises control through stock ownership of the three companies operating the several services. Of the three means of transport the street railway, at the same flat fare charged by all, is the most profitable. The bus service is about carrying itself, and the city uses the surplus which it earns from its street railways to build extensions of its rapid transit lines.

In May, 1927, 490 buses were being operated by the bus department of this combined system, the Berlin General Omnibus Company, and 100 more were under order. Most of the buses are mounted on either N.A.G. or Bussing chassis with bodies built in the shops of a manufacturing company associated with the bus company, conducted under the name of Wagen Bauwerke, G.m.b.H.

The newest garage of the Berlin General Omnibus Company is on Helmholtzstrasse and is shown in the accompanying illustrations. It was begun in the spring of 1925 and finished in October, 1926, at a cost of about 1,500,000 marks ($360,000). It is probably the most complete in equipment of any in Europe, possibly elsewhere as well. It has accommodations for 160 buses, with the possibility of increasing this number to 200 without great difficulty.

Structurally, the garage is of steel girder construction with a great deal of glass in the roof and a span for the main part of the building of 53.5 m. The depth is 90 m., making this open area without columns about 175 ft. wide by 295 ft. long. Adjoining this space, used for the daily storage of buses, is an open bay extending the length of the garage, 18.6 m. (61 ft. wide), known as the wash and inspection bay. Adjoining the latter is a two-story building, also extending the length of the building and 10 m. (33 ft.) wide for carrying on light repairs, charging batteries, general storage, etc., with part of this extension opening on the main floor. The gasoline charging station and superintendent's office are in a separate building a short distance away.

Every Day Washing and Inspection of Cars

The bay called the washing and inspection room is a busy place between 10 p.m. and 6 a.m. All buses entering the garage in the evening before 10 o'clock are run to the western side of the garage unwashed. Beginning

Digitized by Google

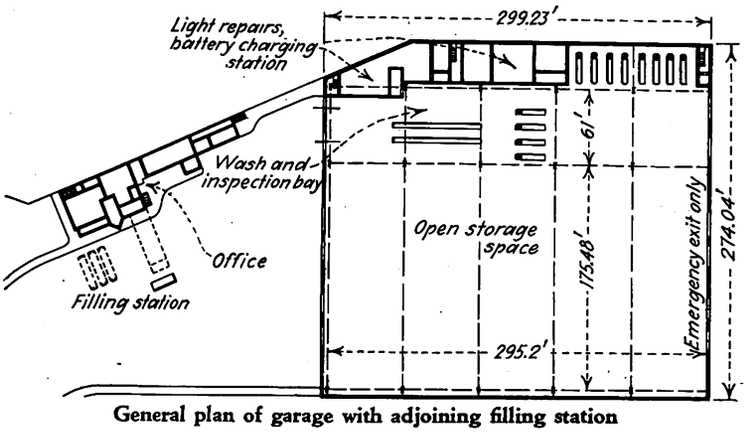
Digitized by Google

In winter the water used for washing is kept at a constant comfortable temperature by an automatic heat regulator. The washing process takes three minutes in all.

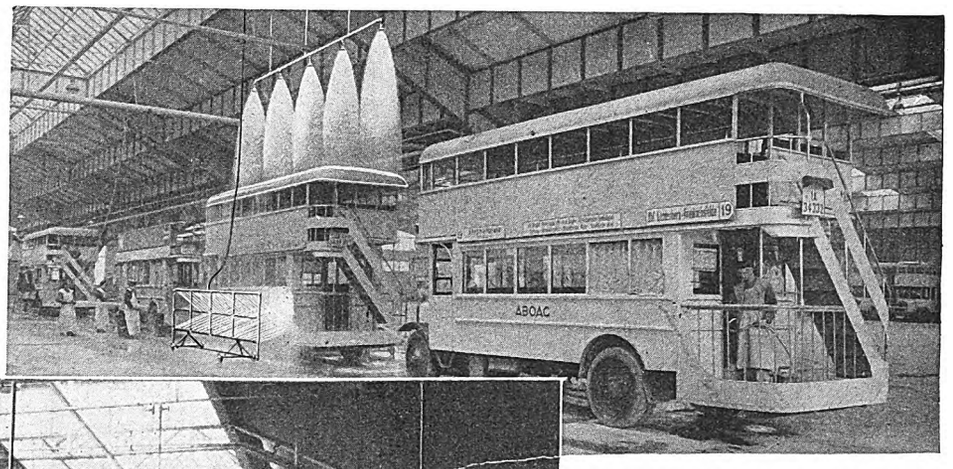
Drains under the washing stand are arranged to trap the dirt before the water flows off into the sewer.

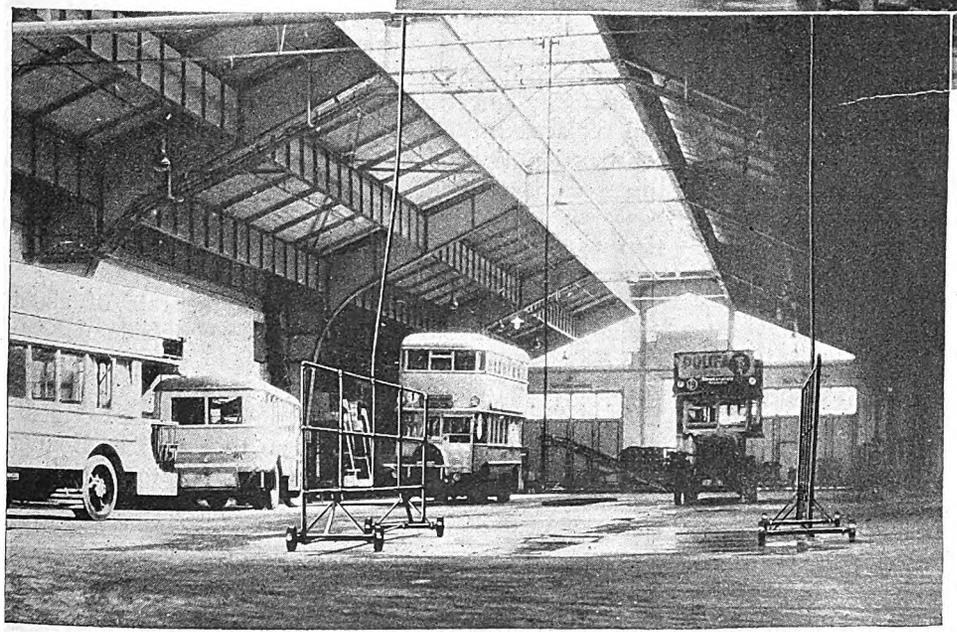
From the washing stand the bus goes to the inspection pits, where it remains about twelve minutes. During this time the buses are greased from below while the batteries are being changed, the spark plugs examined and the oil reservoir for the motor is being filled from above from a portable oil tank, which measures the oil put in each bus. This inspection and change of batteries are done to each bus daily. The inspection pits are lighted and heated as well as fitted with electric power sockets and compressed air connections. They are connected with each other and with the repair pits by an underground passage so that any material needed can easily be brought to the pit workers.

One of the illustrations on page 388 shows a near-by view of these inspection pits. On the right of the pillar in the foreground is a blower forming part of the general steam and hot air heating system of the garage. On the left of the pillar is a telephone booth. The view also shows the oak protecting curb which has been built around the bases of the pillars to prevent any sidewiping or endwiping of them by a bus.



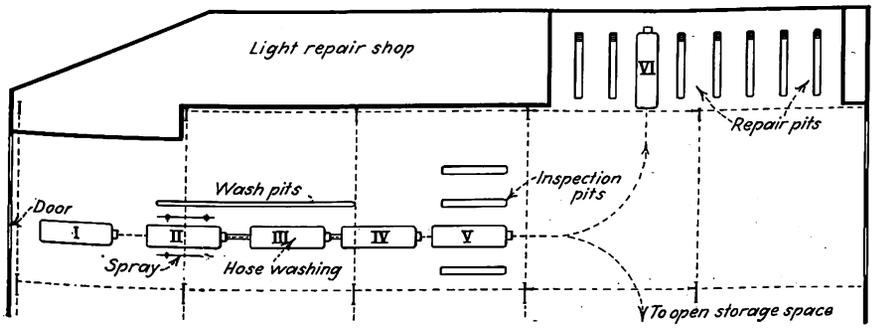
General plan of garage with adjoining filling station





The daily cleaning and inspection includes (1) vacuuming the inside, (2) spray washing, (3) hose washing, (4) inspection

The spraying racks are mounted on wheels so they are adjustable in position. They are connected to the water supply above by flexible hose



Every bus follows a regular daily course of washing and inspection

The examination of every bus at the inspection pit determines whether it shall go to the operating or south side of the garage, ready for service, or to the repair pits on the north side.

Fire protection for the garage is supplied by a sprinkler system as well as by the provision of a number of chemical extinguishers and sand pails.

The filling station is in a separate building some distance away from the garage, for fire protection purposes, and is of an uncommon type in

Digitized by Google

that the filling pipes are supported on an overhead structure or bridge. Before adopting this design the management considered the two more common methods of post connection and side wall connection for filling stations, but adopted the overhead plan as more compact and rapid, since it permits two buses to be charged with 100 liters (26½ gal.) of gasoline each in a minute. The plan adopted is held equally safe from a fire standpoint.

The main supply of gas is stored in three underground tanks adjoining the outer support or pillar of the bridge. Each of these tanks has a capacity of 60,000 liters (16,000 gal.). Gasoline is brought to these tanks in the company's own 50,000-liter tank wagons, which are weighed on scales adjoining the bridge support before and after they discharge their contents into the underground reservoir. They can do this while standing on the scales.

From these underground tanks the gasoline is forced by electrically driven centrifugal pumps through a self-cleaning filter. The piping system is so arranged that gasoline can be drawn from any one of the three under-

The company has five of these tank wagons for taking gasoline from the railroad tanks to the garage charging stations

ground tanks and can be pumped from any one of these tanks to any other. After leaving the filter the gasoline passes through a set of meters to the three sets of charging pipes. Each of these consists of two pipes, one of 40 mm. (1½ in.) diameter and one of half that diameter. The larger one is used until the tank on the bus is nearly full, then it is shut off and the pipe of smaller diameter is employed. There is a separate meter on each pipe to give more accurate measurement of the amount taken. With a flow capacity in each set of pipes of 135 liters (35½ gal.) a minute, a capacity of each bus tank of 100 liters (26½ gal.) and three sets of charging pipes it will be seen that buses can be charged easily at the rate of 30 seconds each. When the filling of a bus is completed the charging hose is hauled out of the way. In addition, there is a small tap on the supporting pillar of the bridge for use in drawing gasoline for miscellaneous or emergency purposes.

Thermometers are arranged both in the measuring room and on the bridge, so that if the gasoline reaches a temperature thought dangerous all pumping is automatically stopped and a warning given. At all places where there is a possibility of drip there are gutters to catch the gasoline and carry it to an underground chamber, where it is pumped by hand through a filter and saved.

The standard bus of the Berlin General Omnibus Company has two decks, usually with the upper deck inclosed, four wheels and solid tires. Operating expenses about the first of this year were 33.5 cents per bus-mile. One six-wheel bus has recently been built for trial. The company has five garages.

Kansas City's Track Rehabilitation Program

REHABILITATION of the Kansas City Public Service Company requires about 25 miles of track replacement and several new bridges. This work will necessitate the use of thousands of tons of rock, which the company has decided to mine itself. A shaft was sunk and new equipment has been installed which will produce 500 cu.yd. of rock daily. For transporting and handling materials, two Differential motor cars, five trailers and one derrick have been added.

With 120,600 ft. of single track to be completed within a year, the problem of excavating 374,999 cu.yd. of material was solved through the purchase of an Insley excavator. This machine will do the work of from 25 to 30 men and will effect considerable economy.

Another addition to the equipment is a 21E Rex paver, capable of laying 700 to 800 ft. of single track a day. This machine is equipped with automatic water control, batch meter and timing device.

To work in conjunction with the paver, two Haiss power loaders have been purchased. These machines are used for loading sand and rock. With this equipment six to eight men can handle all materials to the paver. The loaders are equipped with strike-off batch hoppers that insure a more consistent mixture and, hence, a better grade of concrete.

To break out old concrete ahead of the power excavator two large portable air compressors, capable of handling six paving breakers each, have been added to the new equipment. There are 315 miles of track in Kansas City and about one-twelfth of it will be torn up and replaced by modern tracks and new paving. The construction department has been reorganized to carry on this work, at a cost of approximately $1,000,000. Much has been done to minimize the cost of track rehabilitation by the purchase of new modern machinery and equipment.

This trackwork is progressing at the rate of about 1 mile per week. All material purchased outside of Kansas City, such as rails, steel ties and accessories, are stocked ahead of requirements. However, the larger bulk of the material consists of sand, stone and cement.

The company's cement cars go to a mill at Bonner Springs, Kan., and haul the cement direct to the job on which it is to be used. The sand supply is handled in the same way.

The type of track construction selected is considered the most modern yet designed, consisting of International steel ties and 90-lb. rails imbedded in a solid slab of concrete 13½ in. thick. Only two kinds of material are used, steel and concrete. No ballast, wood ties, asphalt, granite or brick paving are used, as in other types of track construction. The type of track now being torn up consisted of wood ties on ballast, or in concrete, 7-in. rail, tie plates, screw spikes and granite paving. The cost of this type per lineal foot of track was about $13, as compared with a cost of approximately $8 a lineal foot of the new track. The difference in cost is due to various factors: First, the present type of construction calls for less excavation and still gives ample depth for the track structure; second, the section of rail adopted, although about the same weight as the old rail, costs much less per ton, being standard section; third, granite paving is very expensive and is not necessary for the present-day rubber-tired vehicles.

Designing Vehicles to

Sell Rides

By J. H. Lucas
General Superintendent of Rolling Stock
The Milwaukee Electric Railway & Light Company

The following article is taken from an address before the Transportation Section of the Wisconsin Utilities Association at its summer meeting, held at Milwaukee on Aug. 18-19. *All of the pictures were furnished by the author in illustration of the points he makes in the course of the address.*

WITH Joliet, Ill., and Springfield, Mass., bringing out cars like buses and the automobile manufacturers producing buses resembling street cars, we can well afford to devote some time to the consideration of current trends and objectives. It is an encouraging sign for all of us to note the activity throughout the country in providing new equipment, new cars and new buses. And operators all make old equipment more comfortable and attractive. The private auto and the bus have brought new ideas into the transportation field and our car and bus equipment must keep pace or preferably do better.

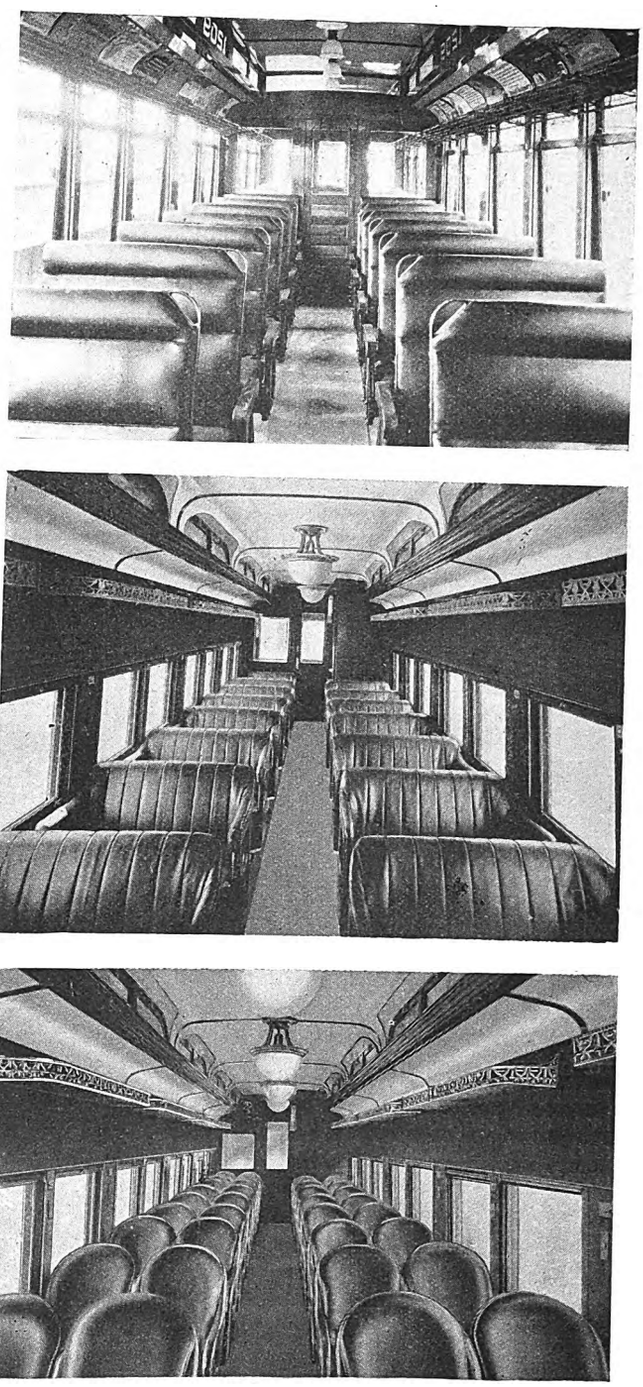
The motor bus builders are good advertisers. Glance at one manufacturer's prospectus and see if it offers anything of value. "The ruggedly built body of the P.D.Q. bus will give years of service. The side panels are padded to prevent road noises and windows which slide in grooves of felt are non-rattling. This car is designed to provide superlative comfort. Deep lounging seats, wide aisles, unobstructed vision, adequate ventilation and quiet operation insure utmost comfort." "Abundant power and speed." "Special heavy duty rear axle and with special springs and balloon tires. This parlor car rides with rail-like smoothness." Note that!

They go on to say that "equipment is complete and includes front and rear bumpers, etc.—and on the dash, grouped under glass, artistically arranged and indirectly lighted, are the instruments—speedometer, ammeter, oil gage, gas gage, thermometer, eight-day clock, etc." "The long low lines of the body blend gracefully into the cowl and hood, and at the rear an ornamental grille work and awning accentuate the luxurious impression."

There's a whole barrelfull of ideas. As a matter of fact, the co-ordination of car and bus design has already made great progress. We have adopted bus ideas to rail car use, and while we can take more, the reverse is also true, i.e., bus designers have used and can use more rail experience and principles to advantage. Speed, comfort and attractiveness are stressed as of major importance in modern transportation vehicles.

In this day speed is primarily important, and we are finding that our electric railway has some advantages. For example, consider our own interurban lines running out of Milwaukee. When paralleling concrete roads were laid a few years ago, the competitive buses were able to take their small load through traffic and into the country more quickly than the rail cars. By a change in route we were able to get onto our own right-of-way in ten minutes, eliminating a long drag through city streets. With motors geared up to 65 to 70 m.p.h., private autos and buses cannot equal our time and we are getting a healthy increase in the interurban business. This particular instance depended for success on other matters beside improved car design, and is a good example of the absolute necessity of doing everything to increase speed.

In city service, likewise, speed must be the first consideration of car and bus design. High acceleration rates are essential, and where $1\frac{1}{2}$ to $1\frac{3}{4}$ m.p.h. per second used

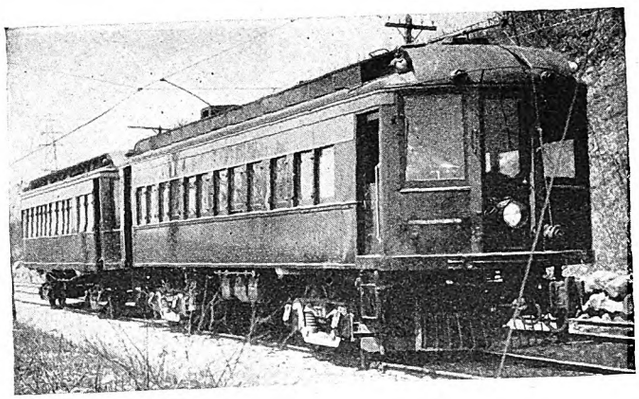


Development of Interurban Car Seats and Interior Finish

At top, high back seats, 1922; center, sedan-type seats, improved lighting and finish, 1924; below, individual de luxe seats, 1926.

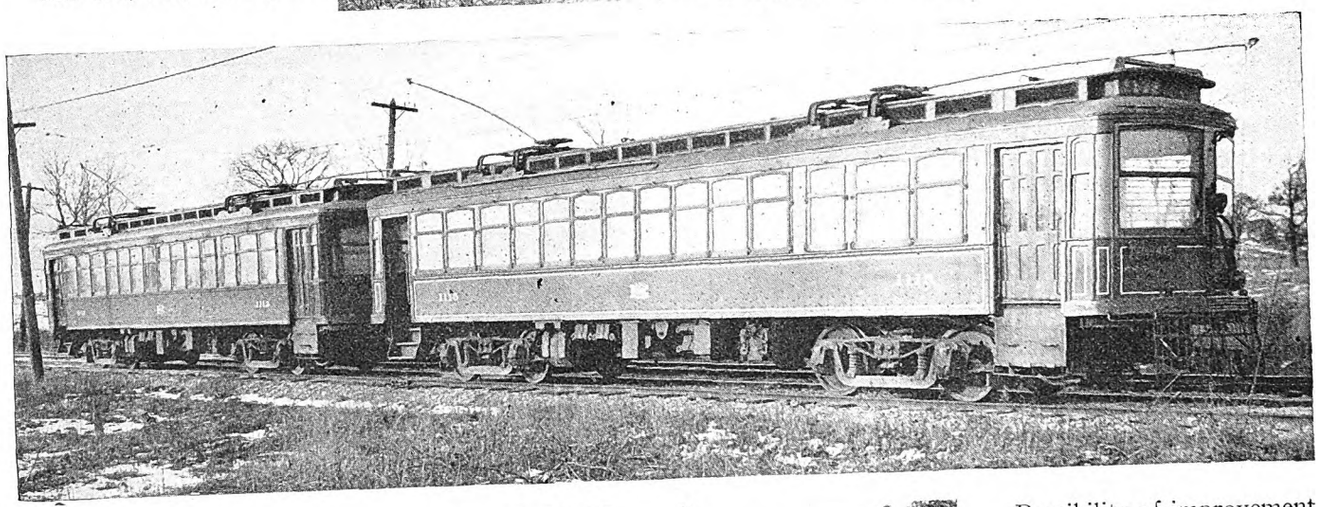
Digitized by Google

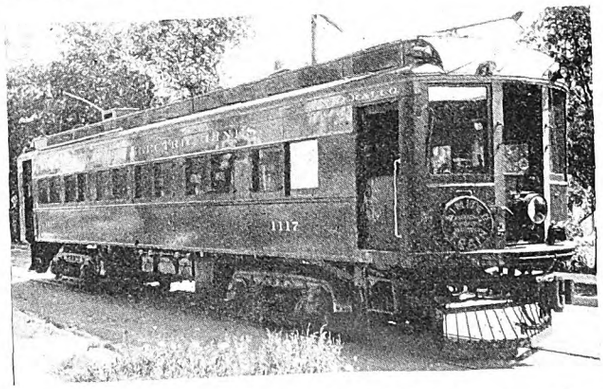
to be considered good, 3 m.p.h. per second is now thought desirable. This necessitates larger motor capacity or higher-speed motors with steeper gear ratios. The possibility of using 6 or 7 to 1 worm gears is one of the things that make the automotive type axle a possibility for car use.



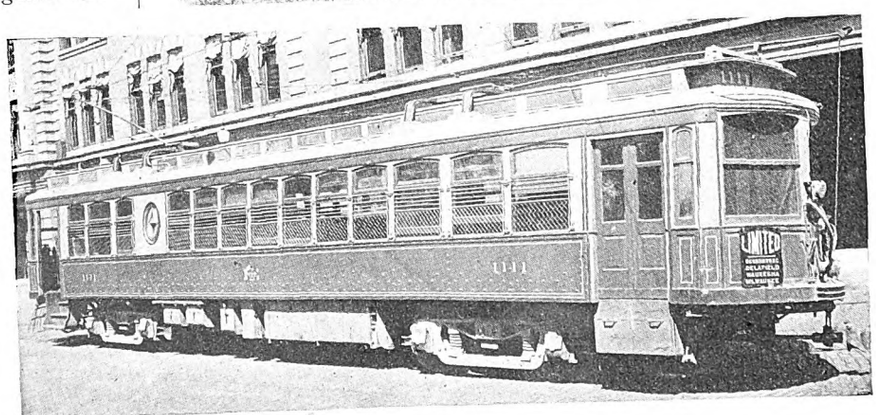
The bus, too, must provide more power for pep and speed. The original four-cylinder engines furnished with the first buses we bought are too small today. In fact, it is pretty generally realized that the six-cylinder bus costs no more to operate and gives better speed and comfort. Gas consumption with the six is practically the same as with the four in equal service, as gears are shifted less frequently. Less gear shifting speeds schedules considerably in city operation, and the greater proportion of time operating in high gear provides more comfort for passengers. The latest product of the bus builders' art employs two motors per car to provide ample power for speed, thus copying electric car practice and further emphasizinng the co-ordination in design.

As a further aid to speed, we must consider the use of anti-friction bearings. Many of us tested anti-friction bearings under cars years ago, and past experience somewhat prejudiced our opinion. Roller bearings today are so much improved that they again merit consideration for the possibility of better acceleration, if for no other reason.





Possibility of improvement in braking also must be given thought. With higher speeds for all vehicles we must specify the best possible brakes for safety. Various types of power brakes are being tried out on buses. Whether the automotive type of braking apparatus that is being tested under street cars is going to be an improvement over our old standard of cast-iron shoes bearing directly on the wheels remains to be seen. It is significant to note that metal to metal brakes are being used to some extent on the buses.



Improving Body Lines of Interurban Cars

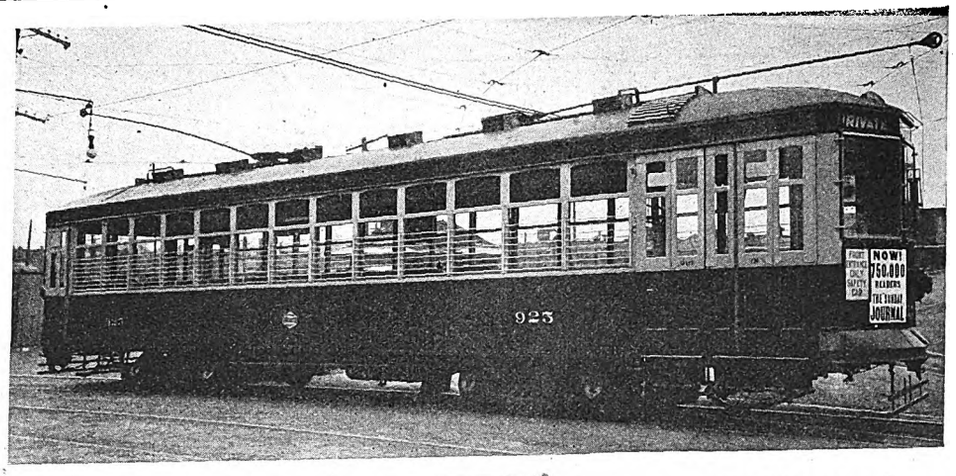
A single car of the old type is shown at the right. Immediately above is a similar car after rebuilding.

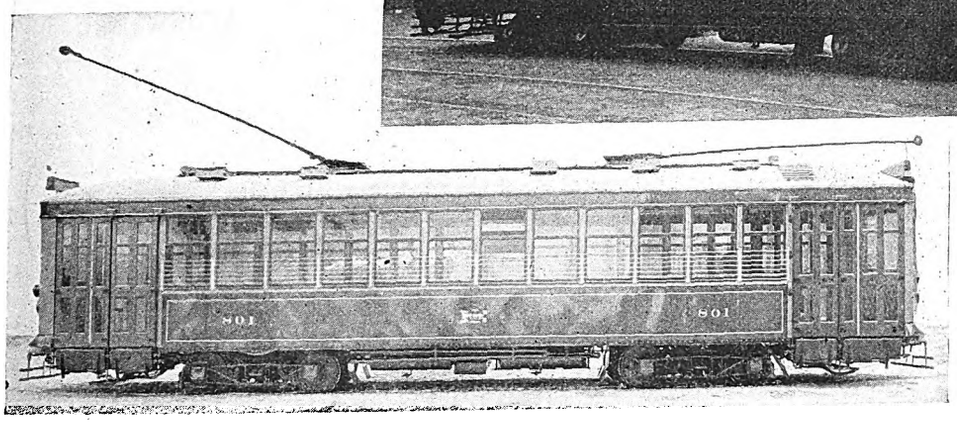
The views at the top show two-car trains of the old and new types, indicating how improved lines have been obtained.

When we consider comfort, we find that the bus and automobile have assisted in one of the outstanding improvements of recent cars, the change in seats. For years our best offering in a car seat used fairly stiff

Digitized by Google

springs and a reversible back, which was straight across and not at all form-fitting. The sedan bus brought the automobile seat and the so-called parlor bus the soft upholstered individual chair, which have proved a most popular addition to our interurban equipment. Nine out





Above—Streamline effect obtained through two-color paint scheme. At left—Old-style single color system of painting on the same series of cars

of ten passengers, asked concerning their impression of our interurban improvements, mention "those seats," so it is easy to know where to stand on the seating question.

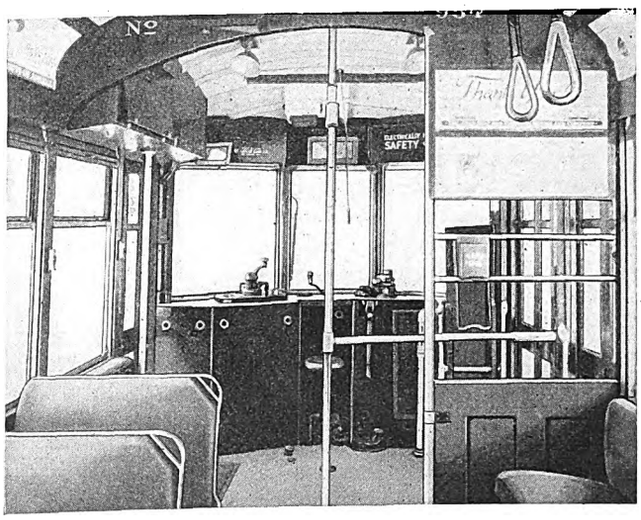
It is out of the question and unnecessary to consider the use of this type of seats in city cars and buses, but for this short ride service the use of fabric or other upholstery than the old standard rattan has made some favorable impression. This may be a passing fad and really has more to do with appearance than comfort.

Other features contributing to comfort are light, heat and ventilation, the elimination of noise and improved riding qualities. The bus does not offer as much with respect to the first three as the rail car does and the relative advantage of noise and ease of carriage is open to question. Lighting is one of the cheapest items. We can well afford to have cars and buses well lighted, so that passengers can read in comfort and cars will appear attractive. Bus fixtures particularly need improvement. All parts of electrical apparatus on a bus are too small and flimsy and bus makers can co-ordinate to considerable advantage by using standard car wiring connections, etc., which admittedly would be oversize, but which would nevertheless give less trouble and failures in service.

Bus heating systems also must be improved if we are to maintain equal warmth for comfort in a bus as we have in cars. Steam and hot water heat for buses are experimental. We have in Milwaukee the first double-deck bus in the world to have heat in the upper story. This is steam heat. One advantage of steam is that you can use ¼-in. copper tubing for body radiator connections and eliminate the large sized exhaust pipes from the floor and inside of the bus. Steam also minimizes the fire hazard.

Ventilation of buses can be improved by following interurban car practice and providing for positive inlet of fresh air. A great deal of complaint of car sickness and nausea can be avoided by proper ventilation in both car and bus.

Quietness and ease of riding are two qualities contributing to comfort that to a certain extent go hand in hand. For a time it was suggested that the automotive

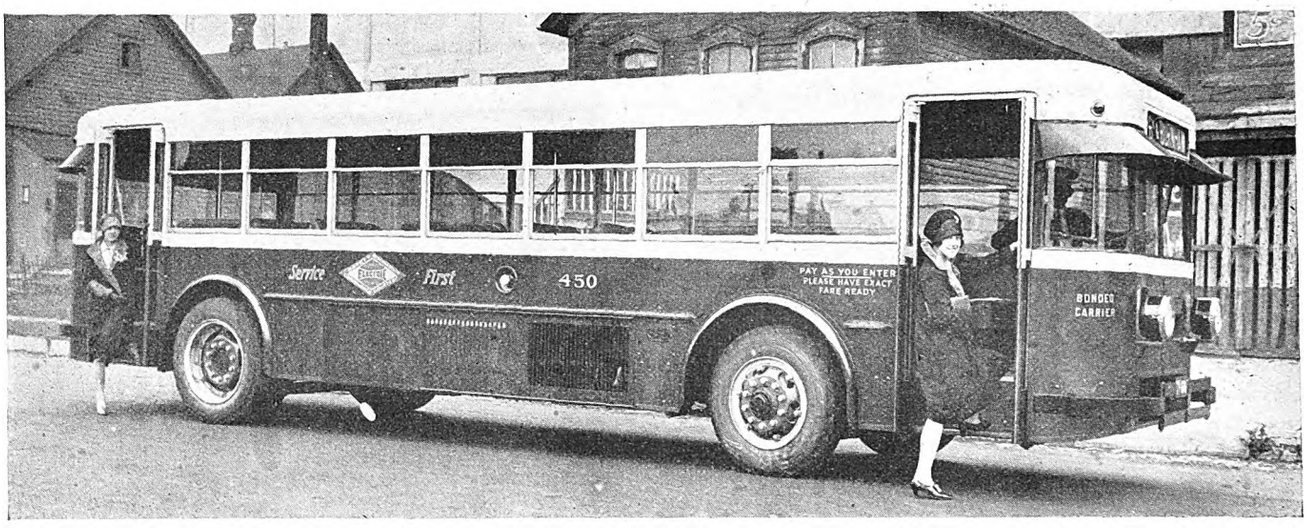


An inclosed cabinet conceals controller and piping, making for a clean platform

vehicle had an inherent advantage because it rode on rubber tires, and we heard a lot of talk concerning the "rubber urge." Now, as in the advertisement quoted earlier, the bus is stressing operation "with rail-like smoothness." Noise is a sign of wasted energy and poor design. Rubber is an excellent absorber of sound, and if we cannot use it in our wheels we at least should employ it to deaden metal-to-metal contacts where annoying noise is produced. Rubber-cushioned wheels have not been successful because the space in which rubber can be inserted in a car wheel is too limited. If we ever come to a cushion wheel for rail cars it will be something other than rubber, possibly the old pressed-paper center wheel such as was used under Pullman cars years ago.

The bus, however, features rubber spring shackles and engine mountings. This points out some advantageous applications on cars. Rubber pads under center bearings have been used and the report on noise research presented before this convention last year indicated that this installation has accomplished something. Rubber washers at drawbar anchorages and rubber hose around

Digitized by Google



A modern bus that has been designed with street car appearance

brake rod supports quiet little knocks that are noticed and complained of by the passenger. Other sound-absorbing materials are available for eliminating noise, squeaks and rattles from bus and car and all such deserve consideration.

Reduction of noise is presumed to be an important feature of the automotive type axle with its worm gear as used under the Joliet and Springfield cars. We may not fancy this particular type of axle with its differential, but we cannot ignore the possibilities of the worm gear on this one count alone. We can get other types of worm gears to go on our standard axle, and from such experience as we have had in our buses, i.e., quiet operation and low maintenance, I would be inclined to try some if the cost were anywhere within reason.

Good roadway and track maintenance affects riding results and noise to a degree that is of equal importance to all that we can do in vehicle design. Up-to-date car trucks with ample wheelbase and proper spring proportions will please our passengers more than the older models can with the same track conditions, but any car rides poorly on rough track just as any bus or automobile does on a rough road. With increased speed, both tracks and trucks must be given more attention.

In a resolution adopted at the December meeting, the equipment committee of the A.E.R.E.A. recognized the need of more attractive rolling stock. This problem concerns not only the design and evolution of new rolling stock, but also includes the changing of existing cars and buses to modernize them and to increase the passenger sales value of the equipment. Competition cannot be met with cars that are the same today as twenty years ago. While all of the old cars cannot be scrapped, they can at least have a change in color of paint and it is surprising how much attention and favorable comment such a relatively small expenditure will bring.

The automotive people have learned to accentuate "streamline effects" with paint. We can undoubtedly use this thought in repainting cars as well as in new construction. Contrasting colors on upper and lower body panels with the judicious use of striping unquestionably adds to the appearance of any car and is much more pleasing than one solid color. I would not suggest consulting an artist when you pick a color scheme for rolling stock. Bright, attractive combinations of the reds, yellows and greens with cream or ivory are very effective on a public conveyance, although they may jar the sensibilities of one who has been educated to values of the more refined tints and subdued shades. The bus builders have led in the adoption of lacquer finishes, and there is no doubt that this material has splendid wearing qualities on metal surfaces. Lacquer for wood may be developed, but there seem to be more possibilities in the adoption of metal covering for all exterior parts so that we can use the present materials. Metal doors and sash are being produced with this in view.

In the Springfield cars the body builders imitated bus design in the windshield effect of the motorman's window. Whether we need to go this far in co-ordinating design is again a question. Personally, I do not think that the automobile or bus with its engine hood sticking out in front is much better looking than our standard car. The "Twin Coach" adopts street car appearance and conceals its motors under the body to produce a fairly good looking job.

On the inside of the car, however, we can take a tip from the bus and arrange our control equipment more neatly. On older cars we have a mess of pipes, valves, a homely controller, door-operating shaft, fare box stands, etc., that collect dust and dirt, old newspapers and transfer punchings; overhead a miscellaneous array of switches and wires. On new equipment, it costs little more to specify simple cabinet inclosures for this equipment, which contribute substantially to good appearance and are easy to keep clean. If old cars are being converted for one-man operation, a little thought and money spent on this feature will be well worth while.

Soldiers Transported on Buses of Boston "El"

BUSES of the Boston Elevated Railway carried nearly 1,500 men to Camp Devens for their summer encampment on July 9. Fifty-nine buses, each containing approximately 25 men, with their equipment, were mobilized in four groups for this purpose.

Two state constabulary officers on motorcycles went with each group, one leading and setting the pace at about 20 miles per hour, the other guarding the rear from interference. The "L" furnished nearly one-half of all the buses engaged in this troop movement, the total involved being about 125.

Methods of Improving Quality of Rails

WILKINSBURG, PA., Aug. 23, 1927.

To the Editor:

Efforts to secure a quality of rail that will have longer life have been made principally in two directions. One has been the use of increasingly harder steels; i.e., of higher carbon content, ranging up to about 1 per cent. The result, however, has been disappointing. While a steel of such high carbon content is much harder than mild or semi-mild steel, it is also much more brittle and considerably greater care as to quality becomes necessary. The use of alloy steels has not as yet met with any degree of success. If they are used simply in the "as rolled" condition nickel or nickel-chromium steels offer little advantage over straight carbon steels. Manganese steel shows exceptional resistance to wear and proves successful in rail junctions and crossings, but it is too costly for use as ordinary rails.

The second line of effort for the improvement of rails has been an attempt to secure perfectly sound and homogeneous steel free from blowholes, non-metallic material and segregation. For trial purposes special rails have been ordered to stringent specifications in regard to homogeneity. The production of steel to meet such requirements, however, entails so wide a departure from ordinary rail production practice that the cost becomes excessive. The desirability of "sound steel" for rails from the point of view of safety cannot be denied, and it is a problem to be faced by the steel maker how to produce a better quality of steel, more suited to modern requirements of speeds and loads, without an excessive increase in cost.

Meanwhile, a third method of improving rail quality is receiving increasing attention, viz., the application of heat treatment. This is by no means a novel idea, as it was suggested and tried many years ago. The great advantage to be gained by the use of heat treatment is that it is possible to combine considerable surface hardness with great toughness and considerable ductility in the body of the rail and to use a steel of medium carbon content. There is, however, a serious consideration which may, perhaps, account for the limited employment of the heat-treated rail. No amount of heat treatment can get rid of the defects and dangers associated with unsound steel; in fact, it is more than doubtful whether it is wise to apply such treatment to steel which is segregated, contaminated with non-metallic inclusions or interspersed with blowholes. Indeed, since internal defects are likely to cause cracking during quenching operation, the heat treatment of steel of relatively low grade may do more harm than good.

The application of heat treatment to rail steel has again been taken up in France at the Neuve-Maisons works of the Compagnie des Forges de Chatillon. Like previous heat-treatment processes applied to rails, the aim is to harden and temper the steel of the head only, by a partial quenching, which leaves the heat from the rest of the rail, flowing into the head after quenching, to effect the right degree of tempering. The novel feature of the method employed at the French works is the way the quenching of the head is carried out. For this purpose the hot rail is pushed into a long frame, in which it is held head down over the long quenching bath. The quenching process consists in making the quenching water come into contact with the rail head for a brief period several times in succession. In order to regulate the severity of the quenching effect a limited amount of water is used, so that the quenching water rapidly comes to the boil. Boiling water has very little quenching effect, and by this means an almost automatic compensation is brought about for differences in the temperatures of successive rails as they are brought to treatment. The hotter rail raises the quenching water to the boiling point more rapidly and thus compensates for what would otherwise be a more severe quenching effect.

There can be no doubt that carefully controlled heat treatment of this kind must produce markedly beneficial results on rails made of medium hard steel of good quality. Hardness and abrasion tests carried out at the French works speak strongly in favor of the heat-treated material, as is to be expected. Whether or not the treatment will justify itself in practice remains to be seen. As suggested above, it must depend to a very large extent upon the general quality of the steel to which the process is applied. Although good steel can be markedly improved by the right heat treatment, the best of heat treatment cannot cure an unsound steel.

JAMES SILBERSTEIN,
Metallurgical Engineer.

Push the Button and Learn the Shortest Route

Intending passengers on London tramways can learn by pushing a button the route to take to any desired point

DEVICES known as "pathfinders" have been installed by the London County Council Tramways at two or three important traffic points on its system. The device consists of a large map of the L. C. C. tramway lines, supported vertically in a frame with a row of some 40 push buttons on each side. Opposite each push button is the name of an important traffic point on the system, with the number of the car route which a passenger must take from the location of the "pathfinder" to reach that point.

If any intending passenger wishes to know the direction and streets covered by that route, he has only to push the button opposite his desired destination. This lights a row of miniature electric lights behind the map, showing the route to be followed.

The accompanying illustration shows one of these "pathfinders" of the L. C. C. tramways at its Westminster Bridge waiting station. An intending passenger is shown in the act of pushing a button.

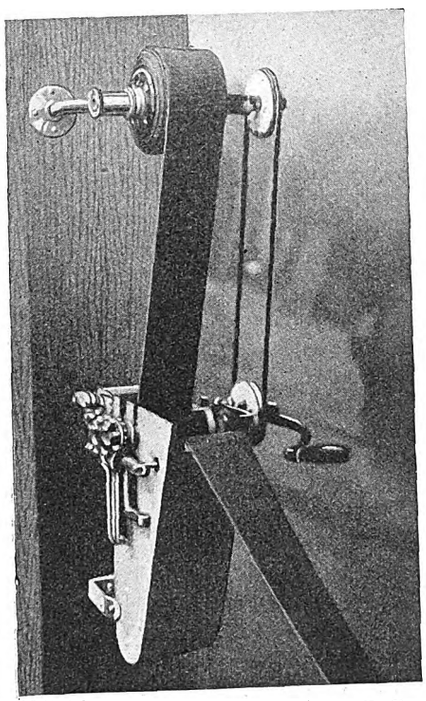
Maintenance Methods and Devices

Canvas Hose Run Through Vat and Wringer

INSULATING compound is applied to the canvas hose used in covering conductor cables on cars of the Dallas Railway & Terminal Company, Dallas, Tex., by a home-made vat, clothes wringer and winding reel. This small but important piece of apparatus is mounted on one of the roof-supporting posts of the shop. Its use enables the coating of 100-ft. lengths of the 2-in. diameter canvas hose in a little less than ten minutes. It replaces the former process of painting with the canvas stretched out on the floor. The vat is "V"-shaped, of sufficient width to accommodate the hose. A sheave at the bottom of the tank guides the hose through the insulating compound, while an abbreviated clothes wringer at the top serves not only to pull the hose through the tank but also to squeeze out excess compound and thoroughly to impregnate the fabric. A reel mounted above the vat is driven positively by a spring belt and pulley operated from the crankshaft of the wringer. In operation, the hose is laid out on the floor in line with the apparatus. It is fed through the lower sheave and up through the wringer rollers. The vat is filled with the insulating compound and the end of the hose is then carried up and attached to the winding reel. It is only necessary then for the operator to turn the crank of the wringer and the entire length of hose is treated without further attention.



Apparatus used in the shop of the Dallas Railway & Terminal Company for treating canvas hose used in protecting cables mounted in cars. It consists of an abbreviated clothes wringer, reel and vat. Ten minutes are required to treat a 100-ft. length

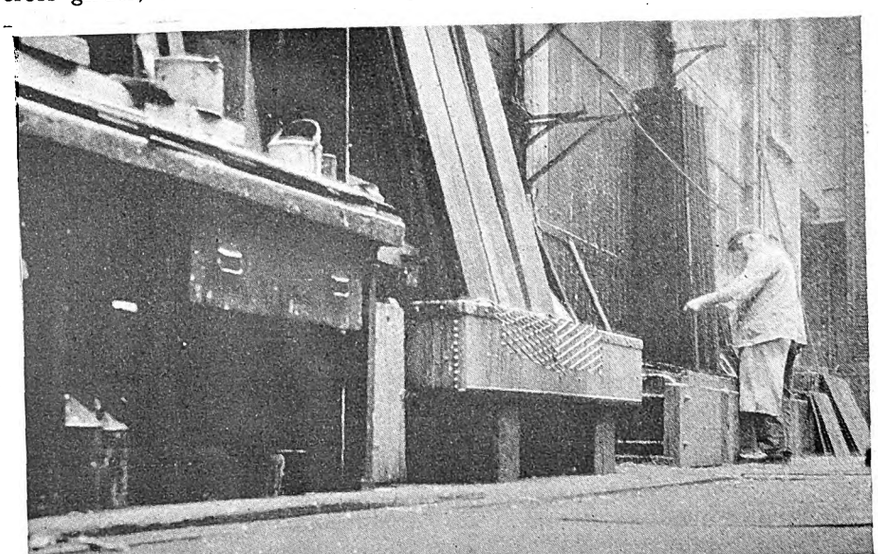
Spray and Dip Painting in London

SPRAY and dip painting are used extensively by the electric railway and bus companies in London, England. In the shops of the London County Council Tramways several rooms, one of which is illustrated, have been partitioned off for spray painting with good facilities for exhausting the waste paint vapors. Temporary partitions are used at present, but later it is expected that permanent rooms for spray painting will be provided.

The room is lighted by two rows of lamps on each side. Each wall has sockets for holding the brackets of the painters' scaffolding. In the view published a row of such brackets are shown above the first cross girder, so that the scaffolding can be used for painting the upper deck of the car. Steam heat is used to assist the drying process and the room is well ventilated from above as well as by exhaust pipes which extend down the walls on each side. Cars are both painted and varnished by the spray process in this room, which is long enough to hold several cars. It is the company's practice once a year to give each car a coat of color and one of varnish. The old paint is rubbed down but not burned off.

The system has several small chambers, 4 ft. high and 4 ft. to 6 ft. wide for spray painting small parts. They look somewhat like dry goods boxes with the front end open. The rear of each of these boxes is fitted

Spray painting of cars on the London County Council system is done in individual chambers provided with steam heating and exhaust systems



Car parts in London suitable for one color jobs are dipped into paint tanks. Varnish is also applied in the same way

Digitized by Google

with an exhaust pipe for removing the unused spray.

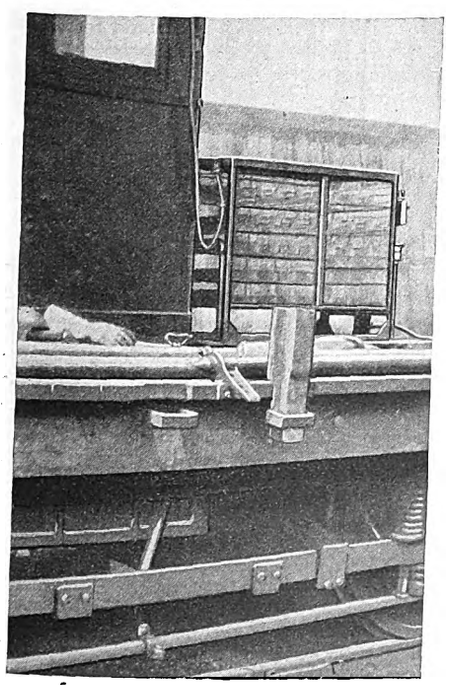
All car parts which can be finished in one color are dip painted rather than sprayed. This applied to parts like life guards, floor mats, long lining boards and gear cases, which, on the London County Council Tramways, are of wood. Some of the dip tanks used for this purpose are 20 ft. or more in length to accommodate the longer pieces. Those parts which need a coat of varnish later are dipped in similar varnish tanks after their paint has dried. A view of one of the dipping rooms is given in the second illustration.

Many a car's downfall is the result of a poor overhaul.

Convenient Method of Carrying Welding Equipment

By M. Spitz
Gary & Southern Traction Company, Crown Point, Ind.

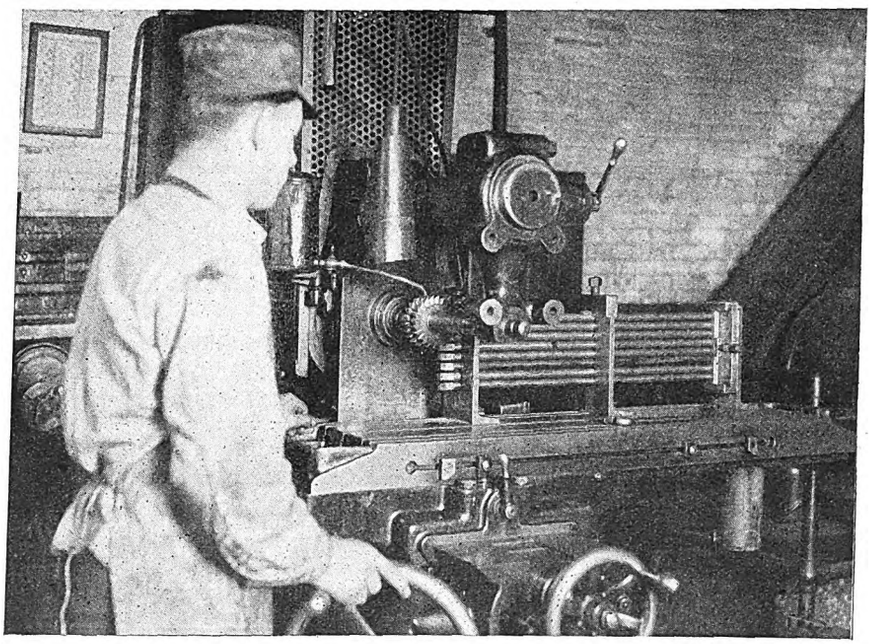
EQUIPMENT for bond welding is carried on a motor car by the Gary & Southern Traction Company, Crown Point, Ind. The welder is connected to the trolley base of the



Method of carrying and connecting welding equipment on a car of the Gary & Southern Traction Company

car, so a separate pole is not needed to connect the welder to the trolley wire. This speeds up the work so that in eight hours 224 bonds were welded to the rail. A total of 2,200 Una bonds have been welded in this manner in a short interval.

Fixture for Milling Square Ends on Rods



Convenient fixture for milling the square ends on elevated gate bars

GATE bars for the elevated cars of the Brooklyn - Manhattan Transit Corporation, Brooklyn, N. Y., are square at both ends. The faces of the square portion must be in the same plane for the two ends of the bar. In order to provide for accurate work in making these bars and also to provide for milling a quantity of them at one time a fixture shown in the accompanying illustration is used.

The fixture consists of three uprights which are fastened to the table of the milling machine and which provide for clamping eight bars. When the squares at one end are milled, these fit into a plate with square holes at the opposite end of the fixture so as to hold the surfaces in alignment while the other ends of the bars are milled. Accurate alignment of the faces results.

Monthly Contest Still Open

EYES of all contestants in Electric Railway Journal's Maintenance Competition are now turned toward the Convention Issue, which will be published on Sept. 17 and will contain an announcement of the winners of the Capital Prizes and the August monthly winner. The winning articles will be published also. The material received has been of such a valuable nature that it has been decided to add a fourth capital prize to the other three for the maintenance article that receives honorable mention by the judges. The list of capital prizes now is: first, $200; second, $100, third, $50, and honorable mention, $25.

Contest Still Running

Competition for the monthly prizes of $25 each still continues and many additional articles are being received. Each of the articles received up to April 30, 1928, will have a chance of winning one of the monthly prizes and, in addition, $5 will be paid for each item published whether it receives a prize or not.

Contest Conditions

1. Any employee of an electric railway or bus subsidiary may compete.
2. The author does not need to be the originator of the idea.
3. Articles may be submitted by several persons or by a department.
4. Any maintenance practice or device for electric railway or bus repairs may be the subject.
5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.
6. Manuscripts should be mailed to the editor of Electric Railway Journal, Tenth Avenue at 36th Street, New York, N.Y. To be eligible for the monthly prizes manuscripts will be received until April 30, 1928.
7. Illustration material may be in the form of drawings, sketches, blueprints or photographs. All sheets should be marked "Maintenance Competition."
8. Details of the conditions not given will be found in Electric Railway Journal for April 16, pages 700-701.

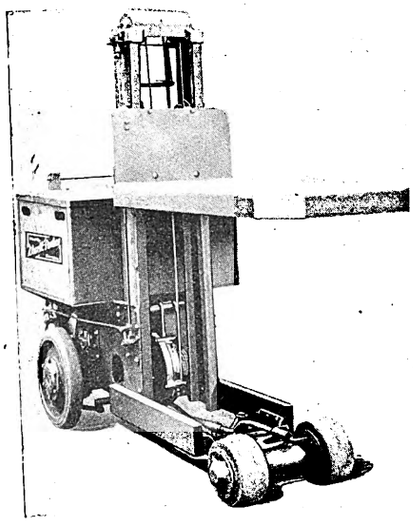
New Equipment Available

Light-Duty Elevating Platform Truck

HANDLING of skid loads or delivering and receiving goods to motor trucks or electric cars is the purpose of a new light-duty electric tiering truck added to the line being marketed by the Elwell-Parker Electric Company, Cleveland, Ohio. It will elevate a load from the floor to a maximum height of 8 ft.

The truck is of all-steel construction and is built on the interchangeable parts basis. The power plant is



New type elevating platform electric truck

of unit type, which includes an Elwell-Parker motor, steel brake drum, steel multi-thread Brown & Sharpe worm, chrome-vanadium drive shafts and universal joints to permit steering and the delivery of power to the steel clutch plates bolted to the outside of the drive wheels. Solid rubber tires are provided.

The operator's pedals, one for brake and the other for controller reverse drum, trip to off position when the pedal is raised and are provided with a heel rest with a non-slip surface. The pedals are spring folded when the operator leaves the truck. The braking and power are actuated separately to provide for incline operation.

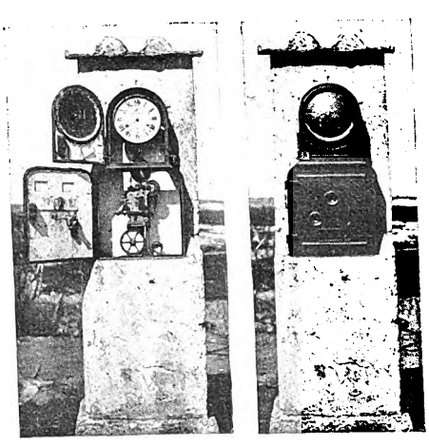
The platform is a solid plate of steel with edges bent to form a deep skirt and with heavy angles welded down the middle for attachment to steel support arms. Each arm carries two long rollers which bear on heavy section channel uprights fitted with a track.

The main frame is built of angles, channels and heavy gusset plates. The battery compartment, with removable sides, will accommodate practically any size battery the service may require, and still the truck is narrow enough and short enough to turn in narrow aisles. The steering mechanism is of the ball-and-socket type. This machine is a high-speed tool and is built with various height lifts and several sizes of platforms.

Rome Headway Recorder

TWELVE headway recorders of the type shown in the accompanying illustrations are in use on the Rome Municipal Tramways. They were designed by Romolo Remotti, superintendent of transportation of the system. One of these recorders was put in service about two years ago and proved so satisfactory that eleven others have been installed during the past twelve months. They are operated by the motorman or conductor.

When a car reaches a recorder, the operator stops, inserts a key, turns it first in one keyhole and then in another, then returns to the car. This takes less than twenty seconds and leaves a record of the time and of the key number. So as not to delay the service, the recorders are placed at points where a stop of at least twenty seconds would be made in any event, as at a terminus or at a near-by street intersection. They are not used in the center of the city, but it is believed as good results are secured as if recorders were also in the busy sections. Even when at or near a terminal, registrations are made on both the inbound and outbound trips.



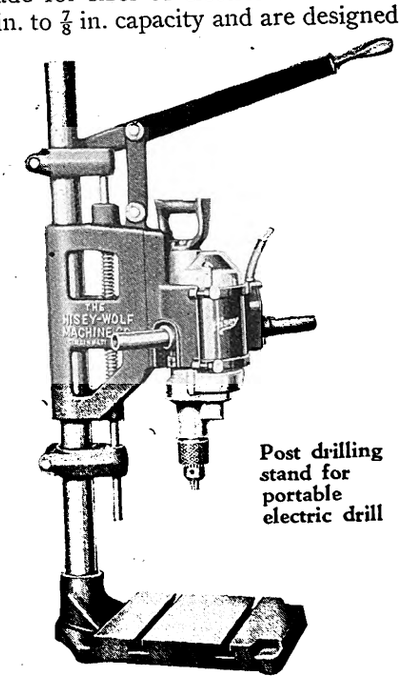
This headway recorder is used in Rome; at left, open; at right, closed

The purpose of the two keyholes mentioned is to prevent dust and other foreign bodies from getting into the working part of the recorder.

When the registrations from this recorder are tabulated or plotted they clearly indicate any irregularities in the running time.

Stands for Electric Drills

FOR post, wall or bench mounting a line of new stands for Hisey electric drills has been designed by the Hisey-Wolf Machine Company, Cincinnati, Ohio. These stands are made for sizes of electric drills from $\frac{1}{4}$ in. to $\frac{7}{8}$ in. capacity and are designed



Post drilling stand for portable electric drill

so that the portable drills can be attached without removing parts of the machine. The supporting bracket and electric drill housing are machined accurately on each end to insure perfect alignment of the drill in the stand.

Improved Aluminum Arrester

VOLTAGE per cell has been reduced, thus affording longer life, in an improved lightning arrester introduced by the General Electric Company for direct-current railway service. The new type of cells, with balancing resistances direct connected, can be substituted easily in the boxes in place of units now in service. Although these improved arresters have just been put on the market, they have been tested thoroughly on railway properties operating in localities where lightning conditions are unusually severe.

American Association News

Convention Program Shows Many Changes from Last Year

Round table luncheon conferences for executives, group meetings for the engineers, and additional time for inspection of exhibits, among the features

MANY changes have been made in the arrangements for the 46th annual convention of the American Electric Railway Association, to be held in Cleveland, Ohio, from Oct. 1 to Oct. 7. The program, just released by the association, shows that much thought has been put on the problem of getting the greatest value out of the time at the disposal of the delegates.

The exhibits will open at noon of Saturday, Oct. 1. As in previous years meetings of the American Association will be held in the mornings and those of the affiliated associations in the afternoons on Monday, Tuesday and Thursday, Oct. 3, 4 and 6. Wednesday will be set aside for inspection of the exhibits, as has been the practice for the past two years. A new feature this year will be the conference luncheons on specific topics, which have been referred to in previous issues of this paper.

Meetings of the American Association and those of the Transportation & Traffic Association will be held in the Auditorium Annex. This is the same room in which these associations held their meetings last year. The Tuesday evening meeting under the auspices of the Advisory Council will be held in the main ball room on the Arena floor of the Auditorium. Meetings of the Engineering Association, the Accountants' Association and the Claims Association will be held in newly arranged rooms in the lower floor of the Auditorium building. The Tuesday sessions of the Engineering Association will be held in four groups, the principal subjects being Way and Structures, Rolling Stock, Purchases and Stores, and Power. There will be a joint meeting of the Claims Association and the Transportation & Traffic Association on Tuesday afternoon. The round table luncheon conferences will be held in private dining rooms of the local hotels, those on Tuesday being at the Hotel Hollenden and those on Wednesday at the Hotel Cleveland. The larger conference scheduled for Thursday will be held at the Hotel Statler.

The complete program, revised to Sept. 2, follows:

AMERICAN ASSOCIATION

Monday Morning, Oct. 3

WELCOME—W. R. Hopkins, City Manager, City of Cleveland.

PRESIDENT'S ADDRESS.

COMMITTEE REPORTS.

ADDRESS—Dr. A. H. Wishart, pastor First Baptist Church, Grand Rapids, Mich.; a talk on what the public expects and how the railways can please.

ADDRESS—Dr. Miller McClintock, head of The Albert Russell Erkine Bureau for Street Traffic Research, Harvard University; a talk on street traffic control and electric railway operation.

Tuesday Morning, Oct. 4

REPORT OF COMMITTEE ON NOMINATIONS—J. N. Shannahan, chairman.

ELECTION OF OFFICERS.

ADDRESS—M. H. Aylesworth, president National Broadcasting Company, New York; a talk on leadership in the utility field.

ADDRESS—George E. Frazer, Frazer & Torbet, certified public accountants, Chicago; a talk on financial structure.

ADDRESS—Merle Thorpe, editor *The Nation's Business*, Washington, D. C.; a discussion of the manifold contacts of the federal government with business.

ADDRESS—Hon. Wm. W. Potter, attorney general of the state of Michigan; some observations on commission regulation.

REPORT OF COMMITTEE ON CONSTITUTION AND BY-LAWS—C. D. Emmons, chairman.

Round Table Luncheon Conferences, Hotel Hollenden, 1 to 2.30 P.M.

No. 1. Traffic Regulation—H. B. Flowers, sponsor.

No. 2. Taxes—Leslie Vickers, sponsor.

No. 3. The Motor Bus—L. H. Palmer, sponsor.

No. 4. The Trend in Franchises—L. R. Nash, sponsor.

No. 5. Developing Sales Instinct in Platform Employees—G. H. Clifford, sponsor.

No. 6. Advertising—to Increase Riding; to Improve Public Relations.

Tuesday Evening, Oct. 4

ADVISORY COUNCIL NIGHT—B. C. Cobb, chairman of Advisory Council, presiding.

CLEVELAND MALE CHORUS.

ADDRESS—B. C. Cobb, New York.

SOLO—Miss Anna Case of the Metropolitan Opera Company.

ADDRESS—Hon. George B. Cortelyou, president Consolidated Gas Company, New York, and chairman Joint Committee of National Utility Associations.

SOLO—Miss Anna Case.

PRESENTATION OF CHARLES A. COFFIN FOUNDATION AWARD.

SOLO—Miss Anna Case.

DANCING UNTIL 1 A.M.

Wednesday, Oct. 5

EXHIBIT INSPECTION DAY. There will be no formal sessions.

Round Table Luncheon Conferences, Hotel Cleveland, 1 to 2.30 P.M.

No. 7. Cars—What Is Being Done and Results—L. J. DeLamarter, sponsor.

No. 8. The Problem of Financing.

No. 9. Public Relations—T. Fitzgerald, sponsor.

No. 10. Bringing City Service Up to Date.

No. 11. The Valuation Question—Walter A. Draper, sponsor.

No. 12. Trend of Fares—F. W. Doolittle, sponsor.

No. 13. Employee Relations—Britton I. Budd, sponsor.

Thursday Morning, Oct. 6

ADDRESS—E. F. Wickwire, chairman committee on co-operation of manufacturers.

SYMPOSIUM—"How the Industry is Progressing." Five-minute talks by operating executives relating the feature accomplishments of the year on properties in different parts of the country. Questions which will be asked and answered are as follows:

Does aggressive property-wide rehabilitation pay?

How are you arranging service and publicity to secure an additional passenger per car mile?

How have you reduced pull-ins to one in 600,000 miles and how have you reduced equipment maintenance costs to 2 cents per car mile?

How have you reduced overhead line breaks to one in 58 days?

What are the facts about your ability to operate at same cost per mile as prior to the war?

Digitized by Google

How have you inspired platform men with greater interest in their jobs?

With very low population per mile of track, how have you made your system pay?

How have you sold the public on the railway?

How have you robbed the junk man of your interurban and made it a profitable property?

How are you meeting the transportation needs of your community?

How have you made a 300 per cent increase in revenue?

How did you change an unprofitable bus operation to a highly profitable one?

What has been your experience with de luxe service in a large city?

ADDRESS—Francis H. Sisson, vice-president Guaranty Trust Company, New York; a discussion of factors that affect the market for electric railway securities.

ACCOUNTANTS' ASSOCIATION

Monday Afternoon, Oct. 3

ADDRESS OF PRESIDENT.

REPORT OF EXECUTIVE COMMITTEE.

REPORT OF SECRETARY-TREASURER.

APPOINTMENT OF COMMITTEE ON NOMINATIONS.

REPORT OF COMMITTEE REPRESENTING THE ACCOUNTANTS' ASSOCIATION AT THE ANNUAL CONVENTION OF THE NATIONAL ASSOCIATION OF RAILROAD AND UTILITIES COMMISSIONERS—W. L. Davis, auditor Lehigh Valley Transit Company, Allentown, Pa., chairman.

Discussion.

REPORT OF COMMITTEE ON BUS ACCOUNTING—M. W. Glover, general auditor West Penn Railways, Pittsburgh, Pa., chairman.

Discussion.

REPORT OF THE COMMITTEE ON STANDARD CLASSIFICATION OF ACCOUNTS—M. W. Glover, general auditor West Penn Railways, Pittsburgh, Pa., chairman.

Discussion.

PAPER—"Public Service Regulation—Effect on Accounting Practice"—Harry Boggs, certified accountant, Indianapolis, Ind.

Discussion.

Tuesday Afternoon, Oct. 4

REPORT OF COMMITTEE TO REVIEW THE PROCEEDINGS OF THE ACCOUNTANTS' ASSOCIATION—J. E. Heberle, assistant to the president Capital Traction Company, Washington, D. C., chairman.

Discussion.

REPORT OF THE COMMITTEE ON FARE COLLECTION—E. A. Tuson, general auditor Public Service Railway, Newark, N. J., chairman.

Discussion.

PAPER—"Combating the Present Day Criminal." This talk will deal especially with conditions as they exist in street railway auditing departments. W. L. Barnhardt, resident vice-president National Surety Company, New York.

Discussion.

Wednesday, Oct. 5

EXHIBIT DAY—There will be no formal meeting except that a get-together luncheon at 12:30 p.m. will be arranged. The details of this will be announced later.

Thursday, Oct. 6

REPORT OF THE COMMITTEE ON GRAPHS—C. R. Mahan, comptroller Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., chairman.

Discussion.

REPORT OF THE COMMITTEE ON STORES ACCOUNTING—R. A. Weston, special accountant The Connecticut Company, New Haven, Conn., chairman.

Discussion.

PAPER—"Passenger Revenue Auditing and Accounting"—Horace L. Howell, Meyer & Wenthe, Chicago, Ill.

Discussion.

REPORT OF COMMITTEE ON NOMINATIONS.

ELECTION OF OFFICERS.

INSTALLATION OF OFFICERS.

PRESENTATION OF PAST-PRESIDENT'S BADGE.

INFORMAL ROUND TABLE OF ACCOUNTING MATTERS.

CLAIMS ASSOCIATION

Monday Afternoon, Oct. 3

PAPER—"Proposed Uniform Traffic Regulation.—Its Advantages, including the ability of the Hoover Conference Recommendation."—R. A. Sears, general claims attorney, Boston Elevated Railway.

PREPARED DISCUSSION BY

J. J. K. Caskie, supervisor of claims Philadelphia Rapid Transit Company.

Frank J. Gatrell, general claim agent Chicago Surface Lines.

Discussion by a traffic officer on "Advantages of National Uniformity in Traffic Rules."

GENERAL DISCUSSION.

Tuesday Afternoon, Oct. 4

JOINT SESSION WITH TRANSPORTATION AND TRAFFIC ASSOCIATION.

REPORT OF JOINT COMMITTEE ON TRAFFIC AND SAFETY—H. K. Bennett and C. H. Evenson, co-chairmen.

PREPARED DISCUSSION.

GENERAL DISCUSSION.

REPORT OF COMMITTEE ON BONUS AND AWARD SYSTEMS — G. T. Hellmuth, chairman.

PREPARED DISCUSSION.

GENERAL DISCUSSION.

ADDRESS—"Work of National Safety Council"—James P. Barnes president, Louisville Railway, Louisville, Ky.

GENERAL DISCUSSION.

Wednesday, Oct. 5

No formal meetings to be held on this day, which has been set aside for inspection of exhibits. An informal luncheon meeting, however, of Claims men has been arranged. At this meeting "Uncle Red," well-known safety engineer, will give one of his characteristic radio talks.

ROUND TABLE DISCUSSION.

Thursday Afternoon, Oct. 6

SYMPOSIUM ON CLAIMS SUBJECTS:

P. W. Klabunde, acting claim agent Milwaukee Electric Railway & Light Company.

J. C. de Sautels, acting general claim agent Montreal Tramways.

Walter Robinson, claim agent Cincinnati Street Railway.

Bert C. Wood, general claim agent Pennsylvania-Ohio Electric Company, Youngstown, Ohio.

Augustus Baker, adjustment department Pittsburgh Railways.

D. A. Finkbeiner, claims attorney Community Traction Company, Toledo, Ohio.

J. W. Giltner, general claim agent Northern Ohio Power & Light Company, Akron, Ohio.

REPORT OF MEDICAL AND SURGICAL COMMITTEE—Dr. W. M. Holtz, Pittsburgh Railways.

PAPER—"The Claimant's Doctor—How May He Be Convinced of the Company's Fairness, and How May the Company Maintain His Friendly Cooperation?"—Dr. Hart E. Fisher, chief surgeon Chicago Rapid Transit Company.

PAPER—"Should the Company Doctor Attend the Injured Claimant?"—Ernest W. Miller, M.D., Milwaukee, Wis.

PAPER—"Should All Accidents Have Medical Investigation and if so, What Information Is Helpful to the Adjuster?"—H. M. Bascom, M.D., Illinois Power & Light Corporation.

PAPER—"The Company Doctor and Litigation"—Value of his examination prior to and his testimony at time of trial—Benjamin E. Sibley, M.D., Boston Elevated Railway.

PAPER—"The Company Doctor and Litigation"—How can he help to nullify the unfavorable effect of the professional medical witness?—John A. Leeming, M.D., Medical Counsel, Chicago Surface Lines.

OPEN FORUM—One-half hour for discussion of any medical problems that may be presented from the floor.

GENERAL DISCUSSION.

American Executive Committee Urges Car Exhibit

STRONG appeal for a representative car exhibit was made by the American Electric Railway Association executive committee in a meeting held in the office of J. H. Alexander, president Cleveland Railway, on Aug. 26. This appeal was made following a report by the exhibit committee that track reservations for car exhibits this year by both manufacturers and operators so far total 25, with only comparatively small track reservations made by some of the large car builders. President W. H. Sawyer declared that the selection of Cleveland as the site for this year's convention had been dictated primarily by the need on the part of the industry for a representative car exhibit which would help to stimulate development in design, and the improvement of electric railway service. An exhibit of cars on a scale large enough to furnish further stimulus toward improvement of design and the replacement of obsolete equipment was held by the president to be of primary importance to the welfare of the industry. Each member of the executive committee was urged to do everything in his power to aid in bringing about a car exhibit that would equal or exceed that of last year, particularly as regards improvement and development shown. Such an exhibit, insisted the president, is of vital importance to the welfare and progress of the industry.

Those who attended the meeting included the following: President W. H. Sawyer, J. P. Barnes, L. S. Storrs, J. W. Welsh, J. V. Sullivan, E. P. Waller, B. A. Hegeman, Jr., Thomas Finigan, G. A. Richardson, T. A. Kenney, M. B. Lambert, S. J. Cotsworth, C. R. Ellicott, H. L. Brown, T. W. Casey, G. L. Kippenberger representing E. B. Meissner, J. S. Kubu representing C. B. Proctor, J. H. Alexander, C. H. Beck, Paul Wilson, Martin Ackerman, E. F. Wickwire, W. R. Power, F. C. J. Dell and Charles Gordon.

Cleveland Convention Plans Almost Complete

Chairman H. L. Brown of the subjects and meetings committee reported that the program for the Cleveland convention was almost complete, with acceptances received from both of the speakers. A complete outline of the program is published elsewhere in this issue. Advance tickets for the noonday luncheon meetings on Tuesday, Wednesday and Thursday of convention week are being sold rapidly, and there were indications that space would not be available at some of the luncheons for delegates who failed to obtain their tickets at an early date.

The membership committee's report presented by Chairman C. R. Ellicott showed a current membership of 320 operating companies, 35 associate companies, 440 manufacturing companies, and 1,175 individuals. In the absence of Chairman J. H. Hanna, Managing Director Storrs for the special subcommittee on depreciation said that a meeting of the full committee, together with the committee on national relations would be held some time during the convention. Mr. Storrs also reported that the hearing on the steam road depreciation case would be held on Nov. 9 by the Interstate Commerce Commission. The committee has been assured that the electric railway case will not be called up until after the steam road decision is made by the commission.

Changes Proposed in Constitution and By-Laws

Changes in the constitution and by-laws have been prepared in pamphlet form to show the old and new provisions, for the information of delegates voting on the new constitution at the convention. Chairman E. F. Wickwire, for the committee on co-operation of manufacturers, reported progress in the preparation of two booklets for distribution at the convention, one on stimulating the replacement of obsolete equipment, and the other on suggestions for increasing the sale of car rides.

A report by the nominating committee, read by Chairman C. R. Ellicott, placed the names in nomination for officers and members of the executive committee for the ensuing year. These were published in the issue of Aug. 6, page 242.

Progress in the study of the statistical work of the association, and in the coordination of statistical activities on the part of the several agencies in the electric railway field, was reported by Chairman J. P. Barnes. A meeting of the committee will be held in New York on Sept. 19 for the purpose of drawing up final recommendations.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Sept. 7-9*—American Society of Mechanical Engineers, Machine Shop Practice Division, first national meeting, Mason Laboratory, Yale University, New Haven, Conn.**

***Sept. 8-9*—Central Electric Railway Master Mechanics Association, Hotel La Salle, South Bend, Ind.**

***Sept. 13-15*—International City Managers Association, Dubuque, Ia.**

***September 19-23*—American Welding Society, national meeting, Book-Cadillac Hotel, Detroit, Mich.**

***Sept. 26-30*—National Safety Council, annual congress, Hotel Stevens, Chicago, Ill.**

***Oct. 3-7*—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

Managing Director Storrs called attention to the apparent apathy on the part of operating companies toward some of the awards offered to the industry for outstanding accomplishments. He called particular attention to the opportunity offered by the Brady Safety Award for capitalizing the safety of electric railway transportation in the eyes of the public. Entries in the Brady competition have been very disappointing, Mr. Storrs said, and indicate a failure on the part of operating companies to take advantage of the opportunity afforded. Members of the executive committee were urged to cooperate in promoting the advantages of that contest. Plans prepared by the committee on education for its program during the coming convention were read by Secretary Welsh in the absence of Chairman Edward Dana. Enough registrations in the training course for foreman-conference leaders are in hand to show that the course will be well supported. The committee is planning an educational day at the convention for Friday, Oct. 7.

Rapid Transit Report Reviewed and Committee Continued

G. A. Richardson, chairman, reviewed the report of the committee on rapid transit, which has continued the collection and interpretation of information on the subject for a period of several years. In the 1927 report the entire question of financing rapid transit, and the allocation of costs, is developed. The work of the committee has consisted in the establishment of fundamental principles regarding rapid transit construction and economics, which are expected to lay the foundation for sound financing of such construction in the future, which in turn will permit more extensive development of rapid transit facilities throughout the country than would otherwise have been the case. Although Mr. Richardson expressed the opinion that the committee's work this year would be so far completed as to avoid the need for its continuance during the next year, it was the opinion of the executive committee that the special committee should be continued in order to tie together, for the purpose of continuity of thought, the representative membership which is included. It was felt that even though only a single meeting be held next year, and no formal report prepared, there would be considerable advantage for the industry in having the committee in essentially its present organization and membership.

The insurance committee, according to chairman Paul E. Wilson, will report a second year of favorable fire loss showing. The committee will also recommend that it be authorized next year to negotiate with rate-making bodies for a general rate reduction in electric railway insurance based upon the experience record of the industry. Mr. Wilson reported an increased interest on the part of all electric railway companies in fire prevention work and said that present figures show a profit

Digitized by Google

for the insurance companies of 18 per cent on electric railway car policies.

After some discussion it was tentatively decided to throw the convention exhibit open to the Cleveland public on Sunday afternoon and Wednesday night of convention week. President J. H. Alexander of the Cleveland Railway, as chairman of the exhibit committee, said that no trouble was anticipated from this admission of the public, and that adequate police protection would be provided to insure that exhibits will not be disturbed. An early attendance on the part of delegates to take advantage of the opening of exhibits on Saturday noon preceding convention week is indicated by the report of Paul E. Wilson, chairman of the hotel committee, that almost half of the hotel reservations so far made indicate arrival of delegates on Saturday. Regarding housing accommodations available, Mr. Wilson also reported that the Cleveland, Hollenden and Statler rooms have all been reserved, but that many good rooms in downtown hotels are still available. Telephone facilities are to be increased 100 per cent over what were available last year in order more effectively to handle convention business. Still further to facilitate inter-communition between hotels, there will be special telephone stations provided in each hotel, so that a delegate making a call from one hotel can use a station directly connected to the switchboard of another hotel. Advance registration indicates a total attendance that will exceed that of last year.

Special Trains Planned

On the subject of transportation, Carl Beck, chairman of the committee, reported arrangements for special trains from St. Louis, Chicago, New York and Boston. Most of these trains, with the possible exception of those from Chicago, will arrive Saturday night or Sunday morning, in order to permit delegates to attend the exhibit before the opening of the convention on Monday morning. Every effort will be made to stimulate early arrival by delegates.

A resolution commending the work done by J. W. Colton as editor of *Aera* was read by Secretary Welsh upon suggestion of G. A. Richardson. This resolution, which read as follows, was unanimously adopted by the executive committee.

Whereas, the executive committee of the American Electric Railway Association, believing it to be the best policy to discontinue the publication of *Aera* in its present form and supplant it with a smaller magazine without advertising, feels it proper that this statement be made regarding the services of John W. Colton, who has edited *Aera* since 1921;

Mr. Colton's editorship has been of the highest order and the change in the form of *Aera* is in no way a reflection on his ability.

He assumed the editorship at the request of association officials, resigning the editorial page directorship of the Hartford *Times,* to which position he had been called for a long and honorable period in New England journalism.

During the past four years the circulation, advertising and financial results have been completely changed and *Aera* has gained much new circulation among persons outside the industry, including financial writers, students, city officials and others. Therefore, be it

Resolved, that this executive committee extend to Mr. Colton its sincere appreciation of his efforts and assure him that he has performed the duty to which the association officials assigned him to their entire satisfaction.

H. L. Brown was instructed to draw up a suitable resolution thanking Mr. Albee, president of the Keith-Albee vaudeville theaters, for his co-operation in discouraging the needless disparagement of electric railway service from vaudeville stages. A vote of appreciation to L. J. De LaMarter, vice-president and general manager Grand Rapids Railway, for his work in enlisting Mr. Albee's co-operation, was passed by the committee.

The next meeting of the executive committee was fixed for Cleveland, Ohio, on October 7.

Members Elected

NEW members elected at the meeting of the executixe committee of the American Electric Railway Association held on Aug. 26 include twelve manufacturers and 34 individuals. A list of new company members follows:

Manufacturer Companies

Cincinnati Car Company, Cincinnati, Ohio.
Commercial Shearing & Stamping Company, Youngstown, Ohio.
Graham-White Sander Corp., Roanoke, Va.
Hynson, Westcott & Dunning, Baltimore.
Murray Conduit Systems, New York, N. Y.
Murray Corporation of America, Detroit, Mich.
National Standard Parts Association, Detroit, Mich.
The Russell Manufacturing Company, Middletown, Conn.
Skinner Automotive Device Company, Inc., Detroit, Mich.
Snap-On Wrench Company, Chicago, Ill.
Titeflex Metal Hose Company, Newark.
The Van Dorn Electric Tool Company, Cleveland, Ohio.

Training Course for Foreman-Conference-Leaders

THE staff which is to conduct the training course for foreman-conference leaders in connection with the Cleveland convention met in Washington Aug. 29 to 31 with the staff of the Industrial Education Service, Federal Board for Vocational Education. The program for the training course was worked out in detail, insuring the best possible use of the time of the members of the group. It was agreed to be necessary to hold the registration strictly to 50 and to divide the group into morning and afternoon sections, 25 men in each. On Friday, Oct. 7, "Educational Day," the two groups will meet simultaneously, in different rooms, to permit the men to attend the round-table conference, under the leadership of Dr. A. J. Rowland, which is to be held immediately after the educational luncheon on that day. On Saturday, also, the two sections will meet simultaneously in the morning so that the course will close promptly at 1 p.m. on that day.

Publications Available At A.E.R.A.

FOLLOWING is a list of publications available at the American Electric Railway Association, New York City. The supply is limited but members can obtain them free of charge upon application.

Electric Railway Practices in 1923, 1924, 1925, and Making Transportation Pay—Electric Railway Practices in 1926. Series of four volumes edited by H. H. Norris, reviewing the presentations made by electric railway companies for the Charles A. Coffin Annual Award. The presentations include new developments of progressive properties that have achieved success and show what electric railways are doing to improve transportation and how they are doing it.

Handbook of Modern Electric Railway Methods and Practices, 1925. A compilation of methods, practices, experiences and policies of electric railways of the United States as obtained from the companies by the committee on management and operation of the American Electric Railway Association.

Proceedings of the American Electric Railway Association, 1924, 1925. Annual volumes of convention reports and discussions of the problems confronting the executives of electric railway companies in the successful operation of urban and interurban transportation systems.

Proceedings of the American Electric Railway Accountants' Association, 1923, 1924, 1925. Annual volumes of convention reports and discussions of accounting methods and classifications used by electric railway companies.

Proceedings of the American Electric Railway Claims Association, 1924, 1925. Annual volumes of convention reports and discussions of the problems of the claims and medical departments of an electric railway company.

Proceedings of the American Electric Railway Engineering Association, 1924, 1925. Annual volumes of convention reports and discussions of the standards, recommendations and miscellaneous practices for apparatus and materials in the operation of the equipment, power, way, structures, purchases and stores departments of an electric railway company.

Proceedings of the American Electric Railway Transportation and Traffic Association, 1923, 1924, 1925. Annual volumes containing reports and discussions of the problems of the commercial, personnel, traffic and safety departments of an electric railway company.

Progress in Cars—Report of Committee on Essential Features of Modern Cars, 1926. Contains a series of typical cars, experiences with modern cars of three interurban and five city electric railway companies, passenger car statistics, age of electric passenger cars and a bibliography of articles on car replacements and the advantages of new cars.

Service at Cost Plans, by Harlow C. Clark, 1920. An identical analysis of statutes, ordinances, agreements and commissions' orders in effect or proposed, together with a discussion of the essentials of local transportation franchises.

News of Other Associations

Standardized Practices of the Milwaukee Way Department*

By E. J. Archambault
Engineer Way & Structures Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

REPAIR of tracks and pavement on congested city streets becomes increasingly difficult each year. The growing congestion of vehicular traffic requires more painstaking care in planning the work and in safeguardring the workmen and the public. It is obvious that in the larger cities more track repair work must be done at night to secure the best results, and to do it at the least cost and at the greatest safety to employees. This applies particularly to the replacement of track special work parts, the minor track and pavement repairs necessary in the downtown section of the city, and especially track welding and rail grinding work. The major portion of the work of the track department, however, must necessarily be performed in the daytime. With the co-operation of the citv in closing streets temporarily, obviously it can be done with more safety. with greater speed and with better results.

The track construction and reconstruction program in Milwaukee usually comprises the building of 10 to 12 miles of track in paved streets each year. It may be of interest to describe the form of track construction which has been adopted as standard in Milwaukee.

Milwaukee Track Standardized

The track trench is usually excavated for the full width of double track to a depth of 21⅜ in. below the grade of the street. This sub-grade is rolled thoroughly with a 7-ton roller. Sub-grade drains are placed crosswise of the trench at every city manhole connected with a storm sewer. No. 4 crushed limestone is then spread on the sub-grade to a depth of 6 in. and thoroughly rolled. Upon this the new track is placed. No. 2 crushed limestone is used for tamping the track. With fabricated track sections and Lorain electric butt welds the surfacing of the track is done after the welding work has been completed. In certain cases where rail ends are thermit welded the tracks are tamped in advance of the welding operation. Tie plates and tie rods are used on all city and suburban track.

By special arrangement and with the approval of the city 10-in. reinforced concrete pavement has been adopted as standard. Since 1919 more than 300,000 sq.yd. has been laid in the track zone. The standard rail section used on the Milwaukee system is the 7¼-in. No. 102 T-rail, which has a slight bevel on the outside edge of the rail head, bringing the rail ¼ in. above the adjoining pavement.

Track Fabricated in Yard

In Milwaukee some departure has been made from the usual practice of laying track. Fabricating sections in 62-ft. lengths with the track building machine designed by our engineers enables the building of the track sections in our lower Cold Spring yard, hauling them to the job and placing 1,200 to 1,500 ft. of track in one night. We have found that this practice saves considerable time and confusion over the former method of delivering ties, rails, tie plates, spikes, etc., separately and building the track on the job.

On practically all of the track construction and reconstruction jobs extensive use is made of temporary track on the side of the street. This track is made up in 33-ft. sections, constructed of No. 60 T-rail bolted to 3-in. planks for ties. Kerwin or high type crossovers are used almost exclusively and very little trouble is experienced with derailments, as we have developed a very satisfactory design for the run-off rails for this sturdier and more substantial type crossover.

Trackwork is always carried on so as to cause the least amount of inconvenience to the public. It is the usual practice for the construction engineer to interview the business people along the street and to advise them fully of our plans. We find that this practice is productive of good will. Merchants appreciate this advance information. We make it a point to convince them, by deed as well as word, that we wish to do the work with the least amount of interference to their business. The city of Milwaukee usually permits us to shut off the street entirely to vehicular traffic, enabling the work to be carried on in the most expeditious manner. Proper detour signs are provided by the way department and placed at such places as are suggested by the city or county.

Mechanical Equipment Speeds Up Work

The use of mechanical equipment for carrying on the activities of the way department is important. The way department has three electric shovels on caterpillar tractors for excavating work, fourteen electric-driven compressor outfits, which operate pneumatic tie tampers and concrete breakers, and two electrically operated tie-tamping outfits, which are generally used on the inter-urban lines. Our equipment also includes a complete concrete paving outfit, with an up-to-date 1-yd. mixer, two bucket loaders with measuring hoppers for properly proportioning the sand and stone, several truck tractor outfits for the delivery of the aggregate to the mixer, and with a special loader for the placing of the cement on the trucks as they proceed to the mixer. This concrete outfit is also provided with a special finishing machine, which has been in use for three years, and produces a finished job which we believe is unsurpassed by any other street railway paving outfit.

For the handling of construction material in the Cold Spring yard the company has a 45-ton Brownhoist electric locomotive and two modern double drum derrick cars which are used for the handling and delivery of temporary and permanent track sections, rail and special work. Probably no single piece of equipment effects greater economies than do these derrick cars. Use is frequently made of these derricks in conjunction with the pile driver outfit and for the air-operated pile driver in breaking concrete where street pavement is removed for track extensions.

Motor Cars Have Plows

The utility division is equipped with modern Differential motor cars and trailers which provide facilities for side dumping so that the material is deposited free of the track, thus minimizing rehandling. Two of the motor cars are equipped with wing plows, air operated, which constitute some of the company's formidable snow-fighting apparatus, in addition to their use for spreading dirt and ballast on open track construction. During heavy snowstorms several trucks are available and provided with the necessary attachments for the quick installation of plows. This equipment supplements the snow sweepers of the transportation department and is used primarily for cleaning landings and special work layouts.

Cold Spring yard is provided with a sand drier outfit of modern design which was constructed a few years ago. Sand is hauled in from our gravel pit, dumped in a hopper, and by gravity is fed to a conveyor leading to the sand drier, whence it passes over a gravity screen discharging the rejection in a separate bin. A substantial structure houses the sand drier and from 4,000 to 5,000 cu.yd. of sand is run through this drier each year for use on city tracks.

The company operates its own stone quarry, about 15 miles north of Milwaukee on the Milwaukee-Northern Railway, an associated company. It is equipped with modern crushing machinery and buildings and a 50-B Bucyrus shovel and 45-ton electrically driven Brownhoist crane. The output of this quarry runs about 300 to 400

*Abstract of a paper presented before the Transportation Section, Wisconsin Utilities Association, Milwaukee, Wis., Aug. 18-19, 1927.

Digitized by Google

tons per day, the major portion of which is used by the company for track reconstruction and paving work.

Chrome Nickel Steel Used in Special Work

It is the standard practice in Milwaukee to use chrome nickel steel on most of the track special work layouts. Its development and use came during the war, when the price of manganese steel made its use almost prohibitive, and we believe that the substitution of chrome nickel steel in place of manganese has been a boon to the industry. We get excellent results with the use of this kind of special work and have adopted it as standard. Chrome nickel steel has a great advantage in that it lends itself admirably for top welding, maintaining uniformly level flangeways in flange-bearing layouts. It permits also of the welding of the joints in the special work layout. In fact, a track special work layout is not installed in Milwaukee today without thermit welding all of the internal joints of the layout except for the standard switch and mate castings, thus making it entirely homogenous. All track special work layouts are generally paved with granite block.

During the last few years considerable attention has been given by the company to the construction of rapid transit lines. There was completed and put in operation on June 14 of last year the first of these projects. It involved the building of approximately 4½ miles of double track on private right-of-way leading from the west side of Milwaukee to a connection with the Watertown interurban west of West Allis. The building of this line reduced the running time to Watertown by approximately twenty minutes. On June 20 of this year the second step in rapid transit line construction was completed and put in operation. This consisted of a connection between the Watertown line and the East Troy-Burlington line. Although but 1 mile in length, its strategic position enabled a reduction of 23 minutes in running time between terminals. The building of these rapid transit lines has not only speeded up interurban railway service, but has opened up a vast territory for suburban development to the west and southwest of this city.

Motor Buses and Street Railways in Large Cities*

By Konrad Sieber
Managing Director Nürmberg-Fürther Street Railway

Replies received from operators in 45 large cities included 30 with both bus and car operation. In 25 of these cases the buses are operated directly by the railway and in the other five by subsidiaries.

The preponderant use of the bus for routes where the traffic is light is indicated by the fact that the annual car trips varied from 128,000 to 461,000 per kilometer of route (205,000 to 738,000 per mile), whereas the bus range was less than half this (8,100 to 172,000 per kilometer of route, or 13,000 to 275,000 per mile of route). The flexibility and small capital investment of the bus are of great benefit in developing new realty values.

Most of the bus routes are not directly profitable, but this is to be expected in view of their extensive use as feeders.

Data on operating and overhead costs are more liberally supplied than reports on profits, but there is room for greater clarity in accounting. The operating expenses of street railways are given as ranging from 45 to 102 pf. per car-kilometer (16.2 cents to 40.2 cents per car-mile), while that of buses are from 34 to 132 pf. per kilometer (13.6 cents to 52.8 cents per mile). The average operating cost of cars was 65.1 pf. per car-kilometer (26.1 cents per car-mile) and of buses 74.5 pf. per bus-kilometer (29.8 cents per bus-mile).

The chief difference between cities in operating cost is due to wages, which range from 65 to 238 pf. (16.2 cents to 59.5 cents) an hour. Next in line is the character of operation. Thus, the same wages and vehicles yield a range of 55.8 pf. to 118.7 pf. per bus-kilometer (22.3 cents to 53.5 cents per bus-mile) because the annual performance ranges from 50,300 km. (31,186 miles) to 18,900 km. (11,718 miles).

The only certainties are that for like conditions the bus costs materially more than the car in power, lubrication and wheel (tire) wear.

Railways usually pay heavier taxes than the buses, reaching a maximum of 14.5 pf. per car-kilometer (5.76 cents per car-mile), whereas the bus maximum is 8.1 pf. (3.2 cents per bus-mile).

Capital charges on street railways range from 5 to 24 pf. per car-kilometer (1.4 to 9.6 cents per car-mile); on buses from 5 to 30 pf. (1.4 to 12 cents). The overhead for railways goes up rapidly as the traffic becomes thinner.

After weighing the various factors involved, it may be said broadly that the dividing line in favor of the rail for a service offering an equal number of seats is a twenty-minute headway, but with no allowance for interest charges on track. It may also be said that a bus route is not ready for conversion to rail until it is economical to replace the buses with the same or a shorter headway with cars of larger capacity.

There appears to be no great difference in the accident record of the car and the bus. Comparison is difficult in any event, because the two types are used under such different circumstances. The average of thirteen operators showed 5.06 collisions per 100,000 car-kilometers (per 62,000 car-miles) and 5.28 per 100,000 bus-kilometers (per 62,000 bus-miles). The corresponding personal injury averages are 2.66 for the car and 1.74 for the bus. The higher car figure is probably due to the inclusion of trailers as though they were part of a motor car.

Where the bus is operated as supplementary on a unified flat-fare transportation system, rates tend to be the same as on the cars. A number of zone-fare systems, however, charge 30 to 40 per cent more on the buses. Most systems charge higher fares in any event. There are also cases where suburban bus rates are modified if the passenger continues via car.

Chartered service amounts often to 10 per cent of gross revenue at rates varying from 90 pf. to 2 marks per kilometer (36 cents to 80 cents per mile).

Running Speeds

Permissible running speed of buses over different sections of city streets ranges up to 45 km. (27.9 miles) per hour, with an average of 30 km. (18.6 miles). Occasionally a speed like 16 km. (9.92 miles) is specified because trailers are used.

On the other hand, many street railways are still supposed to stick to 25-year-old regulations specifying rates like 8 km. (5 miles) per hour over certain sections. The few tramways which are free to run at any speed in the discretion of the motorman are also those showing the least number of accidents per 100,000 ton-kilometers.

Yet some systems report speeds actually below those permitted by ordinance. The range of car running speeds reported is 18 km. to 50 km. (11.16 to 31.0 miles) per hour, and of buses, 25 to 60 km. (15.5 to 37.2 miles).

The difficulty with the lowest-speed railways is that the rates of acceleration are too low to permit satisfactory schedule speeds. In this connection, the new articulated motor-car train of the Berlin Street Railways is commended because it enjoys a good rate of acceleration, even on slippery rail.

Schedule speed (probably exclusive of layovers—Ed.) of street railways ranges from 12 to 17.24 km. (7.44 to 10.69 miles) per hour, and of buses, from 10.8 to 25 km. (6.7 to 15.5 miles). The higher speeds include suburban routes. There is no substantial difference in speed of car and bus under like traffic conditions.

Speed is of such extraordinary importance in large city transport that a

*Abstract of paper presented at Copenhagen convention of the Internationaler Strassenbahn und Kleinbahnverein (International Street and Interburban Railway Association), June 22-24, 1927.

Digitized by Google

saving of five minutes per trip for each of the 4,000,000,000 riders a year carried by association members would save 20,000,000,000 minutes, worth 200,000,000 marks (approximately $40,000,000), if the riders' time was valued at 1 pf. (0.25 cent) a minute. Such an increase in speed would bring about 50,000,000 marks (approximately $12,500,000) more operating revenue and almost as great a saving in operating expenses.

Besides a higher rate of acceleration, the stop spacing, car type, make-up of train and braking equipment are important factors in raising schedule speed.

As to the most efficient capacity for cars, the experience in America with large cars in competition with jitneys and buses on shorter headways is proof that cars must not be so large as to tempt the operator to lengthen headways. Replies to the questionnaire show that operators in large cities are of this opinion, as their preference is for cars 9 to 11 m. (29.5 ft. to 36 ft.) over all. There is a greater difference of opinion concerning the proper motor bus capacity.

On dry roads the braking of cars and buses seems to be equally efficient, but cars are affected somewhat by slippery rail.

Rates of Passenger Interchange

Wide variations exist in the speed of passenger interchange. On ordinary cars it takes 1.5 to 2 seconds per passenger, but with extra doors this time has been cut to 0.75 second per passenger. Vienna reports a record of 0.3 second per passenger in filling a car with 100 passengers pleasure-bound. Vienna motor cars have three doors and the trailers have four.

On one of the association properties reduced stop time by means of three-door cars and a spacing of 430 m. (1,410 ft.) between stops would produce a schedule speed of 17.2 km. (10.66 miles) per hour.

Theoretically, a satisfactory passenger interchange rate ought to be secured with one exit or entrance passage for every 3.38 m. (10.9 ft.) of car length. On such a car the effective passenger-carrying area would be 5.3 sq.m. (57 sq.ft.) per passage. On buses with no more than two passages at best the area per passage must not exceed 10.6 sq.m. (114 sq.ft.) if the bus is not to fall too far behind three-door cars in handling heavy traffic.

Only five street railway and two bus operators used separate exits and entrances. Others had abandoned this practice because of unbalanced loading and resulting arguments with passengers who could not see why they should not have the right to use any passage available.

Vienna reported a total of 30,000 car passengers handled per hour one way on a single track which is believed to be a world record. Two or three lines of buses would have been required for the same job. A high bus figure is that of 5,680 passengers per hour for the Fifth Avenue Coach Company between 31st and 42d Street, as given in the Electric Railway Journal, page 590, Oct. 10, 1925.

The plan sometimes suggested of running buses in the downtown areas and cars in the outer areas with transfer of passengers is not desirable. The opposite method would be more logical.

Eight rail systems and eight bus systems operate one-man equipment, but only for light service. At Vienna auxiliary conductors and slot machines for ticket sales help to broaden the scope of one-man operation. Several undertakings gave up one-man operation because their excessive stop time for passenger interchange delayed other street traffic.

Increasing Passenger Comfort

The consensus of opinion on means for increasing passenger comfort and traffic may be summarized as follows: Replace obsolete cars with new cars possessing large platforms, low floors, low windows with arm rests, pleasing interior, unimpeded outlook, mirrors, leather cushions with suitable proportion of cross-seats, broad aisles, comfortable handholds for standees, good lighting, good ventilation, improved spring suspension, more easily read destination signs, display of pleasing local scenes within the cars, electric heating (with fresh air instead of exhaust in buses), pneumatic tires, six-cylinder buses, decreased noise, better upkeep and greater cleanliness. A variety of track improvements are also desirable, as well as safety islands and more sheltered waiting places. Increased attention could also be given to time-tables for the public and various types of fares to meet the varying degrees of patronage.

Higher schedule speed would be obtained by such measures as: More powerful motors, three or four exits and entrances per car, up-to-date brakes, electric signals (push-button, door contact, etc.), bow contact for current collection, which avoids wire derailment delays, shorter intervals by decreasing train units, synchronized watches and clocks, stops lengthened to intervals of 400 to 500 m. (1,312 ft. to 1,640 ft.) etc.

The increasing congestion from automobiles which use street space so inefficiently calls for many changes in street railway practice, such as rerouting, relocation of tracks in streets and plazas, safety isles, stop-and-go signals and motorman's signals for securing a quicker getaway from the traffic policeman. It is a question whether the street railway should have to bear so much of the burden of reconstruction cost, but it is unwise to follow a needlessly obstructive policy.

The answers to supplementary questions on bus practice showed that pneumatic tires are used almost everywhere with an average life of 30,000 km. (18,000 miles). Seven undertakings have six-wheelers in service. Sixteen undertakings operate with right-hand control, seven with left-hand and five use either.

Reducing Accidents*

By J. H. Handlon
Claim Agent Market Street Railway, San Francisco, Cal.

FROM a brief review of the effort now being put forth it would appear offhand that all that we can do to further safety work is to show greater zeal and to render more effective what is now being done. However, I submit these suggestions hopeful that perhaps some, if not all, will, if adopted, be the means of further reducing accidents.

1. I would suggest a closer study of the accident breeding habits of employees. A closer supervision of each man's work and a study of each man's accident record may reveal a tendency on his part to take unnecessary chances, or follow careless habits, or both.

2. The transportation department should be urged to avail itself of the opportunity the claim department offers it to investigate and determine the causes of accidents regardless of whether a claim is presented, for when causes are determined then remedies can be applied, assuming that the conditions are controlled by the company.

3. A careful inspection of company property and trackage should be continually maintained. Construction work; new buildings; street work; new crossings; temporary or permanent diversion of street traffic; new grade crossings; obstructions near company tracks, etc., all set up hazards of which due cognizance should be taken and safety measures adopted to meet these changed conditions.

4. Consideration should be given to establishing a uniform method of detecting, systematically, defects in eyesight and hearing of platform men and some thought to the advisability of devising tests to see how they respond to certain circumstances and conditions.

5. Claim agents should keep fully informed all operating officials of instances that come to their attention of employees being careless or derelict in the performance of their duties, realizing that their impartial investigations disclose facts that would otherwise not be known.

6. Claim agents should also investigate the cost from an accident standpoint so far as possible of any alterations or changes in the rolling stock or any saving effected by their use.

7. Through company magazines and by means of badges, buttons or some other insignia recognition should be given to the platform men having excellent accident records and a permanent safety campaign should be fostered.

8. Every effort should be made to lessen the turn over of platform men on the theory that the experienced trainman is better qualified to prevent accidents. Splendid work in this direction can be done by interviewing every employee who voluntarily leaves the service.

News of the Industry

Summary of Piedmont Briefs

Pros and cons cited on application of Southern Electric Railway to Build 128 miles of line

QUESTIONS as to the jurisdiction of the Interstate Commerce Commission to issue or withold a certificate authorizing the construction of an extension of an electric interurban railway, as well as issues raised by the opposition of existing steam railroads to the proposed extension, are discussed in briefs just filed with the commission. The case involves the application of the Piedmont & Northern Railway for authority to connect its existing lines by completing the gap between Spartanburg, S. C., and Gastonia, N. C., 53 miles, and by building from Charlotte, N. C., via Salisbury, to Winston-Salem, N. C., 75 miles.

The application is opposed by the Southern Railway, the Seaboard Air Line Railway, and the Atlantic Coast Line Railroad, with its affiliated lines, the Louisville & Nashville, the Carolina, Clinchfield & Ohio and the Charleston & Western Carolina, while the Georgia & Florida Railroad is supporting the application.

The applicant electric line, in addition to pointing out what it asserts to be the public need for the proposed extension, takes the position that its road is not operated as a part or parts of a general steam railroad system of transportation, and is therefore, by paragraph 22 of section 1 of the interstate commerce act expressly excluded from the operations of paragraphs 18 and 21 of section 1, under which the commission grants certificates of convenience and necessity.

Says Commission Is Without Jurisdiction

It contends that the commission is without jurisdiction also on the ground that the proposed construction was begun in good faith prior to the effective date of paragraph 18 and was never abandoned. However, it asks, that in the event the commission holds it has jurisdiction, the certificates be issued permitting the proposed lines to be built.

The Georgia & Florida, in its brief supporting the application, points out that it operates a line from Madison, Fla., to Augusta, Ga., and is now engaged in extending its line 56 miles from its northern terminus at Augusta, Ga., to Greenwood, S. C., where it will connect with the Piedmont & Northern, so that it is vitally interested in the proposed through routes that would be opened up by the electric line extensions. This company believes that the excptionally favored territory in Georgia and North and South Carolina, served by the petitioner and the Georgia & Florida, which already has made such remarkable strides industrially and agriculturally within the last decade, is destined to expand even more rapidly within the next few years. It says that "the Piedmont & Northern will introduce into this territory much needed and healthy competition and thus improve vastly the convenience of the public."

It is also asserted in the briefs in favor of the application that it is supported by every available representative of public interest in the territory affected, including the Governors of North and South Carolina, the Railroad Commission of the State of South Carolina, the Corporation Commission of the State of North Carolina and by representatives of cities and towns, shippers and citizens generally.

As indicated previously in the Electric Railway Journal, the Southern Railway, in its brief, says the Piedmont & Northern is controlled by the "Duke interests" that control the Southern Power Company, Southern Public Utilities Company and other allied companies, and that these relations have resulted in control by it of a vast amount of traffic.

The Piedmont & Northern contends, in its brief, that the community of interest existing between it and the power interests is neither improper, illegal nor opposed to the public interest; that business diverted from other lines will be inconsequential, and that the proposed lines will develop additional traffic and furnish competition in transportation.

Tacoma Railway Replies

Charges in Engineer Harlan's report refuted by Manager Sullivan. Offers solution. Another answer on way. New franchise suggested with sliding scale of fares and fixed minimum return

THE Tacoma Railway & Power Company, Tacoma, Wash., in a 197-page report has replied to the report prepared by Kenneth G. Harlan, city utilities engineer, several months ago. The propriety of the financial set-up of the company, economy of its operation, justification of certain operating and interest charges, valuation for rate-fixing purposes and various other angles to the Tacoma transportation problem have been presented in the report. Taking issue with the city engineer on practically all his theories of public service corporation finance and operation it supplements the report with 121 pages devoted to alleged errors of fact and figures in the city report. The original report took eight months to prepare and covered 221 pages. It was received by the Tacoma management on April 30 and the answer was filed on Aug. 22. The City Council has taken the reply, signed by R. T. Sullivan, manager of the company, under advisement and the author of the original report says he will have an answer to the railway reply within ten days.

Use of Ingenious Methods Charged

It is charged that the Harlan report figured average fare by dividing the number of revenue passengers into the total revenue, including freight, express, advertising space and power sold, rather than including passenger revenue; that it assumed that all power ever purchased by the local street railway companies would have been purchased at a new and reduced rate which the city of Tacoma municipal light plant put into effect on Aug. 1, 1926, the previous rate having been nearly double the new rate; that it assumed that extensions and betterments were made at no cost, whereas, as a matter of fact the company claims that all of the net earnings available and millions besides have been spent on improvements and betterments.

Replying to the charge that operating costs of the Tacoma street car system were unnecessarily high, the company shows that the Tacoma Railway & Power Company and the Pacific Traction Company are operating efficiently, the cost per car-mile in 1926 having been only 23.12 cents. In this connection it points out that there are only two cities of more than 100,000 people in the United States operating at a lower cost per mile, according to the American Electric Railway Association's analysis.

Whereas the Harlan report asserted that a valuation of not more than $2,500,000 could be justified, the reply asserted that if a revaluation were made today of the properties in Tacoma, a figure much higher than that allowed by the state now for rate-making purposes would be given, $10,000,000.

The reply concluded its analysis of the situation with a suggestion for a solution, consisting of a proposal for a new franchise to supplant the 40 existing and varying franchises. This should provide for a sliding scale of fares, depending on the showing of returns made, and permitting the company to earn, if possible, a certain minimum after taxes. Manager Sullivan, in submitting his suggestions

Digitized by Google

for a solution, asserted the readiness of the company to meet the city more than half-way and do everything possible to give the city an adequate service for the upbuilding of the city.

Engineer Harlan, after a hurried scanning of the company's refutation of these and other charges, declared it was an attempt to confuse the issue with a mass of irrelevant and unimportant correction of things he never intended to be accurate to the penny. He declared he was ready to meet the company upon all issues raised.

City Council Revises Chicago Bills

Aldermen decide to appoint sub-committee to draft an entirely new set of bills for presentation to Assembly. Governor to be heard from on special legislation session

DETERMINATION on the part of the City Council of Chicago to work out a traction program satisfactory to both city and companies was renewed after a lull of more than three weeks on Aug. 17, when the Aldermen decided to appoint a subcommittee to draft an entirely new set of bills for presentation to the general assembly, if Governor Small keeps his original promise to call a special session in October. The new bills are to represent the city's viewpoint on the legislation required to settle the city's traction problems, while the five bills defeated by the Legislature last June were regarded as company measures.

Prior to the appointment of this subcommittee a written opinion on the validity of the five former bills and their amendments was given the Aldermen by Corporation Counsel Breen. Briefly, the opinion holds that three of the bills and their amendments are constitutional but that two of them are not. The three that were found legal are the subway bill, the local transit commission bill and the measure which changes the cities and villages acts to conform to the proposed changes in other bills. Amendments added to the indeterminate permit and traction unification bills in the house of representatives make them unconstitutional, the opinion holds.

Although the old bills together with amendments are being used as a working basis by the new subcommittee, many important changes have been made in the new drafts. In the two weeks following its appointment, the subcommittee had completed the revision of the entire set of bills, *i.e.*, the measures dealing with the length of franchise grants, local transit commission, unification of local transportation systems, amending the cities and villages act, and the construction of subways. Among the most important of the changes adopted was the elimination of an amendment to House bill No. 437 which limited franchises to 40 years. The new bill would permit the city to grant either an indeterminate permit or a franchise for 20, 30, 40, 75 or any other period.

Revisions to the local transit commission bill provide that four of the five members of that body shall be appointed by the Mayor and the fifth by the County Board, whereas the original bill specified that two members should be named by the Governor, two by the Mayor and one by the County Board. With the completion of the work of revising the bills, the sub-committee is now ready to report to the full committee.

Anxiety over the prospects for a permanent settlement of the traction problem this fall caused the City Council to appoint a second subcommittee to confer with Governor Small at Springfield Aug. 23 to learn whether he will stand by his original promise to call a special session of the legislature to consider enabling legislation when the city and companies have agreed on a unified transit program. The city's alarm in this matter was attributed to a statement made by the Governor the previous week in which he intimated that he would have the legislature pass the necessary laws only if an ordinance is first submitted to and approved at a popular referendum, as well as by the city and companies.

The Governor refused to commit himself on the matter, however, until he can reach some agreement with Mayor Thompson, and the Alderman returned to Chicago with less hope than ever for a special session.

New Business Campaign of Illinois Traction

A new business campaign was started on July 15 by the Illinois Traction System. It is built on the idea that the modern railway company can no longer be content with accepting only the business that may come to it through the usual channels of solicitation. Its first effort along the line of interesting employees in selling its services was the organization of the Go-Getters Club. This activity has now been enlarged and intensified with the present organization known as the Employees New Business Club, which is extended to employees of Illinois Power & Light Corporation and associated companies. It started its activities with a special 90 day summer campaign. The co-operation of employees of the several associated companies has been invited and is freely given on the basis that whatever is good for the Illinois Traction System is good for the entire company family.

Employees of Illinois Traction System numbering about 2,000 men and women will endeavor during this 90-day special campaign to make an average of one call per day on a prospective customer for Illinois Traction System service. Each employee will talk to his friends, his neighbors, his lodge and church associates, his local merchant or manufacturer, with the idea in view of selling the services of the railway. Where it is possible to secure a direct piece of passenger, freight or express business this will be done, but the prospects will be told about these services.

Employees of the Illinois Power & Light Corporation in the territory served by Illinois Traction Systems are co-operating in this campaign to the extent of acquainting themselves with the specific services of the electric railway and soliciting business in the same manner as Illinois Traction System employees, except that they are not asked to make daily reports. Neither do they participate in the competitive feature of the campaign.

Referendum to Be Recommended in New York

In his report to the commission which is partially completed Samuel Untermyer, special counsel of the Transit Commission, will recommend a referendum to determine if the voters favor the maintenance of the 5-cent fare on the city's proposed unified transit system with the deficit from operation, if any, carried and paid by the taxpayers. He will make it clear, however, that no loss is expected. His plan will be based on the recapture of the Brooklyn-Manhattan Transit Corporation subway system. Mr. Untermyer's idea is that the returns from these profitable lines will go a long way toward carrying the high-cost new subways at a 5-cent fare.

Negotiations with representatives of the Interborough Rapid Transit Company for the purchase of its lines, unsuccessful so far, are still pending. The great difficulty in the negotiations with the Interborough has been the necessity for making some arrangement with the stockholders of the Manhattan Railway, which owns the Manhattan and Bronx elevated lines, now operated by the Interborough on a 99-year lease.

Dayton and Springfield Properties Sold

The Peoples Railway, Dayton, and the local railway in Springfield, Ohio, owned by the same interests, are reported sold. The new owners are Wood & Turner, Philadelphia.

The Peoples Railway for years was owned by the American Railways. It was later sold to the American Gas & Electric Company. Wood & Turner were anxious to procure the Electric Light & Power Company in Wilmington, Del., owned by the American Gas & Electric Company, but that company is said to have refused to sell the Wilmington utilities unless the two Ohio companies were included. The property is not to be formally transferred until Sept. 15.

Baltimore Fare Hearing Set

The Maryland Public Service Commission has set Sept. 6 as the date to start a hearing for an increase in fares on the application of the United Railways & Electric Company, Baltimore. The company seeks to raise the fare from 8 cents, or two tokens for 15 cents, to 10 cents. In addition it applied for an immediate emergency increase. This plea will be heard first.

An intervening petition against an increase of fare for the United Railways & Electric Company, Baltimore, has been filed with the Maryland Public Service Commission by The People's Committee Against Increased Fares of the People's Corporation.

This petition declares among other things that there is no unforeseen sharp or unusual rise in the cost of doing business or unforeseen lapse in the volume of business; that loss of 29,000,000 passengers since the fare was increased to 7½ cents, despite normal increase in population, is due to the increase and not to automobile competition as contended by the company; unprofitable long riding has grown and short riding has decreased, fare increases being held responsible. The petition says that as a matter of principle and common fairness, the company's right to a fair return on fair value is not disputed, but "we do protest the suicidal and reactionary policy of attempting to increase returns by further advance in fares."

Date Set for North Shore Rate Hearing

A hearing is to be held in Chicago on Sept. 15 before Examiner Hoy on the intrastate passenger rates of the Chicago, North Shore & Milwaukee Railroad within the states of Illinois and Wisconsin. Formal investigation was ordered recently by the Interstate Commerce Commission. In a petition the railroad alleged that its passenger fares between points in each state were below the level of rates charged for interstate travel and that the railroad commissions of both states had refused to permit an increase in local tariffs.

Higher Fare Sought in Madison

The Madison Railways, Madison, Wis., filed a petition with the Wisconsin Railroad Commission on Aug. 17, asking that the rate in Madison be raised to 10 cents for adults and 5 cents for children under twelve years. It was claimed by the company that such increases were necessary to carry out its program of improvements. W. Dineen, secretary of the commission, stated that the petition would be heard in September.

An increase on Jan. 2, 1925, was allowed to provide funds to carry out a program of additions and improvements agreed upon between the railway and the city of Madison. According to the petition, "during the 30 months which has elapsed since that order was entered the revenues of petitioner accruing under such schedule of rates and fares have been at all times insufficient to provide petitioner with any funds to carry out said program." The petition also stated that the rates of fare had been and were inadequate to afford a reasonable return on the fair value of its property devoted to the service of the public.

If the plea is allowed, tickets or tokens would sell at fifteen for $1. At present they are seventeen for $1. School children's tickets would undergo no change in price.

The petition was signed by F. W. Montgomery, president, and Alice N. Montgomery, secretary of the company.

Changes in Holyoke Delayed One Month

At a hearing before the Massachusetts Public Utilities Commission on Aug. 23 on the petition of the Holyoke Street Railway, Holyoke, Mass., for a readjustment of its fare rates and a revision of its zoning system, a delay of one month, making Oct. 1 the day when it is proposed to make the changes effective, was granted on request of city officials of Holyoke and Chicopee. More time was desired by them to study the schedules. A further hearing by the commission on the subject was set for Sept. 21. L. D. Pellissier, president of the company, said it was expected the readjustment would bring in about $175,000 additional revenue yearly.

An unusual feature of the first hearing before the utilities board, on Aug. 23, was that all the speakers, mayors, legislators, aldermen and selectmen, paid the Holyoke Street Railway the compliment that it was giving satisfactory service, maintaining adequate equipment and presenting a fine upkeep. There was no complaint against the company, but a feeling that it might not be necessary to give it a 25 per cent increase in fares.

State Sues United Railways for Collections from Riders

The State of Missouri on Aug. 29 filed suit in the United States District Court in St. Louis to take from the United Railways a total of $83,000 collected from car riders last February under the form of an increase in fare which a special United States Court later held was not warranted. At the time the fare increase was put into effect the company was operating under the protection of an order from Federal Judge Reeves of Kansas City.

During this period the company raised the fare from 7 cents to 8 cents, but gave receipts for the extra penny to passengers on demand. Later when the special court ruled against the company those passengers who presented the receipts were paid back the pennies. While the 8-cent temporary fare was in effect the company collected about $85,000 in extra pennies, but later returned $2,000 to patrons who presented the desired receipts.

The state now contends that the company has no legal right to retain the money and that it is the property of the people who paid it. The state seeks to place it in a fund and if the rightful owners do not assert their claims to turn it over to the state treasurer for state expenditures.

The state suit is in the nature of an intervening petition in the federal receivership case. Charles W. Bates, counsel for Receiver Rolla Wells, has stated that the suit of the state will be vigorously opposed.

Charles W. Bull, associate city counselor, several days ago informed the St. Louis Board of Estimate and Apportionment that neither the city nor the state had a legal right to claim the money. That the return of the extra fare was a private matter between the company and the car rider and that if the car rider did not claim the money the company could retain it.

Portland Employees to Serve as Tourist Guides

Franklin T. Griffith, president of the Portland Electric Power Company, Portland, Ore., has suggested through a letter to Mayor Baker of Portland that the services of a staff of seventeen traffic inspectors of his company be allowed to act as volunteer information guides while on duty during convention periods or heavy tourist seasons. He said these men were carefully instructed in service of this character. The Mayor replied that the offer was appreciated as an excellent suggestion and that it would help to create a spirit of welcome to travelers in the city.

Mercury Arc System in Bridgeport

Energy for street railway operation by the Connecticut Company in the city of Bridgeport was changed over on Aug. 23 from the company's own generating system to a mercury arc rectifier system fed from the lines of the New York, New Haven & Hartford Railroad. Mention of the order placed for the rectifiers was made in the ELECTRIC RAILWAY JOURNAL, issue of Jan. 22, 1927, page 189.

Hearing on Schenectady Fares Scheduled

A hearing will be held before the Public Service Commission in Albany, on Sept. 8, on the petition of the Schenectady Railway for permission to increase its cash fare rate in Schenectady, N.Y., and in each operating zone on its Albany, Troy and Saratoga divisions from 7 to 10 cents and school tickets from 2½ to 3 cents. The company also asks the right to increase commutation ticket rates.

Recent Bus Developments

Albany Official Wants Trolley Given a Chance

Bertrand T. Fay, assistant to the vice-president of the United Traction Company and the Capitol District Transportation Company, Albany, N. Y., in an interview with the Albany representative of the ELECTRIC RAILWAY JOURNAL on Aug. 18, declared that in his opinion people generally preferred the bus as a means of transportation in Albany because the bus is constantly moving while the cars of the electric railway are often held for long intervals by congested traffic.

When the United Traction Company embarked on bus transportation three years ago Mr. Fay was placed in active charge of the supervision of the bus operation under the direction of the general manager and vice-president. He has made an exhaustive study of bus conditions of traffic as compared with the street car.

Contrary to the opinion expressed by L. F. Loree, of the Delaware & Hudson Railroad, about a year ago, Mr. Fay does not expect the bus to supplant the street car. He said:

If the automobile traffic on the streets which impedes the street car could be speeded up, the street car would rapidly assert its superiority. While the street car invariably arrives at the end of the route ahead of the bus, the people seem to prefer the bus as a means of transportation because it is almost constantly in motion. They think they are getting there quicker.

My personal opinion is that there is no comparing the comfort of riding in a trolley car with the bus. The trolley car is light, airy and roomy. The bus is often crowded and there is a certain amount of gas that will escape into the car. Yet people seem to prefer all this to the trolley car. My idea is that if the trolley cars were given an even chance to go through the public streets and the carriageway was restricted to moving traffic you would solve the problem of rapid transit.

Buses Expected on Five Auburn Lines

There was a further hearing before Public Service Commissioner Lunn on Aug. 30 on the petitions of the Auburn & Syracuse Electric Railroad for approval of declarations of abandonment of five of its lines in the city of Auburn, N. Y.

It was stated by Mr. Elder, city representative, that the city had arranged with a new company to operate bus lines over the routes traversed by the five trolley lines and that it was expected the bus lines would be in operation by Oct. 15, to operate on a 7-cent fare.

Provided the bus lines are established there will be no objection to the abandonment of the trolley lines. It is expected that applications will soon be made to the commission for the required authority for operation by the bus lines and early hearing will follow. The case was ordered closed by Commissioner Lunn.

Commission Authorizes Seven Rye Lines

The Public Service Commission on Aug. 23 issued to the County Transportation Company, Inc., a certificate covering the operation of seven lines in Rye, N. Y., to provide bus service where street car lines have been abandoned.

The bus routes are not identical with the lines of the railway and the commission's certificate is subject to the terms of the consent by the village authorities granted on April 6, May 23 and June 15 last. There was no opposition to the company's application at a hearing before Commissioner Van Namee.

The company proposes to use eighteen buses, each carrying 29 passengers, with a zone fare of 10 cents with transfers to other zones in Rye.

The change in service is part of the general reorganization by the New York & Stamford Railway of its transportation system in towns and villages in Westchester County.

Bus Terminal Planned in Heart of New York

Plans to establish in New York City, N. Y., a terminal for interurban bus lines are now being executed following the leasing of Astor Court, the private street running from 33rd to 34th Street at the Waldorf-Astoria Hotel, by the Gray Line Motor Tours, Inc. The spacious area leased from the hotel, which owns the property, together with a large room in the western end of the Waldorf, adjoining the court, will give the Gray Line, which has been operating its sightseeing and tours service from the hotel for some time, rights to the 6,000 square feet of space.

Since the recent regulation of the Police Department has necessitated the establishment of permanent terminals off the streets for interurban bus lines, the Astor Court terminal, to be shared by many other bus companies, will go a long way toward solving the traffic and parking problem, as well as centralizing interurban bus operation for the benefit of the public. The station will be operated under the name of the Gray Line Waldorf-Astoria Bus Terminal. It is estimated that it can take care of buses to the extent of from 500 to 700 a day. J. J. Reddington, manager of the Gray Line Motor Tours, says that the establishment of this terminal will stimulate interurban bus travel. The terminal will be operating early in September.

Alabama Buses Under Commission Jurisdiction

Operation of buses over the state highways of Alabama is now under the jurisdiction of the Alabama Public Service Commission, through a bill which was recently adopted by the Alabama Legislature and favored by a number of companies operating bus lines. Under the new law all bus companies are required to file a petition with the commission for a permit to operate. The commission has the right to allow or refuse the petition.

Before the enactment of this legislative act there was practically no law in Alabama governing the operation of buses on public highways. The last State Legislature before the present one did not enact any bus legislation because there were no bus lines in operation in the state at that time.

Virginia Utility Opposes Bus Grant

The Petersburg-Hopewell & City Point Railway, Petersburg, Va., will oppose the operation of a bus line from Petersburg to Hopewell, according to a statement made by Samuel W. Zimmer, president and general counsel for the company. The Southside Transportation Company recently was granted a franchise to operate a bus service between the two cities, effective within 30 days. The car line serves all plants in Hopewell except Hummell Ross. It is proposed by the bus company to operate buses into the plant area. The franchise calls for three buses to be operated daily with a 60-cent round-trip fare between Petersburg and Hopewell. The car line is operating on a 35-minute schedule at a round trip fare of 25 cents for a labor ticket.

The Councils of Petersburg and Hopewell had opposed the granting of the franchise. It is said that the trolley company will appeal the granting of this franchise to the Supreme Court of Appeals of Virginia, on the grounds that the present railway schedule serves the public adequately by the 35-minute schedule now maintained and also that the company has vested rights in the franchise. During the past few years there has been a decrease on account of business conditions, and now, since there has been a considerable increase of traffic between the cities on account of the new industries, Mr. Zimmer believes the car line is entitled to some returns from the investment.

Toledo Considers Golfers' Trials

A special bus service of three buses a day from the end of the Wildwood feeder line to Heather Downs Country Club for the use of golfers, caddies and residents of the district has been started as an experiment by the Community Traction Company, Toledo, Ohio. Service will be increased if the patronage warrants.

Digitized by Google

Bus Competition for Oklahoma Interurban Railways

Over the protest of both steam and electric railways the Corporation Commission of Oklahoma has authorized through bus transportation between Oklahoma City and Ardmore, Oklahoma City and Stillwater and Oklahoma City and Tulsa. These routes parallel electric lines between Oklahoma City and Norman, Oklahoma City and Guthrie and Sapulpa and Tulsa. The commission has assumed to modify or neutralize the effects of the new competition by prohibiting the motor carriers from picking up or discharging passengers between points served by electric railways, but the latter lines express apprehension over the loss of business heretofore delivered to them at points of connection with the motor routes.

North Shore Line Renews Chicago-Milwaukee Bus Service

Supplementary motor coach service between downtown Chicago and the business center of Milwaukee was reestablished on Aug. 20 by the Chicago, North Shore & Milwaukee Railroad. A similar coach service between these cities was started last year by the North Shore Line but was discontinued after a few months because of insufficient earnings.

The new line is operated as a nonstop service between Evanston, Ill., a suburb of Chicago, and Milwaukee. Only interstate passengers are carried. Coaches leave the Auditorium Hotel in the Chicago "Loop" at 8:20 a.m. and 2:20 p.m. daily for Milwaukee, stopping at the North Shore Line rail terminals at Adams Street and Wabash Avenue, Wilson Avenue, Chicago, and Dempster Street, Evanston. Two trips are also made daily from the Milwaukee terminal of the railroad to Chicago. The coaches make the 90-mile run each way in 3½ hours, connecting at Wilson Avenue and Dempster Street with the company's trains to and from Chicago. The new motor coach rate between Chicago and Milwaukee is $3.06. Tickets are interchangeable, being honored on either the buses or trains.

Service on the new route is furnished with one 29-passenger A.C.F. Newell type parlor-observation coach and one, 29-passenger Fageol parlor coach.

Bus Terminal at Cincinnati Under Attack

The use of Government Square, Cincinnati, Ohio, for a terminal for all motor coaches entering the downtown district may be discontinued if the suit of Eli G. Frankelstein is successful. He seeks in the Common Pleas Court to enjoin Col. C. O. Sherrill, City Manager, from enforcing the order which permitted the use of the square for a bus terminal.

Government Square, in the center of the main business district, is a block long and about 100 ft. wide. The center of this square for its full length is devoted to buses of both city and interurban lines. These include vehicles on four city motor coach lines, the Cincinnati Street Railway Company's coach lines and Interurban lines to all parts of Ohio and to cities in Kentucky and Indiana.

Mr. Frankenstein declares that in spite of the fact that the square was dedicated to general street purposes the city has barred all vehicles except buses from one-third of its width and these buses have paid nothing in return for this exclusive privilege. He says the lives and property of the traveling public are menaced because people are permitted to cross the lanes of traffic at any point in this block to the consternation of motorists, who never know when some one will dart in front of them to the buses.

The question of removing the terminal from the square has been up for consideration several times, but city officials have delayed action, recognizing that the square is a very convenient location for this loading.

Iowa Tax Law Again Censored

A second attack on the constitutionality of the Iowa law which taxes buses and freight carriers operating between fixed terminals was heard recently in the Polk County (Iowa) District Court. Advancing the charge that the law passed by the 41st General Assembly is discriminatory in its application, the Iowa Motor Vehicle Association and 25 bus operators of the state began suit before Judge William Bonner to prevent the Board of Railroad Commissioners from collecting the so-called tonnage tax. The fight was led by Mrs. Helen Schultz Brewer, well-known Iowa bus operator.

Much of the time in the presentation of the plaintiffs' side of the case was taken up with showing exhibits and other proof that hundreds of other vehicles ranging from heavy freight and passenger carriers down to taxicabs are using and wearing out the Iowa roads, yet pay no part of the tax because they are not operating on regular schedules but between fixed points.

Casper Schenk, counsel for the bus operators, charged that the law was class legislation and that it penalized regularly organized bus and freight lines while the great majority of commercially operated passenger and freight vehicles went tax free.

After hearing the evidence Judge Bonner took the case under advisement.

The first suit brought to test the legality of the tax resulted in a decision by Judge Lester Thompson of the Polk County District Court, in which he held the statute unconstitutional. Appeal was taken by the state and the Iowa Supreme Court ordered the case back to the district court for retrial on grounds that the lower court erred in allowing the facts to be stipulated instead of brought out by testimony.

Operators Come Out of Legal Excitement Unscathed

Bus operators in Georgia have new regulations to observe as a result of the passage of a new motor vehicles measure by the Legislature at its 1927 session.

If they are operating automobiles, the license charge will be made upon the basis of weight, the charge being 50 cents for each 100 lb. or fraction thereof. If they are operating buses they will find the charges the same as last year on a capacity basis, ranging from $15 to as high as $1,125 for heaviest trucks. Tractors, except those used exclusively for agricultural purposes, trailers, semi-trailers, and motorcycle side cars will be charged a license fee for the first time in the state.

The speed limit in Georgia has been increased from 35 to 40 m.p.h. for cars under 10,000 lb. For motor vehicles between 10,000 and 16,000 lb., the speed limits have been set at 8 m.p.h. for metal tires, 20 m.p.h. for solid tires and 25 m.p.h. for pneumatic tires. And for buses and trucks of more than 16,000 lb. weight, the speed limits are 5 m.p.h. for metal tires, 18 miles for solid tires and 20 miles for pneumatics.

Other attempts were made to tax bus companies, but all these failed in the closing days of the Legislature.

Line Between Lawrence and Lowell

The Eastern Massachusetts Street Railway, which has sought to establish a bus line between Lawrence and Lowell, Mass., for some time, has been successful in securing permission and the necessary licenses from Mayor Walter T. Rochefort of Lawrence, Mass. It is planned to start operations as soon as possible. All other municipal licenses have been secured and schedules are now being worked out. The line will operate via Tewksbury and Andover.

Fee Charged Intercity Buses

For the first time in four years intercity buses must pay a license fee in Chippewa Falls, Wis., according to the terms of an ordinance recently adopted that all buses operating in and out of Chippewa Falls must pay an annual license of $25 a year. The police department has been assigned the duty of enforcing the ordinance.

Rail-Light Company Protests Buses

A protest against the application of the Buckeye Stages, Inc., seeking to operate bus service between Columbus, Ohio, and Westerville, has been filed with the Public Utilities Commission by the Columbus Railway, Power & Light Company. The protestant declares that its system has provided ample service between these two points and that additional service could be provided.

Financial *and* Corporate

Rail Earnings Continue to Show Profit in Pasadena

Continuous losses in income from the operation of buses in the city of Pasadena, Cal., are shown in the June report of the Pacific Electric Railway, recently filed with the City Directors of Pasadena. The report shows a loss of $10,559 for the month of June, while the first six months of 1927 shows a loss of $50,172.

During June, 141,247 bus-miles were traveled by the buses in Pasadena, the average earning was 0.1796 cent and the average expense 0.2403 cent. The number of passengers carried on the bus lines in June was 487,022 compared with 529,529 in June, 1926. The report shows 395,499 passengers paid fares, 76,612 rode on transfers and 14,951 rode free. Passenger earnings amounted to $25,107.

During the same time, the railway transportation in Pasadena has continued to show a profit according to the report, the net operating income for June being $6,328. Analysis of the passenger traffic on the rail lines for June showed a revenue of $26,271. A total of 486,012 passengers was carried, 410,395 paying fares, 56,381 riding on transfers and 19,236 riding free. The car mileage traveled was 104,237.

New Bedford Line Sold

Sale of the New Bedford & Onset Railway, New Bedford, Mass., to a New York group whose identity was not revealed, was announced on Aug. 24 by Elton S. Wilde, president of the Union Street Railway of which the Onset line is a subsidiary. Mr. Wilde asserted that the new owners plan to continue operation.

B. M. T. Fights Bond Decision

Seeking a rehearing on its petition the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., has taken issue with the Transit Commission for exceeding its authority in denying the application to issue $20,000,000 bonds of the New York Rapid Transit Company to be taken by the Brooklyn Company for $16,000,000. In denying the application the Transit Commission held that the sale of the bonds to the B.-M. T., which is the parent company, was among other things prejudical to the interests of the city of New York because of the city's partnership with the company in the routes on which the cars are to be used.

The application for a rehearing was considered and referred to counsel at the meeting of the commission on Aug. 31. This action on the part of the company is regarded merely as a formality precedent to an application to the Apellate Division for a writ. Among other things the company contends that Mr. Untermeyer, as special counsel, the commission and the city, said there would be no objection to the sale of $3,467,000 of the bonds at 80 for equipment for additional operation. Reference was made to this bond sale in the ELECTRIC RAILWAY JOURNAL previously.

Indiana Utility Would Issue Preferred Stock

The Northern Indiana Public Service Company, Gary, Ind., an Insull utility, has applied to the Public Service Commission for authority to issue $1,300,000 of preferred stock at 6 per cent. The proceeds, according to the petition, are to be used to reimburse the company's treasury for capital expenditures made up to Aug. 1 of this year, and for money used in the retirement and purchase of certain stock.

Plans Purchase of Pennsylvania Property

The Pittsburgh Railways, Pittsburgh, Pa., subsidiary of the Philadelphia Company, is negotiating for the purchase of the Homestead & Mifflin Street Railway, operating more than 3 miles in Homestead, Pa. Expenditures of $300,000 for improvements are planned if the purchase is completed.

Indiana Line Sold

The real estate, right-of-way and rolling stock of the Fort Wayne & Decatur Traction Company, Decatur, Ind., has been sold to the Indiana Service Corporation of Fort Wayne. The line, 22 miles long, ceased to operate cars on Aug. 9 by authority from the Public Service Commission. Electric power will be continued to Decatur and intermediate points by means of the high-tension line now in service. The work of tearing up the rails will begin soon. Equipment from two substations, which will be removed, will be placed at points on the Indiana Service Corporation lines.

$7,000 for Batavia Property

The S. Snyder Corporation of Rochester, N. Y., has closed negotiations for the purchase of the physical property of the Batavia Traction Company, Batavia, N. Y., and will begin to dismantle the road immediately. Although no price was announced, it is believed approximately $7,000 was paid for the property, which includes six cars and other equipment. The Batavia Traction Company operated 5 miles of line.

Combined Surplus in Porto Rico $925,572

The net income of the Porto Rico Railways, San Juan, P. R., for 1926, after providing for depreciation, amounted to $426,026. Income derived from other sources, $9,938, made the total net income $435,964. These facts were contained in the twentieth annual report.

Interest on first mortgage and refunding mortgage bonds for the year absorbed $174,329. Provision has been made for the preferred stock dividend for the year, amounting to $70,000, and a dividend on the common stock, amounting to $30,000, paid January 15, 1927. The balance of $141,635 has been added to surplus account, which has been carried forward at $925,572. The amount of first mortgage bonds outstanding was reduced during the year by the sum of $66,500, in compliance with the terms of the trust deed.

CONSOLIDATED STATEMENT OF PROFIT AND LOSS OF THE PORTO RICO RAILWAYS, LTD., FOR YEAR ENDED DEC. 31, 1926

Net profit from operation for year after providing for depreciation		$426,026
Add: Net income from other sources		9,938
		$435,964
Less: Interest on bonds—		
First mortgage bonds	$109,845	
Refunding mortgage bonds	64,483	
		174,329
		$261,635
Less: Income tax accrued		20,000
		$241,635
Deduct: Dividend on preferred stock	$ 70,000	
Dividend on common stock	30,000	
		100,000
		$141,635
Add: Balance at credit Dec. 31, 1925	$794,926	
Less amount applicable thereto	10,989	
		783,936
Combined surplus carried forward		$925,572

The current assets as of Dec. 31, 1926, including bonds purchased for future requirements of the sinking fund, amount to $814,284, against $702,298 in the previous year. Current liabilities stand at $426,139, compared with $336,618 a year ago. The net working capital of the company has thus been increased by $22,466, and now amounts to $388,144. During the year there was expended on capital account the sum of $158,044, mostly for additions in power and light divisions.

More New Jersey Stock for the Public

Another campaign for the sale of the company's 6 per cent cumulative preferred stock to consumers will be put into effect in the fall of this year by the Public Service Corporation of New Jersey. The sale will be under the supervision of Charles G. Colyer, vice-president of the Public Service Stock & Bond Company, a subsidiary. The total number of preferred stockholders has increased from 2,763 in 1921 to 55,253 on Dec. 31, 1926.

General Engineering Concern Disposes of Utility Holdings

The World Engineering Corporation, Boston, Mass., engaged in the business of construction and appraisals, has announced through its president, Carl M. Pihl, the disposition of its public utility holdings to the J. G. White Management Corporation, 33 Liberty Street, New York City, N. Y. The holdings include the Derry Electric Company, Derry, N. H.; Yarmouth Light & Power Company, Ltd., Yarmouth, Canada; West Virginia Light, Heat & Power Company, Sistersville, W. Va., and the Sistersville & New Martinsville Traction Company, Sistersville.

Louisville Properties Valued at $28,393,734

Report of the Beeler Organization on the appraisal of the properties of the Louisville Railway, Louisville, Ky., made public by members of the Board of Public Works, recently, showed the total property values of the company to be $28,393,734. There was a depreciation of $3,944,952 on the grand total, leaving a balance of $24,448,782, which is considered the sound property value which will be used as a basis for fixing the rate of fare to be charged by the company in the future.

In making the report public members of the Board of Works refused to comment on the contents as did James P. Barnes, president of the Louisville Railway. Mr. Barnes and Charles Milner, counsel for the railway, conferred with members of the board regarding the report, but did not have time to study its contents. It will be three or four months before the board will be ready to make a statement, according to David R. Castleman, chairman. The report in four large volumes dealt with every phase of the management and operation of the Louisville Railway. A copy of the report was turned over to George W. Hubley, engineer for the Public Utilities Bureau, with the request that he make a study of the contents in order to advise members of the board regarding various items prepared by representatives of the Beeler organization.

Michigan Line Abandoned

The Marquette County Electric Railway, operated under the management of the Michigan Gas & Electric Company, suspended operations on Aug. 20 for an indefinite period. The Twin City Motor Bus Company, managed by W. J. Billing of Ishpeming, Mich., has arranged its bus schedule to follow as closely as possible the route of the cars, with half-hour service between Negaunee and Ishpeming.

The railway has been operated under numerous managements since July 1, 1892. One of the chief obstacles to the successful operation of the road has been the severe winters. Often only summer schedules were maintained. With the impoverished cars and the inability to add new ones, the company intends to junk the equipment.

$300,000 Value for Sedalia Railway

The Missouri Public Service Commission on July 2 fixed the valuation of the property of the City Light & Traction Company, Sedalia, Mo., at $1,765,000 as of Dec. 31, 1925. The figures for the various departments follow: Electrical department, $1,045,000, including $950,000 for physical property and $95,000 for going value; gas department, $420,000, including $400,000 physical property and $20,000 going concern value, and railway department, $300,000 for physical property and no going concern value, because the lines are being run at a loss.

The property was valued in connection with an application for an increase in rates for gas service in Sedalia. The commission denied the application, holding that present rates are fair and will be continued.

The order stated that the commission in fixing going value had been controlled by the circumstances surrounding each department. The state body said that slow growth of the city in recent years did not indicate immediate prospects of a substantial increase in business or extension of service except in the electrical department.

Foreclosure Decree for Massachusetts Properties

Hearing has been given by Judge Sanderson in the Massachusetts Supreme Court on the form of a decree for foreclosure by the American Trust Company of a $2,500,000 mortgage on the Boston & Worcester Street Railway, Framingham, Mass., securing a $2,460,000 bond issue, and a mortgage of the Framingham, Southborough & Marlborough Street Railway, securing $60,000 bonds. It is understood bondholders will purchase the two lines.

The framing of a decree satisfactory to Judge Sanderson involves many details not yet worked out, and counsel has informed the court that the sale cannot be made before six weeks after the decree has been entered. The upset price to be named in that decree by Judge Sanderson is agreed upon as $360,000, and the purchaser will have to provide about $180,000 in cash to meet expenses and charges. Counsel reports that a deficiency of $90,000 still exists in the finances of the Boston & Worcester in spite of the good work done by Franklin T. Miller as receiver.

Oklahoma Line Suspends

The Chikasha Street Railway, Chickasha, Okla., recently suspended operations because of its inability to meet expenses.

$23,083,776 Depreciated Value Found for Nashville Properties

The railway and electrical properties of the Nashville Railway & Light Company Nashville, Tenn., are valued at $26,046,773 as of July 1, 1926, in the report to the Railroad and Public Utilities Commission by the special investigation committee composed of William J. Hagenah, Chicago, and Prof. Albert S. Richey, Worcester, Mass.

The committee was appointed by the commission at the request of the local utility company. The report covers two years of research and computation work. In it the engineers declare that the properties of the company are in good condition, without delayed maintenance, and giving an excellent service to the public.

The estimate of the local properties covered a detailed study of every department of the company, its bulidings, tracks, ties, poles, rolling stock, motors, power plants and itemized valuations of every piece of property. The report made to the commission shows an initial cost of $16,843,201 for the properties, which the statistician declared would cost about $1.65 for every dollar expended at the time of the establishment of the company and its properties in Nashville.

The depreciation on the $26,046,773 total valuation as of July 1, 1926, would amount to approximately $3,000,000 or in detail a total of $1,918,919 on the railway properties and $1,044,148 on the electrical properties. This leaves a net valuation of $23,083,776 for the company's entire holdings in the city.

The report showed that the local company had expended approximately $3,418,000 for repairs and improvements within the past ten years.

Hocker Line Sold for $28,500

The Hocker line, officially known as the Kansas City, Lawrence & Topeka Electric Railroad, Merriam, Kan., was sold for $28,500 to the Sonken-Galamba Corporation, Kansas City, Kan., at a special master's sale on the steps of the Johnson County courthouse at Olathe, Kan., on Aug. 26. The line has not been operating since July 16 following a receivership of eight years.

Nearly 300 residents of Shawnee, Merriam and other points along the line, which extends from Rosedale to near Zarah, Kan., were given a faint hope the Hocker cars would not be discontinued and the property junked. Herman Sonken, who made the successful bid for the line, said after the sale his concern would give a "reasonable" time for the citizens served by the road to take over the property for operation. If the offer is refused the line will be junked.

Lester Blanton, president of the Merriam Chamber of Commerce, said citizens would hold meetings in Merriam to plan an organization to operate the road. He blamed the service rendered for the failure of the line to operate successfully.

Legal Notes

ALABAMA—*Injury to Passenger Trying to Board Car.*

Where a street car stops at a point with a manifest purpose of discharging and taking on passengers, it extends an invitation to that end, and it is the duty of those in charge of the operation of the car to exercise reasonable care and diligence that no person in the act of accepting such an invitation in the usual way is put in a dangerous position. Hence, a passenger, at a regular stopping point, whose hand was caught in the platform door when it was closed and was dragged some distance and was injured, could collect damages. [Birmingham Electric Co. vs. Cleveland, 113 So., 403.]

CALIFORNIA.—*Disclosure of Names of Witnesses Not Obligatory.*

A section of the civil code requires an injured plaintiff to submit himself to physical examination and the defendent to permit the plaintiff's expert to examine the machinery alleged to have caused the damage. A section of the penal code requires the drivers of vehicles which have caused injury to give to the occupants of the vehicle or person injured the names of the passengers, not exceeding five, in the vehicle causing the injury. It was held that neither of these sections requires the motorman on an interurban car to give to the plaintiff in an action for damages the names of the witnesses obtained by him after the accident. [Barrington vs. Pacific E.R., 256 Pacific, 567.]

CALIFORNIA—*Motorman May Assume that Motorist Will Use Due Care.*

Where an autobus driver approaches a railway crossing coincidently with a railway car, the continuing duty rests upon him to use reasonable caution in protecting his passengers from collision. He must presume that the motorman of the car, in reasonable probability, would continue up to and over the crossings without slowing up. The motorman may presume that the autobus driver approaching the railway crossing will use due care and need not check the otherwise rightful speed of his car in passing such crossing until he has reason to believe that the bus driver is neglecting to use care. [McCarthy vs. Pacific Elec. Ry., 255 Pac., 868.]

KENTUCKY—*Several Charges to Bus Lines Not Double Taxation.*

The law imposing a franchise tax on companies possessing special privileges from the State was held to cover bus lines. Charges for use of the highway can also be collected from them by the State under its police power, provided these charges are intended for the repair of special injuries to the highways caused by the operation of the buses. Additional charges can also be collected to help to defray the expenses of administering this law. These several charges do not constitute double taxation which is prohibited under the Kentucky constitution. The fees mentioned for the use of the highway, etc., may properly be measured by capacity and weight, as well as a charge for the tag required for each of them. [Blue Coach Lines vs. Lewis, et. al., 294 S.W., 1080.]

ILLINOIS—*Policy on Issue of Certificates Defined.*

It is the policy of the State, established by legislation for the regulation of public utilities, to provide the public with efficient service at a reasonable rate by compelling established utilities occupying a given field to provide adequate service and at the same time protect them from ruinous competition. Where an additional or extended service is required, and a utility in the field is willing and able to furnish the required service, the Commerce Commission is not justified in granting a certificate of convenience and necessity to a competing utility until the existing utility has had an opportunity to demonstrate its ability to give the required service. While priority in the field is an element to be considered, it will not of itself govern the granting of the certificate. Where the extension of service of an existing utility was required and it proposed to furnish that service only by transfering passengers at a point which was without adequate facilities for the necesities and convenience of passengers while awaiting transfer, the Commission was warranted in granting a certificate to another company which was willing to give through service. [Bartonville Bus Line, vs. Eagle Motor Coach Company, 157 N.E., 175.]

MASSACHUSETTS—*A Utility May Be Responsible for Passenger's Injury.*

A street railway, as a carrier of passengers, may be liable for negligence in failing to warn a passenger of danger in alighting from its car or in failing to see that he alights in safety.. [Williamson vs. Boston Elevated Ry., 156 N. E., 21.]

MASSACHUSETTS.—*Responsibility Defined for Construction Defects in City-Owned Subway.*

The Tremont Street subway was constructed by the Boston Transit Commission, which ceased to exist in 1918, all of its powers and duties being imposed on the city of Boston. The subway is now owned by the city, which derives a return from it. The service in the subway is supplied by the Boston Elevated Railway. A passenger was injured by falling into an open space left in the original construction between the station platform and the car body and brought suit against both city and company. The latter was held not responsible, as the platform was designed and constructed by public authority, and the city also was not responsible because the subway is a public enterprise for the general welfare, hence the city cannot be deprived of the defenses which are open to the public agency in undertakings of this kind. [Bartol, vs. City of Boston and Boston E.R., 156 N. E., 844.]

NEW YORK—*Motorman Held Not Responsible for Pedestrian's Acts.*

A pedestrian who, in crossing a street between blocks, stepped in front of an approaching car 20 to 25 ft. away, and was struck by the near corner of the car, was held guilty of contributory negligence and motorman was not held negligent, as he was not required to anticipate the pedestrian's acts. [Schneller vs. Ninth Ave. Ry., 220 N. Y. Supp., 434.]

MINNESOTA—*Railway Not Liable for Injuries to Repairer of Fire Alarm Wire Attached to Its Poles.*

A fire alarm wire was attached to a railway pole without the company's express consent, though without its objection. When the wire broke a person not an employee of the city but with the consent of the fire department began to make repairs and was injured when the pole broke. The company had not given permission to anyone but its own employees to climb the pole and was held not liable for the injuries. [Howard vs. Minneapolis & St. P. S. R. Co., 214 N.W., 658.]

MISSOURI—*Duty of Pedestrians When Crossing Street to Look and Listen.*

In order not to be guilty of contributory negligence, one must, before entering on a street railway track, look and listen in both directions for cars, provided by looking and listening he could discover their approach. Where the view of a person is obstructed as he approaches a railroad track, he must look in both directions for approaching cars after he passes the obstruction and reaches a point from which looking would be rendered effective. [Zlotnikoff vs. Wells, 295 S.W., 129.]

MISSOURI—*No Damages Allowed for Mental Distress.*

No recovery can be had for fright, terror, anxiety or mental distress caused by negligence, where unaccompanied by any personal injury, or for personal injuries caused solely by mental disturbances without external impact. [Gibbon vs. Wells, 293 S. W., 89.]

WASHINGTON.—*Commission May Anticipate Future in Granting Certificates.*

In granting certificates of convenience and necessity, allowing the operation of motor transportation companies under the State Law, the Department of Public Works may anticipate the future as well as consider the present necessity and convenience. Such action was upheld as regards a district not completely served by a railway, although the latter was not given a special opportunity to furnish increased facilities before the competing carrier was licensed. [Northern Pacific Ry. et al. vs. Department of Public Works, 256 Pacific, 333.]

Personal Items

Walter J. Cummings New President of Chicago and West Towns Railway

Walter J. Cummings, an outstanding figure in the industrial and civic life of Chicago and president of the Cummings Car & Coach Company, was elected president of the Chicago & West Towns, Railway, Oak Park, Ill., on Aug. 22, succeeding the late ex-judge Willard M. McEwen. The new incumbent's connection with this railway

W. J. Cummings

property dates back to 1913. He has been chairman of the board since 1918.

As manufacturer and operator Mr. Cummings knows the railway business, senses its needs and has confidence in its future. His active interest in the electric railway industry dates back approximately twenty years when the successful foundry and forging business that had been built up by the Cummings brothers was expanded through the purchase of the McGuire Manufacturing Company, well-known manufacturer of trucks and sweepers.

Later with the addition to its line of products of a gas-electric bus for supplementary railway service, the name of the company was changed from the McGuire-Cummings Manufacturing Company to the Cummings Car & Coach Company. In 1904 Mr. Cummings became vice-president of the McGuire-Cummings Manufacturing Company and president in 1918. His ardent belief in the future of the railway business was expressed in an interview published in ELECTRIC RAILWAY JOURNAL for March 27, 1926. He has steadfastly held to the view that the essential nature of the service rendered by the electric railway made its position fundamentally sound. He believed that the bus added a new and valuable agency for handling the type of service that did not justify railway construction and contended that bus operation by electric railways need not be a losing venture when approached from the proper viewpoint.

Mr. Cummings was born on June 24, 1879, at Springfield, Ill. His early training was in the banking business. The Chicago & West Towns Railway, over which he now assumes executive control, operates 67 miles of electric railway in the section lying just west and southwest of the Chicago. In addition, it owns more than 7 miles of track which are leased to the Chicago Railways Company. The company also operates bus lines supplementing its railway service.

G. I. Wright, Engineer of Electric Traction at Reading

G. I. Wright has been appointed to the new position of engineer of electric traction of the Reading Railroad, Reading Pa.

Following his graduation from Leland Stamford University in 1913 as an electrical engineer he was employed by the Southern Pacific Railroad in connection with the electrification of branch lines. He left that post in 1917 to enter the United States Navy, being appointed electrical officer of the *U. S. S. Montana* after a course of instruction at the Naval Academy. In August, 1918, he was promoted to lieutenant and sent to the Portsmouth Navy Yard to supervise the construction of several submarines.

He resigned from active duty in February, 1919, and for three years was construction superintendent of the Duluth Edison Electric Company, at Duluth, Minn. Following this, he was employed by the Illinois Central Railroad as assistant engineer in charge of electrifying their Chicago Terminal. He was with that company for five years, during which time he was promoted to office engineer and handled all features of that work.

C. H. Forsgard in Toledo. Other Changes in Line-Up

Charles H. Forsgard, who has been made general superintendent of the Community Traction Company, Toledo, Ohio, and given direct supervision of the operations of the company, has been in the service of electric power and railway properties ever since his graduation as an electrical engineer from the Texas Agricultural and Mechanical College in 1911.

Mr. Forsgard is a native of Waco, Tex. His first work was with the Houston Light & Power Company, controlled then by the United Gas & Electric group. Later he went into the Texas Panhandle district to manage three small properties for a Boston financial group. In 1917 he went to the Weston Light & Power Company, in Colorado, later taken over by Henry L. Doherty & Company. Here he remained with this property for seven years and then was transferred to Durham, N. C., in an executive capacity with the Doherty utilities there.

In his new capacity at Toledo, mention of which was made in the ELECTRIC RAILWAY JOURNAL, issue of Aug. 13, page 290, he will relieve J. Frank Johnson, vice-president and general manager of the company, from many of the details of operation, permitting Mr. Johnson to take a greater part in the promotion of public relations and general policies of the company.

In the change E. V. Emery, who has been transportation superintendent of the company, will go to the New York offices of Henry L. Doherty & Company.

C. H. Forsgard

Sidney L. D. Jackson, attorney who has been with the law firm of Tracy, Chapman & Welles, general counsel for the company, has also been added to the claims staff of the Toledo company to assist Attorney Donald Finkbeiner.

OBITUARY

WILLARD M. MCEWEN, president of the Chicago & West Towns Railway, Oak Park, Ill., died suddenly on Aug. 18 at his summer home at Ephraim, Wis. Mr. McEwen was an ex-judge of the Superior Court of Cook County and a former law partner of United States Senator Charles S. Deneen. Recently, Mr. McEwen was in the limelight when he directed the litigation of the now famous bus case which resulted in the ruling of the Illinois Supreme Court to the effect that the State Commission must give preference to able existing utilities over those desiring to compete.

HARLEY W. BRUNDIGE, for eight years a member of the California State Railroad Commission, died on July 16. It was in 1919 that Governor Stephens named him to the commission. Prior to that time he had been engaged in journalism, the career he chose after leaving college. His first editorial experience was in Missouri, where he attained distinction. He later went to California and filled several important positions in the newspaper field. Mr. Brundige was born in Ohio in 1865.

Manufactures and the Markets

New Electric Rolling Stock in England

Hitherto the London, Midland & Scottish Railway has employed on its London suburban electrified lines cars open internally from end to end with end and center doors. These are in general similar to those used on the London tube railways and are employed in through service between the Baker Street and Waterloo Railways and Watford on the L. M. S. line. This was started before the railway amalgamations, when the Watford route was part of the then London & North Western Railway. On the other hand the Southern Railway has on its London suburban electrified lines (Brighton section) compartment cars similar to those employed on the steam railways. With this idea in mind the London, Midland & Scottish Railway in its latest order for additional cars has chosen the compartment type. The vehicles are arranged in three-coach units as usual, but two or more units can be coupled up when long trains are required during the busy periods. The new order embraces 28 third-class motor cars, 24 composite trail cars and 23 third-class control trail cars. The body length of motor cars is 59 ft. and of the others 57 ft., with a body width in each case of 8 ft. 11 in. The centers of the bodies are 39 ft. apart. The unladen weights of each type are respectively 56 tons, 28 tons and 30 tons, while the seating accommodation is for 84,100 and 96 passengers respectively.

The bodies are of No. 14 gage channel finish galvanized steel and the floors are of galvanized steel sheets covered with decolite. The seating is after the usual British steam train type. In general, it may be said that the cars conform largely to standard practice.

Economic Problems Before Chamber of Commerce

The part organized business is to play during the forthcoming year in the solution of outstanding economic problems, such as agriculture, flood control, taxation and merchant marine, will be shaped at a meeting of the national councilors, committees and board of directors of the Chamber of Commerce of the United States to be held at West Baden Springs, Ind., Oct. 15 to 18.

It will be the first meeting of the kind to be called by the national organization and the first conference on questions of national economic policy to be held in the environment of the Middle West. The meeting place has been deliberately chosen with a view to affording business interests of that region the widest possible opportunity to present their views on current economic and legislative problems.

The West Baden meeting will, it is expected, bring to a focus opinion of business executives representing organizations in every state. Invitations have been extended to more than 1,000 national councilors, each representing a trade association or commercial organization in the membership of the national chamber, and approximately 200 officers, directors and members of special committees dealing with particular phases of business activity.

Norfolk Receives Five New Buses

Five new 21-passenger buses have been placed in service at Norfolk, Va., by the Virginia Electric & Power Company, Richmond, Va. They have replaced five buses on the Navy Yard routes. The old equipment will receive a general overhauling and renovation. The routing of two trolley lines, the Craddock and the Park View lines, have been changed by the company.

C. V. Marks Hurt in Fall at Ohio Brass Plant

C. V. Marks, treasurer of the Ohio Brass Company, Mansfield, Ohio, on Aug 5, was severly injured in a fall down an elevator shaft while inspecting the company's new office building. He suffered several broken bones, which will incapacitate him for some time. His friends in the industry will be glad to learn that apparently no internal injuries resulted and that he is doing very well.

Pre-Convention Flashes from Cleveland

THERE was an enthusiastic meeting of the decorations subcommittee of the A.E.R.A. exhibit committee in Cleveland last week. Fred Dell, director of exhibits, looked wise and mysterious but said very little about the plans formulated at the pow-wow, which was held in the office of Col. J. H. Alexander, president of the Cleveland Railways. A JOURNAL man after much inquisitiveness unearthed that they were going to decorate the decorations under the big roof, and also that miniature artist models of the buildings were approved. Sumpins' in the wind, but the wind ain't blowin' this way.

Speedy and early shipment of cars exhibited on the track section at Cleveland will greatly facilitate the work of the sub-committee which recently met in Cleveland and tentatively laid out the arrangement of the cars.

I. R. T. Receives Large Shipment of Electric Snow Melters

The Interborough Rapid Transit Company of New York City is receiving from the Westinghouse Electric & Manufacturing Company more than 1,060 snow melter units for railway track switches. The shipment is the largest ever made to one company and is the third order of this equipment for the I.R.T. The company will have 3,200 units in use when these are installed.

Electric snow melters have been used by many transportation companies during the past two years and have given exceptional service by keeping track switches open and operating during heavy snow and sleet storms. During the terrific blizzard of February, 1926, when more than 12 in. of snow fell in less than a day, the heaters gave excellent service.

These units are so installed that sufficient heat is generated at the important points of each switch to prevent the collection of snow or the formation of ice. Each switch group of heaters is individually connected to the power line by a fuse and single-throw switch and the yard men can turn them on whenever occasion demands. This simple method of keeping the track switches clear forestalls possible tie-ups of service during sudden storms and removes the necessity of recruiting a large force of men upon short notice.

Construction Commenced on Warehouse for Kansas City Lines

The Kansas City Public Service Company started excavations on Aug. 11 for a large warehouse and office building at the southeast corner of 40th and Summit Streets. The building will house the equipment and working force of the construction department.

The ground dimensions of the warehouse will be approximately 75 ft. by 135 ft. and a part of the planned structure will be two stories high. The two-story portion of the building will be about 75x100 ft. in area and it will contain the locker rooms for the employees of the construction department, of which there are about 100. The ground floor will be used for the protection of welding machines and other valuable equipment of the department.

Due to the considered setting back of Summit Street for a traffic way, the building will be built 30 ft. from the present Summit Street.

A tentative agreement between officials of the city and those of the Public Service company has been reached, it is understood, whereby the company would not oppose the widening of Summit Street through its Westport yards, which are extensive.

The proposed trafficway would start at 38th Street and cut through residential property at 39th Street east of the intersection of Summit and 39th Streets, to avoid cutting into large business and apartment structures at the intersection.

Digitized by Google

If this plan is followed the traffic way would enter Summit Street proper at about 40th Street, where the new warehouse and office building is located.

Quiet Week in Metals but Copper Picks Up

Copper has sold in much better volume than for several weeks, and prices have taken a turn for the better; other metals, however, have been quiet, with lower prices for lead and tin. Zinc has had an unusually quiet market, but prices have held.

The tone of the copper market is perceptibly better. Again in the week ending Aug. 31, as in the two previous weeks, most of the large sellers have refused to quote below 13¼ cents, delivered to usual Connecticut points, though business has been taken in certain directions as low at 13.05 cents. In fact, resale lots of spot copper have been sold in the New York district for as low as 12.95 cents cash. However, the cheaper offerings have become less in evidence and on Aug. 31 it was difficult to find anything under 13.20 cents delivered Connecticut, and as early as Aug. 29 some sellers got the full 13¼ cents.

The week's trading in the lead market opened very feebly and consumers showed little or no interest; small lots were sold at prices ranging from 6.15 to 6.17 cents per pound f.o.b. St. Louis. On Aug. 30 the American Smelting & Refining Company again reduced its contract price: it will be remembered that this was fixed at 6.60 cents and Aug. 24. The present reduction brings the price down to 6.50 cents, New York. Corroding grades command a premium of $2 to $3 per ton over common load.

The week ended Aug. 31 has been the quietest week of the summer for zinc, practically no sellers doing their normal volume of business. The price has fluctuated between 6.225 and 6.30 cents St. Louis. New York prices on Prime Western continue at the usual premium of 35 cents per 100 lb. over St. Louis.

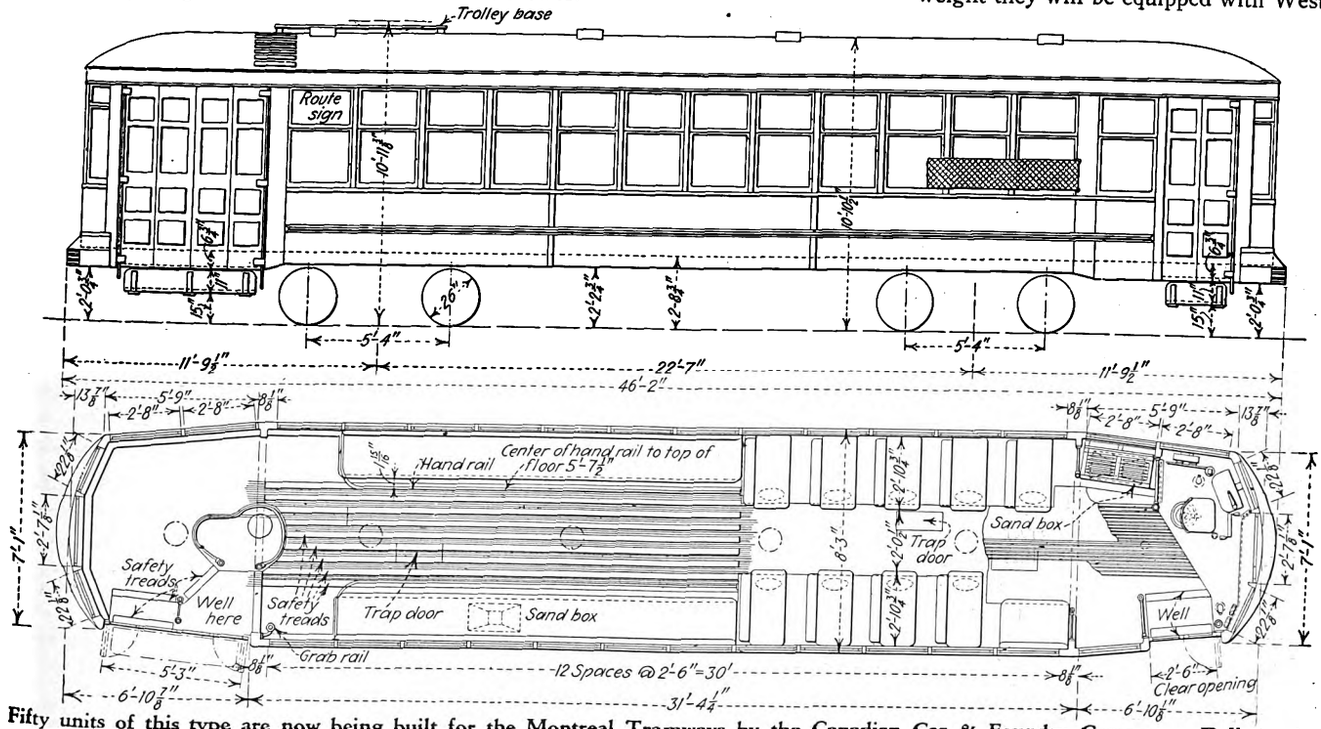
Only small fluctuations in the price of tin have occurred. Identical prices obtain for spot, September, and October tin, and there is a small premium amounting to one-quarter of a cent on November and half a cent on December deliveries.

50-Car Order for Montreal Tramways Placed June 14

As forecast in ELECTRIC RAILWAY JOURNAL for Feb. 19, 26 and March 12 an order for 50 two-man, city type, single-end cars has been placed by the Montreal Tramways, Montreal, Canada, with the Canadian Car & Foundry Co.

In announcing the signing of this contract, dated June 14, D. E. Blair, general manager of the tramways, states that the units are to be constructed along the general lines adopted for the 50 one-man cars built last year. "The length," writes Mr. Blair, "has been increased 5 ft. and the rear platform arranged for normal two-man operation. By using aluminum for side posts, girder plates, wainscoting and other trim, the weight of the cars will be no greater than that of the one-man cars, namely, 36,000 lb., complete with trucks and four 42 hp. motors on 26-in. wheels."

The units, each seating 44 passengers, will be painted the same standard green color as the other two-man cars now in service. Owing to their light weight they will be equipped with West-



Fifty units of this type are now being built for the Montreal Tramways by the Canadian Car & Foundry Company. Delivery is expected in September. Aluminum alloy will figure largely in their construction.

Number of units	50
Type of unit	Two-man, motor, passenger, city, single end, double truck
Number of seats	44
Builder of car body, Canadian Car & Foundry Co. City and state	Montreal, Canada
Date of order	June 14, 1927
Date of delivery	Sept. 30, 1927
Weights:	
Car body	19,350 lb.
Trucks	10,000 lb.
Equipment	6,650 lb.
Total	36,000 lb.
Bolster centers	22 ft. 7 in.
Length over all	46 ft. 2 in.
Length over body posts	31 ft. 4½ in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 3 in.
Height, rail to trolley base	10 ft. 11⅛ in.
Window post spacing	30 in.
Body	Semi-steel
Roof	Arch
Air brakes	Westinghouse variable load
Armature bearings	Plain
Axles	4½ in.
Car signal system	Faraday
Compressors	Westinghouse
Conduit	Metal
Control	K-35
Couplers	Bar
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	End, folding
Fare boxes	Coleman
Finish	Enamel
Floor covering	Wood slat with Kass strips
Gears and pinions	Nuttall B.P. helical
Glass	21 oz.
Hand brakes	Peacock staffless
Heat-insulating material	Hair
Heaters	Electric
Headlining	¼-in. Haskelite
Interior trim	Cherry
Journal bearings	Plain
Journal boxes	Cast iron
Lamp fixtures	Keystone compensating
Motors	Four Westinghouse 510-A-2, inside hung
Painting scheme	Green and cream
Roof material	Wood and canvas
Safety car devices, Doors interlock brake and line switch	
Sash	Brass
Seats	Ottawa Car Manufacturing Company
Seat spacing	30 in.
Seating material	Rattan
Slack adjusters	Westinghouse
Steps	Folding
Step treads	Mason
Trolley catcher	Keystone
Trolley base	Nuttall U. S. 20
Trolley wheels	Ideal
Trucks	Canadian Car & Foundry 790-F
Ventilators	Railway Utility
Wheels	Cast iron, diameter 26 in.
Wheelguards	H-B
Special devices	Heaters thermostatically controlled

Side posts, corner pillars, wainscoting, girder panels and miscellaneous body parts of aluminum alloy. Floor framing of steel. Interior finish, window sills and posts, etc. of cherry wood. Floor two-ply wood with tar felt between.

Digitized by Google

inghouse variable load brakes. Operation of doors will be interlocked with the line switch and air brakes.

Delay in placing the contract, as indicated in the JOURNAL'S issue of March 12, was occasioned by a desire on the part of the Montreal Tramways Commission to consider the advisability of designing a triplex car, also because of the commission's views on further orders for one-man operated units, to which it was in no way committed by reason of the cars of this type ordered last year.

Quincy Mayor Pilots New Trolley

During a recent trial run of one of the de luxe model cars purchased by the Eastern Massachusetts Street Railway, Boston, Mass., for operation on its Quincy, Mass., division, Mayor Thomas J. McGrath relieved the veteran motorman operating the car, at the suggestion of John H. Hayes, local manager of the company. The party on the try-out run included several representatives of the company, the city and the Quincy *Ledger*.

The cars, seven of which are to be used on the Quincy division, are being built at a cost of $15,000 apiece. Each will seat 44 persons. They are finished in mahogany and have dome floodlights and Spanish leather cushions.

ROLLING STOCK

SHORE LINE MOTOR COACH COMPANY, Michigan City, Ind., operating buses from Detroit to South Bend, where connection is made with electric trains of the Chicago, South Shore & South Bend Railroad, has received two White six-cylinder buses.

EASTERN MASSACHUSETTS STREET RAILWAY, Boston, Mass., has received four White buses, model 50-B.

LEAVENWORTH TRANSPORTATION COMPANY, Kansas City, Kan., has accepted six Mack city-type buses, 25-passenger capacity, 196-in. wheelbase, with four-cylinder motors.

BOSTON ELEVATED RAILWAY, Boston, Mass., has placed an order with the Taylor Electric Truck Company, Troy, N. Y., for ten type L. R. H. double trucks, 5-ft. 2-in. wheelbase and 26-in. wheels.

GRAND RAPIDS, GRAND HAVEN & MUSKEGON INTERURBAN COMPANY, Grand Rapids, Mich., announces that the American Car & Foundry Company will deliver six 30-passenger parlor car type buses on Aug. 25, as the first units in the company's plan to co-ordinate electric rail and bus service. The dual service will be effective Sept. 1.

COUNTY TRANSPORTATION COMPANY, bus-operating subsidiary of the New York, Westchester & Boston Railway, New York City, has accepted delivery on seven Mack 29-passenger city type buses, 225-in. wheelbase, with four-cylinder motors for operation in Westchester County. Twenty-five Macks are now in service.

"An' the Gobble'-uns-'ll Git You

if you don't watch your step in signing up for the big Parade at

Cleveland, Oct. 3-8

Those little gobble'uns, "Regret" or "No Space Left" will be a-chasin' you for the next twelve months. Or if you keep pulling off a sound business move you may get the railroad end of a porterhouse steak.

Exhibit Now and Rejoice at Leisure

FREDDIE DELL CAN TELL YOU HOW

TRACK AND LINE

HOLYOKE STREET RAILWAY, Holyoke, Mass., has completed the laying of new rails and the relocating of the track from the side to the center of the street for a total distance of 1 mile on Northampton Street. The work was in two sections, between Sergeant and Cherry Streets and between Hitchcock and Lawler Streets.

SAGINAW TRANSIT COMPANY, Saginaw, Mich., reports the reconstruction of tracks on South Michigan Avenue from the Michigan Central near Dearborn Street to Holmes Street as progressing rapidly. Service is being maintained by means of temporary track laid adjoining the curbing. The new work embodies the latest type of construction; that is, the placing of the steel rails on steel ties and completely imbedding them in solid concrete. It also involves the relaying of 3,400 ft. of track at an expense of $33,000. The new rail weighs 80 lb. to the yard and is 66 ft. long. Directly underneath the rail is an oak block that absorbs the vibration and noise. Thermit welding of the rail joints is one of the features of the rehabilitation program.

METAL, COAL AND MATERIAL PRICES—F. O. B. REFINERY

Metals—New York	Aug. 30, 1927
Copper, electrolytic, cents per lb.	13.013
Copper wire, cents per lb.	15.25
Lead, cents per lb.	6.55
Zinc, cents per lb.	6.275
Tin, Straits, cents per lb.	63.50
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.325
Somerset mine run, Boston, net tons	1.85
Pittsburgh mine run, Pittsburgh, net tons	1.95

Central, Ill., screenings, Chicago, net tons	†
Kansas screenings, Kansas City, net tons	2.675
†Quotations withdrawn because of strike.	
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.55
Weatherproof wire base, N.Y., cents per lb.	5.20–5.70
Cement, Chicago net prices, without bags.	2.05
Linseed oil (5-bbl. lots), N.Y., cents per lb.	11.5
White lead in oil (100-lb. keg), N.Y., cents per lb.	13.75
Turpentine (bbl. lots), N.Y., cents per gal.	63.0

TRADE NOTES

HASKELITE MANUFACTURING CORPORATION, Chicago, announces that in the new Twin Coach designed by F. R. Fageol, Plymetyl is used for 75 per cent of the surfaces, while Haskelite is used for the floor.

WILLIAM E. BROWN, manager of the central station department, New York district of the General Electric Company, has been appointed New York district sales manager. Mr. Brown's headquarters will be at 120 Broadway, New York.

J. G. BRILL COMPANY, Philadelphia, has transferred W. M. Horsell to the Philadelphia plant to represent the company's electric railway division in the southeastern territory. Mr. Horsell was formerly sales representative for the G. C. Kuhlman Car Company in the central states serving this plant of the Brill Company since 1920.

MANGANESE STEEL FORGE COMPANY, Philadelphia, announces the opening of a new office at 1335 Old Colony Building, Chicago, Ill., in charge of W. H Potter, formerly in the Philadelphia office.

A. H. FERRANDOU, formerly manager of motor coach sales for Dodge Brothers, has been appointed director of the motor coach division. Mr. Ferrandou's experience includes many years in the public utility business. He was an executive of the Washington Railway & Electric Company previous to joining Graham Brothers on June 1, 1925.

ADVERTISING LITERATURE

ACME STEEL COMPANY, Chicago, is mailing a folder describing Acme non-slip steel matting, which is used in machine shops and factories.

GOULD STORAGE BATTERY COMPANY, INC., Depew, N. Y., has mailed out a bulletin describing the new Gould kathanode storage battery.

LINCOLN ELECTRIC COMPANY, Cleveland, Ohio, has just issued a booklet on the "Stable Arc" welder, which outlines the theory of the use of arc welding in production manufacturing.

MARKET DATA BOOK COMPANY, Chicago, Ill., tells of the Market Data Book, and how advertising agencies use the book, in a folder recently issued by it.

COPPERWELD STEEL COMPANY, Rankin, Pa., has distributed a folder describing Copperweld ground rods and ground wire attachments.

OHMER FARE REGISTER COMPANY, Dayton, Ohio, has mailed an announcement of the opening of its Philadelphia sales and service branch.

Co-operation of Manufacturers Will Insure Interest in Car Exhibit

WORD went out some time ago from the committee on co-operation with manufacturers calling attention to the importance of capitalizing to the utmost on the value of this year's car exhibit. Facilities for showing cars are better in Cleveland than they have ever been for an electric railway association convention. In the opinion of the manufacturers' committee, therefore, it is important that all manufacturers co-operate to insure that the maximum value be derived for the industry from the showing of cars while there is the opportunity.

The committee suggests that all manufacturers, whether or not they are directly interested in the production of cars or car parts, help to insure adequate attendance of visiting delegates at the car exhibits. The job is simple. First look at the cars yourself and study the development shown. Then talk about them to every delegate who will listen. Finally, urge the railway man who visits your booth, after he has seen your own exhibit, to be sure to inspect the new cars on display. Better still, if you can do so take him out personally to see the cars. Talk about them and point out the new things of interest. You will be doing something not only for the industry, but you will get a better understanding of the general situation and of the progress being made.

Ship Early to Exhibit Intelligently

IN THE ISSUE of this paper two weeks ago was published a résumé of the shipping instructions sent out by the exhibit committee for the Cleveland Convention in October. They were clearly detailed and they need no further comment. It is not in the method of shipping that a possible danger lies to the ultimate success of the exhibit, but rather in the question of early shipping and erection. One has but to recall the helter-skelter confusion of the first days of some of America's biggest exhibitions to have this evil of late shipping forcibly impressed upon the mind.

The exhibit that is partly completed after the official date of opening receives scant attention from early visitors. "I'll come back here later," they say—and then they don't. The whole business leaves a bad taste in the mouths of those for whom the exhibit is specially designed. By Friday evening, Sept. 30, every exhibit at Cleveland should be completed, and by noon on Saturday, booths must be ready for the visitors' inspections

Since last October the exhibit committee, from Colonel Alexander and Director Fred Dell down, has worked unceasingly to make the 1927 show an outstanding success. Unless one is familiar with the ramifications, the mass of detail and the real generalship necessary to promote a pageant of this character, he cannot appreciate the importance of complying with every suggestion contained in the committee's shipping and arrangement instructions, especially as at this moment the industry stands on the threshold of a new era of development in which the manufacturer will play a tremendous part.

In this connection for manufacturer and operator alike the JOURNAL can think of no better advice than that given by the Bard of Avon: "There is a tide in the affairs of men which, taken at the flood, leads on to fortune. . . . We must take the current when it serves or lose our ventures."

In other words, the tide of progress in our industry is at the flood of progressive ideas. Concretely expressed in exhibits these ideas may be weighed in the balance at Cleveland, if they are presented at the psychological moment. The half-filled booth, the confusion wrought by saw and hammer, will not contribute to an adequate presentation or a sober contemplation of these ideas. Ship early to exhibit intelligently.

Duplication, Alternation, or Co-ordination

HOW best to fit the bus into the general transportation scheme in the territory served by Public Service Railway of New Jersey has long been a difficult problem. Bus operation originally was developed by independent owners and no effort was made to avoid duplication of facilities already existing. On the contrary, practically every bus route was laid out with the deliberate intention of stealing the cream of the traffic from some railway route. This bus business expanded rapidly until the State Legislature passed an act which more or less checked further increase in the number of buses. The number in operation at the time of the passage of the law was so large, however, that the competition was ruinous to the railway.

Several years ago the parent company, the Public Service Corporation, with a view to co-ordinating rail and bus operation, organized the Public Service Transportation Company as a bus-operating subsidiary. Hundreds of the independent operators were bought out, but a small number demanded such exorbitant prices that the company declined to purchase their equipment and rights. The mixed ownership of buses was a stumbling block in the way of real co-ordination. It was obvious that improvement in transportation facilities could be accomplished by removing the buses to streets other than those on which the railway operated its cars, but the independents objected to any such change. A certain part of the public found the duplication of service to be convenient, and they also opposed any change.

Difference in the rates of fare on the cars and buses further complicated the situation. The independent buses, free of most of the financial burdens imposed on the railway, were able to give service at lower fares. On routes where this could not be done, the buses did not operate at all. The lower fare on the buses was a potent influence behind the public opposition to any change in route.

In this situation the best that the company was able to do was to develop a system of alternation. Schedules

Digitized by Google

were arranged so that cars and buses operating on the same streets alternated with each other instead of running side by side from one end of the route to the other. This gave an even headway shorter than that which had previously been given by either the cars or the buses, and made it possible to save a certain amount of duplicate vehicle mileage. The result, however, was far from being a real solution of the transportation problem.

Recently a comprehensive survey of the whole transportation system in the city of Newark was made for the mayor by the engineering firm of Parsons, Klapp, Brinckerhoff & Douglas. An abstract of the report appears elsewhere in this issue. It goes straight to the heart of the matter and states unequivocally that there is no need for duplication of service on the same streets in this territory. Rerouting of buses to serve districts lying between the railway lines is recommended. Equalization of fares is emphasized as a necessary adjunct to this scheme.

Many other interesting points are touched upon in this report. Without minimizing the importance of the other phases, it may be said that the recommendations for coordination of bus and railway service are the outstanding features. These recommendations are now before the municipal authorities and it is to be hoped that active steps may soon be undertaken to bring about this desirable improvement in transportation facilities.

The Stone That Was Rejected

MICHELANGELO'S wondrous representation of young David was said to have been cut from a stone spoiled, rejected and abandoned as worthless by an unskilled workman. Many passed by this fine specimen of Carrara marble as it lay among the waste and rubbish on a street in Florence until the sculptor saw the beauty within. Likewise out in Kansas junk seemingly useless awaits only the touch of the reclaimer endowed with patience and skill sufficient to convert it into a thing of real utility.

Some twenty years ago this so-called interurban was placed in service. According to recent indictments, apparently well justified, its equipment and appurtenances, only lately retired from service, are reminiscent of that day. The road had never boasted a new car since its inception. When so-called new rolling stock did appear, it was transported from other properties willing to strike a bargain over second-hand equipment. That this floundering project would succumb in a flood tide of de luxe cars, fast schedules, trained employees and willing managements was inevitable. The enigma of a broken-down, neglected railway in the present era will answer partially, though belatedly, William Allen White's question "What's the Matter with Kansas?"

But a day of atonement may yet come for the sins of omission and commission on the part of this railway management, whether culpable or not. Efforts are being made to restore the service largely on the faith that local people have in the line. In this scrap heap there appears to lurk material replete with possibilities for creating a railway system which gives promise of serving all the better for its having been almost ruined. If in capable hands a thing of beauty can be made from material seemingly marred beyond redemption, may not a defunct railway, said to have failed not because of lack of patronage but through "ultra-conservatism," be fashioned into an up-to-date utility? There are many instances to prove that this hope is not unreasonable. And as the unveiling of "David" caused a great sensation, so may the hoped-for resumption of this road be celebrated with the appearance of de luxe cars ushering in a new régime with its shibboleth, "satisfied customers."

Another Good Report from Toronto

PROBLEMS not unlike those experienced in the conduct of private companies confront the municipality that attempts to run its railway system. This is apparent from the report of the Toronto Transportation Commission, digested elsewhere in this issue. The statement on the whole makes a very creditable showing. The commission, however, has felt called upon to issue a warning that extensions into unprofitable areas cannot be made without danger of having to raise the fare. A growing city with new suburbs and new subdivisions creates a problem in transportation. Householders are loath to move into a section not conveniently served by cars. The agitation for service grows and by and by must be met. As the Toronto *Globe* points out, if the commission supplies a service too soon, it will lose money, the deficit will pile up and cause borrowing. Borrowed money requires additional funds for the payment of interest. Thus the vicious circle grows. On this point the commission says:

> One of the most difficult conditions your commission has to meet is the constant demand for extensions of its rail lines and bus services into localities from which practically no additional revenue can be derived. While your commission recognizes its obligation as a publicly-owned utility to provide city-wide service, yet it must have regard for fundamental economic considerations if the present rates of fare are to be maintained. The revenue from the universal fare system has varied only slightly from year to year. The problem of administering the system would be greatly simplified if there were a moderate and consistent yearly increase in revenue.

The *Globe* also shows that the system on an average fare of 6.16 cents pays its way, provides for depreciation, wipes out almost $1,000,000 yearly on "intangible assets" for which the city had to pay in acquiring the system, and has a surplus of $76,961, or a little more than one half of 1 per cent on the gross income.

This, of course, is a comfortable but not a buoyant condition. The competition of private motor cars constantly cuts into revenues and it is not likely to decrease in the slightest. As the commission has made plain, improved business conditions contributed last year to the increase in revenue. Despite this, however, 5,500,000 fewer passengers were carried in 1926 than in the record year established in 1923. The increase in gross income over 1925 was partly due to the increased development of motor coach traffic and partly to the aforementioned improvement in the general business conditions in the Toronto district.

A difficult condition confronted the commission from the very inception of the municipal system. Money has been spent with a free hand, but one not too free. The conclusion of the *Globe* seems to be sound that for the immediate future the commission appears to be on safe ground without disturbing the fare. The service, generally speaking, is highly creditable. The personnel is, indeed, very able, but it never could have done the things it has done had it not been unusually free from political interference. In short, an able management has been left largely untrammeled, a condition under which the greatest success is assured by approximating the conditions of private enterprise.

What European Departmental Organization May Teach Us

SEVERAL articles in recent issues of this paper on European street railway practice suggest the question whether railway companies in this country can learn much from foreign methods. In view of the far greater extent of electric railway development in America than in any other country and the ready exchange of information, is it not probable that Americans already know the best methods of electric railway operation?

Undoubtedly in number of miles and cars in operation, America leads other nations, but size is not necessarily synonymous with quality or even with opportunity for progress. For example, in the United States, the field of electric railway operation is so large that much of the manufacturing can be done in comparatively large quantities. This makes the employment of standardized equipment almost obligatory from an economic standpoint. But in Europe, because of high tariff walls, each country is largely dependent on its own production, and the demand for electric railway equipment in each is comparatively so small that the same advantages cannot be gained from standardization. Hence there is greater diversity of practice, and possibly for this reason more opportunities of finding a new and better way of carrying out a certain task. In the form in which this method is used abroad it may not be always directly applicable to American conditions, but it may often suggest a method which would be suitable.

The leading European article this week relates to company organization. Most American managers are accustomed to think that a company organization must be largely along certain lines, but here is a railway company with the responsibilities grouped in quite a different way, yet functioning very successfully. Briefly, there are only three general departments, which may be defined as (1) financial and secretarial, (2) operation and engineering, and (3) legal and executive. In this country, the first and second would be divided into at least two each, often with three or four departments to cover "operation and engineering."

A second interesting feature of the Paris organization is the position given in the departmental arrangement to research work. There are two independent research departments, each along quite separate lines. One handles transportation methods and also has the duty of compiling the schedules. But in both this and its transportation research work it is entirely independent of the transportation department, reporting directly to the manager of operation and engineering. The other research department is devoted to technical research, and it is as independent of the engineering department as the department of transportation research is independent of the transportation department.

From the American standpoint there may be some objections to this plan, but at least it seems to give both research departments a freer field for action than if that devoted to transportation research reported to the superintendent of transportation and that on technical research reported to the chief engineer. This latter plan, usually followed here, means that recommendations for a change in either engineering or transportation methods, based on research, have to originate in the department concerned; in other words, they become essentially the criticism of a superior by a subordinate. In the more independent departmental arrangement used in Paris, this objection does not hold. In practice, it may not be a serious one, but it is worth considering. Still another interesting feature in the organization is that departments or sub-departments to discover better ways of doing things are not confined to transportation and engineering. The executive department also has its research department, although its duties, as explained in the article, are not confined to studying new and better ways of carrying out administrative work.

The Battle of Smoke

SHOULD passengers on the street cars be allowed to smoke, or should the present rule against smoking be kept in force? In this manner *Two Bells,* the leaflet distributed on the cars of the Georgia Power Company, presents to its readers an old problem for discussion. The Atlanta company is asking for expressions of opinion on which it may base its decision to retain or amend the no-smoking rule. Years ago smoking was permitted under certain conditions. The no-smoking rule was adopted to please the majority of the car riders, but that was when few gentlemen and no ladies smoked in public. Now times and customs have changed and perhaps the opinion of the majority is different.

Atlantans are taking considerable interest in the controversy and are sending in many letters. Strange to say, most of the replies evade the main question to discuss a secondary one, the feminine angle of the referendum. A typical correspondent states, "Though I am too old to be classified a flapper I am not opposed to women smoking and I should like to ask, if the no-smoking rule were abolished, would ladies be permitted to smoke on the cars the same as men?"

The objectors are even more emphatic than those in favor of the change, as witness:

"What! Permit smoking on the street cars? I should say not! How would you like to sit next to a man who was smoking an old pipe or a cheap cigar?"

Although the subject is live at present in many cities it is not new. From an operating standpoint it is highly undesirable to set aside sections of a car, or worse still entire cars, for smokers, since it makes it difficult to distribute the load. There is also the problem of maintaining a smoking compartment in a sanitary condition. Patrons who advocate the no-smoking rule further maintain that smoking and carrying smoldering cigars, cigarettes or pipes in a car is improper and unreasonably unsafe. Some go further and hold that aside from the danger of filling the eyes and throat with smoke and subjecting clothing to sparks the habit has a baneful influence on "ethical purity." Smokers, on the other hand, claim that these arguments are not valid and that since they are in the majority the majority should rule.

Two Bells made a worthy comment on the argument in its opening statement, "This is going to be the battle of smoke, with plenty of the smoke of battle." While it may be settled there always will be the difference of opinion, as voiced on one side by those who hold that it is "the inalienable right of mankind, as guaranteed by the Constitution and the laws of the land, to breathe fresh and pure air, uncontaminated by unhealthful and disagreeable odors," and on the other side those who maintain "the inalienable right of man to indulge in a good Havana."

Transportation Survey

Made in Newark

Rerouting of buses to reduce duplication of service, equalization of fares and curtailment of parking are recommended in engineers' report. Desirable development of rapid transit facilities outlined

FROM the traffic and transportation standpoint as well as economically and commercially, the city of Newark, N. J., is an integral part of the New York Metropolitan area. With a population of 465,000, together with widely diversified industrial and commercial activities, it ranks as the most important sub-center in this district. At the same time Newark is a fully developed city, with its own business and residential areas, and must be considered also as an independent center. Transportation problems arising from this situation have been the subject of several months study by Parsons, Klapp, Brinckerhoff & Douglas, engineers, New York, N. Y., and a comprehensive report recently has been submitted to the municipal authorities.

To further the growth of Newark as a business center, the report states that three distinct classes of service should be developed: First, a local service of existing buses and trolleys, confined essentially to Newark and the immediate vicinity; second, a de luxe or semi-de luxe bus service operated to towns and cities outside of Newark and centering in the business and shopping districts; third, a rapid transit system arranged to co-ordinate with the local trolley and bus systems and with the commuter service on the steam railroads and the Hudson & Manhattan tubes.

Rerouting of Buses Needed

On the main thoroughfares in and out of the central business district of the city the report states that trolleys now carry approximately 34 per cent of the total traffic, buses 33 per cent and passenger automobiles, including private vehicles and taxicabs, 33 per cent. Traffic checks, however, show heavier loading of the buses than of the trolleys on a number of routes where both occupy the same streets. That trolleys and buses are operating on the same street is due largely to the original creation of the bus service as an independent competitive system and partly to the effort made to supply service by buses during the trolley strike several years ago. According to the report there is no necessity in a territory of this extent for the concentration of two classes of transportation upon the same street.

All transportation facilities must be utilized in the most efficient and effective way if the present 5-cent fare within the city limits is to be maintained. This means a co-ordination of both railway and bus service, so as to load them uniformly without overcrowding. The report states that 80 per cent of the passengers using lines entering the downtown district want to be delivered along Broad or Market Street. For that reason the greater part of the service of both cars and buses must be continued along those thoroughfares, the engineers declare. In the outlying residential districts, however, greater convenience to the passengers and more equal loading of vehicles could be obtained by shifting some of the buses to other streets parallel to their present routes. This would divide the districts between existing trolley lines by bus routes traversing sections not directly served at the present time. With schedules properly adjusted this rerouting would tend to relieve overcrowding by a better distribution of the loading between buses and trolleys and bring utilization of both vehicles to a more even balance. Present and recommended routes are shown on an accompanying map.

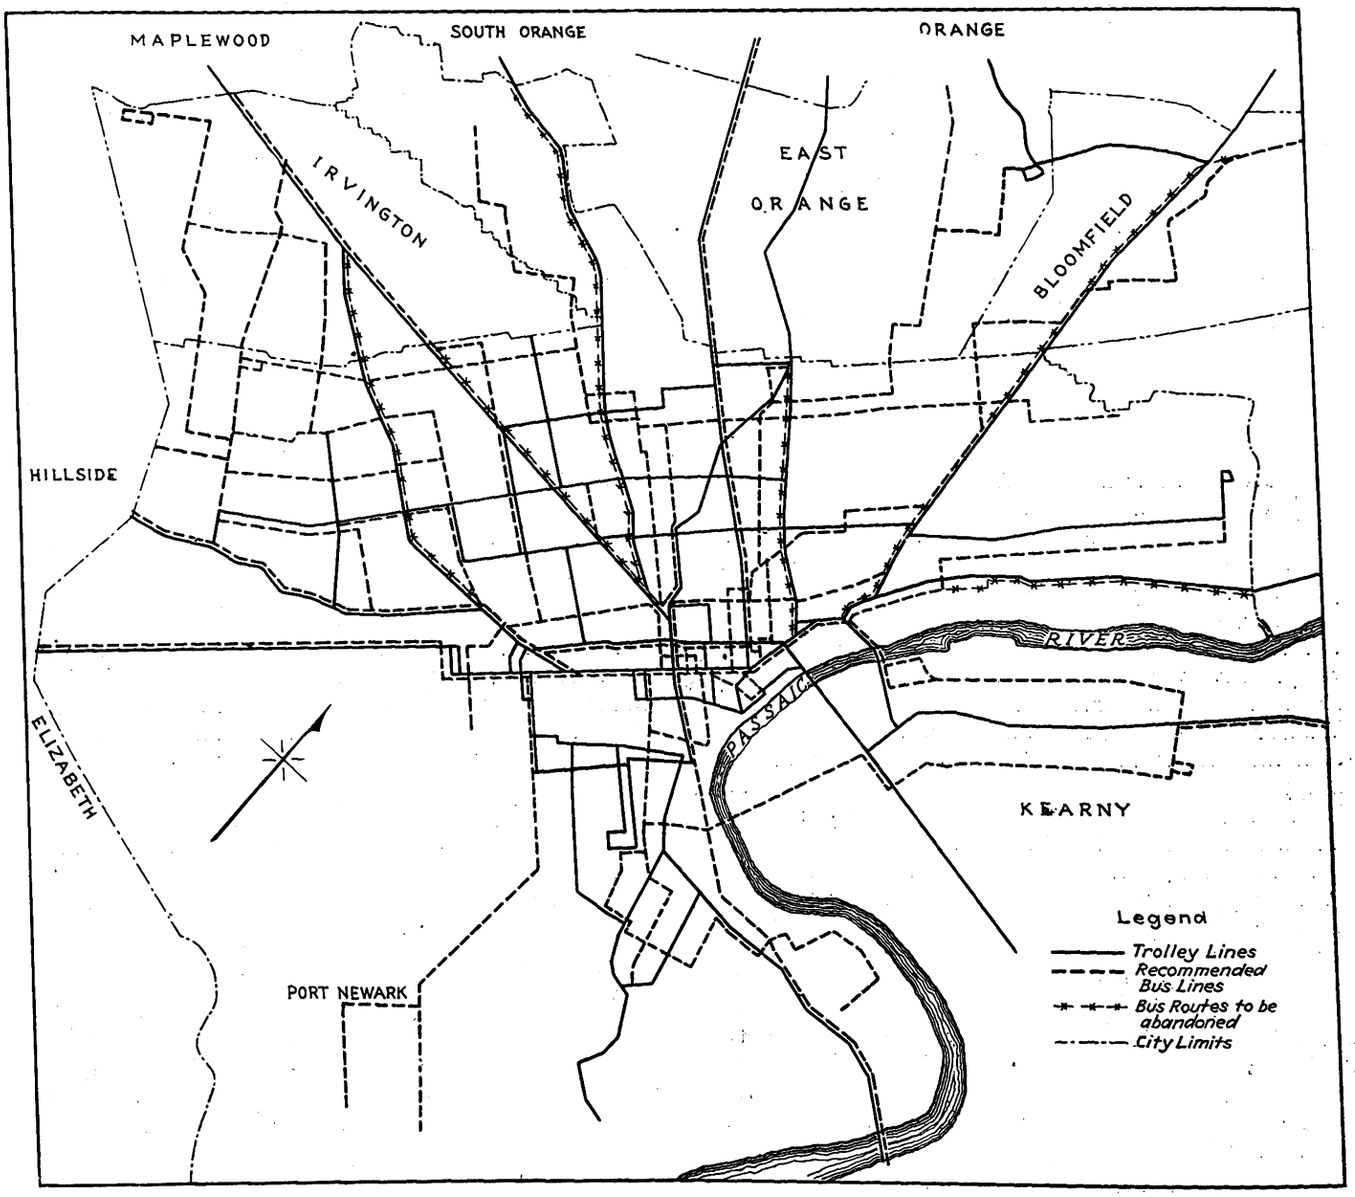
Full benefit of such rerouting, however, cannot be developed until an equal fare is charged on both bus and trolley lines serving the same territory. On account of the irregular outline of the city a number of lines well located for the convenience of the public traverse portions of Newark and one or more urban communities. The older trolley lines have established fare zones, corresponding generally with the limits of Newark. The newer bus lines, on account of their original competitive operation, have a single fare, against a doube fare on the trolley, although both are now operated by the same company. Equalization of these fares is considered by the engineers to be of prime importance.

The question of adequate service must be considered in relation to the fare. The report states that it cannot be hoped for a 5-cent fare to give a seat to every passenger on zones of such length as occur in this system. During rush hours a reasonable number of standees must be carried. Moreover, if enough buses and trolleys were operated to give a seat per passenger congestion would be so increased that they could not get though the streets at reasonable speed during the rush hours.

Parking Restrictions Recommended

Progressive steps must be taken by the city authorities to eliminate parking at critical points in the interests of the general traffic movement in these localities. Critical points occur opposite the passenger loading platforms of the trolley cars, where the width of the street is less than elsewhere. Parking along the curb opposite these loading platforms is contrary to ordinance. Observation of existing conditions indicates, however, that automobiles are sometimes parked the full length of the curb opposite loading platforms. This restriction should be extended 30 ft. beyond the ends of the platform, and steps should be taken to see that the regulation is observed. Double parking is also contrary to ordinance and should be stopped.

Digitized by Google



Present car and bus routes in Newark, N. J., and changes as recommended in report made recently by Parsons, Klapp, Brinckerhoff & Douglas. It is proposed to shift the bus routes in the outlying districts to streets on which no cars are operated, thereby eliminating much duplication of service and also accommodating additional territory. No changes are recommended in existing car routes.

A tabulation in the report indicates that 86 per cent of the automobile drivers observe the one-hour parking limit. If the 14 per cent violators had observed the ordinance, the curb line space which actually accommodated 9,679 cars would have accommodated 14,625, an increase of 51 per cent. Better observance of the ordinance, it is said, must come from force of public opinion, as the police cannot at any reasonable expense keep track of every car at all hours of the day.

Traffic conditions on Broad and Market Streets have been the subject of special study. Broad Street from Lincoln Park to Washington Park and Market Street from the Court House to the Pennsylvania Station constitute the two heaviest traffic streets in Newark and their intersection is the heart of the shopping, financial and business district. The vehicular traffic over this intersection is equal to and on some days exceeds that at Fifth Avenue and 42d Street, New York City. It is stated that a twelve-hour traffic check at this intersection between 8 a.m. and 8 p.m. on July 23, 1926, showed 30,828 vehicles crossing, comprising street cars, buses, automobiles, taxicabs and trucks, carrying more than 205,000 persons. The vehicles were divided as follows: Street cars, 2,623; buses, 4,412; automobiles, 17,015; taxicabs, 1,565, and trucks, 4,713.

Any obstruction of these streets which cuts off a lane of traffic necessarily delays all of the passengers in some degree, the report states. During rush hours parking probably causes at least five minutes delay to each passenger. This means a loss of more than 12,000 man-hours every weekday on these two streets. A check of the speed of cars and buses on Market Street from the Court House to the Pennsylvania Railroad Station, Dec. 20, 1926, compared with a similar check during the evening rush hour made Jan. 27, this year, when parking was prohibited, showed a time saving over this route of 2.34 minutes on the trolleys and 2.14 minutes on the buses, due to the increased freedom of vehicular movements on the later date. A substantial increase in speed was shown also by the buses on Broad Street. All automobile traffic on both streets was greatly accelerated.

A comprehensive view of Newark's transit situation,

Digitized by Google

the report states, must recognize that before many years a subway either for rapid transit trains or for preliminary use by street cars will be required under Broad Street, at least from Clinton Avenue to Washington Park. Rapid and convenient transportation free from surface traffic interferences will be required to develop Newark's business districts between the above-mentioned parks. Such a section of subway if used at first for trolley cars will ultimately serve as a rapid transit route.

Purchase of the bed of the Morris Canal, the report continues, established the obvious east and west rapid transit route. Development of this line between the Pennsylvania Station and Bloomfield Avenue is recommended as an initial step, with possible extension later. This should be designed for use as a trolley subway, although it will ultimately be required for rapid transit trains. The extension of the Hudson & Manhattan tubes to a terminal under Military park is proposed to give a three-point delivery for that service at the Pennsylvania Station, the proposed station at the southerly end of the city, and the terminal under the park. This, the report declares, would relieve rush-hour congestion.

Construction of a terminal under the park is important because it is the only point at which a general transfer station can be established from which any section of Newark can be reached with a single change. Eventually it would become the intersection of the subways in Broad Street and the canal bed. The proposed terminal site, the report points out, is the heaviest loading point in the city at the present time. A suggested arrangement of facilities at this location is shown in an accompanying drawing.

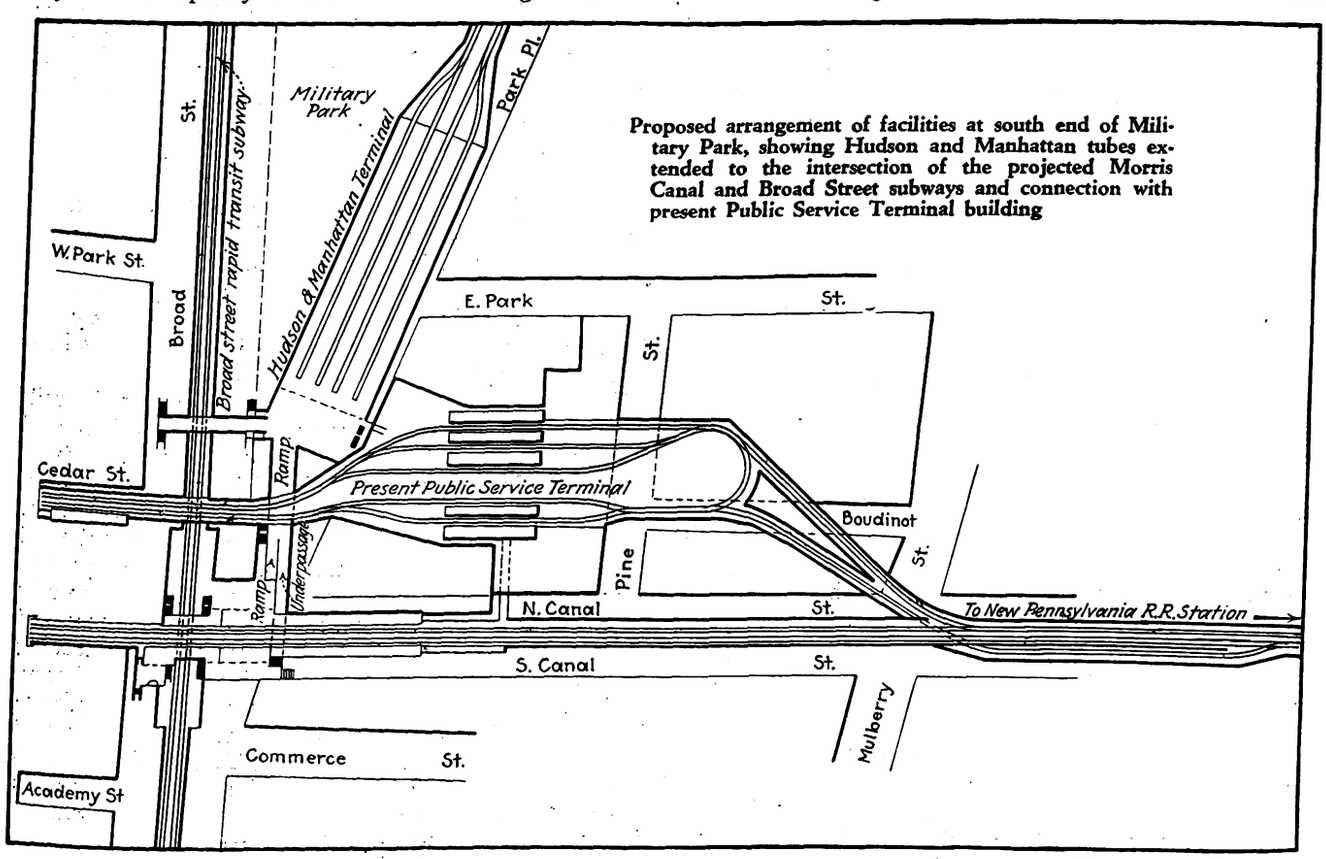
A modern subway built through the central portion of a large city is the most expensive form of construction for a rapid transit line. In certain districts, however, where street congestion and pedestrian traffic have grown beyond the capacity of the surface thoroughfare, a recourse to subways, however expensive, becomes necessary. The great cost per mile of such structures can be justified only by great density of traffic providing a revenue to support them unless the city finds it necessary to construct subways to provide convenient access to its congested districts because of the insufficient street capacity. The report points out that expenditures for a subway system must be justified as self-supporting or must produce a return to the city by increase in property values and consequent larger tax revenue. A study of the city boundaries of Newark shows that its width east and west is not great, and to tap many of the outlying districts would require extension into the territory of other municipalities. As they would participate in the benefits from rapid transit development, they should also participate in the financial burden.

Rapid Track Reconstruction in St. Louis

Widening of Olive Street necessitated the relocation of 3.35 miles of double track without interruption to service

By C. L. Hawkins
Engineer of Way and Structures
United Railways of St. Louis

DURING the past winter the city of St. Louis took possession of property condemned for the widening of Olive Street, one of the most important arteries leading into the business district, and workmen recently completed the removal of buildings from the area condemned. Double tracks of the United Railways are located on this street and the improvement necessitated extensive changes in the location of these tracks.



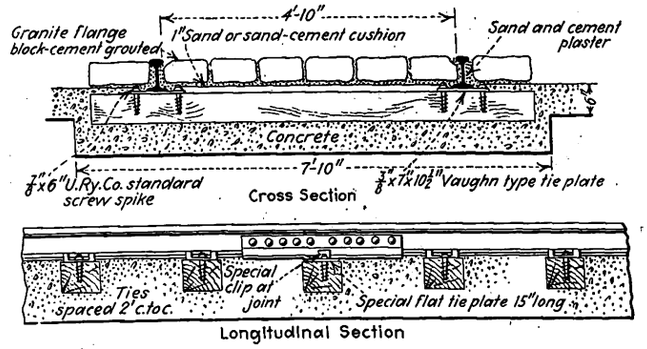
Proposed arrangement of facilities at south end of Military Park, showing Hudson and Manhattan tubes extended to the intersection of the projected Morris Canal and Broad Street subways and connection with present Public Service Terminal building

Digitized by Google

Formerly the width of the street between property lines was 60 ft. with a 36-ft. roadway and 12-ft. sidewalks. The new width of the street is 100 ft. between property lines with a 76-ft. roadway and sidewalks of the same width as before. A total length of 3.35 miles of double track was relocated at a cost of $276,250.

The tracks were of 9-in. Lorain section No. 440 rail, weighing 132 lb. per yard, laid in 1915 on 7-ft. cypress ties in solid concrete foundation laid in 1906. The rails were laid on ½-in. x 6-in. x 11-in. flat tie plates with malleable iron clips and 1¼-in. x 6-in. screw spikes, ⅞-in. round tie rods and 16-rivet Nichols composite joints. These rails carried approximately 4,000,000 cars prior to their removal, while the foundation carried approximately 6,225,000 cars. It is estimated that the rails, if

Widening of Olive Street, St. Louis, necessitated the relocation of 3.35 miles of double track of the United Railway



Granite blocks, Vaughn tie plates, screw spikes and Nichols 10-rivet joints are features of the new track laid on Olive Street, St. Louis

left undisturbed, would have been good for eight years more. After removal they will be used for minor repair work on other tracks.

New tracks were laid on a center line 20 ft. south of the old center line. This left 5 ft. between the gage line of the north rail of the new westbound track and the gage line of the south rail of the old eastbound track and permitted the construction of the new double track without disturbing the old. Rails are 100-lb. A.R.A. series "A" tee section, laid on adzed and drilled 6-in. x 8-in. x 7-ft. 4-in. white oak ties. Vaughn tie plates are used with four lugs bent down over the rail base. Spikes are ⅞-in. x 6-in. screw type. There are no tie rods. Joints are Nichols composite 10-rivet type. A solid concrete foundation is used with the concrete brought up to the top of the ties. The tracks are paved with granite blocks, flange blocks being used along the rail. The area which the railway is obligated to pave is 12 in. wide and the blocks are 12 in. long, laid at right angles to the rail.

Excavation for the southernmost or eastbound track was made with an electrically operated Thew shovel, which loaded the dirt into 5-ton Pierce-Arrow dump trucks standing on the pavement between the old eastbound track and the old south curb of the street. The contractor furnishing the dump trucks kept nine of them in service during a large part of the job and was paid for his services on the basis of yardage handled. The trench behind the shovel was finished by hand. All work on the new eastbound track was done without interference to traffic on the old double track and with little disturbance to the use of the old roadway.

Concrete in the eastbound track was allowed to set for approximately two weeks before work was started on the construction of the new westbound track. After that eastbound cars were operated over the new track and the Thew shovel began excavating a trench for the new westbound track, loading the dirt directly onto cars standing on the old eastbound track. In other respects the method of procedure was the same as for the track first built.

Work Done in the Two Nine-Hour Shifts

Two shifts of nine hours each were used on this work, the first starting at 5 a.m. and quitting at 2:30 p.m., while the second began at that hour and stopped at midnight. Work was begun on the eastbound track on June 8 and was completed, including pavement, on July 1. This work included some grading and some special work required for construction of the westbound track. Work on the latter began on July 18 and was completed, including paving on Aug. 4, making a total of 42 days for the construction of 3.35 miles of double track, or 12½ days per mile of track, including paving.

The new westbound track is located just north of the curb of the old 36-ft. roadway of Olive Street. The new eastbound track is located within the old sidewalk space on the south side of the street. While practically all of the buildings in this area were business houses, only 30 ft. of the new eastbound track is located over old cellars under the former sidewalk. In the 40-ft. strip on the south side of the street the city has kept inspectors on the scene during the wrecking of buildings to see that only clean material, free from wood, building paper and other trash was used for filling in the cellars. No clay was permitted to be used in the filling process. By this careful inspection it is hoped that a foundation has been secured that will not settle materially.

Contracts for paving the roadway outside of the railway area was let by the city on July 26. Work started soon thereafter and it is hoped that the south roadway and south sidewalk will be finished before cold weather interferes. During the construction of the south half of the street westbound cars will be operated over the old westbound track and eastbound cars will be operated over the new westbound track. This will leave the new eastbound track as a landing space for passengers and make unnecessary the construction of temporary loading platforms. The old westbound track will be out of service because portions of it must be removed to permit the installation of manholes for telephone conduits centered under the new westbound track. All conduit manholes are so built that the entrances are far enough away from the tracks to permit pulling in or out of cables without interference with the operation of cars.

The Prince of Wales and Vice-President Dawes transferring from their automobile to the Ondiara for the Niagara Gorge trip

Royalty Visits Niagara Gorge

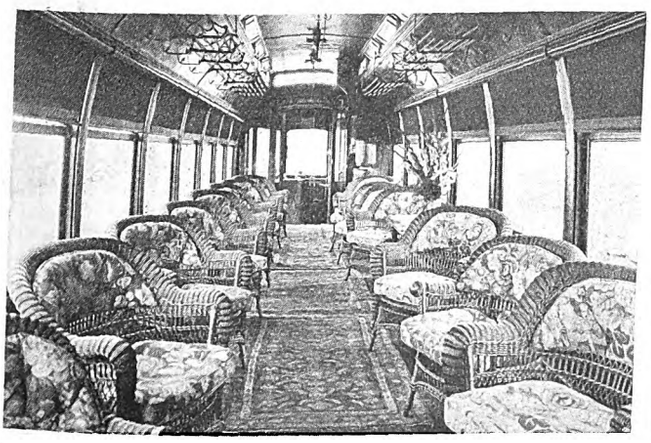
International Railway was host to the Prince of Wales, Vice-President Dawes and others. The trip was safeguarded well by the company

WHEN his Royal Highness, the Prince of Wales, his brother, Prince George, Prime Minister Stanley Baldwin of Great Britain, Secretary of State Kellogg, Vice-President Dawes and other officials representatives of England and the United States attended the dedication of the new $4,500,000 Peace Bridge across the Niagara River from Buffalo to Fort Erie, Ont., the International Railway, Buffalo, N. Y., played the rôle of host to a large part of royalty and American statesmen on a trolley tour through the lower Niagara Gorge.

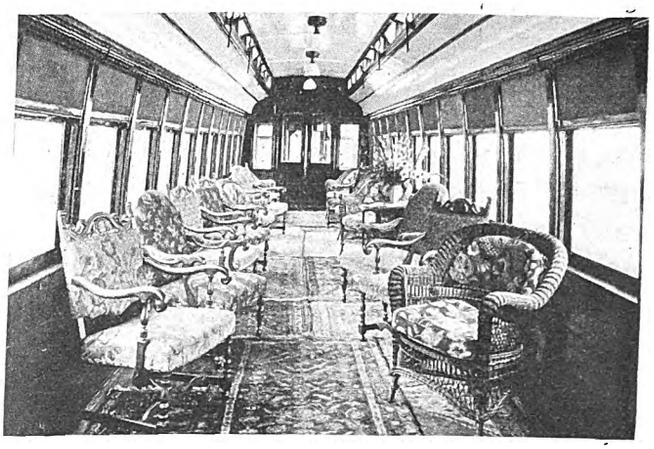
It was the first time that an heir to the British throne and a Vice-President of the United States, together with more than a score of other prominent members of the royal family and distinguished American officials, were guests of an electric traction company. They deserted their private automobiles and the royal train, which carried the British and Canadian party across the Dominion, for seven especially decorated street cars.

For two weeks previous, the International Railway had been planning every detail of the trip which started at Chippawa, Ont., and continued over the Park and River division of the company to Queenston, over the company's lower bridge to Lewiston through the lower Niagara Gorge via the Niagara Gorge Railway, up through the business section of Niagara Falls, N. Y., over the Falls View Bridge of the railway company and back again into Canada.

The photographs show interior views of two of the cars used by the royal party. The cars previously had been put through the paint shops, the seats had been removed and heavy wicker arm chairs and period furniture was installed. Oriental rugs covered the floors and



The Ondiara, private car of the International Railway, carried the Prince of Wales and his party



The Rapids, private car of the Great Gorge Route, also was used to carry the royal visitors

Digitized by Google

the cars were decorated with flowers. Arrangements had been made with a caterer to serve tea to the distinguished passengers. The trainmen were especially selected from the viewpoint of experience and appearance. Seven cars were in the procession, the first being a pilot car carrying Bernard J. Yungbluth, president of the International Railway, and other officials. The second car carried the Prince of Wales, Prince George, Prime Minister Baldwin, Secretary Kellogg, Vice-President Dawes and some of the ladies in the party.

All arrangements covering a period of two weeks were handled personally by President Yungbluth. No other traffic was allowed over the various divisions and bridges while the royal party was in transit, and there were no stops for customs or immigration inspection. At the intersection of the International local lines in Niagara Falls and the New York Central Railroad, trains were held up so cars would not be detained at the crossing.

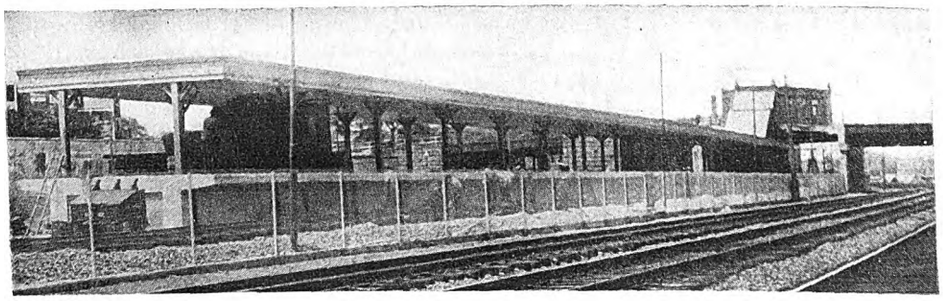
Twenty officials and employees of the company were assigned by President Yungbluth to supervise the trip, indicating the extreme care exercised to insure the safety and comfort of the distinguished party. In addition, other men were assigned to ride the cars in the royal procession and to inspect all men in uniform. The two private cars used were the Ondiara of the International Railway, and the Rapids of the Niagara Gorge Railway. The police supervision was also arranged by the Dominion authorities, the United States Secret Service, the New York State constabulary and the Niagara Falls police, these bodies co-operated with the railway executives and there was a lengthy detailed assignment of these men to prevent any unpleasant incident. One of the photos shows Vice-President Dawes and the Prince of Wales leaving their private automobile at Chippawa to board the International Railway special car.

First Station Completed on Dorchester Rapid Transit

SIMPLICITY is the keynote in the design of the new Columbia station, the first to be completed on the Boston Elevated Railway's new Dorchester rapid transit extension. This station will serve a heavy residential district and several large industrial plants. In general arrangement it is of the "island" type. The headhouse is provided with wide doorways. It has an area of approximately 290 sq.ft. on the sidewalk level for prepayment use. The fare collection apparatus includes two General Electric automatic dime-in-the-slot passimeters and an old type passimeter located at the change booth window.

Two flights of stairs lead from the fare collection barrier to the north end of the platform, which extends 350 ft. beyond the stairs. The width of the platform varies, being 20 ft. wide at the stairs and 23 ft. at the opposite end. A feature of the design is a 4-ft. space between the platform edge and the concrete base, which not only provides a place for cables, wires, piping and other necessary equipment but serves as a refuge for track workmen when a train is approaching. A canopy with slab waterproofed concrete roof is supported by steel members and extends the entire length of the platform. Two switch rooms and toilets for the public and employees are located under the stairways, while a waiting room and station master's room are in the center of the station.

The entire structure is fireproof, being built of brick, concrete and steel. The tracks were so located as to provide for a 135-ft. extension to the platform to be built when increased traffic warrants six-car trains.



Above, Columbia station from Old Colony Railroad. Columbia Road viaduct and headhouse are on the right

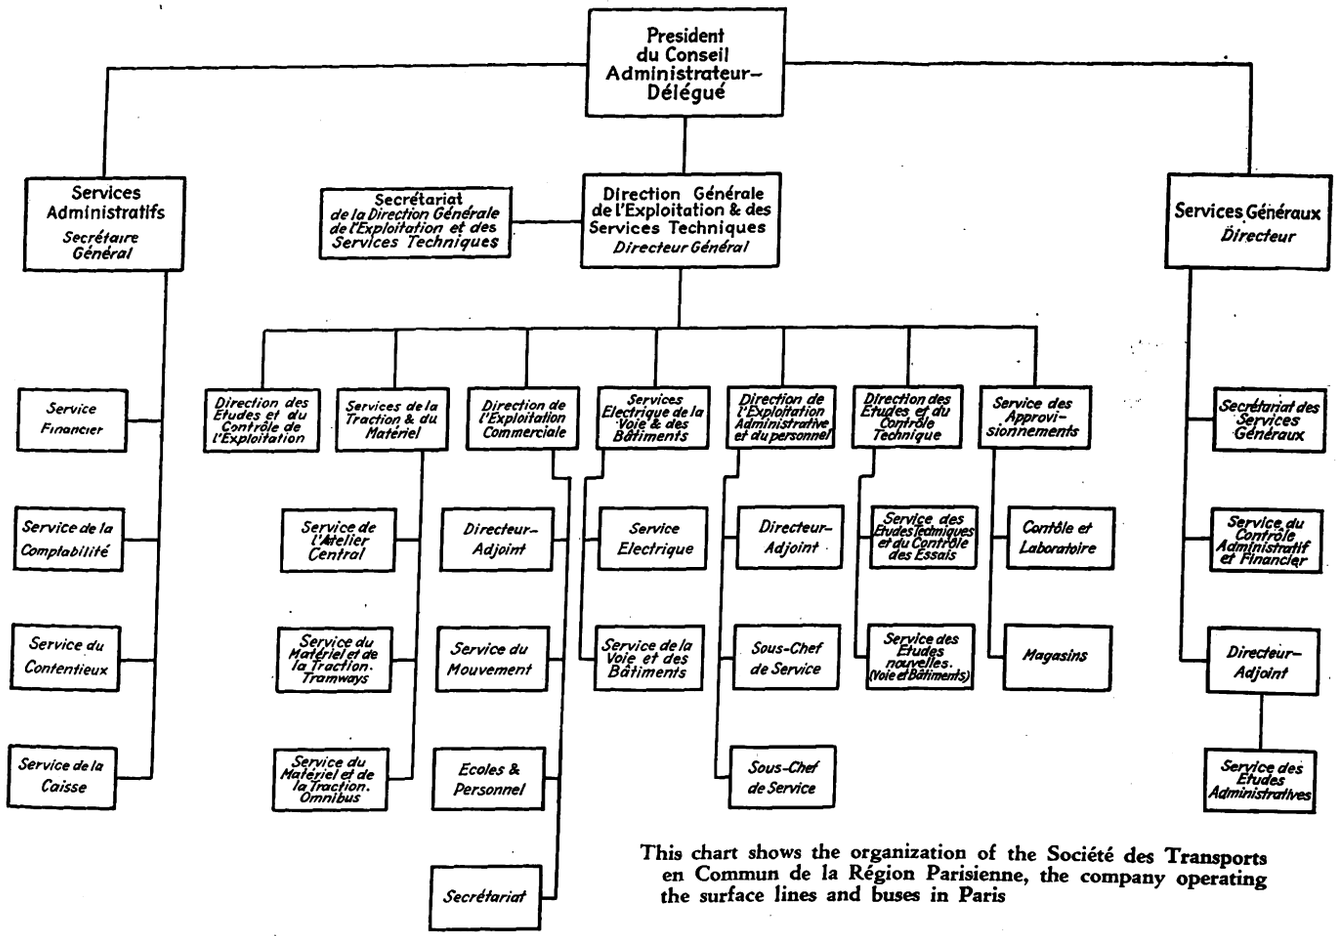
How the

Duties Are Assigned Abroad

European companies have different departments and divisions than railways here. The organization chart of the Paris electric railways and bus system is analyzed



This chart shows the organization of the Société des Transports en Commun de la Région Parisienne, the company operating the surface lines and buses in Paris

ORGANIZATION of the European tramway companies differs widely from that of electric railway companies in the United States. There are more departments, and the responsibilities of the different department heads show quite a variation from American practice. To illustrate this an outstanding European company, the Société des Transports en Commun de la Région Parisienne, which operates all of the tramways and bus lines in Paris, has been selected, and an organization chart is published herewith. In this chart the titles of all of the officers and departments are given in French, as there are no exact equivalents in English for some of the titles.

This company is one of the largest in Europe, and during the ten months ended Oct. 31, 1926, it carried 858,813,055 passengers and had gross receipts of 441,416,709 francs ($17,656,668). Besides its buses and street cars, it operates a short suburban steam road and a line of boats on the River Seine.

The chief executive officer of the company is called Président du Conseil, Administrateur Délégué, corresponding to our president.

The three department heads reporting to him are the secretary general, in charge of the department of Services Administratifs; the general manager, in charge of the department of Exploitation et Services Techniques, and the manager of the department of Services Généraux.

The department of "Services Administratifs," presided over by the secretary general, is much greater in scope than that under the same officer in this country. Broadly speaking, it looks out for the corporate life and activities of the company, except that directly connected with the movement of passengers and the legal activities. Besides being responsible for the corporate records and the

Digitized by Google

preparation of the various financial reports of this company, the secretary general is the ranking financial officer of the company. This means he is in charge of all receipts from the time they are turned in at the various depots by the representatives of the transportation department. He also has charge of all purchases of material and all disbursements, such as payments for wages, pensions and insurance, and even the issue of tickets to the depots. He also attends to the sale of any property of the company and has charge of all litigation relating to claims. The officers of the company corresponding to the treasurer, stock registrar and claim agent report to him. The titles of the four subdivisions of the department of "Services Administratifs" may be translated as finances, accounts, claims and treasury.

Transportation and Engineering Department

All operating questions come under the Directeur Général, or general manager, the title of whose department might be translated as Transportation and Engineering. This department has seven subdivisions, as shown in the chart. The secretary of this department acts as liaison officer to these several subdivisions as well as attending to the duties naturally pertaining to his work. The duties of these subdivisions will be considered as they appear on the chart.

The first subdivision on the chart, is Direction des Etudes et du Contrôle de l'Exploitation, which might be considered the same as our schedule department, except that there have been added to it some of the duties of a commercial research department, such as the determination of new routes, compilation of bonuses for motormen and energy-saving campaigns, and of statistics on operation.

The next subdivision, "Services de la Traction et du Matériel" corresponds to our equipment department. This department is shown in the chart to have three divisions which correspond to our (1) main repair shop (2) maintenance of cars, and (3) maintenance of buses. There are also two other departments not listed, i.e., "boats" and "steam railroad," because of the operation of these two services by the Paris company, as explained.

The next subdivision listed is that of "Exploitation Commerciale," which may be termed the transportation department, and its three divisions might be called vehicle movement, instruction and personnel, and secretarial. The first of these has charge of the movement of cars and buses in regular and extra trips, the issue of all tickets to employees and the supervision of carhouses and garages as far as relates to car movement. The second division is responsible for the training of motormen and conductors, the issue of the employees' rule book, application of discipline, safety work, study of the causes of accidents, and the issue of merchandising literature, such as posters and guides. The secretarial department has charge of the employee files and the lost and found departments, and acts as liaison officer for the other group departments.

The next subdivision might be known as the electrical and way engineering department. One of its divisions has charge of the electrical distribution, high tension and low tension, and substations. The other has charge of track and buildings, including cleaning of track and conduit and the greasing of switches and curves.

The next sub-department listed is that of "Exploitation, Administrative et du Personnel." This means a combination of the duties of an American employment department and welfare department. This department attends to the hiring of the transportation employees, the maintenance of the files of employees who have retired from the service, supervision of the benevolent funds and pensions, and the employees' medical service.

The next subdivision listed is that of "Etudes et du Contrôle Technique" and might be considered as the technical research or statistical department. Its work differs from that of the operating research department already mentioned because its attention is devoted purely to studies for the improvement of the equipment, including track and buildings. It has two subdivisions, one to cover existing equipment, the other, new work, including track.

The final subdivision of the operating department is that of "Approvisionnements," which corresponds to the stores department on an electric railway, except that it also has charge of the printed unissued tickets as well as of all fuel supplies. It also passes on all requisitions for purchases of material and orders for sales, conducts all laboratory tests required on material purchased or under consideration, and performs some other duties which are not usually undertaken by the stores department of an American electric railway.

Department of General Services

The final main department is that of "Services Généraux" or general services. This is essentially the legal department, though not including accident litigation. It has supervision of the franchise matters of the company and cares for all legal questions in relation to the franchise which may arise with the municipal authorities. It also has charge of the publicity of the company except that of merchandising literature, but including the relations of the company with the press. All of these duties are performed by the first sub-department, listed in the chart, "Secrétariat," or by the third, "Services des Etudes Administratives."

The second sub-department, or "Service du Contrôle Administratif et Financier," is essentially an auditing department, not only of accounts and inventories, but of all official orders and instructions issued so far as to see that they do not exceed the powers of the company or conflict with existing city ordinances. Where any such orders require the visé of some municipal officer, this department conducts the negotiations to obtain such approval.

Blotters Advertise Levis

These blotters effectively call attention to the beauties of Quebec's South Shore, which is served by the Levis Tramways

QUEBEC'S South Shore and its attractions are being advertised by the Levis Tramways through the distribution of blotters lithographed in color. Attention is called to the superb spots for summer residence and good beaches for bathing and canoeing only a short distance from Quebec that may be reached by tramway or by auto.

Quality Trainmen

Obtained for the Transportation Department

Los Angeles finds careful selection of trainmen greatly reduces labor turnover. About 50 new men only now required to keep force to standard size. Full particulars given of methods employed

METHODS of selecting, employing and training platform men for service on the Los Angeles Railway follow well-established lines. Careful attention, however, is paid to obtain courteous, safe operators who will create public good will. Because of favorable climatic conditions in southern California this company has large numbers of applicants for positions as motormen and conductors from which to make selections. Professional men, operators of experience and other classes of men from all over the country seek positions as platform men in Los Angeles. This abundance of applicants from which to choose has raised the standard of employment and improved the service.

Selecting the proper men centers around a few simple mental tests. No attempt is made to put a man through an extended psychological examination. His ability to react favorably to the Haggerty test, which is a modification of the army examination, is sufficient to qualify him to fill out an application blank. Failure, of course, eliminates the applicant.

The superintendent of employment gives each man a general interview outlining the work and policy of the company, after which an acceptable candidate fills out an introductory blank and is then subjected to the mental test. Tests are given Monday, Wednesday and Friday. Classes of from 20 to 25 applicants are handled, depending on the need for men at the various divisions. Results of the psychology test are recorded and forwarded through the employment department and further examination of the applicant rests upon the grade made.

The successful candidate proceeds to the employment desk, where he is given an arithmetic test which embodies simple problems of addition, subtraction and calculation. This has had its effect in weeding out applicants who are not mentally fit to make out the trip sheets and other forms of the company requiring simple calculating and arithmetic.

More Than 90 Per Cent of Trip Sheets Correct

Both systems of tests are employed at the present time, the company not having decided which type will be adopted as final. However, since the installation of the calculation test, combined with the effect of the merit and bonus system, an improvement has been noticed in the calculations made on the trip sheets Before the tests were in effect, and prior to the merit and bonus system, fully 60 per cent of the trip sheets were calculated inaccurately. Now more than 90 per cent are correct, as checked by the auditing department. In the calculation test a man is allowed twenty minutes to do the problems. Usually he takes less time than this. His grade in this test is recorded as a percentage, with the notation of the number of minutes he required to complete the work.

With the calculation test passed, the man desiring employment is permitted to fill out the application blank. On this form, shown in an accompanying illustration, the applicant must answer all questions to the best of his knowledge. On the third page of the form is an agreement between the Los Angeles Railway Corporation and the employee. A clause in this agreement says that a $1 deposit is required of each applicant for payment into the fund of the Co-operative Association of Los Angeles Railway Employees. This fund is for the purpose of covering the responsibility of all equipment furnished by the company to its employees, for uniforms purchased on installments and partially to indemnify the company against losses from wrongful acts of employees.

After the application blank has been filled out and checked by the clerk in charge, to see that all questions have been answered, a receipt for it is given to the applicant.

A man must be 23 years of age to qualify as conductor and 25 years of age for motorman, and he must be under 40 years of age. An exception is made to this latter qualification in the case of re-employment of men with particular qualities which make them especially desirable employees.

Applications of approximately 100 motormen and 100 conductors are kept on hand. Calls are made on these in the order of their application. The experience of the company in calling applicants for service has been that out of the 100 applications on file about 60 men are available for immediate service.

During the past four years the number of new men employed each year has been steadily decreasing. In 1923 approximately 1,600 men were engaged for employment in the train service. In 1925 this number had been reduced to about 800, and at present the employment department is handling only about 50 men per month.

Every Tuesday groups of men, as needed by the operating department, are called into the employment office to report for instruction, and, if satisfactory, for subsequent employment. At this time the men are required to pay an additional $1.85 for their caps. They are sent from the employment office to the auditor's office to

No. 1. The application blank, which is a four-page folio, requests detailed information. The third page contains a working agreement between the corporation and the employees
No. 2. The medical department fills out this form at time of examination

make this deposit and from the auditor's office to the tailor shop, where the cap is issued. A medical examination is given at the time the application is made, so that there will be no delay in placing the man in the school of instruction if he is satisfactory in other ways. Also, at the time of medical examination, the applicant is told about the medical service which is given on a co-operative plan by the company. Trainmen who pay a fee of 50 cents per month are entitled to medical attention, advice and treatment. The company pays an additional 50 cents per month for each man in order to maintain this service.

The order in which the applicants return from the auditor after depositing the money for their caps determines their seniority for the term of employment with the company. After all have reported back to the employment office they are given their first course of instruction.

Instruction by Class and Road Work

Classes for instruction are held two days a week at twelve noon. The superintendent of instruction outlines the prospective work for the men, stressing the disagreeable features as much as possible. After his preliminary lecture and at several times during the course of instruction he gives those who do not care to go on with the work an opportunity to leave. About 12 per cent of the men leave for one of four causes: Resignation, falsifying of application, general slowness and insubordination.

At the preliminary instruction the men are told that if they qualify and are employed they will receive $2 a day for the instruction period. After that they will receive the regular wage scale with a guarantee. The course of instruction varies with the man. For some it requires only two days; with others fourteen, being shorter for conductors than for motormen. After the first day of class instruction the men are divided into groups, the student conductors being taken by the conductor instructor and informed of their duties.

The motorman instructor takes the class of student motormen to the instruction car, where the main instruction is given. Two cars are used for this work. Both are of a rather old type, but one which naturally would be used by a new trainman on a tripper run. Four days are spent by the class of motormen on the instruction cars. The first day is spent with the car in the yard. On the second day the motorman instructor runs the car out of the yard and over one of the lines of the division, showing the new men the operation of the controller and air brake and calling their attention to conditions along the line.

In the yard work the student is taught to keep his head up while at the controller. Each man is given a chance, the instructor permitting him to try to master

No. 5. Order on photographer to have applicant's picture taken. A copy of the photograph is sent with each reference inquiry

the sequence of operations before permitting another to practice. Imaginary starts and stops are made, the instructor giving the bells while a student operates the handles. With a car out on the line the instructor permits first one student and then another to run it, making starts and stops to pick up imaginary passengers. This preliminary instruction work lasts four days. In addition, for two nights the students must operate the car under the guidance of an instructor during the evening hours. If on the fourth day the student is not bewildered by the downtown traffic, nor has become confused in an emergency, he is considered qualified for further instruction on a regular run with a line instructor.

Final training of the student is handled individually by line instructors who operate out of the various car-

Digitized by Google

houses. They are men picked particularly for their ability, and for this work they are paid $1 per day extra. Runs on which line instructors teach motormen are particularly long and cover the greatest amount of territory. About seven such runs are taken out of each division, this amounting to approximately 20 per cent of the number. The student reports to the line instructor and stays with him until the work is completed, taking a different run each day, so that at the end of eight days the division has been covered by the instructor and student. As there is not enough training to go around, the work is rotated so that all instructors are assigned to part of it.

Vacancies in the operating department supervisory positions are filled from the group of line instructors. This system is designed to anticipate the future approximately five years, when openings will occur in the operating department which of necessity must be filled from the rank and file of the organization. Since this system was begun two years ago seventeen men have been promoted to supervisory positions. At the time a line instructor qualifies for such a position he is asked what particular work in the department appeals to him and what position he would accept. This statement is placed on his qualifying papers and when an opening occurs he is asked if he cares for the position.

Conductors are instructed for about eleven days by an operating conductor instructor. They are taught how to make out trip sheets and the various forms required. This work is supplemented by outside instruction on the car under the supervision of a line instructor similar to that done in the case of the motormen.

On Probation for Three Months

While under the line instructors on the cars both conductors and motormen are subject to additional quizzing by other line instructors. Those who show aptitude are pushed through the course more rapidly. After qualifying with the line instructor, the student is turned in to the division headquarters as ready for work. His name is placed at the foot of the extra list, and from then on he becomes a regular employee of the company. For 90 days from starting the instruction work the new man is on probation. Three months after the probation period is up he comes under the merit and bonus system and is entitled to receive $5 per month bonus for efficient operation.

While on probation the new man is given additional training by traveling instructors, two of whom operate out of each division. These men call attention to infraction of rules or improper handling of equipment.

As a rule they do not report such lack of efficiency to the operating department, but make the correction on the spot and stay with the student until he has overcome the difficulty. However, instructors do make reports of inefficient operation of regular trainmen. These reports have their effect on the trainman's efficiency record, upon which is based the bonus system.

Particular attention is paid to instruction in energy saving. A watt-hour meter is carried on each car, its use is explained to the new man and he is taught how he can best operate the car to reduce the energy consumed.

After 90 days of service the new trainman returns to the instruction department for four hours of lecture work. These groups are made up of practically the same men who formed the student instruction class.

No attempt is made in the course and during the subsequent car work under the line instruction to teach the student the details of equipment and how it operates. The principle has been to give the men one thing to assimilate at a time and gradually to work up to the more complicated details of motor control and train operation. At the South Park shop is located an instruction room fitted with both the K and H-L types of control and a complete layout of air lines. Groups of motormen on probation are given instruction on this apparatus so that they will be familiar with the mechanical operation of their equipment. It is not the intention to make mechanics out of them, but each man must be able to make minor adjustments on the road in order to cut delays to a minimum.

Instruction Is Continued to Trainmen

After a man is definitely started in the regular train service his instruction does not stop. Meetings are held every other month, at which a representative of the supervisory force, the superintendent of operation, his assistant, or some other company executive, addresses the men at the various divisions on the matter of safety, courtesy and efficient service.

Three talks are given on each particular day to each division. This permits the attendance of men who work at various hours. On alternate months questionnaires are sent to the men, with the request to return the answers to the division superintendent within a specified time limit. All of these questions relate to operating problems and the answers should be known to each trainman. At the lecture these questions are gone over in a general way and additional information given to the men on any point which, through their answers to the questionnaires, they have indicated lack of knowledge.

Gray Line Shows Missourians

WHILE Kansas City keeps growing in numbers and in industries, opportunity is not lacking to interested residents and inquiring visitors for acquaintance with that section of the country bounded by the fertile valleys of Missouri and the wheat fields of Kansas. Seeing Kansas City via the Gray Line is an education no less inspiring than instructive. So thorough has been the survey for sightseeing possibilities that now no fewer than seven tours are being conducted by the Gray Line, operated by the Kansas City Public Service Company in Greater Kansas City. Considering this is the initial attempt of the company into the sightseeing business, the tours are doing remarkably well. Many interesting trips can be made by street car or motor coach, the routes of which traverse every section of both Kansas City, Mo., and Kansas City, Kan., extending as far east as Independence, Mo. The Montgomery Ward and Sears-Roebuck plants, the famous Country Club residential section, well-known boulevards and parks and the industrial districts are all reached by one or more of the tours.

These places of interest are described very alluringly in a twelve-page illustrated pamphlet containing map and all necessary details as to price, time consumed on each trip, length of tour and historic points of interest covered en route. In addition suggestions are made to prospective picnic parties for the chartering of coaches, to parties desiring to spend a day on the golf course and to travelers seeking a sightseeing itinerary in other cities.

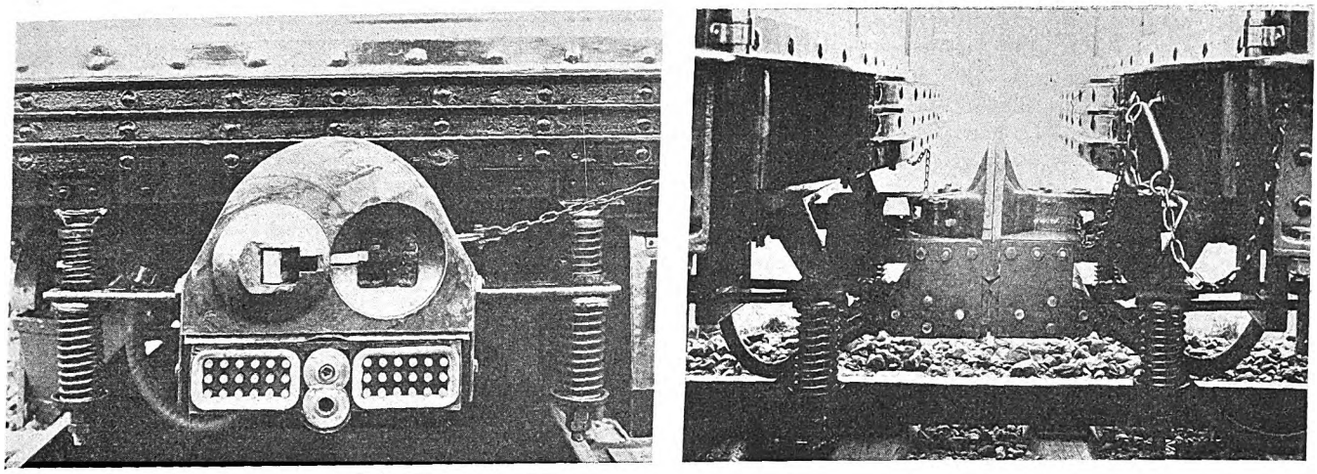
Hamburg Elevated Develops Automatic Combination Coupler



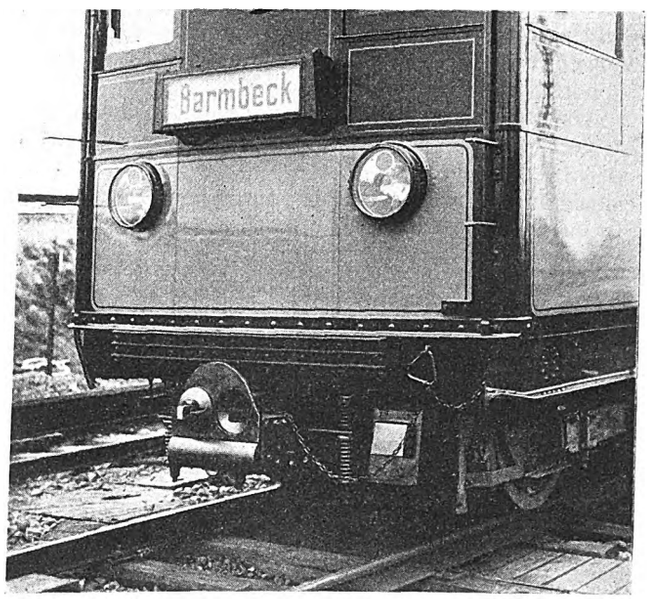
At left, front view of coupling; at right, side view of coupling

COMBINATION of the functions of a car coupler and methods of connecting the air pipes and electrical conductors has been accomplished in an automatic coupler by the Hamburg Elevated Railway, Hamburg, Germany. A number of the cars have been equipped with this coupler, and its use is being extended to the rest of the equipment. The car coupler is above and the electrical and air couplers below, and the latter are protected by a cover which automatically swings upward and back when the coupling takes place. The operation of the car coupler is well shown in the five line engravings.

Fig. 1 is a plan view of adjoining couplers on two cars about to be coupled. In each end there is a link attached within the housing to one side of a sort of triangular plate, pivoted in the center and held by a spring in the position shown. On the side of this plate opposite to the link is a notch over which the link on the other coupler slips.

Fig. 2 shows the action of these plates as the cars come together, the triangular plates turning, so that each link slips into its proper notch. When the faces of the couplers are together the springs draw the plates to the position shown in Fig. 3.

Uncoupling is accomplished by a chain which, when pulled, throws the plates into the position shown in Fig. 4, releasing both links. The triangular plates then return to their original position, the first to do so being the one whose chain has not been pulled, shown as the one at the left. Its link then slides further into the housing of the other car, and remains in the position shown in Fig. 5, until the cars part. Then the second plate returns to its original position.



Coupling with protective cover down

The principal feature of the electrical and air portions of the coupler is the sliding cover shown in the third halftone engraving, below the car coupling portion of the coupler. This cover, which is pivoted, revolves up and back through the action of the triangular plate, already mentioned, when coupling is to take place.

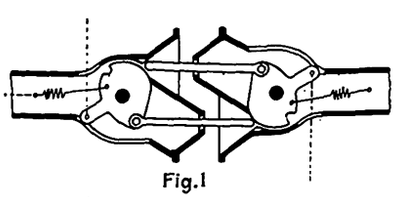


Fig. 1

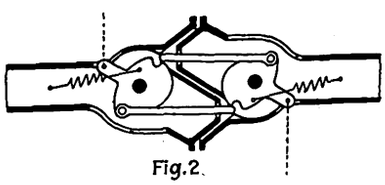

Fig. 2

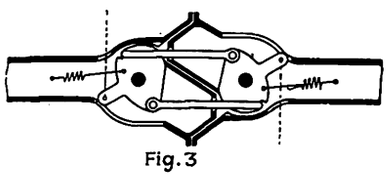

Fig. 3

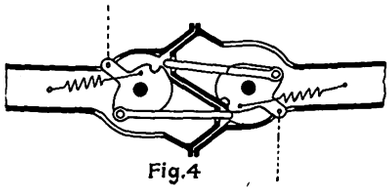

Fig. 4

Automatic car coupling operates by double link

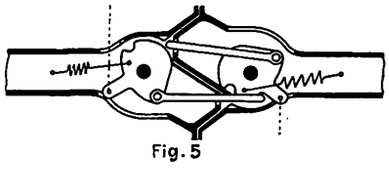

Fig. 5

Digitized by Google

Valves keep the pressure air pipe closed except when the cars become coupled, and a special electrical switch near the controller in the motorman's cab provides the necessary connections for cutting out any disabled car, making the circuits dead at the time of coupling or any other connections desired.

The car coupling portion of the coupler described is known in Germany as the Scharfenberg type. The electrical and air connection portion of the coupler was developed by the engineers of the Hamburg Elevated Railway.

Calculating Rail Tonnages by a Lightning Method

By Edward A. Roberts
Of Fisk & Roberts, Consulting Engineers, New York

MOST of us have gazed in amazement at so-called lightning calculations as the demonstrator deftly solved an intricate problem of arithmetic by some apparently absurd twist of his numbers. Later study always showed that a definite law of mathematics, and not magic, supported the lightning calculation.

Such a method of calculating the number of gross tons of steel in any given length of railroad has been developed by this organization to simplify the hundreds of calculations that are necessary in making an appraisal of a railway property. For example, consider this problem:

How many gross tons of steel (2,240 lb. to the ton) are there in a stretch of 33.11 miles of single-track railroad built of rail of 70-lb. section (70 lb. to the yard)?

Now to figure that without a handbook means, first, to convert the miles into yards, multiply by 70 to get pounds and divide by 2,240 to get gross tons. Then the answer is wrong because you forgot to multiply by two on account of single track consisting of two rails. The lightning method of getting the correct answer is this:

Write down the number of single track miles	33.11
Write it down again, one space to either the right or the left	33.11
Add the two, setting the decimal point one place further right	3,642.1

The exact number of gross tons of steel in the section of 33.11 miles of single track constructed of 70-lb. rail is 3,642.1. This method is infallible and gives the correct weight to the last ounce.

It is unnecessary to remember whether the second entry of the number of miles is set to the right or the left of the first number. The answer is the same, of course, whichever way the second number is set down. For example:

33.11	33.11
33.11	33.11
3642.1	3642.1

This method of calculating the weight of 70-lb. rail will give the correct answer for any length of rail under the sun. No magic has been used in selecting the particular mileage used in the illustration.

The above method, to be sure, does apply only to calculations involving 70-lb. rail. It can be adapted readily, however, to many other standard rail sections with a simple modification, particularly to 56, 60, 80, 84, 90 and 105-lb. sections. This modification consists of adding to or subtracting from the result obtained above the proportion represented by the difference in weight between 70-lb. rail and the desired rail section. A 105-lb. section is 50 per cent heavier than a 70-lb. section, and the complete calculation becomes:

	33.11 33.11	miles of single track
Divide by 2	3642.1	gross tons of 70-lb. rail
Add	1821.05	
Total	5463.15	gross tons of 105-lb. rail

Just one more typical application to a different weight of rail, in this case 80 lb. to the yard:

	33.11 33.11	miles of single track
Divide by 7	3642.1	gross tons of 70-lb. rail
Add	520.3	
Total	416.24	gross tons of 80-lb. rail

The reason for dividing by 7 is that 80-lb. rail is one-seventh heavier than 70-lb. rail.

This method of calculating rail tonnages is particularly applicable to field work and to calculations made without the assistance of handbooks and prepared tables of weights. On account of its simplicity it can readily be remembered.

The underlying principle is so extremely simple that it will not be stated here. Those who are interested enough to test the application of the method will enjoy discovering why it is absolutely infallible.

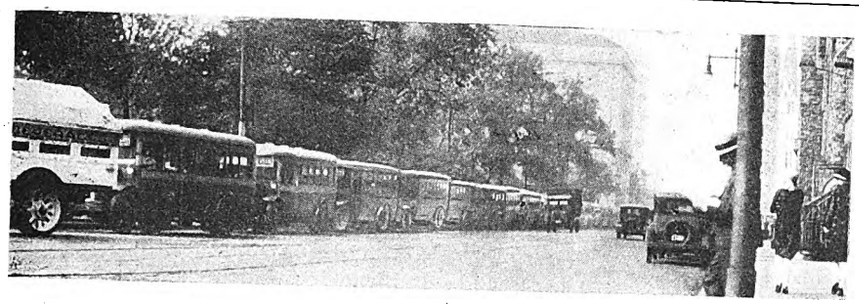
Careful Organization Makes Big Bus Excursion Successful

MORE than 1,200 passengers, members of a large benevolent association, were carried on July 28 on a 108-mile excursion without a single mishap by 56 buses of the Public Service Transportation Company, a subsidiary of the Public Service Corporation of New Jersey. The buses started from Newark at 8 o'clock in the morning and followed a route through Elizabeth, Rahway, Perth Amboy, South Amboy and Red Bank to Asbury Park. Each driver was supplied with a typewritten description of the route to be followed. The first bus arrived at its destination at 11:15. A five-minute stop was made at Morgan, about half-way, where the buses pulled in at a prearranged parking space alongside the road. Returning, the buses left Asbury Park at intervals between 6 and 8 p.m., and the last bus reached Newark about 11 p.m.

All buses were 31-passenger gas-electrics. They were operated in groups of five, each group being designated by a letter and each bus by a number. These designations were placed on placards outside the vehicle for purposes of identification. A supervisor was assigned to each group of buses, riding on the last one of the group. The headway between groups was five minutes. How well this was maintained is indicated by the accompanying reproduction of a headway check taken along the route.

An extra bus was assigned to every third group. This carried no passengers, but was driven by a mechanic. At the rear of the entire procession was a service truck. The only trouble which developed during the entire excur-

Digitized by Google



sion was a flat tire. Passengers on the bus which developed the flat tire transferred to the next empty bus which came along. The mechanic then replaced the tire with a spare and soon caught up to the procession again.

Parking was arranged for several days in advance. Two men had been sent down an hour beforehand to complete the necessary arrangements. Buses were stored in a large lot on Ocean Avenue. This was measured off by the advance agent and markers placed denoting the position to be occupied by each group of buses. Two car cleaners accompanied the excursion and cleaned out the buses while the passengers were amusing themselves at Asbury Park.

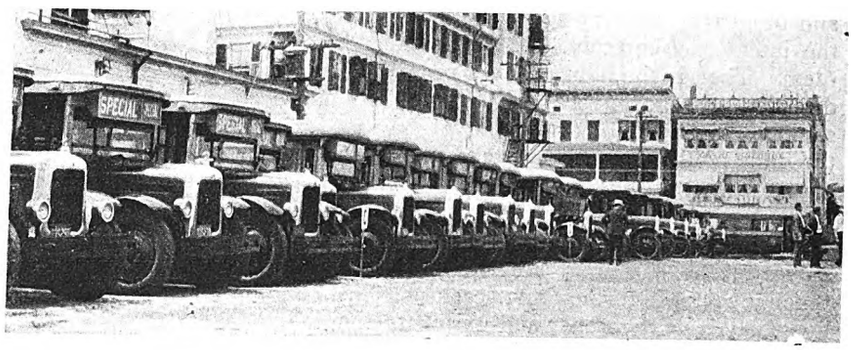
Long Island Cars 100% Steel

ONLY cars of steel construction will be operated for the transportation of passengers on and after Saturday, September 10, according to an announcement made by the Long Island Railroad management.

Early this year the board of directors authorized the purchase of a sufficient number of steel passenger cars to replace every remaining wooden passenger car by the end of 1927. The rapid delivery of these new steel cars makes it possible to remove all the wooden cars in service, sooner than was anticipated by the company.

With the acquisition of nearly 250 steel passenger cars during 1927, at a cost of approximately $5,000,000, and the retirement of 135 remaining wooden cars, the Long Island takes rank as the first Class I railroad in the United States to place its passenger carrying equipment on a 100 per cent steel basis.



Each bus carried a combination letter and numeral designation

Traffic Control Must Be Fitted to Needs of Particular Situations

CHICAGO SURFACE LINES
CHICAGO, ILL., July 14, 1927.

To the Editor:

It is hardly safe to generalize too much concerning any of the features of signal control of traffic. In general, the short cycle speeds up traffic movement, as stated in the editorial which appeared in ELECTRIC RAILWAY JOURNAL July 30, but we must remember at all times that the setting of a signal system to a given section of street is an engineering job wherein the length of cycle, the time given to the cross-streets, the speed of movement, system of signals, the control of turns or the handling of other special features should be made appropriate to that particular section. It is no more appropriate to use stock methods of handling traffic than it is for an architect to draw on stock plans from his cabinet, regardless of the requirements of his client or of the location on which a building is to be built. Approximately correct results can sometimes be achieved by such treatment, but best results are obtained only by careful study.

If signal control is to be used at a single intersection, the traffic at that intersection will be delayed the least if changes come frequently instead of having a long cycle in operation. Traffic arrives at single intersections in a somewhat uniform volume per ten-second intervals. A driver, however, can slow down slightly when approaching an intersection that has a traffic light set against his movement, so as to arrive at that intersection after the light has changed to green. If the cycle is short few vehicles will be standing still waiting for the light to change. When it does change those vehicles standing and those that are moving slowly to approach will cross the intersection quickly, leaving an open space behind them. Then if the light changes promptly for the other direction the next wave of vehicles will form in a similar way and the intersection will be used actively all the time without much wastage and with only short delays to the vehicles.

When the control is a part of a system, it is advantageous to avoid stretching out the group of vehicles that moves through together, and rather to keep them in reasonably compact form so that each portion of the green light may have its proper and uniform quota of vehicles. If either vehicles or pedestrians on the cross street are held too long there is developed unnecessary impatience and needless delay. It is possible to make much more uniform flow of traffic with short cycles than with long ones.

The length of cycle should have a definite relation to the speed and the distance between cross streets, and it is also influenced by the interference that is occasioned by the kind of turns permitted, the volume of pedestrians, the physical handicaps to free movement of vehicles at a given intersection such as street offsets, restricted widths of lanes, improper contour of paving and sharp curb corners. Sometimes the cycle may be either of two lengths which will differ considerably, such as either 60 seconds or 100 seconds. In one instance where these two cycles were tried they gave substantially the same speed, but one gave greater street capacity than the other, because the longer of the two permitted longer movements at intersections where handicaps to movement prevent a reasonable number of vehicles passing through under the short cycle.

Conflicts at troublesome intersections are sometimes aggravated with too frequent changes. For example, in our recent check of the effect of a 75 second cycle as compared with an 85 second cycle in the heaviest evening rush hour on Wabash Avenue, we found that due to both right turns and left turns for vehicles and almost capacity use of the street, the number of vehicles in one block waiting for the green light in the next intersection ahead could not pass through that intersection on the shorter cycle. With the longer cycle and less frequent changes the vehicles and street cars could pass through the loop with fewer missed lights. On the streets more lightly used, such as Clark Street, the shorter cycle with more frequent changes permits each block to be made in a shorter time, and therefore a greater speed was attained by each street car or vehicle.

It is the desire to avoid an appearance of inertia of traffic and to permit a group or wave of vehicles to pass through a street with the fewest number of stops that has led the users of synchronously controlled systems to adopt longer cycles, and having got the mass in motion, to keep it in motion as long as seemed tolerable for the cross traffic. However, the co-ordinated control breaks this traffic up in smaller groups by frequent changes in signals at the entrance to the system, and then so arranges the signals that these vehicles once started may keep on traveling without the waste that comes from stopping the group and then starting it again.

E. J. MCILRAITH,
Staff Engineer.

Kansas City Cars Handle Record Crowd

THE Kansas City Public Service Company handled the largest crowd in its history on Friday night, Aug. 5, at the motion picture party of the Kansas City *Star*. Sixty thousand people attended the first showing in Kansas City of "The Rough Riders," and of this number only about one-tenth could find parking space for their automobiles. The remainder were transported by street cars. Thousands used their cars to approach as near as possible to Muehlebach Field and rode the rest of the way on the street cars.

Early in the evening 75 extra cars were placed on the Brooklyn and crosstown lines leading to the field. Within an hour this had to be increased until the company had 300 extra cars transporting the greatest single-event crowd in Kansas City's history. There were no traffic jams. Motorists were not allowed to park between 18th and 21st Streets, the region of the field.

When the performance was over the 60,000 people were removed by the street cars in an hour and ten minutes without trouble. The crowd moved quietly, and outside the field D. L. Fennell, general superintendent of transportation for the Kansas City Public Service Company, had a string of 300 cars, standing fender to tail light from 31st Street to 10th Street. Extra lamps strung around the field by the company flooded the neighborhood after the show ended and enabled the vast crowd to reach the street cars with ease and rapidity. The company had 141 employees on foot between 18th and 31st Streets in directing and expediting traffic.

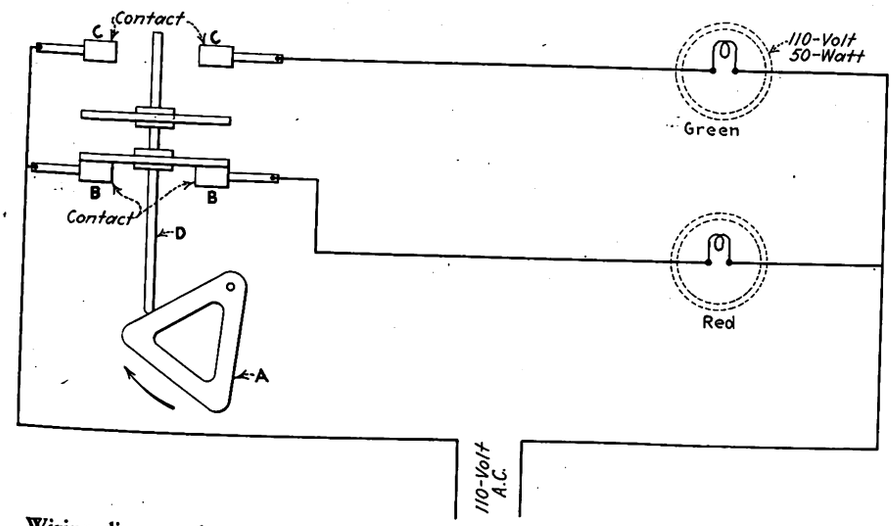
Maintenance Methods and Devices

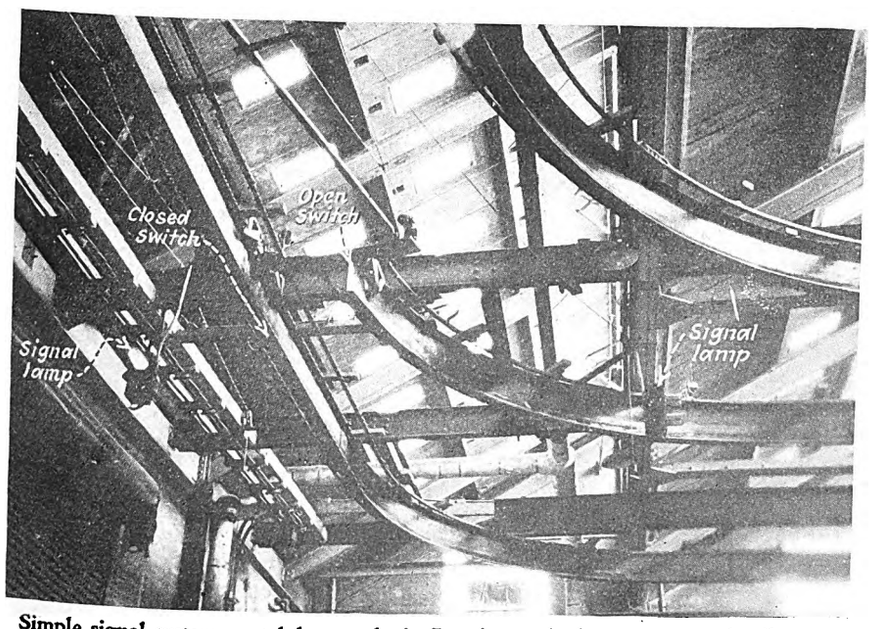
Signal System Prevents Telpher Derailments

WHERE a number of telpher cranes are operated at a high rate of speed and where switches are constantly being thrown from one rail to another there is a possibility of derailment due to running through an open switch. To minimize this danger the Interborough Rapid Transit Company of New York developed and installed a simple signal system which automatically protects an open switch with a red light and gives the right of way to the closed switch with a green light.

The telpher switches are operated by hand and when opened or closed come in contact with a safety stop which is connected through a movable arm to a set of interlocks controlling the red and green signal lamps. With the safety stop "A" in the position shown in the sketch the red light is in operation, indicating that the switch is open. When the switch is closed stop "A" moves upward as indicated by the arrow, moving the relay arm "D" upward, closing contact "C" and opening contact "B." This puts the green light in operation and extinguishes the red signal.



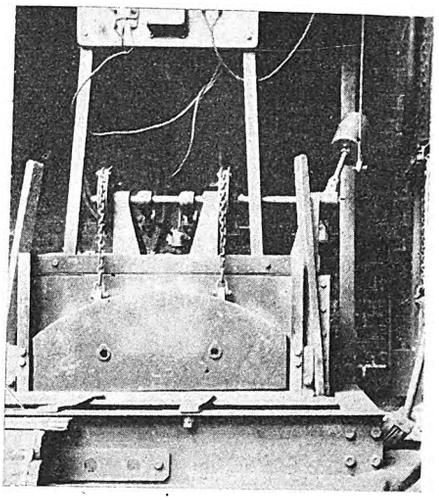
Wiring diagram shows connections to telpher signal lights. Relay-rod "D" is raised or lowered by operation of safety stop "A"



Simple signal system on telpher tracks in Interborough shops prevents derailments

Electrically Controlled Gas Oven for Heat Treatment

ONE of the most convenient parts of the equipment of the shops of the London County Council Tramways, London, England, is an electrically controlled gas oven for heat



This automatically regulated heat treatment furnace has been found very convenient for tires, brake riggings and similar parts

treatment of tires, brake rigging and other parts for which such treatment is suitable. Its advantage is that they can be left in the oven without fear of injury as the temperature cannot rise above the predetermined temperature. The automatic control is obtained by a thermocouple which actuates the regulator admitting gas and air into the furnace. Another feature of the furnace is that when the door is raised the gas is shut off automatically so that there is no burst of flame. These features make the equipment much easier to handle.

Incidentally, it might be said that all steel tires on this tramway system are now being refinished by grinding, rather than being turned on a lathe. This method is found to give a great saving in material over re-turning, the saving amounting each year to about 300 tires.

There is also a saving in time, as one grinder can finish twelve pairs of wheels a day as compared with five or six pairs a day turned on a lathe. Axle fits are also now being ground instead of being turned. An improvement in brake rods recently introduced has been the repair of broken rods by butt welding by

Digitized by Google

the electric transformer method rather than by forging. Since the introduction of the electric butt welding machine for this and other work for which it is adapted it has been possible for the shops to shut down two smithies with six men.

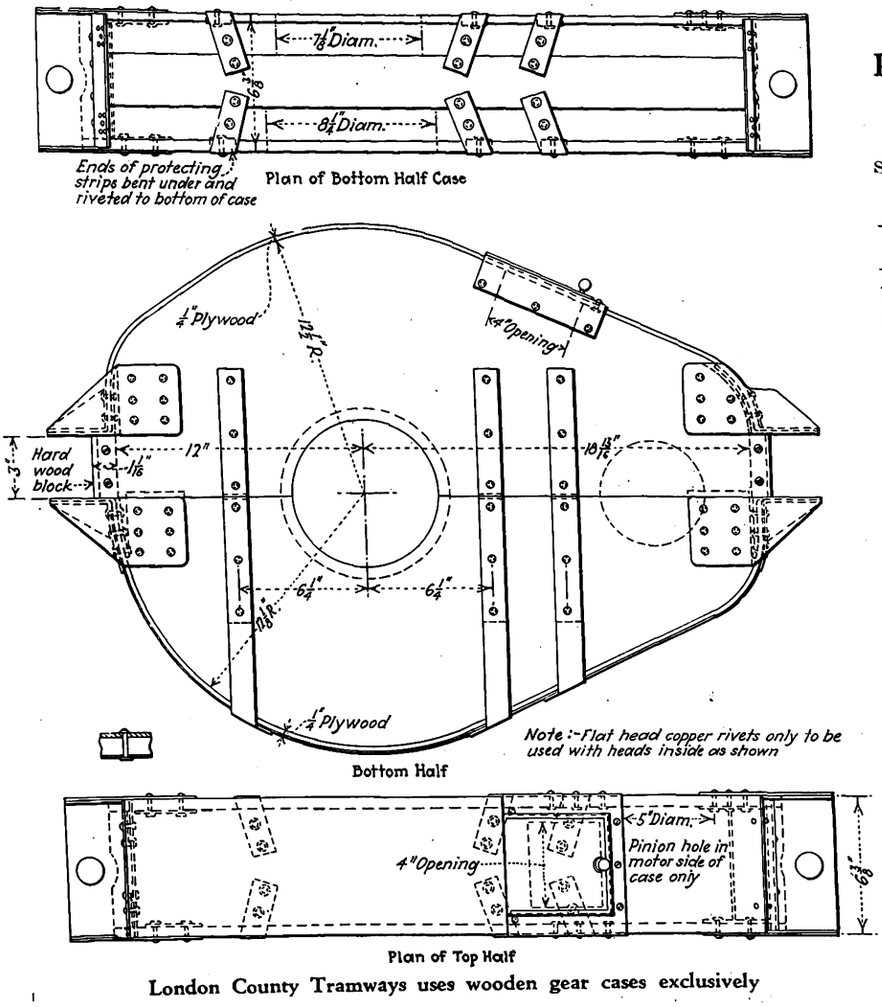
Wooden Gear Cases Are Used in London

ON ALL of its motor equipment the London County Council Tramways of London, England, is using a wooden gear case made in its own shops, for which a number of advantages are claimed. One advantage is that it is lighter than a steel case. A second advantage is that if injured the case can be repaired more easily. There is finally the thought that a wooden gear case may reduce the noise of the gears, although there is no definite information on this point.

The gear case is made of whitewood, strapped with No. 12 or No. 20 malleable steel straps. The top and bottom parts are of ¼ in. plywood, which is steamed and bent to shape before being nailed to the sides. The nails used are 1 in. with a screw thread. A strap of No. 20 s.w.g. gage malleable steel protects the bottom from injury. All rivets used are of copper with a flat head inside the gear case.

Before being put into service each half of the gear case receives not less than four coats of gray enamel, each being thoroughly dried before the next is applied, to insure that the surfaces, especially of the interior, are finished with a hard, glossy and oil-repelling coating.

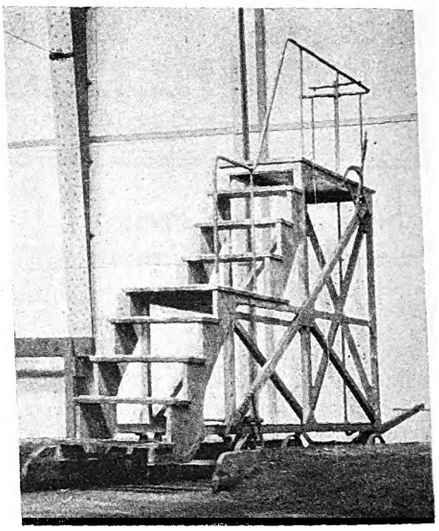
The cost of the gear case is about 50 shillings ($12) each.



London County Tramways uses wooden gear cases exclusively

Ladder for Depot Inspection of Cars

MOVABLE ladders or scaffoldings for the use of car inspectors are part of the equipment of the carhouses of the Berlin Surface Lines, Berlin, Germany. One of these ladders, shown in the accompanying illustration, is mounted on six wheels and can be pulled from one corner of the carhouse to another very easily by a handle in front. It is also fitted with a brake which is set from the upper platform. This upper platform is high enough so that the trolley and other parts on the roof can easily be inspected from it. As the motor resistances in Berlin are carried on the roof instead of underneath the car, roof inspection has to be somewhat more thorough than otherwise. There is another platform on the ladder about half way down.



Movable ladder used for car inspection in carhouses of Berlin Surface Lines

Prolonging Life of Steel Ties in Concrete

By Louis T. Botto
Superintendent Maintenance of Way San Antonio Public Service Company, San Antonio, Tex.

BEFORE placing the concrete in steel tie track construction a final test should be made to make certain that each tie bolt is tight. Each bolt should be given a tap with a light sledge and then the nut should be given its final turning.

Good results in concreting are obtained by using a 1:3:5 mixture. If the sand varies in color or texture it should be tested to insure that it will make good concrete. Sound materials are essential. The amount of water in the concrete should be kept as low as possible to permit proper workability and the concrete should be tamped thoroughly under and around the ties and rails. It is good practice to delegate a man to see that this tamping is performed carefully.

After concreting, traffic should be kept off the new work for at least fifteen days and the concrete should be kept damp during this period. With the observance of these simple precautions, under ordinary conditions steel tie construction should last the entire life of the rail.

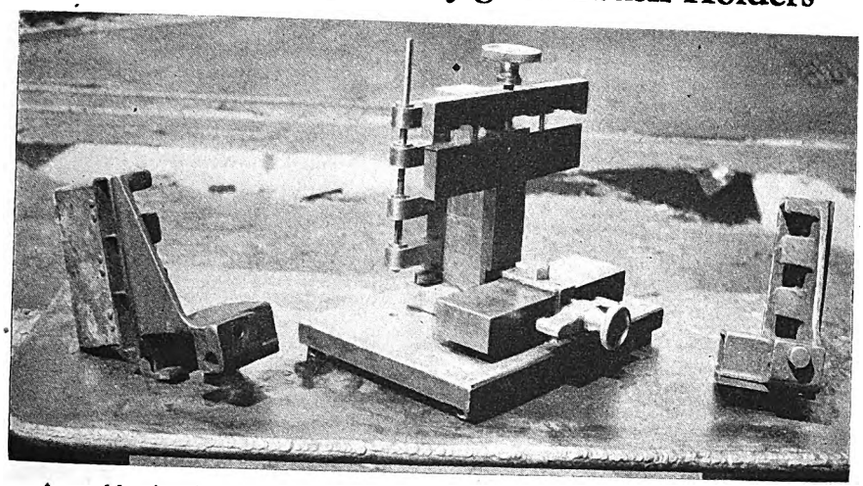
Combined Gage and Jig for Brush Holders



A combination jig and gage for Westinghouse type 50L brush-holders is shown in the center. On each side is a brush-holder, one right hand and the other left

THREE carbon brushes per brush-holder are used with the Westinghouse type 50L railway motor. The $\frac{5}{16}$-in. pin about which the pressure adjusting mechanism pivots passes across the entire width of the brush-holder and through lugs at each of the partitions separating the brushes. It is thus necessary to drill four holes in the brush-holder lugs in order to insert the pin. These holes must be located accurately so as to line up with each other and also so as to be in a plane perpendicular to the brush-holder support.

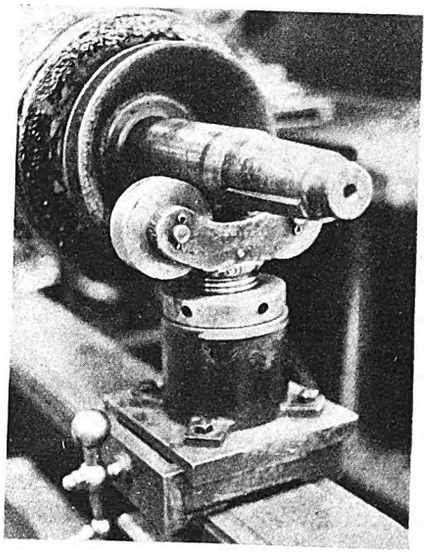
When these brush-holder holes become worn it is the practice of the Brooklyn - Manhattan Transit Corporation, Brooklyn, N. Y., at its 39th Street repair shops to fill in the holes by welding and then to redrill them. For this work a convenient jig has been constructed. in which a pair of brush-holders, one right and one left, can be inserted and drilled with one setting. The jig has a rectangular steel bar just above the base plate over which the casting support fits. The upright portion of the jig is arranged with four arms which project out and fit on either side of the carbon brush separating partitions. In order to place a brush-holder on the jig it is necessary for the carbon boxes to be perpendicular to the section which fits about the support. Any distortion of the brush-holder castings will prevent their being shoved into position and so the jig serves as a gage for making certain that the brush-holders are in proper alignment. With the brush-holders in position they are clamped tightly by two knurled knobs. The entire fixture with the two brush-holders in position is then placed on a drill press and the holes are drilled in one operation.

The accompanying illustration shows the jig with two brush-holders, one on either side. The drill is shown in the bushings of the arms so as to indicate just how the holes for the pivot pins are drilled.

Aligning a Commutator for Slotting

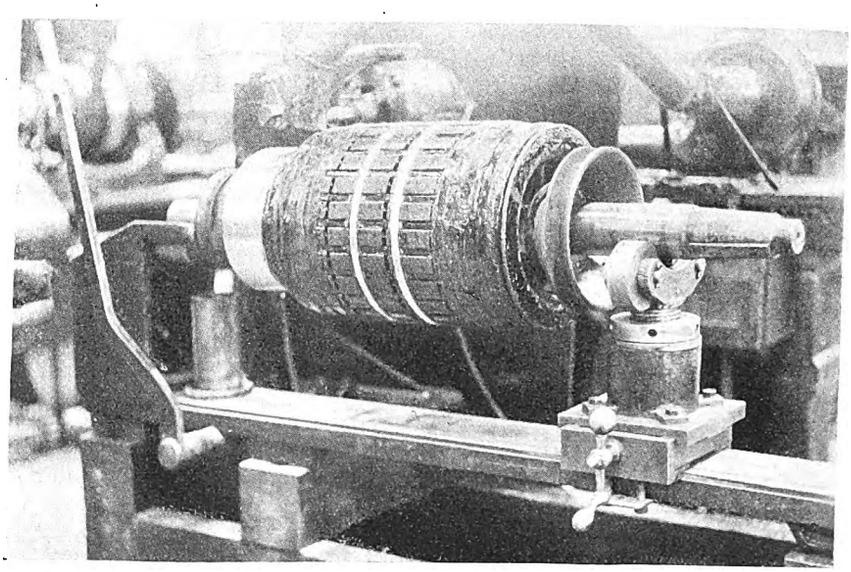
TO INSURE accurate slotting of commutators a valuable attachment has been developed and installed on the commutator slotter used in the shops of the Market Street Railway, San Francisco. This consists of a tailstock mounted on the bed of the slotting machine which allows for the transverse movement of the pinion end of the armature so that the travel of the milling cutter may be made to follow the slot in the commutator. Rarely is the commutator assembled with the slots directly in line with the shaft.

The tailstock allows for this transverse movement of the pinion end of the armature and also for raising and lowering. It slides freely on the bed of the machine. Incorporated in the base is a feed screw which moves the upper part across the baseplate, similar to the cross feed on a plate. The upper part includes a large diameter elevating screw with supporting nut having holes for a spanner wrench. The head of this screw is Y-shaped with 3-in. rollers mounted on pins near the ends of the frame.



Tailstock allows for both transverse and vertical movement of gear end of armature shaft

The cross feed is similar to that used in a lathe. The elevating screw is similar to those in house jacks. The two rollers in the Y frame are identical with two in the head of the machine



Commutator slotter equipped with tailstock to allow for accurate alignment of commutator segments with the milling cutter

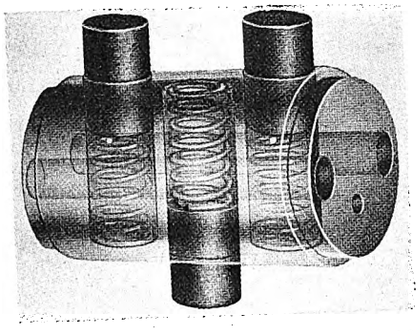
New Equipment Available

Improved Features in Trolley Wheel

AUTOMATIC lubrication by means of graphite plugs is an outstanding feature of an improved trolley wheel being marketed by the Ohio Brass Company, Mansfield, Ohio. Three graphite plugs provide sufficient lubricant for at least 30,000 miles of service. The plugs are compounded especially for this service and provide for lubrication throughout the life of two O-B wheels. They eliminate the use of oil or grease.

The graphite plugs are inserted in the axle and are pressed outwardly



Three graphite lubricating plugs provide lubrication for the trolley wheel

against the wheel bearing surface by means of three coil springs. Two of the plugs press against the bottom of the wheel bearing and one against the top. They are of sufficient size and spaced closely to insure constant lubrication of the entire bearing surface of the wheels.

Unusually large closely fitted bearing areas for the axle and harp are provided. One-half of the axle bearing area is always in close contact with the wheel, while the machined butting areas of the axle are clamped solidly against the equally large contact areas of the harp, which eliminates brush contact washers and springs. The axle is made of hardened cold-rolled steel and is ground accurately to size. Its area is three to four times the usual area of the pins generally used in old-style trolley wheels and harps. The axle is bolted solidly against the two halves of the harp by two bolts which pass through the axle. These bolts can be drawn up as tightly as desired without affecting the operation of the wheel. Thrust washers made of special Bakelized fiber are placed on each end of the axle between the wheel hubs and the harp to prevent end play of the wheel and contact with the harp. These washers prevent arcing between the wheel and the harp and resist moisture.

The wheel itself is cast of a high-grade bronze alloy developed particularly for electric railway service. The harp is made of Flecto malleable iron, which is claimed to be free from brittleness. It is hot-dip galvanized.

Cold Steam Cleaning Equipment

EQUIPMENT for cold steam cleaning of automotive equipment has been announced by the Cold Steam Corporation, Charlottesville, Va. It includes a boiler with necessary connections and a cold-steam nozzle. The boiler is of the vertical fire tube type, designed for working pressures up to 200 lb. per square inch. It is made in accordance with the American Society of Mechanical Engineers boiler code.

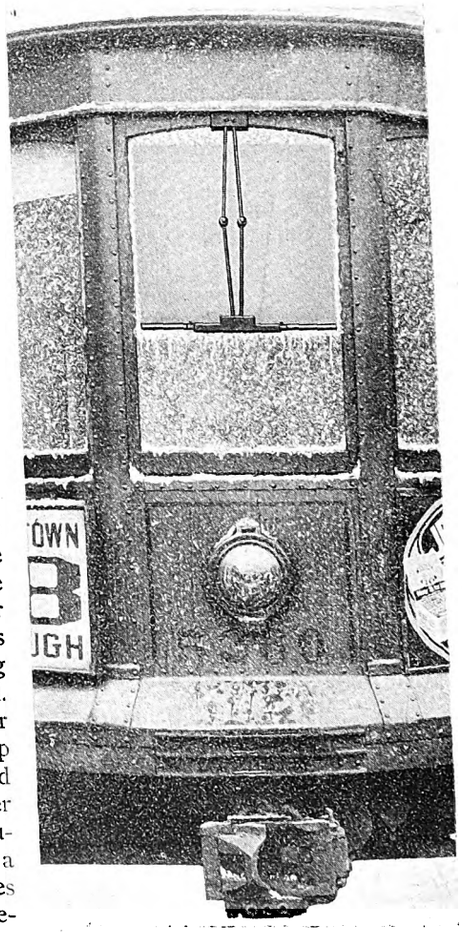
The burner is either of the gas type or the fuel-oil burning type, the former being recommended for use where natural gas is available or where the pressure of artificial gas is sufficiently high. In the oil-burning equipment fuel or furnace oil is used. Preheated water is fed to the boiler by means of a positive driven pump which is controlled automatically and maintains a constant level of water in the boiler. As a further precaution the controller is fitted with a low-water alarm whistle which gives warning should the water fall below the normal level.

Steam is piped from the boiler to the washstand where the steam hose is attached. A cold steam nozzle is provided which is provided with connections to both the steam and water lines. As steam is used at a pressure of about 150 lb., this passes through the nozzle and picks up and mixes with the water in whatever quantity desired. This quantity is determined by the operator according to the needs of the cleaning job and is adjusted by means of the nozzle.

Where it is desired to use some form of soap mixture or other liquid cleaner, hose lines may be attached to their containers and by turning a valve the contents are projected through the nozzle as desired. Two or three-way valves may be used in the water line.

Vertical Moving Window Wiper

SURFACE of 24 in. wide and 22 in. long is cleaned by a vertical window wiper which is a product of the Cinch Manufacturing Corporation, Chicago, Ill. This wiper was designed and perfected in co-operation with several electric railway companies where trials have been made. The principal feature of the Cinch ver-



Window wiper in its lowest position. It returns to the top automatically by spring pressure

tical swipe is that glass is cleaned by a vertical movement, so that rain or snow are carried downward and out of the way.

The movement of the wiping part is by means of a pantograph with two arms pivoted at the top of the sash. The outside pantograph frame is caused to move by the turning of a handle which is fastened to a shaft projecting inside the vestibule of the car. By turning the handle through an arc of 45 deg. the swipe is brought to its lowest position and it returns automatically to the top by spring pressure. In its normal position the swipe is at the top of the glass so as not to obstruct vision.

News of the Industry

Trial Run in Rochester's Subway

Following an inspection trip by railway and civic officials and industrial leaders in the first car ever operated by electricity over Rochester's new subway in the bed of the abandoned Erie Canal, it was announced that the line will start operation about Sept. 15.

It is expected that the interurban cars of the Rochester & Eastern and the Rochester & Syracuse Railroads will be the first to run in the city-built line. City surface cars will not be diverted into the subway until the signal system is completed about Dec. 1.

The Common Council favors operation of the line by the New York State Railways for a three-year trial period under terms similar to those that apply to the city trolley and bus lines, conducted under a service-at-cost contract.

The trial run was made from Winton Road at the extreme eastern end of the line to City Hall Station at the rate of a mile a minute. The entire 9 miles of the subway, which bisects the city, following the route of Clinton's "Big Ditch," was covered by the party.

The new line will not only take all interurban and much surface traffic off the streets, but will provide added switching facilities for industries along the line, under separate contracts to be made with the five steam railroads entering the city.

Civil Service Suggested for Detroit Employees

A movement has been started in Detroit which, it is believed, will ultimately result in the establishment of city civil service for employees of the Department of Street Railways. Del A. Smith, general manager of the D.S.R., recently asked the Corporation Counsel's office for an opinion as to whether the charter or the department regulations permit the discharge of employees because of nationality.

Mr. Smith is quoted as having stated that should the Corporation Counsel agree with the opinion that it is within the power of the Street Railway Commission to adopt any regulation it sees fit to govern the selection of employees, he would ask the commission to adopt a rule barring from the D.S.R. employ aliens who have had an opportunity to become citizens but have not availed themselves of it.

It is stated that 50 or 60 alien employees of the department have taken out their first papers. Mr. Smith believes that men not interested in the city sufficiently to become citizens should not be connected with a government department.

Mayor John W. Smith has announced that he will ask the Street Railway Commission to place the D.S.R. under civil service, and an opinion has been received by him from the Corporation Counsel's office to the effect that it is mandatory upon the city to amend its Charter in conformance with the Home Rule Act, and establish a D.S.R. civil service system. The Corporation Counsel's office also has under consideration the request of the D.S.R. general manager regarding the status of alien employees of the D.S.R. and the opinion has been expressed that the D.S.R. has the right to make its own rules regarding aliens.

The Mayor's action is said to be opposed by officials and representatives of the Amalgamated Association. Following a brief meeting between them, the Mayor and union representatives declined to make any announcement about the outcome of their talk.

Expert Recommends Co-ordination for St. Louis

Report not made public, but Mayor reviews his attitude toward subjects about which differences of opinion exist

ROBERT M. FEUSTEL, who recently made a survey of the St. Louis railway situation at the request of Mayor Victor J. Miller, in a report submitted to the Mayor is understood to have recommended co-ordination of buses and street cars with a service-at-cost franchise as the best solution of the city's railway needs.

Mayor Miller has not determined whether a franchise shall be granted to the St. Louis Public Service Company when that organization takes over the United Railways properties, probably in October. The original plan of the reorganization committee of the United Railways was to secure a 30-year service-at-cost franchise for the new company with the right to earn 7 per cent on a valuation of approximately $60,000,000. Subsequently this offer was withdrawn because the city administration had failed to act within the time limit fixed by the company.

The contents of the report of Mr. Feustel to Mayor Miller will not be made known at this time. However, the Mayor and Mr. Feustel are said to be in agreement on the fundamentals of the St. Louis situation.

The suggestion of co-ordinated bus and railway transportation is not new for St. Louis. Several years ago the reorganization committee endeavored to purchase the competing People's Motor-bus Company, but the parties could not agree as to price. Subsequently the reorganization committee formed the St. Louis Bus Company to supplement its railway service.

In this connection it is interesting to note that the Mayor is of the opinion that municipal ownership of the city's street car system would not solve the railway problem. The Mayor said:

> This problem cannot be solved in a few days. Within the next five weeks I intend to have formulated a policy with regard to the properties of the United Railways, its ownership and future possibilities.
>
> Urban railway transportation is in a state of change and it is very difficult to forecast just what transportation facilities will be most useful for the city within twenty-five or fifty years.
>
> The city will probably employ several experts from other municipalities to aid in solving our problems. I intend to ask the Board of Aldermen for an appropriation for this purpose as soon as I can. I do not know as yet where we will go for our engineers and consultants.

Mayor Miller has outlined four ways of meeting the St. Louis railway problem. His suggestions briefly are:

1. Allow company to continue under existing franchises. This would make it difficult for the company to secure loans over a long period of time for financing and operation purposes.
2. Municipal ownership.
3. Semi-public ownership. Under this plan the city would build and own the facilities and lease them to an operating company.
4. Adopting of a service-at-cost franchise or some similar plan.

The city administration has favored a service-at-cost plan, but failed to

Digitized by Google

agree with the reorganization committee of the United Railways on the valuation for rate making purposes or the amount of return the company should be permitted to earn. The reorganization committee asked for a 7 per cent return, but Mayor Miller contended that 6 per cent was sufficient.

Baltimore Hearings Started

The Maryland Public Service Commission started hearings on Sept. 6 on an application made by the United Railways & Electric Company, Baltimore, for an emergency increase in fares pending later action on the company's application for a 10-cent fare. The entire hearing was devoted to determining whether an emergency exists that necessitates an immediate increase.

Thomas J. Tingley, People's Counsel, led the opposition to the increase. Charles C. Wallace, City Solicitor, and lawyers for various organizations also joined with Mr. Tingley in opposing the increase.

Charles Markell, who represented the United, told the commission that the United had been operating since 1920 under rates that were confiscatory. He pointed out that the commission said several years ago that the company should earn a net of at least $1,000,000, which would be a fair and reasonable return on its investment, but this amount was earned only in 1926, when the greatest economies were instituted. The income of the railway since 1920, he said, has fallen short of the minimum of minimums.

The company has been operating at zero and finds it cannot operate below zero, Mr. Markell told the commission. He denied that the number of passengers on short rides had decreased because of fare increases and also said that people ride in automobiles because they want to and not because of the car fare charged. Mr. Markell also declared that if the fare were lowered to 5 cents it would have no appreciable effect on the number of car riders.

Mr. Tingley replied to Mr. Markell and denied that the need of an emergency increase existed. He said the company had not instituted every possible economy.

Cites Court Decisions on Cost of Removing Conduits for Chicago Subways

Opinions rendered to the Chicago City Council on Sept. 2 by Assistant Corporation Counsel James W. Breen, indicate that the expense of removing and relocating pipes, wires and conduits in connection with subway construction or other improvements must be borne entirely by the public utility companies. Mr. Breen cited numerous Supreme Court rulings which sustain this requirement and refuse to allow such expenses in cases of subway building to be added to the subway rental and indirectly saddled upon the rider.

Convention Guests

MEMBERS of the American Electric Railway Association can extend the privileges of the Cleveland convention to their guests as in past years by registering them on the forms provided at the registration desk. Better still, guests should be pre-registered on the forms distributed to members some time ago. Use of the pre-registration cards will obviate the delay when entering the auditorium, as the badges will then be ready in advance and presentation of the duplicate card will complete the registration.

For those who wish to extend the privileges to guests for a single day only, guest tickets have been provided which will admit the bearer to the convention and exhibit. These tickets will be collected at the door. They are intended particularly for company members in Cleveland and vicinity which desire to have employees and others visit the convention without remaining for the entire time. They may be obtained on application to the executive secretary, J. W. Welsh, 292 Madison Avenue, New York City.

Problems of Salt Lake Company Explained

Rerouting of the Poplar Grove cars of the Utah Light & Traction Company, Salt Lake City, Utah, has been ordered by the Public Utilities Commission, the test to continue for a period of six months from the date on which it begins. This decision was reached at the hearing on the application of the company to abandon service and remove its tracks on Seventh South Street between West Temple and Eighth West Streets. The hearing was continued to the end of the six month test period. In the meantime, the tracks which the company sought to remove on Seventh South Street will be allowed to remain during the six months trial of the new routing.

Edward A. West, general manager of the company, testified that the cost of operating the cars over the section of road it was sought to abandon was $1,085 a month, while the average monthly revenue on that section was $370, leaving an operating loss of $715. There are twenty railroad crossings over which the company's cars pass in going over the Seventh South line. It is largely to eliminate the maintenance of those crossings that the company desires to discontinue service on West Seventh Street.

Mr. West testified that many portions of the system were not paying and that to serve the public best those sections should be pruned from the system. He said the railway had been laid out before the coming of the automobile, and that the system now is too large for the demand of the public.

Salt Lake has 1 mile of trackage for each 1,200 people, while the average in cities of comparable size is 1 mile of trackage to each 2,000 inhabitants. Mr. West declared that average earnings in Salt Lake are much lower than elsewhere, being only 30 cents per mile, compared with 44 cents per mile nationally. The maximum earned on any line in the Salt Lake system is 36 cents per mile, while the minimum is 8 cents. He declared that on the Seventh South Street line the average was 8 cents and that on the North Yard line it was 15 cents.

The commission will conduct a hearing at once on the application of the company to discontinue service on the Holliday line south of Thirty-third South Street. Hearing on the application to discontinue the Mill Creek bus line is also scheduled.

Reconsider Unlimited Term Franchise Bill at Chicago

A decision on the part of the local transportation sub-committee of Chicago, Ill., to reconsider its removal of the 40-year limit on franchises in the legislature marked the only new development in that quarter during the past week. The bills were drafted recently to facilitate settlement of Chicago's traction problems. In revising Senate bill No. 439, one of the Insull traction bills which was defeated in the legislature last June, the aldermen struck out the 40-year clause and substituted the recommendation that the City Council be empowered to grant a permit for 20, 50, 75 or any other number of years. Critics immediately assailed the measure, however, on the score that no protection would thereby be afforded against a perpetual grant. In consequence of this protest the subcommittee decided to reconsider its action at a subsequent meeting. The redrafting of the other 4 bills was completed on Aug. 31.

New Outing Bureau in Chicago Benefits Electric Lines

During the first month of its establishment, the outing and recreation bureau jointly maintained in the city of Chicago by the transportation companies and other local utilities under the management of Samuel Insull and associates has received and answered more than 16,300 inquiries about low-cost vacation trips in the metropolitan area, officials of the bureau recently announced. Telephone calls totaling 12,880 and approximately 3,500 personal calls for outing information were handled in that period and more than 38,000 pieces of vacation literature issued.

The bureau was opened on June 27 to furnish the public with suggestions for outings, vacations, picnic and sightseeing trips in and around Chicago. Attractive, inexpensive jaunts to many nearby resorts and parks have been mapped out by the bureau with full information as to costs, length of trip, things to be seen, etc. The service is free.

Striking window displays of vacation scenes and a large variety of folders

Digitized by Google

and maps describing the scenic and recreation facilities of the region have been used to promote the service rendered. Among the transportation companies interested in the bureau are the Chicago Rapid Transit Company, Chicago, North Shore & Milwaukee Railroad, Chicago, Aurora & Elgin Railroad, Chicago, South Shore & South Bend Railroad and the Shore Line Motor Coach Company. The bureau also serves as a consolidated ticket office for these companies.

Pennsy to Electrify Baltimore Lines

Electrification of the Pennsylvania Railroad in and near Baltimore within the next three years appears to be in prospect. George M. Smith, superintendent of the Baltimore division of the road, recently indicated that the company's roads in and near Baltimore will be electrified and the power used in operation of freight and passenger trains by 1930.

One-Man Car Suggestion Opposed in Los Angeles

Local railway states its case against use of this equipment under peculiar conditions that exist in Pacific Coast Utilities

AT A RECENT hearing before the California Railroad Commission on the application of the Los Angeles Railway for increased fares, the chief engineer of the commission recommended the operation of one-man cars in Los Angeles as a measure of economy. Several different plans were proposed. They included one-man car operation throughout the city, and a zone plan operating two-man cars through the central district and changing to one-man operation outside.

The company is opposed to the suggestion. Figures in the hands of the railway show that the operation of one-man cars would not be a measure of economy in Los Angeles, particularly since the present type of equipment is not adapted to this operation. The engineering department of the railway estimates that the interest charge alone on the capital investment required to make the change would be more than $170,000 a year, which must be deducted from any possible savings. The commission's engineers estimate that a year would be required to put the proposed system into effect.

According to the company there will be besides this the following, all militating against the proposal:

The additional cost of breaking in, as every man would have to be qualified not only as a conductor but as a motorman as well. The San Diego Street Railway reports that approximately 5 per cent of its trainmen cannot qualify for one-man car service. The percentage in Los Angeles would probably be about the same.

Additional supervisory, instruction and cash receiver forces to handle this work, with resulting heavy increase in payroll.

Difficulties of the operator having to stop to pull switches, plug them and going back to take plug out before proceeding.

Additional hazard at railroad crossings on account of flagging.

Greater delays in the case of accidents or blockades.

An increase in the possibilities of hold-ups.

Fenders of the present type are too heavy for one man to handle. This type of fender is used on account of a city ordinance and must be changed from one end to the other at every terminal every trip.

The opinion of the management is that on the Los Angeles system, with the extremely heavy passenger pick-up at many transfer points, and at practically all terminals it would be impossible for one man to handle the situation; and increasing layover time runs into a great deal of money. As the officials of the company see it the cost of one-man operation might be greater than operation under the present man power, not to speak of the easily figured inconvenience and delay to passengers and general street traffic. A loss of 1.38 miles in every car-hour means that during the average week day 10,000 fewer miles would be traveled under any of the suggested one-man operation plans than at present and 60 additional slower moving cars would be on the streets.

St. Paul Seeks Relief From Heavy Expenses

The St. Paul City Railway, St. Paul, Minn., is working for an amendment to the city charter to carry out a recommendation by the Minnesota Railroad & Warehouse Commission made more than a year ago that the city remit some of the expenses under the present charter in regard to paving. The company is now required to do work that costs $56,000 a mile. It estimates that paving relief will reduce operating expenses $115,000. This would make a more reasonable return to the company at the present rate of fare of 8 cents cash or 6 tokens for 40 cents.

It is the contention of the company that paving between the tracks began with the horse car, when the horse motive power wore out the road. Although the electric car does not do this the car rider is still saddled in that city with a charge that prevailed 50 years ago.

Under the proposed amendment the Council will be able to relieve the company of all paving and foundation for paving and maintenance of both; also to relieve the company of all charges for street sprinkling, cleaning, sweeping and removal of snow and ice from the streets except from the tracks.

Wage Reduction Plea Rejected by Oakland Men

A proposal of the Key System Transit Company, Oakland, Cal., to its platform employees urging that they accept a reduction in their wages of 5 cents an hour has been rejected and the uniformed operators will stand by their agreement of two years ago with the company.

This was revealed following a meeting at which the executive committee presented the "suggestion" of the company to the men after debating the merit of the request for ten days.

It was announced that the reduction in wage was essential to the company because its financial condition is "desperate and critical" and that the need for economy on the part of the employees will remain for a year only. The alternative proposition that the employees keep their present wage and accept changes of hours that would result in a similar reduction was also voted down by the operators.

New Fare in San Antonio

A "compromise" schedule recently operative on the lines of the San Antonio Public Service Company, San Antonio, Tex., reduces the price of weekly nickel tickets from 30 cents to 25 cents, but otherwise leaves unchanged the fares, ranging up to 10 cents for adults. It places bus fares within the city limits on a parity with trolley fares (outside the city the fare is 2 cents additional on either bus or street car). The new rates also authorize sale of books, good for 30 days, giving children under seventeen years old forty rides for $1.20 or 20 for 80 cents.

This "reduced" schedule of car and bus fares has ended, at least temporarily, a controversy waged since the San Antonio Public Service Company several weeks ago, increased cash fares from 6 cents to a maximum of 10 cents. All members of the City Commission failed to agree to the new schedule, which is in the nature of a compromise, but a deadlock in the commission prevailed to prevent proposed granting a franchise to a new bus concern that offered a 5-cent transportation. This deadlock also blocked a proposed independent audit of the present railway company's books. The company never conceded the the city's right to require the latter's consent to a change of fares.

The increased car fare schedule, in effect since July 10, made the cash fare 10 cents, but provided for the sale of three metal tokens for 25 cents and for the sale at 30 cents of transferable tickets which permitted holders to ride for one week at 5 cents additional per ride. Children's rate was raised from 3 to 5 cents straight, and for school children under seventeen a 10-cent cash fare. In both cases a ticket rate was established.

Railway to Resume in Mount Clemons

Railway service is to be resumed in Mount Clemons, Mich. Bus service operated on the streets for the past six weeks was termed unsatisfactory and the Detroit United Lines was ordered by the City Commission to place the line back into service. Petitions are being circulated in Lake township for restoration of interurban service on Jefferson Avenue. The service was stopped by the village of St. Clair Shores at the expiration of the franchise on July 21.

North Shore Line Provides Inter-Line Ticket Sales Service

A new interline ticket sales service whereby through tickets to any point in the United States served by a steam or electric railroad can be purchased at any of the company's passenger stations, has been started by the Chicago, North Shore & Milwaukee Railroad. Interconnecting ticket arrangements, including Pullman reservations with all steam lines in the country, have been established for the convenience of North Shore Line patrons. Arrangements have also been made with the Parmalee Transfer Company in Chicago for the free transport of North Shore Line passengers and hand baggage from downtown stations to all steam railroad terminals.

New Paper in Richmond

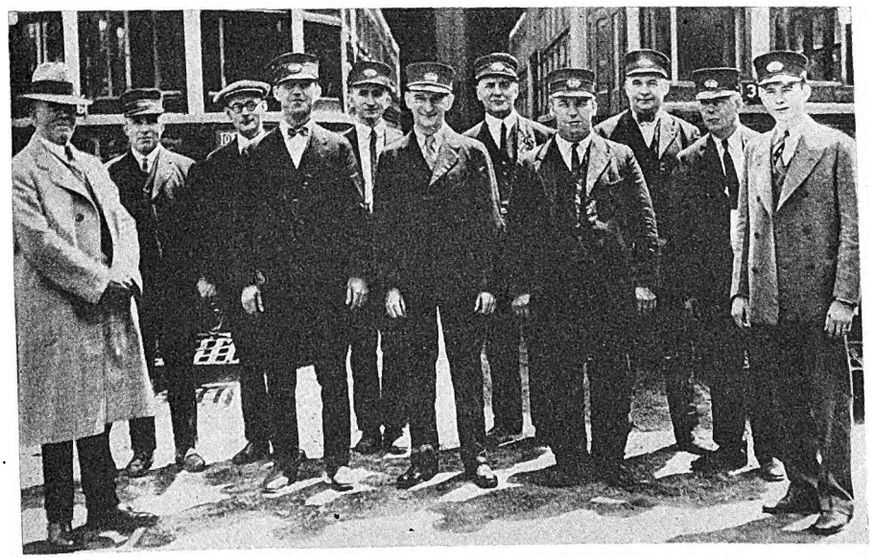
The first number of a magazine for the employees of the Virginia Electric & Power Company, Richmond, Va., has been issued. Nameless now, it will be christened by one of the employees. The employee who chooses the best name will be awarded $10 in gold. A. H. Herrmann, Richmond, is editor of the magazine, and C. S. Stackpole, also of Richmond, and E. H. Will, of Norfolk, are associate editors. The first number of the publication has sixteen pages. Four thousand copies of it were distributed to the employees.

240,000 Miles Without Accident

Ten employees of the New York State Railways, Rochester, N. Y., lines are now clad in brand new uniforms. It's all because they were careful.

The ten men comprise team No. 15 of the Federal Street division in the annual accident prevention contest of the railway. All trainmen of the Rochester lines were divided into teams of ten men each. To be eligible the ten men on the team must have operated a total of 3,000 days, or an average of 300 days each during the year. The winning team, captained by Theodore Hyde, operated a total of 240,000 miles for the twelve months without a chargeable accident. There were three other teams, one from the Federal Street division and two from State, which operated during the year without an accident, but they did not qualify in operating the required number of days.

Accident prevention contests are part of the safety work being carried on under the direction of Leon R. Brown, safety director of the Rochester lines of the New York State Railways.



A careful crew rewarded for what it could do

Ohio Wreck Laid to Trainmen

Trainmen on the Dayton & Troy Electric Railway were at fault in causing a collision on that road near Dayton, Ohio, on June 25, according to a decision of the Interstate Commerce Commission's safety bureau. In the wreck four persons were killed and 39 were injured. The report also stated that in the opinion of the Commission an adequate block signal system on the line would probably have prevented the accident and that an automatic train stop system would have certainly done so.

To Smoke or Not to Smoke

Over this question the Georgia Power Company, Atlanta, Ga., has aroused a considerable argument. Some weeks ago "Two Bells," its official organ, published an article asking car riders to express an opinion as to whether or not its present "No Smoking" rule should remain in force.

In view of the increasing number of women who smoke, officials were seriously considering a change in the rule. But the referendum, in addition to arousing public interest in the affairs of the company, has brought out the fact that a large majority of the riders are opposed to smoking on the trolley and a still larger number are opposed to allowing women to smoke there! The question whether women should be allowed to smoke has almost made a side issue out of the original question.

Danbury Company Will Sell Certain Franchise Rights

The Danbury Power & Transportation Company, Danbury, Conn., has asked the Public Utilities Commission for approval of its proposed plan to sell its franchise rights for distribution and generation of electricity, and its power plant and equipment to the Danbury & Bethel Gas & Electric Company. The petition states that the seller is to reserve to itself its rights to maintain and operate a transportation system.

Superior Fare Hearing Deferred by Commission

The hearing by the Railroad Commission on the request of the Duluth Street Railway, Duluth, Minn., for higher fares in Superior, Wis., has been postponed to late September. The company contends that the present cash fare of 10 cents or five tickets for 30 cents is insufficient to produce a fair net return.

Opening of Philadelphia Tube Delayed

The North Broad Street subway of Philadelphia, Pa., built by the city at a cost of $100,000,000, will not be placed in operation before next May. This was disclosed recently by officials of the Philadelphia Rapid Transit Company which will operate the line. City engineers, it was said, were in accord with the company's findings contained in an engineering survey that the city-built tube could not be ready for regular train service before the expiration of Mayor Kendrick's term in office. Delay in installing the signal system and other essential equipment and failure to provide adequate terminal facilities for through operation under City Hall before the South Broad Street unit is completed were the factors cited by the Philadelphia Rapid Transit Company experts as contributing to the delay.

Loud Speaker in London

Two cars of a train on the Charing Cross & Hampstead section of the London Electric Railway have been fitted with loud speakers. One car has a horn under the roof and the other has a double-mouthed rectangular speaker from which the sound emerges in two directions. The guard has a mouthpiece into which he speaks, giving information on the next station, and connections which can be made there. Tests are being made on the same sort of equipment to give communication between guard and driver.

Electric More Economical than Steam in Switzerland

Twenty thousand tons of coal are being saved yearly because of the adoption of electric railway service in Switzerland. Directors of the Rhätian line, which extends for 173 miles and which has been operating for the last five years, have reported other economies. According to their statistics a reduction of 52 per cent is being made in the engineering staff at the workshops for the maintenance of electric locomotives; 48 per cent in the track maintenance department and 43.5 per cent in the service personnel.

Railroad Electrification in Austria

The Austrian State Railroad authorities are planning two new schemes of railroad electrification. The first scheme will occupy a period of five years in completion. It will involve about 380 miles on the Vienna-Salzburg and Vienna-Gratz-Nauer lines. In the second plan a total of about 475 miles will be electrified.

Halfpenny Fares Restored in Glasgow

The halfpenny fare, which was abolished in Glasgow in 1920, was reintroduced last month by the Town Council. This 1-cent charge covers one stage, or half a mile. Heretofore two stages, or about a mile, were obtainable for a halfpenny. The present move is regarded as experimental and has been recommended as such by the general manager, although the adoption of the 2 d. fare for any distance beyond the 1 d. stage has proved very successful, resulting in the increase, it is believed, of £82,196 in the tramway traffic revenue for the financial year ended May 31.

Bus Proprietors Propose Plan to Middlesex

The London Omnibus Proprietors Association has proposed to the Middlesex County Council to institute a system of bus operation. For the last two or three years the Metropolitan Tramways has been operating the Middlesex cars at a loss, due chiefly to bus competition, it is believed. For this reason there seems to be doubt whether the lease, which expires in 1930, will be renewed. According to the secretary, the association would be prepared to participate in a reasonable scheme of compensation by annual tax or donation to the County Council for loss of capital, and it is prepared to cover a system of fares and timings intended for workmen.

Trolleys More Profitable than Buses in Brisbane

Much of system rebuilt since city took it over about four years ago

THE annual report of the Tramways Department of the Brisbane (Australia) City Council gives £178,672 as the net revenue from railway and bus operation for 1926, but after deduction of interest, depreciation and other fixed charges, the deficit was £7,748, compared with a deficit during 1925 of £26,395. The bus operating revenue was £16,750. There was an increase of £61,188 in total revenue during the year. The increase in operating expenses, according to the report, is due to the operation of the 44-hour week for the full year and to additional services to the public.

Since the purchase of the property by the municipality four years ago, 38 miles of new track has been laid, 71 new cars have been built and other improvements have been made. Further extensions to the rolling stock and new shops are recommended. On the bus situation, the report refers to the loss from operation during the year (£5,631) on the eleven buses used, and says that individual operators have a better chance at success, as the drivers will work longer hours. It then proposes that the municipal bus service be abandoned, presumably under conditions by which private buses would be employed in their place in supplementary rather than in competitive service.

Electricity for South Manchurian Railway

The South Manchuria Railway, Shanghai, China, is now planning electrification of a part of its system. This decision follows experiments on the line serving the Fushun collieries, where the electric railway system has been giving more favorable results than steam locomotives.

At Anshan, Manchuria, where the Anzan Iron & Steel Works are situated, electric locomotives have been put in use for carrying ore from the Takushan mine, also with favorable results.

The first section to be electrified will be the Fushun branch line, which joins the main line at Suchiatun Junction. This will be followed by the Suchiatun-Mukden section on the north and by the Suchiatun-Liaoyang section on the south.

After the program mentioned above has been carried out, the shunting engines on the Dairen wharves will be the next to be electrified. Plans have been made to increase the electric power supply at Dairen by 10,000 kw. in order to meet in part the need for service to the electric railways planned.

York Shows Falling Off in Travel

Figures from York Municipal Tramways, England, for the year ended March 31, 1927, show a decrease of 1,000,653 tramway passengers and of 4,681 railless passengers. The municipal buses carried 207,618 more passengers than last year, but the total figures for passengers carried, 8,357,572, was 797,716 less than in the previous year. There was an operating income, after deduction of expenses, but after the charges for interest and sinking fund there was a total deficit of £5,013 from all three services.

Expenses Increase on Belgian Light Railway

According to the report of the Société Nationale des Chemins de fer Vicinaux for 1926, expenses have gone up, due largely to the devalorization of the Belgian franc, while it has been impossible to increase charges as rapidly. The Société Nationale is a large railway system extending through all parts of Belgium, with 4,361 km. (2,739 miles) of track. The gross earnings in 1926 were 157,871,463 francs and the expenses 149,668,993 francs. This gives an operating ratio of more than 94 per cent as compared with 90.68 per cent in 1925. Rates have now been increased, however, the second class passenger rate per kilometer from 0.13 to 0.22 francs and the first class rate from 0.17 to 0.28, with corresponding increases in the freight rates. The system has 649 electric motor passenger cars and 613 trail passenger cars, but the greater part of the property is still operated by steam. The steam equipment includes 836 locomotives and 2,014 trail passenger cars. Thirty-six motor buses have been put in service.

Liverpool Reports Slight Gain in Revenue

The report of the Liverpool Corporation Tramways for the twelve months ended March 31, 1927, gives receipts from passengers as £1,389,150, a gain of £5,189 over last year. The passengers carried were 247,608,127, a gain of 440,119 over 1926. The total revenue of the system for the year was £1,436,805.

After payment of interest, sinking fund requirements and repayment of loan, there was a surplus of £157,443. Wages constituted 46.5 per cent of the total revenue. The 1 penny ticket represented 68.30 per cent of the total number sold. Next comes the 2 penny ticket with 30.03 per cent.

Recent Bus Developments

Indiana Commission Defines Its Powers on Bus Operation

In an opinion to F. T. Singleton, chairman of the Indiana Public Service Commission, Arthur L. Gilliom, Attorney-General of Indiana, held that the City Council of Indianapolis had no authority to limit the power of the Public Service Commission, concerning the bus law under which the commission grants permits for the operation of bus lines. The question was raised in connection with a motion filed by the Indianapolis Street Railway to dismiss a petition by the Hoosier Transportation Company to take on and discharge passengers within the city limits. The motion of the railway points out that a city ordinance prohibits buses taking on or discharging passengers on streets used by interurban or street cars, unless the buses are operated by the street car or interurban companies. Mr. Gilliom said the commission alone had power to determine who might give service in such streets.

Council Versus Commission in Lincoln

The Lincoln Traction Company, Lincoln, Neb., has run against a snag in securing permission from the City Council to comply with authority received from the State Railway Commission to substitute bus for railway service on its Beach, South Fourteenth and North Tenth Street lines. The Beach line crosses a viaduct three blocks long over the tracks of the Burlington and the Union Pacific Railroads west of the city. The company started buses over this structure before it got the Council's permission. In the division of authority the state commission controls service and rates, while the city governs the use of streets. The Council wants the railway to give bond to replace or repair that portion of the structure used by it. The company asked that nothing be done until the end of the 90-day experimental period, but the Council finally demanded a $6,000 bond before it would permit buses to be operated by the railway, over the structure.

Jitney Operation Sought in Miami

Petitions for the repeal of the ordinance which rules jitney from downtown zones in Miami, Fla., and for the re-enactment of the previous ordinance were presented to the City Commission on Aug. 15. The petitions, containing 6,100 names and 4,200 names respectively, were filed with H. E. Ross, city clerk. Mr. Ross will check the names on the petitions against the list of voters. Under the old ordinance governing jitney operators, special permits and licenses were required as well as proof of the dependability of all drivers and motor vehicles used. Fifteen per cent of all registered voters must sign a petition for a referendum and 10 per cent for an initiative election for the passage of new ordinances.

Further Co-ordination in Westchester County

Leverett S. Miller, president of the New York, Westchester & Boston Railway, proposes to solve the transportation problem of Westchester County northward from White Plains through Brewster, N. Y., and Danbury, Conn., by the establishment of motor coach feeder lines, rather than by the extension of existing railway lines. Mr. Miller's opinion was contained in a communication to L. Ward Prince, president of Prince & Ripley, who had asked, on behalf of Westchester realtors, that the New York, Westchester & Boston extend northward its western division all-electric commuter service now terminating at White Plains. In his letter to Mr. Prince, Mr. Miller said:

> You are familiar, I know, with the fact that this company originally contemplated the extension of its lines from White Plains to Brewster and Danbury. Within the last few years the company was faced with the obligation of completing its routes, both from Larchmont to Port Chester, and from White Plains to Brewster and Danbury within the time limit specified by law, or lose its franchise rights.
>
> To accomplish this would have required the expenditure of many millions of dollars. The time did not seem propitious for the extension to Brewster and Danbury, but the extension from Larchmont through Mamaroneck, Harrison and Rye to Port Chester appeared warranted.
>
> It was for this reason that the railway sought remedial legislation to relieve it of the obligation to build to Brewster and Danbury. At present-day prices it would cost to build these latter extensions double the estimate made at the time these lines were first considered.
>
> In the meantime, much of the remaining undeveloped property to the south and east of White Plains has come into the market, and the growth to the north undoubtedly now will increase. But I do not believe that it is yet of sufficient extent to warrant a rail line such as was originally contemplated.
>
> It seems to me that the more practicable solution of the transportation problem for this section is through the use of motor vehicles co-ordinated with the existing rail lines, to be followed later by the extension of the rail lines as soon as the traffic may warrant.
>
> You refer to present-day values of land in this section and the very large increase that would result in values if transit facilities were furnished. Transportation must, to a certain extent, be a pioneer in such development, but it cannot carry the load for too long a period.
>
> As you say, the property owners would be well repaid if they were to underwrite the cost of such an extension, but, as you also remark, they won't; they will expect the transit lines to carry the bag. The development through motor vehicle transportation would require far less investment, and consequently the underwriting by property owners in such an undertaking might be more favorably considered by them.
>
> The working out of these problems requires the co-operation of realtors interested in the development of the section and those connected with the transportation companies. We all have a common interest in the development of the section which it seems cannot be efficiently accomplished without such team work.

Rights for Morris County Traction Company

Joseph P. Tumulty and Joseph K. Choate, receivers for the Morris County Traction Company, have been authorized by the Board of Public Utility Commissioners to substitute buses in place of trolley cars over the lines from Landing, Morris County, to Maplewood, N. J.

It is proposed to use 35 buses. A similar application was granted last year involving the company's line between Elizabeth and Springfield. By the application just granted five routes will be created for the company's buses. The fare will be 10 cents in each zone, the same rate as on the trolleys.

The bus service must be started within a reasonable time, the board ruled, adding that it reserved the right to order the removal of poles, overhead trolley wires and tracks and the replacement of pavements.

At the hearing on the application it was contended that permission to run buses would add value to the property of the company. Such a contention, the board held, was secondary to the question of providing adequate transportation. The decision said:

> The board does not propose to approve these permits merely to permit the receivers or bondholders' committee to take advantage of that fact and to speculate with them, but will impose a condition that unless the buses are actually provided and that transportation is furnished over the route now covered by the trolleys the approval will be withdrawn.

Rehearing Sought on Albany Fare Grant

A petition for rehearing was filed with the Public Service Commission on Sept. 2 by Mayor John Boyd Thacher of Albany, N. Y., on the order of the commission adopted on Aug. 4 permitting a 10-cent fare to be charged by the Capitol District Transportation Company, Inc., on its bus lines. This company is a subsidiary of the United Traction Company. The rehearing petition alleges a number of particulars in which it claims the order was not warranted by the evidence taken in the case. It is expected that action on the city's application for rehearing will be taken at an early date. A similar petition has already been filed on behalf of the city of Cohoes.

Route in Minneapolis Changed

With an order from the Minnesota Railroad and Warehouse Commission to make a 12½-cent token fare for local travel on the Selby-Lake line of the Twin City Motor Bus Company in Minneapolis, Minn., the route is to be changed, according to suggestion of the commission, so as not to be in direct competition with the Selby-Lake interurban railway. A similar fare and rearrangement of bus route had already been ordered for St. Paul and the proposed new bus route had been approved by the City Council. The through fare and local cash fare is 25 cents. The company expects to increase the bus fleet on this line from fourteen to eighteen or nineteen.

The new route is ¾ mile longer in Minneapolis and four blocks longer in St. Paul, which will add about ten minutes to the running time between terminals. The Twin City Motor Bus Company is a subsidiary of the Twin City Rapid Transit Company.

Group or Party Buses in Reading

The Reading Transit Company, Reading, Pa., has in service two buses which are available to groups or parties for trips out of town. These buses of the latest type have a seating capacity for 29 people each. Application can be made to the transportation department for service and rates for trips within a 50-mile radius of Reading.

Wisconsin Patrons for and Against Buses

Sentiment of the people at a public hearing on the proposal of the Wisconsin Public Service Corporation to substitute bus service for the electric interurban service between Green Bay and Duck Creek, Wis., was equally divided for and against such substitution. Action was delayed until further evidence of the sentiment of that section could be obtained.

New Buses Operating in Milwaukee

Two new buses of the very latest type have been received and placed in service on the Lincoln Avenue line of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. These buses are operated by twin engines. Each has a seating capacity of 40 passengers.

Hearing Held on Troy Bus Line

Public Service Commissioner Lunn held a hearing on Sept. 6 on the petition of the Capitol District Transportation Company, Inc., for a certificate of convenience and necessity for the operation of a bus line in the city of Troy, N. Y., which will be an extension of the present bus system of the company and will afford transportation facilities to a section of the city in which the United Traction Company, the parent company, proposes to abandon railway service. A hearing on the proposed abandonment of the trolley route in Fifteenth Street between Hoosick and Congress Streets was held before Commissioner Lunn at the same time as the bus application. There was no opposition to either application at the hearing. The decision of the commission will be announced later.

Buses for Local Service in Detroit

Effective on Oct. 1 the Detroit Municipal Railway, Detroit, Mich., will reduce the street car fare to Redford to 6 cents from 10 cents, making the former amount the prevailing fare throughout the city. Several new bus lines have been decided upon and express street car service will be instituted on Sept. 18 on a main artery in the easterly side of the city. The buses will stop at each block and will carry the loads to the next station at which the express street cars stop. A free transfer from the buses to the street cars will be given. Loading stations for the express cars will be built similar to safety zones, but will have canvas tops and sides. In the opinion of the general manager this may aid materially in reducing the number of accidents resulting from persons being hit while attempting to cross from curb to safety zone.

While the department has been figuring on instituting such service for several months it has not been deemed advisable to attempt high speed on Jefferson Avenue and other lines due to the condition of the tracks. The new roadbed has been completed in Jefferson Avenue and the express service will start there first. Construction gangs are now replacing the roadbed in Woodward Avenue and if the Jefferson project proves successful, the higher speed service will be used on the main artery. Del A. Smith, general manager, said:

> The research which the department is conducting in connection with the co-ordination of street cars and motor coaches has convinced us that such a plan is not only entirely feasible, but highly desirable.

Mayor Smith said:

> We all know that rapid transit in the form of subways cannot be achieved in Detroit for several years, and for that reason the D.S.R. is making every effort possible to speed up service. The day is past when we figure distance by miles; we figure it now by minutes and if the time required to carry passengers from one point to another can be reduced, the municipal system is benefitting its patrons.

The Street Railway Commission also approved coach service on the Six Mile Road between Woodward and Wyoming Avenues, and extension of the present service on the Seven Mile Road westerly from Wyoming Avenue to Lasher Road. Both these extensions invade territory annexed to the city during the past few years.

The commission also approved coach service on Schoener Road, between State Fair and Gratiot Avenues; and on Connors Avenue between Six Mile Road and Kercheval Avenue. Both lines will go into operation on Sept. 12. This service will be in force only during the morning and evening rush hours, but will be extended as traffic increases.

Buses for Kansas City, Kan.?

Buses of the single-deck type are proposed for operation in Kansas City, Kan., representatives of the Kansas City Public Service Company informed the city commissioners on Aug. 4, in executive session with Mayor McCombs of Kansas City. The buses would serve the districts in the north and west parts of the city that have no adequate transportation facilities. If the plan goes through the buses will be given a six months trial and would be continued if patronage justified the expense, it was reported.

Toledo Bus Ordinance in Abeyance

Enforcement of the new ordinance in Toledo, Ohio, against handling of intracity passengers by interurban buses has been held up through continued postponements in the municipal court of the 40 or more cases that have been initiated against drivers who violated the ordinance. The ordinance has been upheld by the courts of the state. Meanwhile the Community Traction Company has gone ahead with its city bus service for West Toledo, but is suffering from competition of interurban bus lines operating a few miles beyond the city limits.

Coach Service Extended in Wisconsin

Motor coach service, replacing interurbans on runs between Oshkosh and Fond du Lac and Oshkosh and Neenah, Wis., has been placed in effect by the Wisconsin Power & Light Company. Electric railway equipment will be retained, and the track will be used in emergencies or will be restored to regular use if the demands for service appear to justify it.

Ban on Parking Buses Lifted Partly

The peremptory order to interurban bus companies using the streets of New York City as terminals to find stations not on the public thoroughfares has been modified by Police Commissioner Warren, who extended the time limit indefinitely from Aug. 1 for lines which are building terminals but have been unable to complete them. With the opening of the Holland Vehicular Tunnel the commissioner believes there will be a great increase in interurban bus lines. Lines which have made no attempt to obtain terminals will receive summonses for obstructing traffic. Sept. 15 is the new date fixed in the ban against parking.

Commission Hears St. Louis Reorganization Plea

The Missouri State Public Service Commission has under advisement the application of the St. Louis Public Service Company for approval of its plans for the reorganization of the United Railways properties in St. Louis, Mo. The new company recently purchased the United Railways holdings for $49,601,000.

United States District Judge Faris, who has jurisdiction over the receivership, has already approved the general plan of reorganization. The company is expected to emerge from receivership within 60 days.

The commission conducted a hearing on the application on Sept. 2. At this session it developed the new company plans to issue securities in addition to the $52,414,862 heretofore provided for, but specific plans for the additional financial obligations were not revealed at the hearing.

The commission also sought definite information concerning the cost of reorganizing the properties, but Stanley Clarke, counsel for the reorganization committee, stated that there is no way of finally estimating such cost at present. The expenses of the reorganization to date have totaled approximately $895,000, but that amount will be increased before the complete reorganization is perfected.

During the period of reorganization the committee has maintained offices in the Liberty Central Trust Building, St. Louis, and has employed a force consisting of three attorneys, two engineers, a secretary, stenographers and other office help. This force has taken no part in the operation of the company under the receivership, which has been in charge of Rolla Wells and Col. Albert T. Perkins, his general manager.

Counselor Muench for the city took the position that the application of the new company was premature and too indefinite and that under it the commission could only issue an "If and when order." He cross-examined all witnesses for the company.

Walter E. Bradley, secretary of the reorganization committee, testified that the majority of the holders of securities of the old company had approved the reorganization plan. He estimated the percentage of assent as follows: Transit company securities, 99.76 per cent; Suburban company bondholders, 87 per cent; United Railways preferred stock, 96 per cent, and United Railways common stock, 89 per cent. All classes of security holders will participate in the readjustment of the company's financial structure and none of the securities to be issued by the new company will be sold to the general public. He said that all of the stock of the new company has been subscribed by the present security holders.

The new stock will include 73,193 shares of preferred and 342,645 shares of common. Of the preferred stock 19,000 shares will be used to pay off unsecured claims against the old company on the basis of 66⅔ per cent if such stock is accepted in payment. If not, the claims will be paid off on the basis of 33⅓ per cent in cash. Mr. Bradley said that with the exception of the city of St. Louis, all of the unsecured claim holders have elected to accept stock in payment. Such claims total $466,471. The testimony developed that no funds have been set aside to take care of the mill tax judgment.

The new company will have total bonds of only $40,800,000 as against $54,890,000 of bonded indebtedness of the United Railways. New bonds to the amount of $4,500,000 will be issued at this time to refund a like amount of Suburban company bonds. Mr. Clarke testified that the cash in the hands of Receiver Wells would not reach the estimate of $4,500,000 made when the committee first announced its reorganization plans in October, 1924. The total amount of cash now in the hands of Receiver Wells was not revealed at the hearing, and it was stated the probable deficit in cash for the reorganization could not be definitely estimated at present. Mr. Clarke said:

> We probably will have to ask the commission for authority to sell additional preferred stock or prior preferred stock, or some short term notes to make up the deficit in the cash requirements of the plan.

A shrinkage of earnings during the last three years accounts for the lower amount of cash held by the receiver.

Later it was estimated the company would require at least another $900,000 in addition to the cash now available.

The total securities of the new company including bonds and stocks will be $52,414,862 compared with $93,886,000 in securities of the old company now outstanding. The $16,383,000 in preferred stock and $24,913,000 common stock of the United Railways were eliminated in the reorganization plan.

New Owners in Beacon

The Fishkill Electric Railway, controlled by the Central Hudson Gas & Electric Corporation, has relinquished the Beacon, N. Y., railway system to a local syndicate headed by Attorney James G. Meyer and Mayor Macomber. The line covers 7 miles. The fare is 7 cents with no transfers. It is stated that the operating company might find the burden of Main Street paving somewhat burdensome and complications might develop affecting adversely the future of the trolley.

Traffic, Fare and Wage Figures

Traffic on the electric railways continued to fall off during July, compared with July, 1926. The decrease was the heaviest of any month in 1927 thus far. The number of revenue passengers, including bus passengers, reported to the American Electric Railway Association by 219 companies for July, 1927, compared with July, 1926, is as follows:

July, 1927	773,232,934
July, 1926	803,981,889
Decrease, per cent	3.83

Average cash fares in cities of 25,000 population and over:

	Cents
Aug. 1, 1927	7.9223
July 1, 1927	7.8966
Aug. 1, 1926	7.6946

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate Cents	Index Number 1913-100 Per Cent
Aug. 1, 1927	57.23	210.02
July 1, 1927	57.19	209.87
Aug. 1, 1926	56.87	208.70

Dispute Over Applicability of Funds for Income Bond Payment

Thomas B. Jenkins, of Richmond, Ind., owner of $35,000 par value adjustment mortgage 5 per cent income bonds of the Third Avenue Railway, New York City, is bringing suit in federal court to compel it to pay full 5 per cent interest and 27½ per cent accumulated back interest and to prevent it from going into the bus business until the bonds are paying full interest and the accumulation is wiped out. Suit will be brought on behalf of himself and all other bondholders, but Mr. Jenkins has already filed a suit in state court, asking that the company be compelled to pay interest due on his bonds. In urging others to join him Mr. Jenkins issued this appeal:

> On Oct. 1, 1927, a total of 30¾ per cent interest will be due on the adjustment mortgage 5s, amounting to $6,836,000. Of this accrued interest 1¾ per cent, or $275,000, has been ordered paid, leaving an arrearage of $6,561,000, or 29¼ per cent.
>
> According to the company's published reports, full interest of 5 per cent has been earned on the adjustment 5s in the past two fiscal years, with a surplus, after interest, of around $300,000. Only 2½ per cent has been paid or ordered paid in each of these two years.
>
> According to the same reports, the surplus income of the company available for the payment of interest on these bonds accumulated since 1917, but unpaid, is approximately $4,500,000, or 20 per cent on the outstanding bonds.
>
> The company has been operating bus lines in Westchester County and, not only are said bus lines operating unprofitably, but they were financed out of the company's treasury with funds which legally belong and should have been paid to the adjustment bondholders. Officers of the company admit that they contemplate an extensive bus venture in the Bronx, requir-

Digitized by Google

ing considerable further capital. This venture, they also admit, will probably prove unprofitable. The financing of this venture, they state, is to be accomplished through the hypothecation of securities now held in the company's treasury, which were bought with cash from the company's treasury, and which I am advised by counsel ought to be applied to the interest due the adjustment bondholders.

As an owner of the adjustment mortgage bonds, I have employed counsel to estop the company from using the property of these bondholders for capital purposes, in direct violation of the trust indenture securing the bonds, and also to bring legal action against the company, to force it to pay the earned but withheld interest on the bonds.

My attorneys are Barber, Fackenthal & Giddings, 120 Broadway, and I hereby invite all owners of these bonds to join with me in an association for mutual protection.

No deposit of bonds will be required. Please communicate with me in care of my said attorneys or with said attorneys. Telephone—Rector 4573.

A statement by the company says:

The past year has been an eventful one for the companies of the Third Avenue Railway System. Much of the uncertainty as to the future, occasioned by threatened bus competition has been cleared up and the future never seemed more assured or brighter.

Operations for the year ending June 30, 1927, showed approximately $250,000 above 5 per cent on the adjustment bonds. This showing was abnormal in the respect that there was a substantial increase in receipts and in net due to the Interborough strike which occurred during that year, temporarily diverting travel to the Third Avenue lines.

It has been necessary in order to avoid the sale of securities at a sacrifice to finance all the operations of the companies for the last ten years out of surplus.

During the past year among other extra disbursements approximately $300,000 was paid on account of paving bills of previous years which has been in litigation and also it was necessary to pay $350,000 on account of capital expenditures, making approximately $650,000 paid out of the year's surplus for expenditures not chargeable to operating expenses.

At the present time the companies of the system have in the treasury available for all purposes approximately $1,500,000. This is outside of its own securities which were bought and placed in its treasury more than ten years ago.

From this it will be seen that although the future of the companies of the system seems assured, the cash available for all purposes has not been increased during the past year. Under the conservative policy which has characterized the management, it is advisable to conserve this cash surplus. This is more urgent by reason of the increase of wages that has been going into effect during the past few months.

Traffic Increase in Toronto

Transportation Commission's report covering operation of municipally-owned system sees improvement in general business reflected in the operations for the year 1926

IN ITS fifth annual statement covering the operations of the year ended Dec. 31, 1926, the Toronto Transportation Commission, Toronto, Ont., points out that the surplus of $76,951 was slightly more than one-half of one per cent of the gross revenue. The accumulated surplus as of Dec. 31, 1926, was $248,371.

The gross income was $12,050,304, an average of more than $1,000,000 a month and the largest in the history of the commission. The increase over 1925 was partly due to the increased development of motor coach traffic and partly to an improvement in general business conditions in the Toronto district. The revenue passengers were 183,494,076, a gain of 2,714,151 over 1925, but the total number carried for 1926 was still more than 5,500,000 passengers below the record established in 1923.

The investment in capital account, as of Dec. 31, 1926, was $45,350,484. Capital expenditure in road and equipment totals $39,374,813 as of Dec. 31, 1926. The net additions to the property accounts during the year were slightly more than $600,000, all of which were financed by the commission without increasing the debenture debt and without disturbing the invested capital funds held in trust for the commission by the City Treasurer.

The amount carried on the books classified as "Franchise and Other Intangible Assets" now stands at $4,375,449 as of Dec. 31, 1926. This item has been referred to at length in reports of previous years. The amount represents payments the city has been forced to make for the property of the Toronto Railway in excess of any reasonable valuation and for franchises and rights of certain radial railways which previously operated within the city limits. In line with the policy adopted by the commission in 1925, this large item is being amortized as rapidly as conditions will permit.

The commission in 1925 applied $941,941 of the accumulated reserves toward the reduction of the intangible assets. In view of the small additions to the capital accounts and the fact that no large replacements will be necessary in the near future, it was possible to make a further reduction of these assets and an additional amount of $834,844 was therefore applied to this purpose in 1926. During the last two years the intangible assets have been reduced by $1,776,785.

The reserve for replacements, as of Dec. 31, 1926, amounts to $2,811,412. In the revenue accounts for 1926 there has been appropriated from net income the sum of $998,911 for the purposes of this reserve. The net funded debt less funds transferred to the City Treasurer for redemption of debentures is $39,640,679 as of Dec. 31, 1926, a reduction of more than $1,000,000 from the position at the close of the year 1925.

The operation of motor coaches, which was commenced in May, 1925, has been greatly extended during the past year. A total of $132,008 was obtained from this source in 1925. In 1926 the gross income was $300,811. There has been a surplus each year from the operation of motor coaches.

Various classes of service which were operated in 1925 were continued in 1926, including sight-seeing trips, the chartering of motor coaches to private parties, coach transportation to the race tracks and to the Canadian National Exhibition, transportation of school children, and a regular scheduled service to the "Hill" district. In addition, there was inaugurated in July a regular service between Toronto and Niagara Falls. All of these services, which are operated as a separate undertaking and distinct from the street railway and bus transportation, have proved to be very popular, although the rates charged are in all cases necessarily in excess of the rates charged on the street railway. As many as 49 coaches have been chartered in a single rental contract.

Operating expenses of the commission for the year 1926, including the cost of electric current, maintenance, repairs, administration and taxes, but exclusive of the operation of motor coaches, amounted to $7,297,367. This total compares with $7,292,298 in 1925.

The Transportation Commission purchases all the power for operation of the railway from the Toronto Hydro-Electric System, which in turn purchases from the Hydro-Electric Power Commission of Ontario. The average cost of power to the Transportation Commission, converted and delivered as direct current was 1.40 cents per kilowatt hour in 1926. The aggregate amount paid for purchased power was $1,077,277.

Annual charges for interest and sinking fund on the debenture debt increased in 1926 approximately $125,000 over the requirements of the year 1925. In addition, it was necessary to appropriate a large amount for the replacement reserve. The large annual increases in the debt charges, which have been referred to in previous reports, will not continue beyond 1926 unless the commission is obliged to increase the debenture debt. A policy to which the commission has consistently adhered since the commencement of operation is that extensions or additions to the system should not be made unless they will earn sufficient additional revenue within a reasonable period to meet all the expenses of operation and fixed charges on the new capital. If extensions are made without regard to economic considerations, the fare will inevitably have to be increased.

The expenses of operation of motor coaches totaled $211,548, resulting in a net income of $89,262, which was more than sufficient to meet all fixed charges on the capital invested including an adequate allowance for depreciation.

The mileage operated by street cars and buses, but not including motor coaches, aggregated 25,533,893 miles in 1926, an increase over the mileage in 1925 of 286,835.

COMPARATIVE OPERATING STATEMENTS OF THE TORONTO TRANSPORTATION COMMISSION

Gross Income	
1921*	$4,071,969
1922	11,651,512
1923	11,852,334
1924	11,709,695
1925	11,626,658
1926	12,050,304
Operating Expenditures	
1921*	$2,499,773
1922	8,468,841
1923	8,104,680
1924	7,788,563
1924	7,387,570
1926	7,508,915
Net Income	
1921*	$1,572,196
1922	3,182,670
1923	3,747,654
1924	3,921,131
1925	4,239,087
1926	4,541,388
Interest and Redemption of Debt	
1921*	$642,805
1922	1,837,977
1923	2,387,725
1924	2,733,385
1925	3,081,703
1926	3,273,045

* Four months.

The largest adjustment in the surplus account during the year was the transfer of $193,638 to the reserve for replacements. The report states that if sound business principles are to be followed, it is imperative to create proper reserves and to amortize the relatively large amount of intangible assets before accumulating any substantial surplus.

During the year 1926 the average fare collected on the Toronto Transportation System was 6.16 cents. Its distribution was as follows:

	Cents per Passenger	Per Cent of Cost
Maintenance of track work, overhead and structures	0.366	5.93
Maintenance of equipment	0.506	8.21
Power	0.653	10.58
Operation of cars and buses	2.139	34.72
Tickets and transfers	0.040	0.65
Insurance	0.030	0.48
Taxes, legal and miscellaneous expenses	0.091	1.50
General offices and accounting	0.137	2.23
Interest on and redemption of capital and replacements	2.200	35.70
Totals	6.162	100.00

Revenue from sundry other sources, amounting to 0.217 cents per passenger, provides the additional amount required to make up the full allowance necessary for replacements and other operating reserves.

Track extensions built in 1926 were 1.561 miles and track removed in 1926 was 0.713 mile. This made a net addition to trackage in Toronto during 1926 of 1.388 miles.

No new large buildings were constructed during the year. The most important work carried out was an alteration of the paint shop at the Hillcrest property so that a modern and economical system of spray painting could be installed. During the year the last of the three storage batteries which the city was obliged to purchase from the Toronto Railway became useless and the Commission disposed of the equipment at scrap values.

The commission owns 972 passenger street cars, 82 electric service cars, 122 buses and coaches, and 39 motor trucks. All of this equipment is maintained in good operating condition and is used in regular service. The reconstruction work on the cars originally acquired from the Toronto Railway was completed during the year. On Dec. 31 1925, there were 98 pay-as-you-enter cars still remaining to be rebuilt. Of these 32 were converted into pay-as-you-leave cars, and 66 were converted for two-car train operation. Nine additional motor coach bodies were built at the Hillcrest Shops in 1926.

The commission continued operation of the street railways in the Township of York and Town of Weston during the year under the special operating agreements which have been referred to in previous reports. These agreements impose no financial obligations on the Commission.

In concluding his statement General Manager Harvey said that the outstanding feature in connection with the operation for the year 1926 was the improvement in traffic, which was most encouraging after the decrease in passenger revenue experienced in 1924 and 1925. The fundamental need of the system was more business. Without increased revenue it was impossible to justify further extensions.

Totals	180,779,925	183,494,076

It was his opinion that proper coordination of the transportation services of any large city to provide adequate and convenient facilities should include regular and reliable service to important centers outside. At the present time several million passengers per year were transported into and out of Toronto by interurban buses. He said the report of the Motor Bus and Truck Committee of the Canadian Electric Railway Association, adopted by the association in 1927, very definitely stated the situation as follows:

It is becoming more and more apparent that the operation of automotive vehicles by the transportation agency of any given area should not be confined strictly to the geographical boundaries of such area. For the street railway system of a city to sit meekly by while others pre-empt all profitable interurban or suburban routes under conditions amounting in practice to perpetual franchises on such routes, spells disaster in the long run to any such system. It involves a constantly increasing loss of local fares to such through-running buses, the creation of a net-work of outside franchises stifling and forbidding the normal growth and development of the local system, the occupancy by others of a field logically belonging to such system and necessary to the economical development of its urban services, and a substantial and pronounced loss of prestige and local favor.

In the report appears this statement:

One of the most difficult conditions your commission has to meet is the constant demand for extension of its rail lines and bus services into localities from which practically no additional revenue can be derived. While your commission recognizes its obligations as a publicly owned utility to provide city-wide service, yet it must have regard for fundamental economic considerations if the present rates of fare are to be maintained. The revenue from the universal fare system has varied only slightly from year to year. The problem of administering the system would be greatly simplified if there were a moderate and consistent yearly increase in revenue.

COMPARATIVE STATEMENT OF EARNINGS OF TORONTO TRANSPORTATION COMMISSION

	1925	1926
Income:		
Passenger earnings:		
Railway and bus transportation	$11,157,893	$11,362,690
Motor coach transportation	132,008	300,811

Book Reviews

History of the Incandescent Lamp

By John W. Howell and Henry Schroeder. The Maqua Company, Schenectady, N. Y. 208 pages.

So that the present generation may have some idea of the design, manufacture and development of the lamp business this history has been written with numerous illustrations to portray the changes in this industry. Something of the romantic era of electric lighting prior to Edison's invention is described so that the reader is in a receptive frame of mind for the introduction of the battery, the ampere and dynamo. The authors in the preface pay tribute to Thomas A. Edison, whose incandescent electric lamp "is the foundation stone upon which the electric light and power industry of today has been built."

Year Book on Commercial Arbitration in the United States, 1927

Prepared by the American Arbitration Association, 342 Madison Avenue, New York City. Published, 1927, by Oxford University Press, American Branch, 35 West 32d Street, New York City. Cloth, 6x9½ in., 1,152 pages. Price $7.75, postpaid.

This is the first of a series of standard publications on arbitration being prepared under the direction of the Research and Publications Bureau of the American Arbitration Association. The association is a voluntary educational organization, supported by dues and contributions. It serves business through the promotion of arbitration to eliminate the notorious delay, expense and bad after effects of litigation. It acts as an educational body, as an agency to assist other bodies in setting up effective machinery for arbitration and as a practical tribunal where members and friends of arbitration may arbitrate their disputes speedily, justly and at negligible cost.

The body of the book is a complete outline of the existing arbitration arrangements in practically every important industry. Each industry is treated separately with details of the arbitration procedures now in use by its various societies and trade associations. This treatment by industries is followed by a description of the arbitration rules of the U. S. Chamber of Commerce, the International Chamber of Commerce and local chambers all over the United States.

With the aid of name and subject indexes the busy executive can quickly locate those sections relating to arbitration as it exists today in his particular industry or field of work. He will find specific data, names and addresses of organizations, forms and rules of procedure with which he can easily chart a practical course of action. If this book leads to a more general understanding and acceptance of the economies of commercial arbitration it will help eliminate one of the most glaring wastes in modern industry.

Business Cycles and Business Measurements

By Carl Snyder. New York, N. Y.: The Macmillan Company. 326 pages. Price, $6.

The striking variations in the fluctuations of trade, from prosperity to crises and depression which we have come to call "business cycles," have had in the United States a greater intensity and, therefore, arouse deeper interest than in perhaps any other country, and many attempts have been made to determine definitely the extent and regularity of this movement. But it is only in recent years, and largely following the great burst of interest aroused during the war, that the material has been available to make such definite measures. In this book the author has sought to put together this wealth of new material and from it derive measures of business from month to month, one of which is a wide composite of a weighted average of 56 independently computed series.

Others have been found in close agreement with this broad combination, and building upon these foundations and the relationships therein established it has been possible to carry back several measures of trade through more than half a century. These measures seem to show that the crises associated with the business cycle reached their intensity in the latter part of the nineteenth century, and has since been of distinctly lessened severity. But the course of these fluctuations is of wide import and it is of deep interest to the business man, especially, to know just what is the current position of industries and trade with reference to that persistent and never-ending growth. These new measures of trade and productive activity are set forth graphically in a series of more than 40 full-page charts.

Wages in the United States, 1914-1926

New York, N. Y.: National Industrial Conference Board. Price $2.50.

The new volume on wages affords a comprehensive picture of wage conditions and movements in all important occupational fields. Particular attention has been given in the present study to the relation of the wage situation during 1926 to business and industrial conditions during that year. The very pronounced stability and relatively high level of wages during the past three years in the face of declining prices is dealt with as one phase of present conditions especially worthy of study. A novel note is struck by the report in the declaration that the contents of the wage earner's envelope in many instances no longer represent his sole income. Bonuses based on production, quality of work, on attendance, promptness or long service; profit sharing, employee stock ownership, pensions, health, accident and group insurance and, in some cases, unemployment insurance, co-operative purchasing plans, industrial housing and transportation at less than commercial rates are some of the benefits cited as examples of supplements to wage incomes. This new study of the Conference Board covers wages in agriculture, in the public utilities, in the building trades and on the railroads, as well as wages in 25 important manufacturing industries. The text is well fortified with many tables and charts covering the period 1914 to 1926, inclusive.

Directory of Commercial Testing and College Research Laboratories

Bureau of Standards, Department of Commerce, Washington, D. C. 39 pages. Price, 15 cents.

In recognition of the desirability under present conditions of independent commercial testing service, and in anticipation of the marked increase in the demand for such service in both domestic and export trade, there has been compiled by the National Bureau of Standards a list of laboratories throughout the country that are prepared to test various kinds of commodities, to determine whether or not they can apply to its customer's purchase specifications. In accordance with the law, the National Bureau of Standards makes tests and carries out investigations for other government departments. It is impracticable for the bureau to make tests for private individuals if other laboratories can do the work. To inform interested persons of the location of other laboratories the bureau has compiled a list of 207 commercial testing laboratories throughout the country, together with indications of the types of commodities which they are prepared to test. To accompany the list of commercial testing laboratories there has been compiled a list of 143 colleges which are used not only for the purposes of instruction but also to a considerable extent for research work.

For the purpose of minimizing the disadvantages incident to the use of specifications, the bureau has started a so-called "Certification Plan," in accordance with which there is compiled a list of manufacturers who have expressed their desire to supply material complying with certain selected nationally recognized specifications and willing to certify to the purchasers upon request that the material thus supplied is guaranteed to meet the requirements and tests of specifications. This plan has already been applied to 48 United States government master specifications. Copies of any of the 48 lists of manufacturers, to which additions are being made from time to time, can be obtained upon request.

Personal Items

J. H. Lucas Heads Transportation Section

General superintendent of rolling stock at Milwaukee honored by the Wisconsin Utilities Association

J. H. LUCAS, elected chairman of the transportation section of the Wisconsin Utilities Association at its convention in August, is just completing his twentieth year in the car building and maintenance industry. He has spent half of that time with the Pullman Company and the last ten years with the Milwaukee Electric Railway & Light Company. At present he is general superintendent of rolling stock at Milwaukee.

J. H. Lucas

When Mr. Lucas, fresh from high school, entered the Pullman company's shops as a template maker apprentice, all cars were made of wood. Among the company's products were many cars for elevated and subway operation, to say nothing about the cars for steam railroad service.

Among important developments at Milwaukee since Mr. Lucas has been there are the placing in service of the three-truck, articulated train and the double-truck one-man or two-man safety car which succeeded the single-truck safety cars of 1917 and 1918. The larger car, about 45 ft. in length, designed and built in Milwaukee, was put in service in March, 1920. About five years ago a five-year program of rehabilitation of interurban equipment was begun by the Milwaukee Company and since 1919 the rolling stock department has been called upon to meet the problems incident to the operation of buses and those that have arisen in connection with the operation of garages.

As superintendent of rolling stock, Mr. Lucas has developed a very complete system of inspection service and has charge of a shop layout which probably has more modern mechanical equipment and labor-saving devices than any other shops of similar size in the country. His department looks after 800 local cars, 100 interurban cars, 150 buses and 400 other vehicles including work cars, trucks and automobiles.

The outlook of Mr. Lucas with respect to the present and the future design of both cars and buses was perhaps reflected best in the paper which he presented before the transportation section of the Wisconsin Association at the recent meeting in Milwaukee and reprinted in ELECTRIC RAILWAY JOURNAL for Sept. 3, page 391.

Changes Made on Indiana Property

The Indiana Service Corporation, Fort Wayne, Ind., announces the appointment of M. M. Herrell as traffic agent with headquarters at Logansport. Mr. Herrell will represent the traffic department in all matters pertaining to freight and passenger business in Peru, Logansport, Delphi, LaFayette and intermediate towns. He was passenger and freight agent at Wabash for several years. This appointment was made necessary by the increase of business in the towns mentioned and by the desire to have a thoroughly trained traffic man available for patrons at all times.

Marvin Erb, passenger agent at Peru, has been promoted to passenger and freight agent at Wabash to take Mr. Herrell's place.

W. F. See, who was Mr. Erb's assistant at Peru, has been appointed passenger agent at Peru.

Market Street Men Receive Promotions

Five appointments of general interest have been announced by Samuel Kahn, executive vice-president of the Market Street Railway, San Francisco, Cal.

J. W. Delaney has been named superintendent of equipment and his assistant will be C. D. Miller. Both of these men received training in the company's shops under J. M. Yount, who has been elected to the office of vice-president in charge of equipment and maintenance, a new position created to provide technical administration of shops, tracks, cables, overhead lines and substations. Mr. Yount has served as superintendent of equipment of the company since 1910. Mr. Delaney has been assistant to Mr. Yount since 1924 and Mr. Miller has served as inspector of equipment since 1919.

E. H. Lincoln is the new superintendent of the Geneva division. He has occupied a similar post at the McAllister division since 1924. The post vacated by Mr. Lincoln will be filled by P. O'Marie, who for six years has been superintendent of ferry terminals.

T. B. Gavin Auditor at Dayton

Man of wide experience in accounting practices named to interurban recently reorganized

T. B. GAVIN is auditing the books and accounts of the recently rehabilitated Cincinnati, Hamilton & Dayton Railway, Dayton, to which he brings a somewhat varied experience in general accounting work. It was while representing Arthur Young & Company on an audit of the accounts of the Dayton property that he attracted the attention of the officials of that line who later appointed him auditor.

T. B. Gavin

In his early youth at Chicago Mr. Gavin was affiliated with the Stock Yards Company and the Chicago Junction Railway, the former handling all the livestock that went to the Chicago market and the latter transporting the stock in its last interline movement. The accounting for this entire group of interests was handled in one office and was directed by the famous railroad accountant, Charles C. Chace. From the lowly post of voucher clerk in this organization of more than 100 persons to that of assistant to the comptroller he advanced all in the space of four years. He was also appointed auditor of the Electric Light & Power Company, which was a member of this group of interests.

His advancement was accelerated by his night school attendance and graduation from Business College, and his attendance at the LaSalle Extension University, where he took up higher accounting and business management. The knowledge thus gained was soon reflected in his work, and when the war came he was placed in charge of the task of preparing the consolidated income tax return of the allied interests. About that time the railroads were taken over by the government and Mr. Gavin was given the job of directing the accounting of corporate interests of the Chicago Junction Railway and also those of the Chicago River & Indiana Railway. After the war he was appointed income tax auditor for the Revenue Department but preferred to enter the public accounting field.

Digitized by Google

Later he entered the manufacturing field as auditor of the Illinois Tool Works, Chicago, maker of high-speed tools for the automotive industry

Nor does this enumerate the many contacts which Mr. Gavin made before his signing with the Dayton railway property. He became general manager of a large manufacturing house and still later installed a general accounting system in Mandel Brothers, accomplishing this work with the co-operation of the then comptroller, John F. Ruffner, now assistant to the president of the "Fair," Chicago, America's foremost exponent of the retail system of inventory and authority on department store accounting.

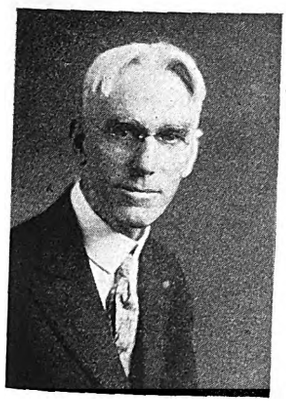
Mr. Gavin was born in Ottawa, Ill., where he received his early education.

Department Heads in Oakland Are Made Vice-Presidents

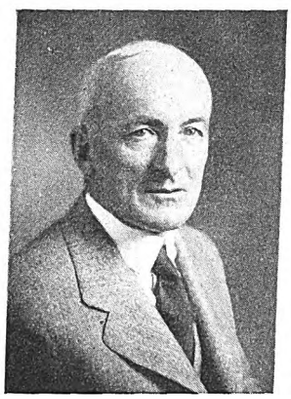
Careers are reviewed of men recently advanced to executive posts by Key System Transit—Each man a specialist of wide experience

FURTHER reorganization of the forces of the Key System Transit Company, Oakland, Cal., was made recently at a special meeting of the board of directors. Four departments were created, each headed by a vice-president, to constitute, with Alfred J. Lundberg, president, the operating force of the company.

The new vice-presidents are: James P. Potter, in charge of operation; H. P. Bell, in charge of engineering; C. C. Vargas, in charge of finance; and Paul Goldsmith, in charge of public relations. Each of these four men formerly bore the title of manager of his department, but they were elevated to the rank of vice-president in accordance with the new president's plan of coordination.



Paul Goldsmith



James P. Potter

C. C. Vargas

C. O. G. Miller remains as chairman of the board of directors and Lester S. Ready, recently resigned as president, is vice-chairman.

J. P. Potter, for many years superintendent of transportation, is now head of the operating department. He will have charge of ferry, bus, car and train operation. He is one of the oldest officials in point of service in the Key System and is one of the best known railway executives in the country.

C. C. Vargas, head of the financial department, is one of the youngest Key executives. He was formerly assistant to C. O. G. Miller when the latter was president. Mr. Vargas, under the new arrangement, will have supervision of all financial matters, including auditing, accounting and purchasing. He entered the service of the Key System in July, 1912, as payroll extension clerk in the auditing department, at a salary of $35 a month. After occupying various positions, he resigned as chief clerk in that department in July, 1918, to become auditor with the capital issues committee in Washington, D. C. When this committee dissolved in December, 1918, Mr. Vargas was made disbursing officer for the War Risk Insurance. There he remained until July, 1920. He then returned to California as auditor for the Mercantile Trust Company. In January, 1922, he reentered the service of the Key System as comptroller, being made assistant to the president on March 16, 1925, in addition to retaining his duties as comptroller. Mr. Vargas was born on Dec. 25, 1892, in Lemoore, Kings County, Cal. He attended grammar and high schools in Nevada. Returning to California, he entered the University of California night school and took courses in accounting and in finance.

Paul Goldsmith, manager of public relations and advertising, is a former Oakland newspaper man. Since he has been in office there has been an era of better feeling between the newspapers and the railway than existed in the past.

FRANK BENNETT, senior supervising inspector of transit for the Board of Transportation of New York, has retired on a pension under the retirement plan in effect for city employees. His associates in the city service honored him recently at a dinner attended by more than 100 of his fellow workers. Mr. Bennett, was the first dispatcher and trainmaster in charge of the electric operation of the southern division of the old Brooklyn Rapid Transit system. He had taken up railroading when he left City College and had been brakeman, towerman and dispatcher on the Delaware, Lackawanna & Western, the Sante Fe and the Union Pacific before he joined the company in Brooklyn. He entered the service of the original Public Service Commission in 1907 as a transit inspector.

OBITUARY

Hugh McCloskey

Notable among the achievements of Hugh McCloskey, beloved citizen of New Orleans, La., who died recently, was the rehabilitation of the New Orleans Railway & Light Company. When in the early years of the present century the transportation system in that city had reached its low point he was urged to come to the rescue, accept its presidency and put it on its feet.

Mr. McCloskey's active connection with the affairs of the New Orleans Railway & Light Company and the American Cities Company, by which the New Orleans Railway & Light Company was controlled, dates from March, 1908, when he was elected chairman of the board of directors of the latter company. Later he was elected president and the position of chairman of the board was abolished. Following the completion of the construction program which he laid down for the company in New Orleans, Mr. McCloskey relinquished the office of president and again became chairman of the board and in addition president of the American Cities Company. He relinquished these posts in 1915.

Among the improvement projects effected during his administration was the placing of the Carrollton Avenue and City Park Driveway tracks in neutral ground so as not to interfere with the street paving, and the authorization of the construction of a new line out to St. James Avenue to Milneburg. Under his administration Spanish Fort was purchased and converted into a pleasure resort, the railway being built to that point. The company stood half the expenses with the New Orleans Land Company in building a driveway to Spanish Fort.

In the midst of his utility activity is another story of his financial, business and social interests. Some years ago Mr. McCloskey received the New Orleans *Picayune's* loving cup for his public-spirited efforts in giving the city its wharves and sheds.

Exhibit Committee Asks Co-operation in Bus Exhibit Placing

Because expense may be incurred to bus and truck exhibitors if they do not deliver their exhibts at the Cleveland Auditorium in time, a special bulletin was mailed on Sept. 3 by Fred C. J. Dell, director of exhibits, urging that all parties concerned adhere strictly to the appended schedule:

SCHEDULE COVERING ARRIVAL OF ALL AUTOMOTIVE VEHICLES TO BE SHOWN AT THE 46th ANNUAL CONVENTION OF THE AMERICAN ELECTRIC RAILWAY ASSOCIATION

Exhibitor's Firm Name	Space Numbers	Buses, Chassis and Trucks to Arrive
American Car & Foundry Motors Company	620 to 625, inc.	Sept. 29 bet. 9 a.m. and 12 noon
Baker-Raulang	667 and 668	Sept. 28 bet. 9 a.m. and 12 noon
Bender Body Company	669–670–671–672–673	Sept. 28 bet. 9 a.m. and 12 noon
Commercial Shearing & Stamping Company	664	Sept. 29 bet. 1 p.m. and 5 p.m.
Fitzjohn Manufacturing Company	406 and ½ of 405	Sept. 28 bet. 1 p.m. and 5 p.m.
Fremont Metal Body Company	452 and 454	Sept. 28 bet. 9 a.m. and 12 noon
Graham Brothers	665 and 666	Sept. 28 bet. 1 p.m. and 5 p.m.
Gramm Motors	663	Sept. 29 bet. 1 p.m. and 5 p.m.
International Harvester Company	422–423–424	Sept. 28 bet. 1 p.m. and 5 p.m.
International Motor Company	448	Sept. 29 bet. 9 a.m. and 12 noon
The Lang Body Company	449	Sept. 28 bet. 1 p.m. and 5 p.m.
Mack-International Motor Truck Company	443–445–447	Sept. 29 bet. 9 a.m. and 12 noon
Mack Motor Truck Company	442–444–446	Sept. 29 bet. 9 a.m. and 12 noon
Mack Trucks, Inc	441	Sept. 29 bet. 9 a.m. and 12 noon
Murray Corporation of America	425–426–427–428	Sept. 28 bet. 9 a.m. and 12 noon
Reo Motor Car Company	404 and ½ of 405	Sept. 28 bet. 1 p.m. and 5 p.m.
The Six Wheel Company	600–601	Sept. 29 bet. 1 p.m. and 5 p.m.
Saf-T-Cab Corporation	453 and 455	Sept. 28 bet. 9 a.m. and 12 noon
Studebaker Corporation of America	473–474–475	Sept. 28 bet. 1 p.m. and 5 p.m.
Versare Corporation	476	Sept. 28 bet. 1 p.m. and 5 p.m.
Twin Coach Company	468–469–470–471–472	Sept. 29 bet. 1 p.m. and 5 p.m.
Walter Motor Truck Company	604–605	Sept. 28 bet. 9 a.m. and 12 noon
The White Company	657 to 662, inc.	Sept. 29 bet. 1 p.m. and 5 p.m.
C. H. Will Motors	495–496–497	Sept. 29 bet. 1 p.m. and 5 p.m.
Yellow Truck & Coach Manufacturing Company	414 to 421, inc.	Sept. 29 bet. 9 a.m. and 12 noon

"It is not considered necessary," Mr. Dell said, "to dwell upon the importance of this schedule being observed. If your equipment does not arrive when scheduled, inconvenience is caused other exhibitors and it may be necessary for you to pay an extra charge in order to get your vehicles placed, because of the possible necessity of rehandling other exhibits which have been set up.

"Buses or trucks arriving in Cleveland under their own power, can be delivered by owners' drivers direct to exhibition space and placed. Buses arriving by freight, where necessary to unload from cars, will be handled by Norris Bros. Company (official draymen), at the same rate as prevails for exhibit materials."

Companies driving buses over the road and wishing to have them washed, can instruct drivers to take them direct to the Auditorium Building Operating Company, East Sixth Street and St. Clair Avenue, Cleveland, Ohio. The schedule of rates including exterior wash, chamois body polish, and interior sweeping and dusting is single-deck buses, $3; double-deck buses, $4. Any single-deck bus that must be stored until the exhibitor has an opportunity of placing it in his exhibition space, will be charged for by the Auditorium Building Operating Company at a flat rate of $2 per night, or for 24 hours for such storage. The storage charge for double-deck buses would be $1 per night or for 24 hours. However, the double-deck buses would not be stored in inside space but would be outside of the building and under responsible watchman service.

Exhibitors are requested to hang from each steering wheel a tag showing the space number where the vehicle is to be placed. This will save moving around. They are also requested to advise Norris Brothers Company, 2138 Davenport Avenue, Cleveland, Ohio, whether the bus or truck will arrive by rail or under its own power, also as to the exact date it will arrive in Cleveland, so the company may plan its other trucking accordingly.

Attention is once again called to the clause in the space contract reading: "The tanks of all motor vehicles must be drained and all vehicles made inoperative immediately after being placed in exhibition space." Drip pans or oil proof canvas should be provided by the exhibitor for the protection of floors. No change of tires will be permitted between 12 noon, Oct. 1, and 12 noon Oct. 7.

Two Objects Cannot Occupy the Same Place at the Same Time

If you, Mr. Truck and Bus Exhibitor, will bear this law in mind there will be no confusion or regrets at the big

CLEVELAND SHOW
Oct. 3-8

Read Freddie Dell's schedule for the arrival of Automotive Exhibits

You Can't Get By When The Road's Obstructed

Double Trackings In Detroit To Begin in Thirty Days

A mile of double track, estimated at $140,000, will be laid on the Fourteenth Avenue and Trumbull Avenue car lines within 60 days, according to an announcement by Del A. Smith, general manager of the Department of Street Railways in Detroit. The work will begin within 30 days and is to be completed on Oct. 15.

Extensions will involve 1 mile of double track on Livernois Avenue from Davison to Fenkell Avenues, linking the present terminus of the Fourteenth Avenue line at Davison and Livernois Avenues with the present Trumbull Avenue line between Fenkell and Six Mile Road on Livernois Avenue. The Trumbull Avenue line will be extended 1 mile west from Livernois on Fenkell Avenue to Wyoming Avenue.

Work on Boston Subway Extension Continues

Work is about to start on the fourth section of the Dorchester rapid transit system in Boston, a $10,000,000 project which was begun three years ago. There were eight bids for the work, ranging from $401,565 to $537,475, the lowest bid being from the C. & R. Construction Company, which also received the contract for the third section, now almost completed. The fourth section runs from Peabody Square to Shawmut Junction, and includes the Ashmont station. It will take about 300 days for its construction.

New Season Opens for Metal Sellers

Not much activity was expected in the non-ferrous metal market in the week ending Sept. 6, what with the Labor Day holiday and all, so potential sellers were not particularly disappointed at the disinterestedness of consumers.

Copper prices are again practically unchanged after another week, with only a small volume of trading. Most producers continue to offer the metal at 13¼ cents delivered in the East and 13⅜ cents in the Middle West, with only an occasional sale of a small lot. On the other hand, custom smelters are sellers at as low as 13⅛ cents, and manage to get rid of enough to prevent their cutting prices further. The foreign market also continues quiet, with the c.i.f. price unchanged at 13½ cents.

The lead market continues to decline and consumers have displayed little or no interest. One large seller is almost out of the market, but, nothwithstanding this, prices declined perceptibly. On Sept. 6 the American Smelting & Refining Company reduced its contract price from 6.50 cents to 6.40 cents New York.

Tin has remained steady, but there has been little or no demand by consumers, sales being mainly to dealers.

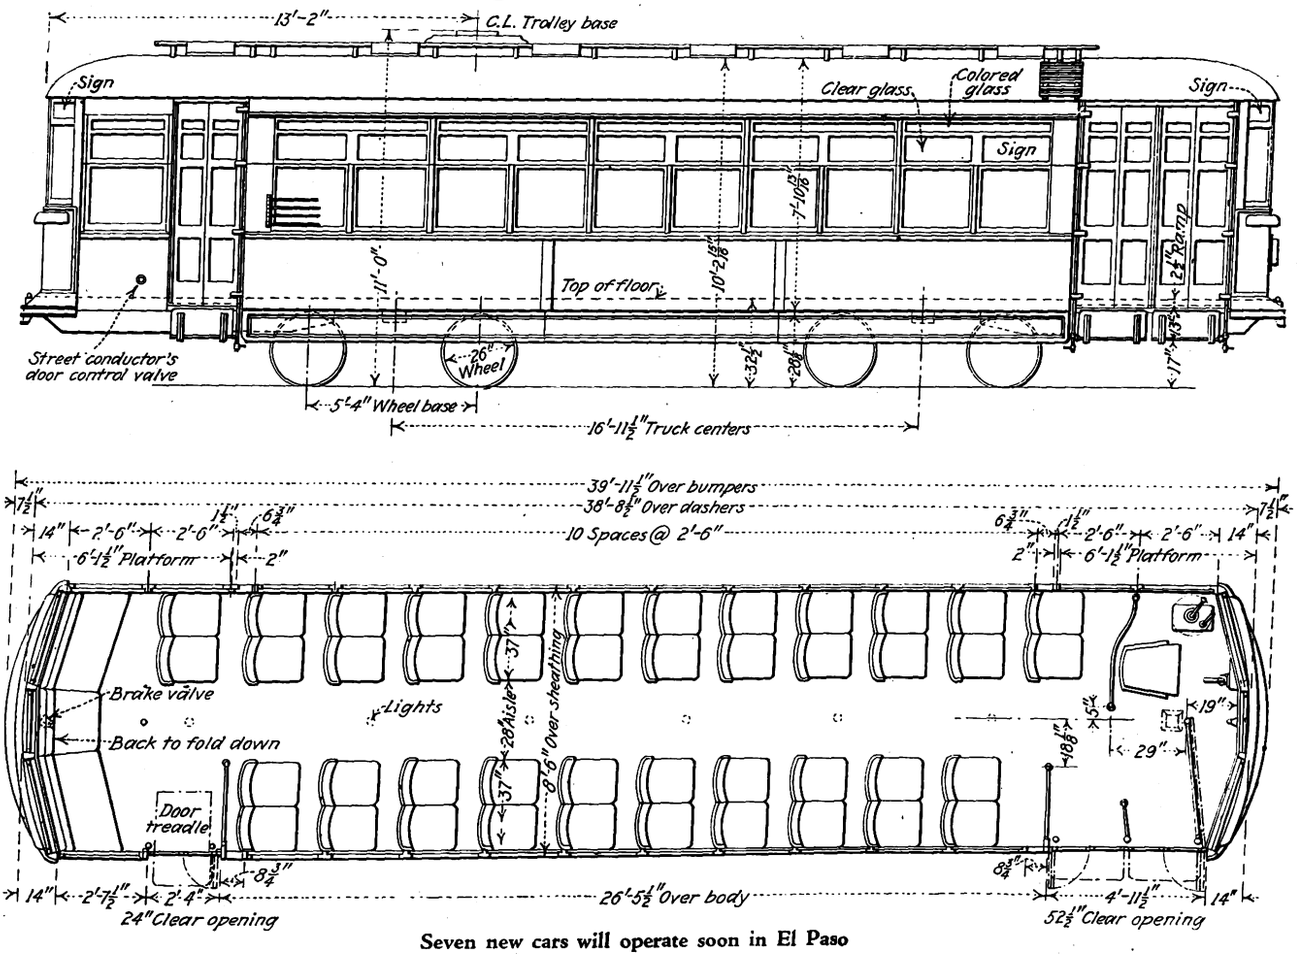
Rushing Work on New El Paso Cars



Seven new cars will operate soon in El Paso

Specifications and details are available for the seven single-end, double-truck cars which on delivery will be placed in city service by the El Paso Electric Company, El Paso, Tex. The order, announced in the ELECTRIC RAILWAY JOURNAL previously, was placed with the American Car Company, St. Louis, Mo., on Feb. 28. The cars will have an over-all length of 39 ft. 11½ in. and will seat 49 persons. Following are the principal specifications:

Number of cars ordered	7
Type of car	One-man, motor, passenger, city, single end, double truck
Builder of car body	American Car Company St. Louis, Mo.
Bolster centers	16 ft. 11½ in.
Length over all	39 ft. 11½ in.
Length over body posts	26 ft. 5½ in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 8¾ in
Height, rail to trolley base	11 ft. 0 in.
Window post spacing	30 in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	Westinghouse
Axles	A.E.R.A.
Car signal system	Faraday
Compressors	DH-16
Control	K-75
Couplers	American Car Company
Curtain fixtures	National Lock Washer Company
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	American Car Company
Doors	Folding
Fare boxes	Johnson
Floor covering	Battleship linoleum
Gears and pinions	Helical
Hand brakes	Standard drop brake handle
Hand straps	Sanitary
Heaters	Consolidated Car Heater Company
Headlights	Golden Glow S.M. 96
Headlining	Haskelite
Interior trim	Mahogany, bronze nickel-plated
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	Safety Car Heating & Lighting Company
Motors	Four General Electric 510-A, inside hung
Roof material	Canvas
Safety Car devices	Safety Car Devices Company
Sash fixtures	Schechter post casing
Seats	Heywood-Wakefield
Seat spacing	30-in.
Seating material	Genuine leather
Slack adjusters	American Brake Company
Steps	Folding
Step treads	Feralum
Trolley catchers	Keystone
Trolley base	Ohio Brass Company
Trolley wheels	Fiest
Trucks	Brill 177-E-1-X
Ventilators	Utility combination honeycomb
Wheels	26-in., Davis cast steel
Wheelguards	H.B., six-bar type
Special devices	Economy meters

Great Northern to Spend $1,000,000 for New Electrical Equipment

The Great Northern Railway has made a contract with the Westinghouse Electric and Manufacturing Company for $1,000,000 worth of new electrical equipment to use in operations on the Cascade Mountain division of the road. The company is building an 8-mile tunnel on this road, from Berne, Wash., to Scenic, the project to be completed late in 1928. Electrification of this division was begun in 1926. The six locomotives are of the motor-generator type, the largest made and like two put in service last spring. Two large single cab locomotives have been ordered from the General Electric Company, one of which will be delivered in a month. This electrification project was recently reviewed in ELECTRIC RAILWAY JOURNAL.

$3,000,000 Repair Shop for New York City's New Subway

New York City will have a $3,000,000 car shop and maintenance plant for its new subway system. The plant will be on the tract of 49 acres between 207th and 215th Streets, from Tenth Avenue to the Harlem River, Borough of Manhattan.

Contracts are now being carried out for grading the site and building a bulkhead and car float bridge on the river side of the yard. The contract to be advertised for construction following the public hearing provides for a main group of buildings constructed of brick 35 ft. high and located on the Tenth Avenue side of the yard. The main group of buildings will be sub-divided into ten units, comprising the machine shops, electrical repair shops, car shops, track shops, wheel and axle shops, wood mill, carpenter shop, blacksmith shop, paint shop and inspection shed. There are to be ten separate structures, segregated from the main plant, which will provide for an electric power substation, office and storehouse, materials shed, oil

Digitized by Google

house, boiler house, service building, coal and ash hoppers, signal tower and maintenance building.

The total area of the buildings included in the contract under consideration is 459,000 sq.ft., or 21 per cent of the total acreage of the site. The balance of the yard will be utilized mainly for storage tracks, which will be approximately 15 miles in length, and on which there will be storage capacity for a minimum of 500 cars. Of the 15 miles of tracks in the entire yard, about 3 miles will be located within shop walls. Some of these will be over inspection pits and others will be used for shunting cars for repairs and maintenance.

By the terms of the proposed contract, the entire plant must be completed within eighteen months from the date of the execution of the contract.

It is proposed to synchronize the work into three groups so as to make the plant available for service before the interior finish has been applied, such as tiling, painting, etc. The program of construction will be carried out as follows: In the first ten months the service building, substation, signal tower and portal wall from the spur tracks under 207th Street must be completed; within the following five months the storehouse, electrical repair shops, machine shops, car shops, track repair shops, wheel and axle shops and boiler house must be completed, and the balance of the plant within the succeeding three months.

Erie Railroad Buys Two Oil-Electric Units

The Erie Railroad has ordered two 100-ton oil-electric locomotives for yard-switching service in the city of Akron, Ohio. A 60-ton locomotive of similar type was bought more than a year ago for use in their 28th Street yard, New York City.

Units now ordered for service in Akron, being of the 100-ton type, are larger and more powerful than the one purchased last year. The first locomotive units will be shipped to Akron between Sept. 1 and 15. General Electric Company, the American Locomotive Company, and the Ingersoll-Rand Company have collaborated in producing these units.

Scraper Business Is Brisk

The Root Spring Scraper Company, Kalamazoo, Mich., reports the sale of 98 life guards to the Pittsburgh Railways, also a $1500 repair order for life guards from this utility. Other orders include 125 No. 7 air operated scrapers and 30 life guards for the railway department of the city of Detroit. September 10 is the day set for shipping 20 hand operated snow scrapers to the St. Louis Car Company for installation on the new units now under construction for the Chicago, North Shore & Milwaukee Railroad. Last week the Root Company shipped 20 life guards to the J. G. Brill Company, Philadelphia.

METAL, COAL AND MATERIAL PRICES—F. O. B. REFINERY

Metals—New York	Sept. 6, 1927
Copper, electrolytic, cents per lb	12.975
Copper wire, cents per lb	15.25
Lead, cents per lb	6.40

Turpentine (bbl. lots), N.Y., cents per gal.	62.0

City Type Buses in Demand

Bus body styles as far as electric railways are concerned continue to follow very closely upon the heels of past performances, according to the delivery report of the Mack International Motor Truck Corporation, maker of Mack trucks and buses. For some time past monthly reports have indicated a general demand for city type or street car type bus body with requests about equal for 25 or 29-passenger capacity. Some parlor car or de luxe bodies are sold for long interurban or suburban operation. Fifty-five per cent of deliveries in May were four-cylinder models. Seventy-two per cent of total deliveries were city type buses, the 29-passenger capacity model having the edge on smaller capacities.

Galena Oil Ltd. Purchased by Standard Oil Subsidiary

Purchase of the Galena Signal Oil Company, Ltd., of Canada, by the Imperial Oil Company, Ltd., has just been announced. The Imperial Company is a subsidiary of the Standard Oil Company of New Jersey, and was previously owned by the Galena Signal Oil Company. No terms were made public.

ROLLING STOCK

ALABAMA POWER COMPANY, Birmingham, Ala., has received a 25-passenger Mack bus whilch will replace the street cars on a line in Gadsden, Ala.

BUS TRANSPORTATION COMPANY, bus-operating subsidiary of the Public Service Company, Wheeling, W. Va., is using a Gramm bus to supplement the street car service.

PUGET SOUND POWER & LIGHT COMPANY, Seattle, Wash., will repaint and overhaul all of its rolling stock. The cars will be painted apple green and straw color. They will be painted one at a time.

CONNECTICUT COMPANY, New Haven, Conn., has accepted delivery on three Mack city type buses, 29-passenger capacity, four-cylinder motors, mechanical drive, 225-in. wheelbase. This company now has 27 Macks in operation in New England. The company's first purchase consisted of two 25-passenger buses, 192-in. wheelbase, in May, 1923.

UNITED ELECTRIC RAILWAY, Providence, R. I., has received four Mack city type buses, six-cylinder motors, 233-in. wheelbase, 29-passenger capacity. This company now operates fourteen Macks, several of which were purchased in June, 1922.

SCIOTO VALLEY RAILWAY & POWER COMPANY, Columbus, Ohio, has purchased a number of new parlor cars, according to announcement of General Manager R. E. Johnson, at the company's office in Columbus. Three of these cars are now in operation and another will be received in the near future.

TRADE NOTES

BENDER BODY COMPANY, Cleveland, Ohio, has designed a new de luxe coach for the new White 6 chassis. Many new features have been combined in the body, passenger comfort being the keynote of the design.

MACK-INTERNATIONAL MOTOR TRUCK CORPORATION announces the following changes in personnel in the Southern division: J. C. Rowold, formerly branch manager at Miami, Fla., is now branch manager at Charlotte, N. C.; R. W. Huffman, manager of the St. Petersburg, Fla., branch has been transferred in the same capacity to the Miami office; W. N. Costello succeeds Mr. Huffman as head of the St. Petersburg branch.

ADVERTISING LITERATURE

OHIO BRASS COMPANY, Mansfield, Ohio, in a circular recently sent out, describes the improved O-B trolley wheel and harp.

INTERNATIONAL OXYGEN COMPANY, COMPANY, Newark, N. J., recently issued catalog No. 27 on welding and cutting equipment.

SULLIVAN MACHINERY COMPANY, Chicago, has issued three advertising bulletins, No. 76-F, describing portable turbinair hoists, No. 81-N on Sullivan spaders and No. 83-F showing two types of portable air compressors.

PYRENE MANUFACTURING COMPANY, Newark, N. J., has distributed a catalog page announcing the new 2-gal. Pyrene hand pump extinguisher.

FISK & ROBERTS, New York, are distributing a sample time-table form which is used by them in preparing working time-tables for transportation companies. This form is intended particularly for companies whose use of such a form is limited and to whom the cost of a lithograph or engraving would be prohibitive.

ANNUAL CONVENTION NUMBER

Meeting the Demand for BETTER TRANSPORTATION

ONLY a few years ago the electric railway industry was laboriously struggling up the road of recovery, carrying a staggering load of public burdens cumulatively imposed. For more than a decade it had been encountering fresh obstacles at each step. A method of surmounting each new difficulty was no sooner devised than trouble from another quarter loomed on the horizon. A tired and discouraged industry sought to maintain faith in the future and strained vainly to catch a glimpse of the bend in the road ahead.

Today those who are in position to view in perspective the ground gained are united in the conviction that the turning point has not only been reached but has been definitely passed. There is a widespread feeling that the succession of difficulties is nearing its end and that the energy and ingenuity which have for years been spent in staving off disaster may now be directed toward accelerating progress. Each step forward may be expected to count as a definite net gain instead of being merely an offset to a backward drift.

Of course the road is still far from smooth. That makes it difficult for those in direct contact with day-to-day problems to see clearly that substantial gains have been made in a comparatively short period of time. But there is much work left to be done. A better understanding of the part which organized public transportation can be made to play in bringing about more efficient use of existing street facilities is necessary before the industry may be expected really to hit the full stride of development and expansion to which it is destined. In preparation for this larger destiny it is important that transportation executives win for themselves a position of recognized leadership in community affairs. This they can do only by gaining public confidence through demonstrated sincerity of interest in the community's problems and by being fully qualified to speak with authority on matters affecting street traffic.

In addition to all this, one outstanding and pressing problem demands immediate and concentrated attention. It is the last great obstacle that blocks the industry's path. Everything depends on our ability to surmount it. In short, a way must be found to win a growing volume of business from an automobile educated public. The character of service must be brought up to the level of present-day transportation standards.

IT IS no easy matter to determine the relative importance of the various factors which attract riders to our cars. We know that cars must be quieter, faster, more comfortable and more attractive in appearance; that service must be more frequent; that there must be less crowding in rush hours; that employees must be more courteous and better trained as salesmen. We know and are discussing many other factors which influence our success in winning riders. But we are still a long way from determining just how, and just how far, improvement in each of these elements of our service can be brought about. What are the elements that make for attractive car appearance? To put this another way, what is a good-looking street car, and how much does its appearance affect the number of people who ride? What are the most comfortable seats, and how far can an operating company afford to go in adding to first cost and maintenance expense in finishing and equipping cars?

The industry must find the way to increase its riders at a profit. In every step of this process, however, there is the problem of balancing improvements against the revenue required to make them self-supporting. It is necessary to find the field for each form of public transportation service and for each type of vehicle, whether on steel or rubber tires. Hope of breaking down the last great obstacle in the way of complete recovery for the industry depends on our ability to meet today's demand for better transportation.

The Right Type of Car Helps to Build Riding

STYLES exist in transportation just as they do in clothes, furniture or jewelry. What is popular today may be out of date tomorrow. Often the style is adopted because some one else has decided it for a reason entirely foreign to the ones that should govern logically. In the past there has obviously been too much tendency for the rank and file of the transportation industry to follow the styles set by the leaders, who usually are located in the cities with heaviest traffic.

Cars designed for service in the largest cities frequently have been adopted in small towns. Worse still, units that have outlived their usefulness for the big companies have frequently been sold to smaller companies and used without change in a class of traffic for which they are entirely unsuited. There is a strong temptation to use cars too large for a given service, first to get increased capacity per platform employee, and second to imitate a larger neighbor.

Two fundamentals underlie all community transportation. These are speed and headway. The patron wants to go from one point to another in a minimum time. Whether he spends time in riding or in waiting for his conveyance, he is equally annoyed at delay. Headway, however, seems even more important than speed, particularly where the rides are short; as the time saved by fast running may easily be lost if the spacing between vehicles is so great that long waits for the cars are necessary. For instance, if the headway is fifteen minutes, few persons will ride the cars for the distance of a mile or less, because the time of the walk will be little if any greater than the time of the ride plus the average wait. Those who do desire to ride are more than likely to use their own automobiles.

Where the traffic is light it follows naturally that the smallest unit consistent with economy of operation is the one to use. Here conditions dictate the single-truck, one-man car. For territory that is more densely settled shorter headways with small cars are preferable up to the point where the urge to walk as a means of saving time has been fully met with frequency of service coupled with reasonable schedule speed. Beyond this it is desirable to increase the size of the unit rather than to give greater frequency of service, using light-weight, double-truck cars. This reduces congestion, increases the comfort of the passengers and lowers operating costs.

For the heaviest traffic the smaller double-truck cars do not have sufficient capacity, and under certain conditions even the largest double-truck cars are insufficient in size. When such extreme traffic density is reached, it is desirable to run the large cars in trains of two or more, or to group bodies together into articulated units. The situations which cannot be met with these types of equipment are rare, although the growth of American cities is making the problem acute in several of the larger communities. For these, of course, the logical thing is to provide rapid transit lines on exclusive right-of-way, leaving to surface transportation the local business.

With the field thus divided, there is a rather distinct need for all the types of cars—single-truck, small double-truck and large double-truck. All of them should be relatively light in weight, although the large cars should be adaptable to train service. In any particular community, except the smallest, all three types may be needed to cover to the greatest satisfaction the demands of the riders and to get the greatest revenue. While a compromise is sometimes made for economy, it may be questionable whether the savings effected by standardization will offset the loss of traffic where large cars on long headways are employed to serve some of the less densely settled districts. Each case should be studied carefully if the correct type of car is to be selected.

Economics of Bus Operation Better Understood

GRADUALLY the place of the bus in the general transportation scheme is becoming more clearly defined. It is still too early for a final definition of its field of usefulness, but great strides have been taken away from the chaotic thinking which prevailed on this subject a few years ago. One reason for the confusion that existed is that we have been inclined to consider buses as a homogeneous species, whereas in reality there are many different kinds of buses in many different classes of service. Large buses and small, single-deck and double-deck, street car type and de luxe; each has its place, but they cannot be used interchangeably.

It is now evident that one of the major fields of usefulness of the bus is in rendering a class of service different from that of the electric railway. By furnishing service superior in comfort, convenience and speed to that of the street car the bus meets a real transportation need. Despite the higher fare which must necessarily be charged for such service, experience in various cities where de luxe service has been tried shows that there exists for it a substantial demand. Indeed, the actual extent of this demand has never been measured, because it continues to grow rapidly as facilities are increased. Apparently the saturation point is a long way off.

Street car type buses also have a real place in the general transportation scheme. It is not as a substitute for the rail car in any large way, however, that this type bus is most useful, but rather as an auxiliary to supplement and extend the service. On lines of heavy traffic the bus can be used to advantage in express service, while the cars do the local business. Whether such express service should be operated at street car rates of fare or whether de luxe or semi-de luxe service should be given at a higher fare depends on local conditions. Both kinds of operation have met with marked success. Use of the bus to do local business while the cars operate express has been tried to a limited extent. In general it has been found easier to maintain high schedule speeds with small capacity vehicles on rubber tires than with rail-bound vehicles of larger capacity. Greater economies can be accomplished, however, by saving hours on a heavily traveled line, and it is likely that express car and local bus operation will be developed more extensively in the future. Use of buses as extensions to the rail system is so well known as to need no comment.

Double-deck buses have done well under conditions favorable to their operation. Experience shows, however, that something more is needed for their success than mere density of traffic along a particular route. Their field of usefulness appears to be in giving a service that combines elements of sightseeing with straight transportation. Unless the sightseeing element is present, passengers will not use both of the decks to an extent sufficient to make this class of vehicle economical in comparison with the single-deck bus.

Digitized by Google

Great as has been the progress made in fitting the bus into the transportation scheme, its proper place is not yet understood by all. Electric railway men were slow to take up the bus. During the past two or three years the tide has turned and many thousands of buses have been put in service by the railways. Now there is a tendency in some quarters to condemn bus operation as an unprofitable venture. So it has been where the right type bus has not been used in the right place. Therein lies the secret of success. The transportation demands of each community, and each section of the community, must be met with vehicles of appropriate type.

Out of the School of Experience

NO NEED exists to attempt improvement or embellishment of the statements made elsewhere in this issue regarding the outlook for the industry by operators in the North, East, South and West. Idealism has come into the railway business. A seat for every passenger is still a long way off, but the industry apparently is headed in that direction. It is no accidental concept. Neither are the other concepts of speed, comfort and convenience in transportation, so strongly emphasized, nebulous things of the future. Of course, reservations must be made. No business can give a service out of proportion to the rates charged.

While low-fare transportation may be looked on as a basic commodity, the comments of these experienced operators show that the brand of transportation furnished a generation ago is by no means acceptable to the public of today. It is only by having sufficient discernment to sense the demand and to satisfy it that the transportation system of tomorrow is to be successful. Qualities that are being demanded are speed, comfort—almost luxury—and frequency. It is not for the men of the industry to cry that the use of private automobiles has perverted the public taste. Should conditions change and a demand for plain food be made, then is the time to curtail and to furnish a product at a minimum price.

Each man speaks from the fullness of his own experience and of his own observation. Other businesses have had to be revamped. It is no discredit to the electric railways that they have been forced to do so. More is it to the credit of the industry that so many have recognized the need, and set about the process so convincingly. He always finds it difficult to survive who opposes himself to custom. And transportation customs are changing rapidly. Utopia is not likely to burst upon us, but the railway man who correctly senses his obligations and intelligently sets about the task of meeting them is no longer a pariah among the dispensers of the world's goods.

Sound Basis Important in Rapid Transit Planning

RAPID transit is a major problem confronting all large cities to-day. No other single factor has greater influence on their development. Provision of adequate transportation facilities is essential to the welfare of the community. In the past there has been too much haphazard construction. There has been too little realization that transportation is a civic matter.

Experience has demonstrated conclusively that a rapid transit system cannot be built and operated on a self-supporting basis under present-day conditions without an excessive fare. Since the car rider cannot be expected to carry the whole burden, part of it must be carried by the other beneficiaries. The city as a whole benefits to some extent through the increase in roadway space brought about by the removal of traffic from the street to the rapid transit right-of-way. The adjacent property owners benefit largely on account of the increased accessibility of their land. These beneficiaries must pay part of the cost if the expansion of facilities is to keep pace with the community's growth.

Congested conditions now existing in large cities are the direct result of concentrated commercial development. It has been customary to condemn this tendency to concentration, but a different view of the situation is expressed in an article on rapid transit appearing elsewhere in this issue. Concentration undoubtedly promotes efficiency in the conduct of business, by reducing the time required to go from place to place. Centralization of many business activities within a comparatively small area is feasible only where rapid transit lines exist to carry the large number of people who live in remote localities into and out of this district every day. Thus it may be said that adequate facilities of this kind are essential to the most efficient conduct of business, as they are to healthy civic development.

It must be remembered, however, that there are physical and economic limits beyond which it is practically impossible to carry the provision of rapid transit facilities. When the cost of transportation becomes greater than the value of the time saved, however, concentration ceases to be desirable. Careful planning and close co-operation between municipal and transportation officials is essential to the creation of a successful rapid transit system.

Franchises and Regulation Needed for Taxicabs

HAS the taxicab a place in a system of co-ordinated community transportation? In two major cities of the country this question has apparently been answered in the affirmative by existing local transportation companies. Undoubtedly the taxicab affords the nearest approach to the service of the privately owned automobile. Operation by a responsible company in co-ordination with other existing forms of transit would seem a step in the direction of stabilizing the character of such individual service and of making it an active agency for reducing the use of private automobiles on congested city streets.

From the standpoint of operation at a profit, however, the taxicab presents a number of problems. The financial history of its operations is by no means an enviable one. Although the general effect of competition has exerted some pressure toward a lower scale of taxicab rates, when the rates have gone down the character and the reliability of service have degenerated to a point that seriously reduces its desirability. The situation of this business is an example of the degenerating effect upon any utility service of destructive competition brought about by the lack of monopoly and adequate regulation. The need for regulation and organization with the concomitant elimination of destructive competition must be more generally heeded by public officials before transportation companies may be expected generally to add taxicabs as the next logical step in rounding out their service.

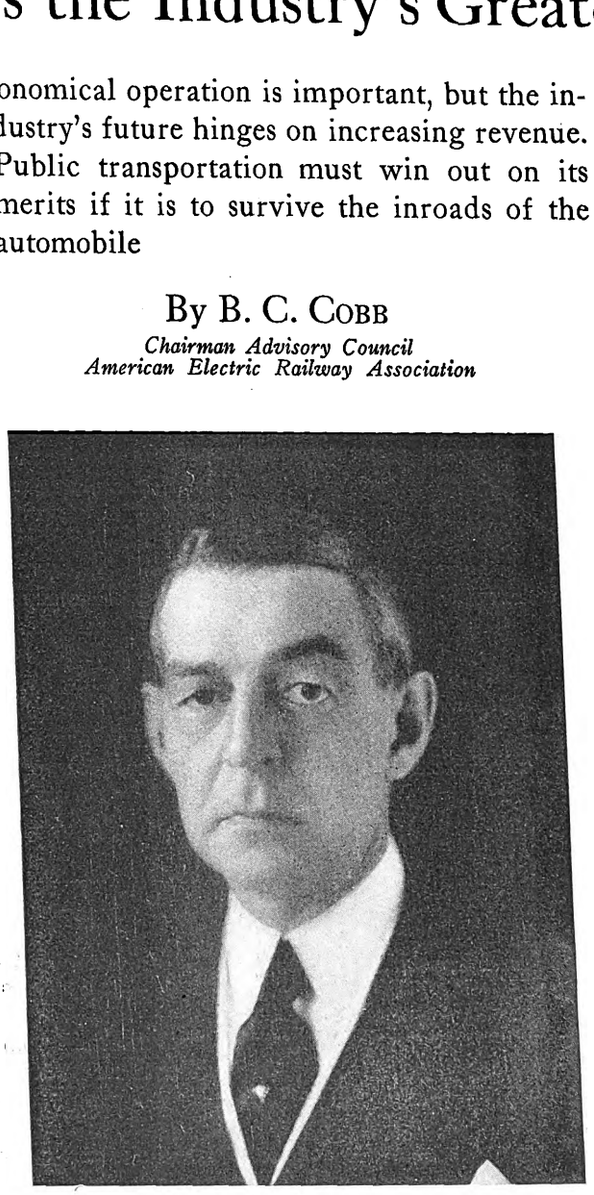
Building Increased Riding
Is the Industry's Greatest Immediate Problem

Economical operation is important, but the industry's future hinges on increasing revenue. Public transportation must win out on its merits if it is to survive the inroads of the automobile

By B. C. COBB
Chairman Advisory Council
American Electric Railway Association



IF THE local transportation industry is to survive and develop on a profitable basis, it must find a way to increase riding and build up its revenues. Every measure adopted to meet the demand for better transportation must have as its definite object the increase of patronage on the public transportation system. Electric railways have met during the past ten years—and in general have survived—a series of unprecedented burdens and difficulties. They have hung on with great courage, and with almost superhuman ingenuity have counteracted one difficulty after another with compensating operating economies.

To the fact that public transportation constitutes a basic necessity in the life of every community of any considerable size, and to the operating economies which have been devised to meet rising costs and unfair burdens, may be attributed the survival of this business today. Economy continues to be important. The street railways of the country are far from a position where they can afford to relax for a moment the strictest vigilance over every penny of operating cost. But they cannot continue to exist, much less develop, on a declining or even stationary volume of patronage. The problem of the moment is to increase riding. It is futile to dodge the fact that this is most serious and baffling.

Street railway riding has increased during recent years on some of the larger properties, but this has occurred principally in the very large cities where the use of private automobiles is materially curtailed by congestion. In cities where there is opportunity for the optional use of automobiles, street railway riding is barely holding its own, and in many of the smaller cities is failing to do so.

At first glance this may present a gloomy picture of the situation, and in a measure that is true. However, when we stop to consider the immensity of the difficulties through which local transportation has come, it is at least conservative optimism to believe that the recurring series of obstacles encountered have run their course and that a better public understanding and increased public co-operation will make it possible for transportation systems to surmount the greatest hurdle of all—that of increasing riding in the face of unprecedented growth in the use of private automobiles. That this solution lies in the direction of meeting more nearly than has been done in the past the present-day standards of transportation demand is apparent to any one having a knowledge of the rudimentary principles of merchandising.

I have faith in the local transportation industry and in its ability to meet present conditions. That does not mean that all present properties will survive. Some of them should never have been built. But I am convinced that the modern city must have efficient public transportation and that the only course available for attracting sufficient revenue to these properties, to put them on a profitable basis, is that of determining a proper balance between the character of the service offered and the rate of fare charged.

In the past electric railways have been too timid in approaching the matter of an adequate fare. The American people have become accustomed to paying two or three times what they formerly did for practically every necessity of life, and increases in even far greater proportion in the case of luxuries. There is no reason under the sun why transportation should be an exception. There is considerable evidence that the public is acquiring a better conception of the relation between service and rate of fare. In most cities throughout the country there has been some measure of relief granted, and it is reasonable to assume that an adequate fare basis can ultimately be obtained.

There are many examples of the tendency on the part of the public to assume a more reasonable attitude regarding franchise conditions, taxes and unfair imposts. This public awakening is one of the most encouraging tendencies in the present railway situation. If service can be so developed as to win an adequate increase in riding at rates of fare that will show a reasonable profit, then local transportation will again have definitely

Digitized by Google

entered a period of successful operation and development.

Right here let me add a thought on the automobile. There is no question but that the individually owned car is the greatest competitor of our public transportation systems. But even though the automobile is responsible for the checking of electric railway riding, and some classes of steam railroad riding as well, it has at the same time greatly added to the sum total of the opportunities for wholesome relaxation and pleasure for workers in moderate circumstances. The automobile industry has become of major proportions in our industrial life. It provides employment for thousands of workers and is an important element in the prosperity of many lines of industry.

The right to use the individually owned car is one that cannot be questioned. Needless restrictive legislation is a bad thing for industry generally and for the nation. Of course, the right to the use of automobiles should not include the right to store them in congested public streets or highways. The user of an individual machine must not be permitted to interfere or retard the use of streets by those millions who travel on street cars and who may or may not be able to afford a private car. At the risk of repetition I want to stress the point that public transportation service must win out on its merits if it is to remain a sound investment for private capital.

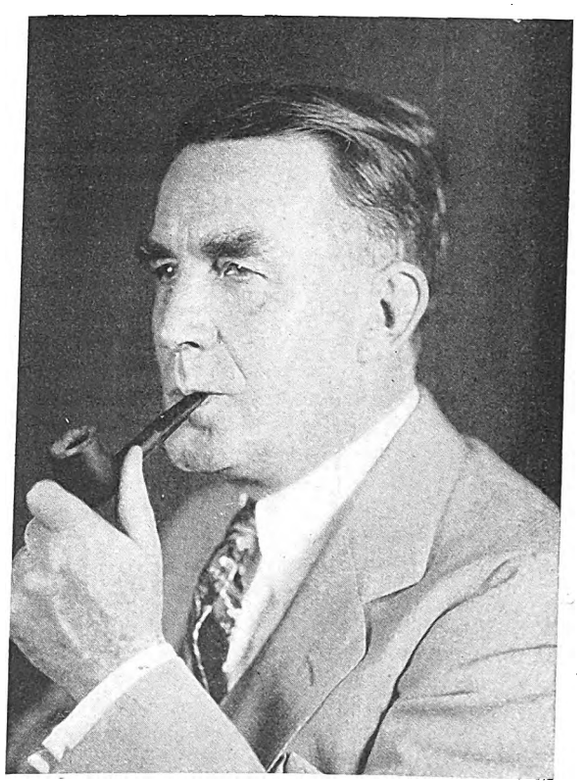
To my mind that is the alpha and the omega of meeting the demand for better transportation. Low fares will not attract sufficient riders to compensate for the loss in revenue that results. The character of the service rendered in each community must be adjusted with the primary object of attracting riders on an adequate rate of fare. In many cases this demands more attractive equipment. Street cars must appeal to the eye of the prospective rider as well as to his purse. Likewise they must be quieter in operation, faster and more flexible. All these things are elements in meeting the desires of the automobile educated rider. Upon the question of whether or not they can be made to pay hinges the future of the industry.

Progress of the Year in Meeting the Demand for

Better Transportation

A changed public requires something more of public transportation than in the past. Both operators and manufacturers have a responsibility in meeting present-day conditions

By W. H. SAWYER
President American Electric Railway Association



TRANSPORTATION is a vital community requirement. The roots of our industry are buried deep in the foundations of community prosperity and growth. But during several years conditions have been changing rapidly. Yes, changing, not yearly or monthly, but daily. During the past year there have been many changes. There has been outstanding progress on many properties. In few instances, however, have the possibilities for the further development and improvement of the local transportation industry been exhausted.

That doesn't mean that all existing transportation properties can be made profitable. Some properties are headed for the scrap pile. They don't have and probably never did have the potential revenue-producing territory that is the essential reservoir to which any improvement or development program must look as its source of profit. This same qualification applies to some of the lines on properties that as a whole are sound, but that need to have unprofitable appendages lopped off before the enterprise can be put on a sound operating basis.

Returning now to the question of meeting the demand for modern transportation. That is the big job before the industry, and one on which considerable progress was made during the past year by many properties. It consists of developing public transportation vehicles and service to meet the present-day public's ideas and demands. This is a different public than we have been accustomed to serve, and for which most of the cars we operate were designed. It is an automobile educated pub-

Digitized by Google

lic. A "silk stocking" public, it has been called. Meeting the demand for modern transportation to me means raising the standards of each class of public transportation to meet the tastes and desires of today's public. Improved cars alone will not do that, but they are an essential part of an improvement program. There must be smooth track as well; quieter operation, higher speed, increased frequency, greater reliability, more courteous service—more personal service would be a good way to express it. The automobile rider has tasted the luxury of individual transportation. He is no longer content with former standards of the public carrier, even at a very large saving in cost. In fact, experience is beginning to show that cost is secondary and that electric railways have overestimated the effect of fare on the volume of riding, provided, of course, that the character of service is improved in proportion to the increase in fare. I am convinced that a 10-cent base fare standard is justified and necessary to insure a character of service that can successfully compete with the automobile.

Looking back over the past year, there have been many interesting and encouraging developments. Many of these have already shown promising results in the way of increased revenue, better public relations and reduced costs. But in my opinion the industry has in large measure only begun to develop the possibilities of meeting the demand for better transportation. Look at our cars, our track, our schedules, our fare structure; the deportment and performance of our men, our advertising, our relations with the public we serve, our interruptions to service, our maintenance facilities and methods—in fact, every one of the multiplicity of divisions of our property and activity. Would any manager contend for a moment that he had reached the limit of improvement in any one of these important factors that, taken together, determine the character of our service? Perfection must be our ideal—or as nearly perfection as it is humanly possible to accomplish. Only then can we afford to rest on our oars. Only when we have completeley exhausted the possibility for improvement in every one of these elements of our service are we even for a moment justified in admitting that the automobile has us on the run.

Public transportation is a conserver of expensive street capacity. Let us not forget that and let's not miss a single opportunity for driving it home in the minds of the public. Public transportation also provides a ride for only a small fraction of the cost in an automobile. These are two of the fundamental economic facts that form the foundation underlying our industry. By being determined to win out we can find the way of putting public transportation once again on a really profitable basis. The electric railway industry must and will go forward—and that is in the direction of meeting more nearly than we have done in the past the modern standards of transportation service.

In the solution of present-day problems, particularly that of meeting the demand for better transportation, manufacturers as well as operators have a direct responsibility. In certain respects, the manufacturer has been somewhat backward. But by no means has this been entirely the builder's fault. Some of the responsibility for the manufacturing situation lies directly at the door of the operators. Nevertheless, even the builders have been slow to recognize the great need for development and improvement of the street car. They have shown some evidence, like many operators, of lacking faith in the industry of which they are a part. Indications are that this situation is changing rapidly and that we shall soon have available for the job of meeting the demand for better transportation a wide selection of cars designed and developed to meet today's critical requirements.

There are many factors which have held back the improvement of the street car. By this I do not infer that car and equipment design and construction have stood still, for that would not be true. There has been substantial progress in construction and in weight reduction. Reduced costs and improved efficiency are important, but they are not enough. Attention to the ride selling features of design and equipment are equally or even more important. Even in structural design, however, recent developments indicate that we have been bound too much by the limitations of habit and precedent.

A discussion of the year's progress would be incomplete without some reference to the part which the bus plays in providing public transportation and in the advance that has been made in finding its place in the general transportation scheme. Much of the novelty and glamor of the bus has disappeared, and we have broadened our viewpoint considerably during the year so as to see the bus in proper perspective.

Even those who are enthusiastic regarding the field of the bus have come to see the folly of advocating a country-wide replacement of cars with buses. I have little patience with a discussion of buses vs. street cars. I think such discussion narrows the perspective of both car and bus men. I believe strongly that the bus will play a constantly increasing part in providing public transportation, and that it affords a railway not only a new flexible tool with which to meet some of its operating problems, but also a different type of vehicle with which to develop new classes of service and revenue.

Bus manufacturers have nearly all come to realize the value of this broadening of the bus field, which is the outgrowth of the policy of co-ordination. In my mind, the bus has a large place in the program of meeting the demand for better transportation. Its development and application were hindered rather than helped by those unfortunate instances of unsound sales policy which have now almost entirely given way to a policy of co-operation with existing carriers.

It takes courage to do the things that are necessary to meet modern conditions. It takes faith in the possibilities of the transportation business. But we have no choice. We must either move forward or pass out of the picture. The American people want something more in transportation than we have been accustomed to provide. I am convinced that they are willing to pay for what they want provided the transportation men of the country grasp an adequate conception of today's transportation demands. When I say that all this requires courage, I do not infer that transportation men have lacked courage in the past—they have faced conditions and encountered obstacles that many times seemed to be overwhelming. They have had the courage to hang on when the transportation situation seemed hopeless. But I am talking today about a different kind of courage; the courage to go ahead, to spend more good money in developing a character of service to meet present-day conditions.

Admittedly, public transportation has been a most important factor in the development of modern American communities. It is inconceivable that they can continue to develop without efficient service of the kind we are struggling to give. In that one basic fact lies the justification for our confidence in the future. Today's problem is one of developing the character of our service so as to win the public support necessary to its financial success.

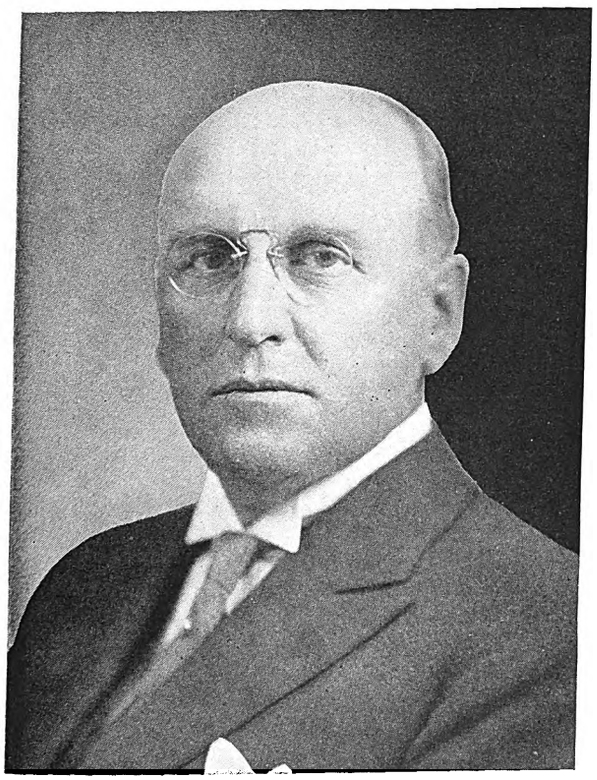
Looking Ahead

In Meeting the Demand for Better Transportation

By R. P. STEVENS
President Penn-Ohio Edison Company



MR. STEVENS, first vice-president of the American Electric Railway Association, looks to the future of the industry with optimism. For each difficulty encountered by the railways, a compensating remedy has been found. The industry has lagged, however, in so recasting financial structures that new capital may be obtained with which to make the physical improvements needed in meeting present-day transportation requirements.

I HAVE optimism as to the future of electric railways, because I feel that we are "over the hill." The post-war era of transportation difficulties is fading rapidly into an experience of the past. A very optimistic statement, yes, but to me the vision is clear enough to justify it. For every blow that the electric railways have received a remedy has been found promptly, and we have now reached a period where economies can count as a net credit rather than as mere offsets to deficiencies.

For the high cost of labor following the war we found one-man car operation to be the remedy. For the high cost of equipment we found lighter cars with lower first cost and maintenance. The "jitneys" have practically disappeared, to be replaced by the motor bus, which is just now finding its place in the scheme of things. We are taking advantage of it to round out and co-ordinate the transportation system of the community.

From a survey of the bus situation, based on the opinions of reliable operators in every part of the country, it appears that the trend continues this year in favor of the operation of more buses by electric railways. There is a notable uniformity of opinion that these buses will not be used to supplant electric cars, but rather to supplement the existing street railway service. We find independent operations assuming a position of declining importance, especially in city service.

In a large number of instances, bus operations at existing fare levels are not yielding a fair return on the investment. This is attributable partly to the fact that many such operations represent surplus service forced by the threat of competition or by public demand for the bus, due to its newness and novelty. In other cases losses which are experienced in bus operation offset heavier losses which would be experienced if rail lines were built to serve territory otherwise untouched.

On the other hand, it is apparent that many companies that have not yet adopted buses as an auxiliary to their street railway systems will be in the market for buses. With these purchases and the necessary replacements I do not anticipate that the requirements of electric railways will show any decrease in the immediate future.

It is becoming obvious today that some of the arguments on which the bus was promoted are unsound. It is becoming clear that the so-called "rubber urge" was merely the urge of novelty, and that the bus depends for its future on its ability to serve as another tool for meeting the demand for better transportation along with the street car and other forms of public transportation. Several of the elements in that demand are becoming better understood. The public shows much more permanent interest in whether or not there is a seat for every passenger than in the presence of rubber or steel tires under the vehicle in which it rides. When properly applied on fare levels which will make this economically possible, buses afford the opportunity of meeting this demand in situations where franchise limitations or the pressure for minimum fares make it impossible to give such service on street cars. There have also been developed in Pittsburgh, Washington, Kansas City and elsewhere examples of an entirely different standard of public transportation with buses at rates of fare approximating 5 cents per mile that show an attractive trend toward profits, and which promise

Digitized by Google

considerable extension of this type of express, de luxe operations. In the field of special party, sightseeing and chartered service, the use of the bus shows an encouraging tendency toward rapid extension on an attractively profitable basis.

With this problem in a fair way to be solved, we have to turn to such matters as public relations and financing. When I think of public relations, I think largely in terms of partnership—getting partnership interest has been done with great success in the electric light and power field, an activity that has changed the sentiment of the entire country toward that industry. It insures the efficiency of private ownership and operation uncomplicated by politics, and at the same time enlists public support and friendship by the very fact of local public ownership in its senior securities, generally preferred stock.

So-called customer-ownership campaigns have been attempted in the electric railway field with success, but only in a few instances. It seems to me that if we would profit by the great success of our sister electric industry we should take greater advantage of this opportunity. I suggested this thought a short time ago to two different operators, and received practically the same answer in substance, viz., "our financial set-up will not permit the sale of a sound preferred stock and, of course, we cannot and will not try to sell a preferred stock unless it is a sound investment."

At the 1925 convention of the American Electric Railway Association, at Atlantic City, the committee on electric railway financing, after many months of work by some of the best financial authorities in this country, submitted a report on electric railways. It was generally accepted as constructive and very valuable to the industry, but in the two years that have elapsed since that report was submitted I have heard of only two companies that have taken advantage of the suggestions contained therein. I thoroughly agree with the answers that were given to me by the operators mentioned above, namely, that their present set-up will not permit a sound preferred stock financing, but the answer to this is "change the set-up."

The electric railway industry, in my opinion, is suffering more today from antiquated financial structures than from any other single cause based on present-day conditions. I know of no industry that is more susceptible to improvement. The electric light and power people, largely through customer-ownership campaigns, have changed the whole attitude of the American public toward this industry. Our industry has the same opportunity.

In the recent past we have had our back to the wall, making a desperate fight for existence. Not the least of our trouble was the fear of what the bus business was going to do to our electric railway transportation systems. Now, I believe, this bugaboo has been exploded and, instead of being a bugaboo, the bus can be used to great advantage for the development of electric railway transportation systems as a co-ordinated adjunct to them. In order to take full advantage of this opportunity and before we can expect the fullest results from our efforts, I believe we must give more attention to our financial structure and must put ourselves in a position where we can raise the funds necessary for improvement of our properties. I believe the far-sighted management that will take full advantage of the opportunities for financing, for improving public relations, and for application of operating economies, will open up an electric railway future that few of us ever dared hope for.

Why Not Grasp the

Transportation executives can take the lead in meeting the demand for better transportation by championing the broad interests of the community. Conservation of street space is essential to the reduction of congestion

By L. S. STORRS
Managing Director
American Electric Railway Association

IT IS not necessary to review the changes that have taken place in the transportation business during the past few years to prove that it is on the way toward a complete rejuvenation. Proof is not lacking that there has been a marked improvement in many of the underlying fundamentals that form the economic foundation of the industry. Nor is it difficult to trace out and show that the industry's troubles during the past decade or more were caused by the fact that it built originally upon an unsound economic structure. In the fire of experience and difficulty, this foundation has been crystallized into sound principles, upon which the industry's future is now being built, secure as never before. Finally, there has grown, out of necessity, a changed point of view regarding the relations between a transportation company and its patrons; an understanding of the methods and practices that must be used in meeting the changed situation brought about by an automobile-educated public.

The industry itself and the public which it serves have made truly remarkable progress during the last several years in coming to agreement on sound principles of partnership. The record of the cities that have completely changed the basis of relations with their transportation companies is impressive, when consideration is given to the relatively short period in which strife, bickering and misunderstanding have given way to cordial and constructive co-operation. New York is the outstanding exception to what is rapidly becoming the general rule throughout the country, and present indications are that unless very material improvement is shown there soon the leading city of the country, in point of size and wealth, will be the last city of the country to apply intelligence and sound reason to the solution of its transportation problems. That the country's metropolis is paying a staggering price for its orgy of political nonsense is evident even to the most casual observer. Just how long intelligent business men and civic leaders of that city, to say nothing of the long-suffering public itself, will continue to put up with political expedients that are economic absurdities is an interesting test of human endurance and patience.

The record of important cities in which there has been an almost complete reversal of fundamental franchise conditions during only the last few years is a long one. Just a few will suffice to indicate the extent of this fundamental improvement, which now awaits only the spark of an increased riding habit to put the industry into a definite boom period. Pittsburgh, Cincinnati and Kansas City illustrate the point I am making. Stagnation,

Digitized by Google

Ideal of Perfect Service?

bankruptcy and chaos have given way in those cities to sound franchise conditions, public partnership and orderly improvement. There are many other similar examples, but these will suffice as typical. In two other large cities conditions are still unsettled, but an intelligent effort is being made to find a solution and there is little doubt that these two important communities will soon join the other cities that have definitely started on the road to progress. New York lags behind the entire country.

Much has been said about the mutual interests of communities and their transportation companies. Two things have been definitely established in this country: First, the absolute dependence of communities upon efficient transportation as a necessity to their existence and continued growth; second, that though privately financed and operated transportation companies have made mistakes and have not always used proper foresight in shaping their relations with their passengers and with the communities they serve, public ownership, in the few isolated cases where it has been tried, has shown no improvement whatsoever, and escapes complete chaos and stagnation only in so far as it retains some of the characteristics of private management and a personnel trained under private initiative instead of political chicanery and "buck passing."

The man on the street has a better understanding today of the fact that efficient, reliable and comfortable service are dependent on making the conditions of partnership between company and city such that the transportation company can remain solvent and be able to finance improvements and extensions needed to keep up with a city's changing requirements and growth. But our industry has in a sense marked time during the past few years, while this necessary change in public attitude was developing. In the meantime the automobile made such strides in popularity that though the industry now stands on a better foundation of public understanding, there is much work to be done in making up lost time in winning increased patronage by application of modern merchandising methods.

The industry will fulfill its destiny only as it rises above the conception that the transportation executive's task is merely the efficient operation of cars and buses. Under today's conditions it is far more than that. The vision of our executives must transcend the limits of a strictly company viewpoint. They must come to see clearly that the greatest service to their companies will be rendered through an understanding of the community's needs. From this will grow a broader conception of the entire community transport problem. It will ripen into new public confidence and real community co-operation.

Traffic congestion continues to be a baffling problem. Business men and politicians alike have been almost helpless in coping with it. Real leadership in showing the way to traffic relief will win for our industry a degree of public good will that will in turn bring inevitable success. But that leadership can be won only by demonstrated sincerity of purpose. This must be supported by expert knowledge of traffic matters, not only as they apply to public transportation companies, but also as they affect all users of the public highways.

In the increased use of public transportation and decreased indulgence in the luxury of individual transportation lies the logical solution of traffic congestion. But to bring this about there is one requirement of paramount importance. The character of public service must be brought as nearly to the level of that provided by the individual vehicle as is physically and economically possible. Only then can the public at large be expected to understand fully the importance of fostering the development of the best possible public transportation service. Transportation men must have as their objective the ideal of perfect transportation service. Each type of vehicle which is found suitable for rounding out this service in the best interest of the community should be developed and applied to the limit of its possibilities. The commutation service of railroads, rapid transit lines, large cars and trains for trunk lines on the surface, lighter cars in smaller communities and less densely populated territory, various types of buses for the classes of service in which they are most suitable, and perhaps taxicabs as well, should all form part of a city's co-ordinated transportation service. These various classes of service and different kinds of vehicles should be operated in the interest of giving maximum usefulness of existing street facilities. In fact, there seems no good reason why the movement of freight and commodities over city streets should not likewise be co-ordinated with the movement of passengers in the interests of bringing about maximum street usefulness with minimum interference and waste. All of these factors, to my mind, should be considered in the broad problem of meeting today's demand for better transportation.

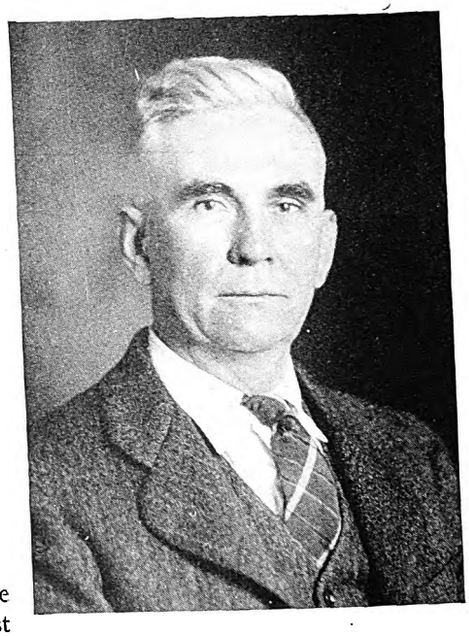
Prize Winners in ELECTRIC RAILWAY

FIRST Capital Prize of $200 awarded to James A. Duffy, superintendent of equipment Monongahela West Penn Public Service Company. Second Prize of $100 goes to Joseph Mercier, general foreman of the track service division, Montreal Tramways. Third Prize of $50 was awarded to Charles Herms, general foreman San Diego Electric Railway, and a Fourth Prize of $25 was given to E. M. Miley of the Chicago Surface Lines. Prize-winning articles are published on pages 532 and 533 of this issue



James A. Duffy, the winner of the first capital prize and the monthly prize for August in ELECTRIC RAILWAY JOURNAL's Maintenance Contest, is superintendent of equipment for the Monongahela West Penn Public Service Company with headquarters at Fairmont, W. Va. Since 1919 he has been in this position, to which he came from the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, where he was master mechanic for seven years. Mr. Duffy was also master mechanic of the second division north side shops of the Pittsburgh Railways for seven years.

He is a Pennsylvanian by birth and was educated in the schools of Fayette and Jefferson Counties. His first experience was in the coal mines in Pennsylvania, where he was engaged in installing electrical mining machinery.

Mr. Duffy has had considerable power plant experience in addition to his railway equipment work. He was with the Duquesne Traction Company, Pittsburgh, and later with the Fifth Avenue Traction Company of that city, where he served as power house engineer. Later he was made assistant chief engineer of the company's power plant. In 1899 Mr. Duffy went to the Havana Electric Railway, Havana, Cuba. There he was engaged in constructing power plants, overhead lines and equipping the street cars of that company.

EQUIPMENT arranged for building up the treads and flanges of car wheels by electric welding with provision for grinding the wheels to proper contour at the same time was awarded the first capital prize of $200 in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest. This item also received the monthly prize of $25 for August. This equipment is used in the Fairmont, W. Va., shops of the Monongahela West Penn Public Service Company, and a description of the equipment, together with its economies, was submitted in the contest by J. A. Duffy, superintendent of equipment for that company.

Wheel work constitutes one of the principal maintenance operations on any electric railway system. The turning of steel wheels to provide a proper tread and flange contour when these become worn and the grinding of cast-iron wheels to get rid of flat spots have long been universal practice. The building up of the treads and flanges when they become worn by applying metal through the electric welding process is a more recent development. Many city properties are using this with satisfactory results and with desirable economies. Few high-speed interurban roads, however, have adopted the process because of a feeling that there might be danger of a derailment should the welding prove defective. The Monongahela West Penn Public Service Company operates interurban service through a number of towns in West Virginia and Ohio and the restoring of treads and flanges by automatic electric welding is used. To save time and labor the special equipment described in the article was devised so that one wheel is ground while the other wheel is being built up by electric welding. Provision was made for driving the wheels at a speed desirable for the welding operation through gearing attached to the center of the axle, and a variable speed motor with proper control provides for variations in peripheral speed of from 5 to 13 in. per minute. The automatic welder is of standard manufacture and convenient mounting is attached as part of the equipment. The grinding wheel is driven by a separate electric motor.

This method of grinding and welding has eliminated the use of a wheel lathe and a saving of about three hours per pair of wheels in machinist's time has resulted. With this equipment the welder can do other kinds of hand welding at the same time that he is overseeing the wheel welding by the automatic head. The judges considered that this method provided for a decided saving in labor and expense in one of the most frequently occurring maintenance jobs with which electric railways are confronted.

A quick release latch for a hacksaw blade as submitted by Joseph Mercier of the Montreal Tramways was awarded the second capital prize of $100. This equipment is extremely simple, but fills a long-felt want in making it possible to remove the frame of the hacksaw quickly when a car approaches. This obviates the necessity of removing the blade from the rail, which frequently results in

Digitized by Google

JOURNAL *Maintenance Contest*

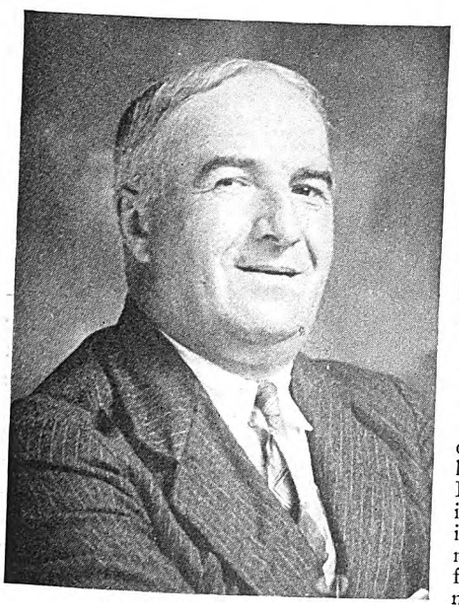
breakage. This equipment provides a rigid hacksaw blade for doing the work and an instant release so that the blade can be left in the rail provided it will clear the wheel flange.

The third capital prize of $50 in the Maintenance Contest went to Charles Herms, general foreman San Diego Electric Railway, for an adjustable mandrel to be used in babbitting journal brasses. This is the second prize that has been won by Mr. Herms in the Maintenance Contest, as he was awarded the monthly prize for June for a spacing attachment used with a commutator slotting machine. The babbitting mandrel described by Mr. Herms is arranged so that different types of journal brasses can be poured on the same mandrel while securing perfect alignment with the axle and journal box. Side adjusting plates can be put in position quickly and so the time for the operation of babbitting is reduced considerably.

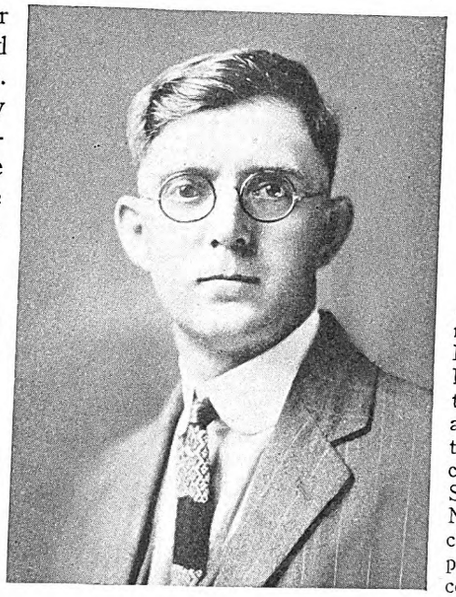
In previous announcements in the JOURNAL provision was made for but three capital prizes. In going over the large number of manuscripts submitted, however, it was found desirable to add a fourth prize of $25 to the list for honorable mention in the articles considered for the capital prizes. This fourth prize goes to E. M. Miley of the electrical department of the Chicago Surface Lines for his description of the method used by that railway in reclaiming steel trolley poles by electric welding. With this method some 900 poles have been reclaimed, which has resulted in a saving of approximately $27,000 from the cost of new poles. The method is also used for reinforcing poles while they are standing in the street under load. It should prove a valuable maintenance practice for adoption by other railways.

The equipment used for grinding and welding wheels at the same time was described in the Aug. 20 issue of ELECTRIC RAILWAY JOURNAL and was awarded the August monthly prize.

Honorable mention for August was awarded to Charles Herms of the San Diego Electric Railway for his description of an air clamp for drill press.



Joseph Mercier, the superintendent of the track service division for the Montreal Tramways, Montreal, Canada, was the winner of the second capital prize in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest. He was born in New York State and began his electric railway service with the old Montreal Street Railway, now the Montreal Tramways. He has been in charge of the track service division since May, 1916. This division includes a machine and frog shop, where welding, grinding and similar work are carried on. In addition, a large amount of track repair equipment is maintained, such as bonding apparatus, crane cars, concrete mixers, tie tampers, concrete breakers, steam rollers, and other similar equipment used in the track construction department.



Charles Herms, who won the third capital prize, is shop foreman of the San Diego Electric Railway. He has been with that company since 1923. He began his electric railway experience in 1919 with the San Antonio Public Service Company in Texas as general repair man and continued in this capacity for four years, when he was promoted to foreman over a crew engaged in remodeling cars.

Mr. Herms has always been interested in mechanical construction. During the war he was attached to the First Army headquarters in a motor repair unit. Other experience outside of the electric railway field includes supervision of the mill department of the San Antonio Portland Cement Company and a position with the Boston & Superior mine in Arizona to recondition the electric and telephone system of that company.

E. M. Miley, the winner of the fourth capital prize, is estimating engineer for the Chicago Surface Lines. He started work for the Western Electric Company in Chicago in 1902 in the power apparatus testing department and later was promoted to shop superintendent. In 1917 he took the position of chief electrician for Hillman's Department Store in Chicago and later went with the Northwestern Elevated Railway, now included in the Chicago Rapid Transit Company. His work there was on substation construction work. In 1908 he went with one of the Chicago railways now included in the Chicago Surface Lines.

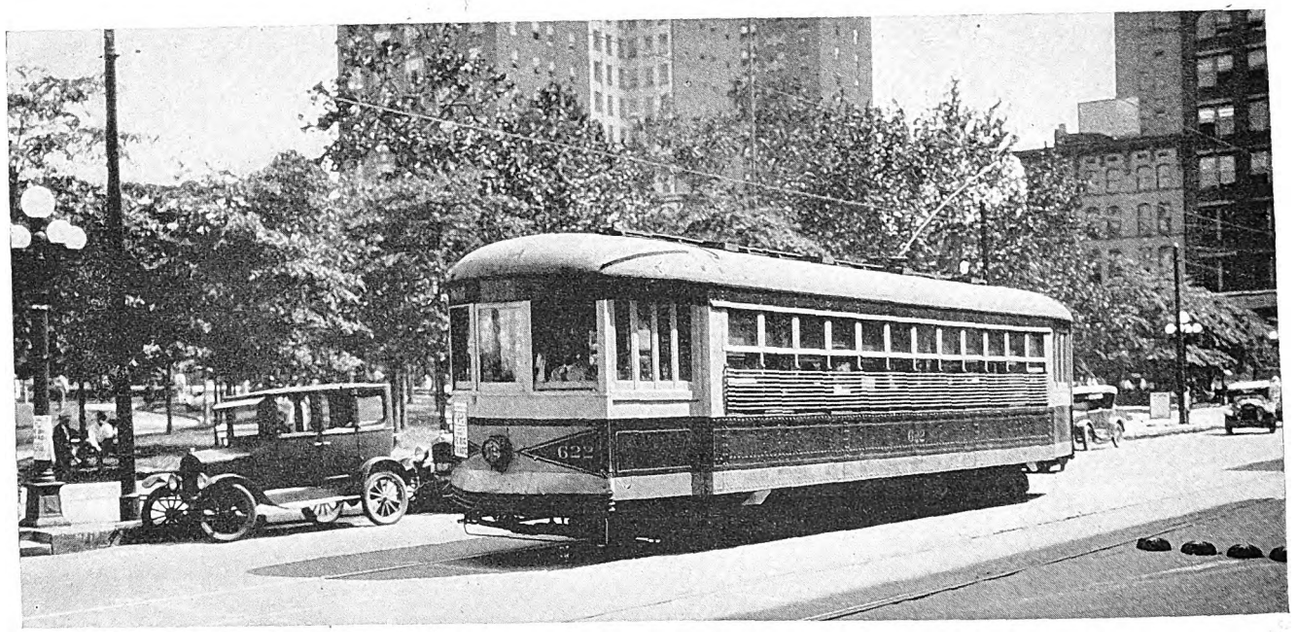
Modern Light-Weight Cars

Meet Transportation Demands of Medium-Sized Cities

By A. D. McWHORTER
General Superintendent Memphis Street Railway



Operation of rail coaches of this type has met with widespread public approval in Memphis, Tenn.

VERY different from its predecessor of a few years ago is the modern light-weight city car, with its arched roof, wide windows, metal sash, deep upholstered seats and up-to-date lighting fixtures. Practically every week for the past year we have read in the technical press of new light-weight cars being put in service in our medium-sized cities. Many of the installations have been accompanied by celebrations, historical pageants, bonfires, etc. The industry is making progress and putting up a winning fight to regain some of its lost business.

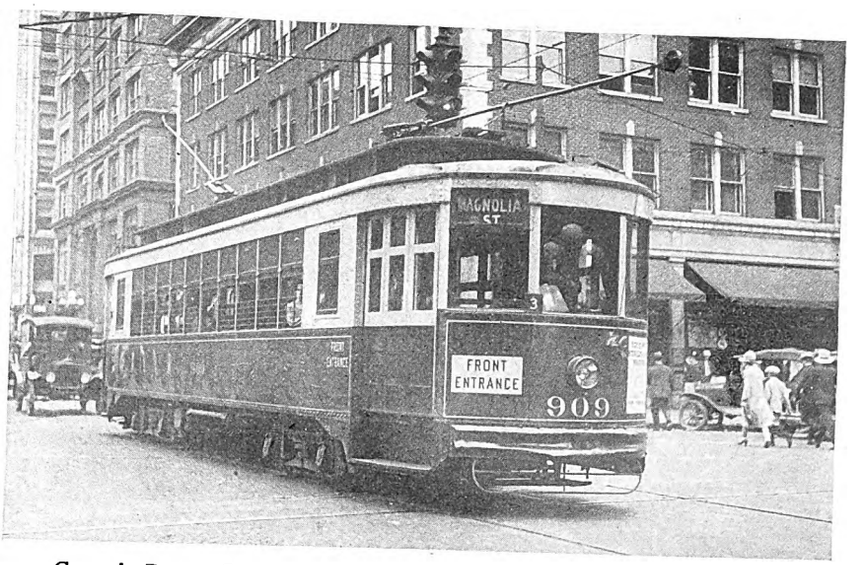
Evidence of this strong comeback is found in the wide distribution of the rehabilitation programs now under way or completed during the past few months. The trend toward light-weight, double-truck, one-man cars for cities of 100,000 to 500,000 population has been increasing rapidly for the past two years. The Memphis Street Railway is now operating 97 modern cars of this type. Atlanta, Birmingham, Dallas, New Orleans, Richmond and other Southern cities in the 100,000-500,000 class also have recently bought light-weight cars. In the North similar equipment has been purchased by the railways in Providence, Worcester, Springfield, Scranton, Grand Rapids, Youngstown, the Twin Cities, Milwaukee, and by the Eastern Massachusetts Street Railway. In other sections of the country the trend has been the same. The popularity of the light-weight double-truck car is everywhere evident, particularly in the cities of medium size, but also in those with a population of more than 500,000 and those with fewer than 100,000 inhabitants.

The story of the modernization of the rolling stock of the Memphis Street Railway is typical. In 1923 this company purchased 40 double-end, two-man, light-weight, low-level, double-truck cars, the first new equipment placed in service since 1914. They were built by the St. Louis Car Company, but sharpened ends characteristic of Memphis were retained in the design. These cars were converted last year for single-end, one-man operation. To augment and improve the service the company purchased 32 modern "electric rail coaches." The first of these went into service Aug. 11, marking an epoch in street railway transportation in Memphis.

The latest cars are of the one-man, low-level, light-weight, double-truck, semi-noiseless type. All passengers enter by the front door. White passengers leave by either the front or rear exits, while colored passengers leave by the rear exit only. Each car has 55 seats, upholstered in taupe plush, with Nachmann spring units. Mosaic rubber tile flooring, laid on a thick layer of celotex which covers a heavy wooden floor, helps to deaden any noise emanating from the trucks. An important feature is the artistic painting, "streamline effect," which gives an unusually attractive appearance.

Digitized by Google

In Atlanta the Georgia Power Company recently bought 60 one-man cars, making a total of 120 new units ordered during the past four years. Use of modern low-level cars for city service in Atlanta began in 1922, when the company purchased twenty. The following year twenty more were built in the shops of the company, and in 1924 another group of twenty cars was ordered. These were delivered in 1925. Later the same year twenty additional cars were put in service, and still later in the year 40 more were ordered.



Georgia Power Company at Atlanta has bought 120 light-weight cars during the past four years

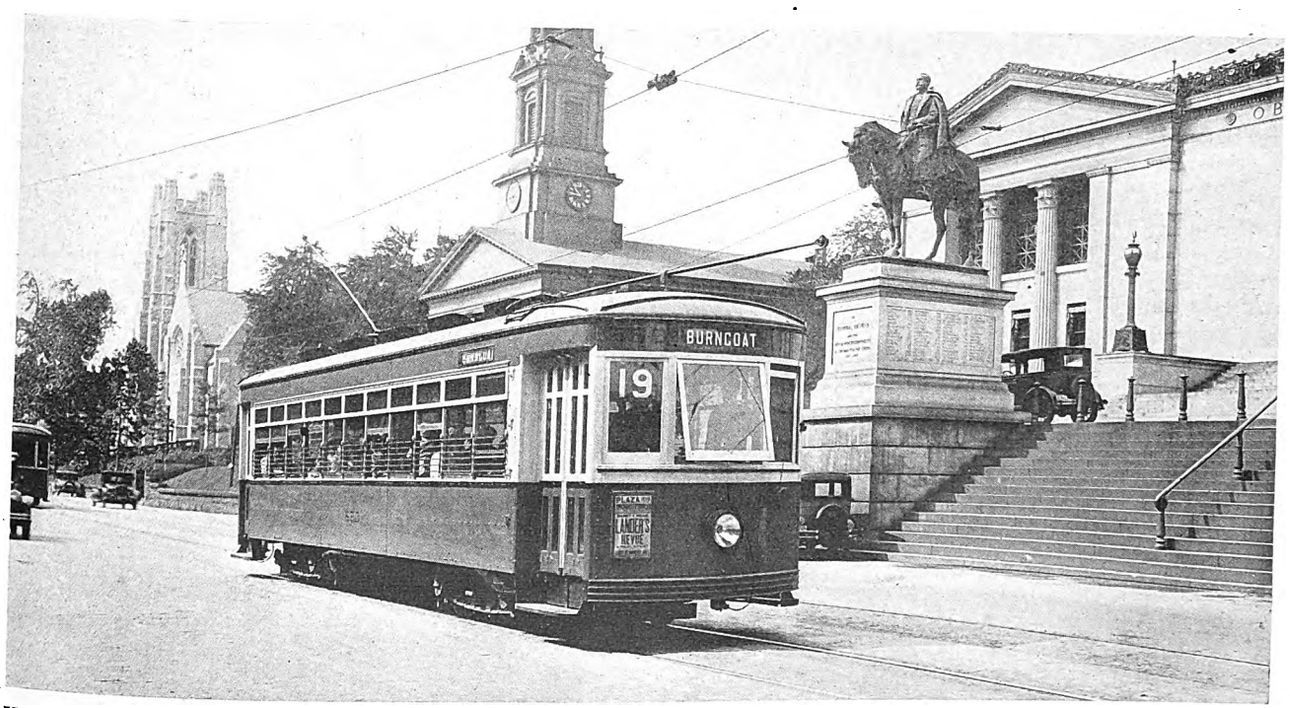
The company estimates that, with the savings in maintenance of equipment, way and structures, and savings due to larger capacity, increased speed and reduced accidents, the gain from the operation of the new one-man cars ordered approximated $210,142 for the first year. This figure is based on a comparison of actual operating costs of the new one-man cars and the old two-man cars retired.

Birmingham recently bought sixteen light-weight, double-truck cars. To eliminate as much noise as possible in the new vehicles all trapdoors in the floor have been omitted and oiling and inspection are done from underneath. As a further step, helical gears are used and the bolsters are filled with ground cork and cement. Where they connect at the side with the framing of the car the bolsters are insulated with $\frac{1}{4}$-in. linoleum, securely fastened between the end of the bolster and the side sill.

These cars have fourteen cross seats and additional longitudinal seats at the rear, all upholstered in plush. The latter, together with the row of seats extending across the extreme rear, accommodate 32 passengers, making the total capacity 60. Formerly, fixed partitions were used to separate the colored passengers from the white, but in these cars the arrangement has been so modified that the amount of space set aside for colored passengers may be varied at will. This eliminates the necessity for white passengers having to stand while seats remain unoccupied in the colored section.

Nashville, Tenn., recently added ten modern rail coaches to its equipment. The inauguration was celebrated with a historical pageant and parade, consisting of the old mule car of 1866, the first electric car of 1899 and successive types in line, with, finally, the fleet of ten new parlor coaches. Each of the ten cars bears the name of an immortal Tennesseean. Newspapers and citizens in one voice pronounced it one of the most interesting, unique and educational events in the history of the city.

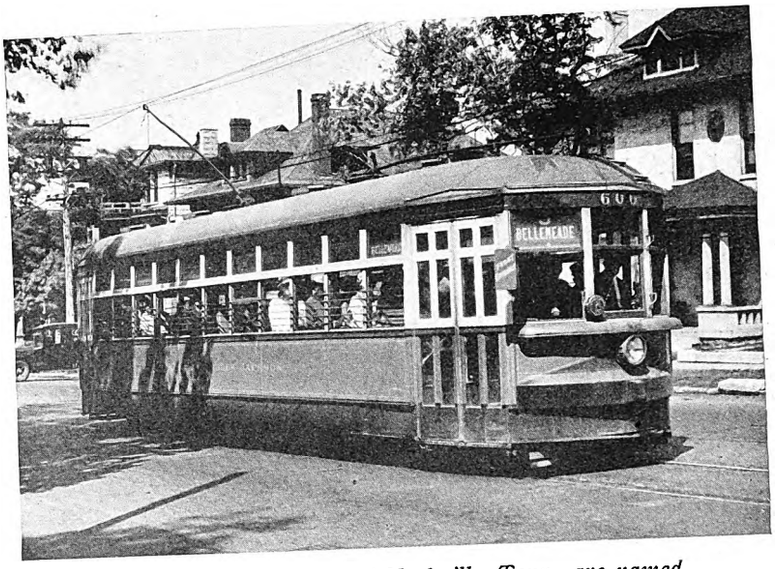
In New England the United Electric Railways of Providence has purchased 235 new cars since Jan. 1,



Worcester Consolidated Street Railway and the affiliated Springfield Street Railway recently bought 100 new light-weight cars. The first of the new cars for Worcester is shown in operation on Main Street

Digitized by Google

1923. Of this number 210 are of the light-weight, double-truck type designed for either one-man or two-man operation. Although it is difficult to estimate the savings in equipment, power and platform expense which may be credited to the new cars, there is no doubt that operating expenses have been reduced materially. It is even more significant that the gross revenue of the company has shown a substantial increase since 1923, as indicated below, despite a general business depression in this district. Expansion of bus service and fare increases undoubtedly have contributed to the gain in gross earnings, but improved car service has been an influential factor.



New light-weight cars of Nashville, Tenn., are named after prominent citizens of the state

Revenue of United Electric Railways of Providence

Year	Gross Earnings
1923	$8,006,202.21
1924	8,179,822.41
1925	8,159,446.59
1926	8,193,345.17

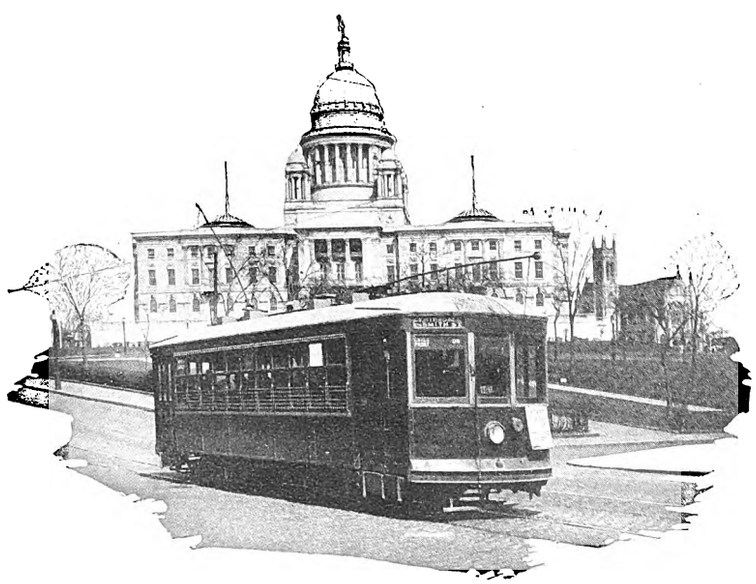
Other New England cities in the 100,000-500,000 population class which recently have bought light-weight, double-truck cars are Worcester and Springfield. A total of 100 new cars were ordered in the early part of this year by the management in charge of the railways in these two cities. The first of these cars began operation early in August of the present year. After the entire lot has been put in service it is planned to retire much of the older, heavier equipment. Similarly, the Eastern Massachusetts Street Railway recently bought 50 cars of the same general type for use in the industrial cities, such as Lawrence, Lowell and Fall River, which it serves.

In the North Central states the Milwaukee Electric Railway & Light Company has placed in service 40 modern, double-truck, light-weight cars, in which control apparatus and air piping are entirely inclosed in cabinets made of a metal-faced wood. This gives a light but strong construction which will not become dented or defaced as easily as wood and can be refinished readily. An opening provided between the two sections of the cabinet gives kneeroom for the operator. Interior trim is light cherry with a cream color ceiling. The exterior color scheme is orange and cream, the orange being placed in the panels below and above the windows with cream in between them to give a streamline effect. Aluminum fittings are used throughout for seats and handrails. Seat cushions and backs are upholstered in the customary rattan, which is covered with hair felt $\frac{1}{2}$ in. thick, and a final cover of black Kemi-suede. The first cost of this seat is slightly higher, but it is claimed that its life is greatly increased.

The chief function of a railway company is to sell rides at a profit and success is dependent on creating demand through improvement of the product. Replacement of obsolete equipment is of paramount importance and should be given serious consideration. Application of the same principles that cause a merchant to pay careful attention to the appearance of his store will attract new business and make more friends for the railway. Modern cars attract greater patronage and earn more revenue than those of obsolete design.

While light-weight, double-truck cars of the type discussed lend themselves most admirably to service in cities of 100,000 to 500,000 population, they are in successful use in cities of more than 500,000 inhabitants. There are light-traffic lines even in the largest cities, and a double-truck car of medium size, economical to operate, is more efficient for this service than a bigger vehicle would be. Then, too, there are many routes where the traffic is fairly heavy in the smaller cities. The light-weight, double-truck car is well suited to such conditions.

Properly used it is an important factor in restoring the popularity of the electric railway.



Light-weight cars at Providence, R. I., have reduced operating costs and increased earnings

Front-entrance, center-exit car of the United Railways, St. Louis, is well adapted for handling heavy loads

Heavy Traffic in Major Cities Demands

Large Double-Truck Cars

By R. J. LOCKWOOD

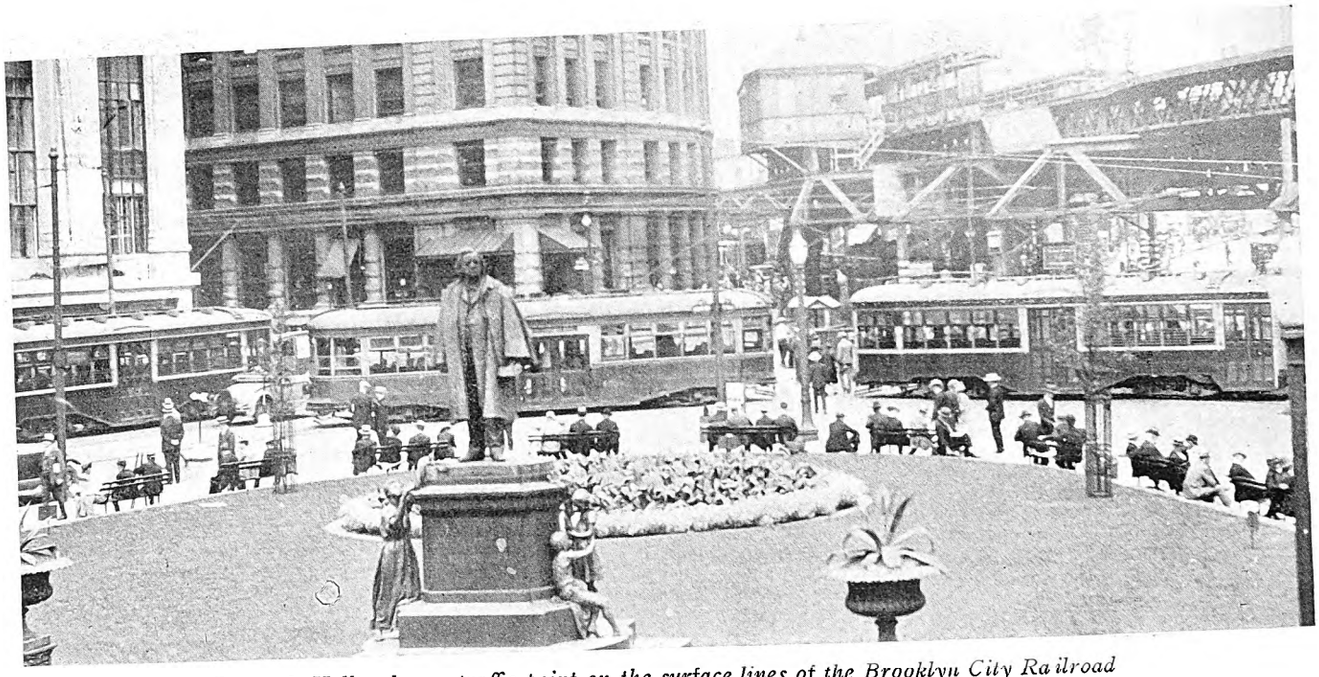
Assistant Manager for Receiver United Railways of St. Louis

FROM the standpoint of the street railway operator the field of urban passenger transportation has become vastly more complex during the past few years. Not so long ago it consisted of subway, elevated, street car and suburban steam railroad services. In those days the street car operator was not confronted with the problem of serious competition, the field being somewhat distinctive. His concern was largely with the financial and engineering problems of increasing and extending his service to meet the expanding needs of growing communities. Today, however, his problems are more complicated as the forms of urban passenger service have increased until now they include subways and elevateds, large double-truck street cars, smaller one-man cars, double-deck buses, single-deck buses, taxicabs and, last but not least, private passenger automobiles. Each of these types of transportation undoubtedly has its own particular field, but actually they are not bound by exact economic limitations and in many instances their services overlap. Thus competition and unnecessary traffic congestion follow, with all their attendant ills. It is the purpose of this article to discuss the large double-truck street car and its field of operation and to touch upon other services only where comparison with the large car is needed.

Undoubtedly the large street car has a most useful field of operation, particularly in handling mass transportation in cities where the travel spreads out in many directions and does not follow a restricted line of flow, as in the Borough of Manhattan. Such a city, for instance, is St. Louis, containing in its metropolitan area about 100 square miles and a population of approximately 1,000,000. Other similar cities are Chicago, Philadelphia, Cleveland, Detroit, Baltimore and Cincinnati.

In St. Louis about 30 per cent of the population coming from the entire metropolitan area travels each day into the congested district, comprising an area about ½ mile square. Later each day the 30 per cent assembled in the congested district travel home again, their routes of departure radiating like the ribs of a fan. In addition to this, about the same number of people travel each day to and from various other points of the city. To handle such travel on subways would require the construction of so many miles of line that the proposition would be prohibitive in cost. Because of street traffic congestion in the central business district, it might be desirable to put the surface cars underground for relatively short distances, but present traffic at present fares does not furnish revenue enough to justify such a proce-

Digitized by Google



Borough Hall, a heavy traffic point on the surface lines of the Brooklyn City Railroad

dure unless the people are willing to pay for it by taxation. Even then the large double-truck street car would not be replaced, but merely would be operated on an underground right-of-way for a minor portion of the trip.

From data available it is apparent that in the large cities the street railways are handling about two-thirds of the urban passenger travel. Interesting figures from a survey made in St. Louis in 1925 are presented in an accompanying table showing that 63.5 per cent of all passengers are carried by the street railway. Cordon counts made at Baltimore, Md., for successive years show that the street car continues to be the most important passenger-carrying agency. A survey in Detroit, the so-called "home of the automobile," showed 62.4 per cent of all rush-hour passengers using the electric railways and an all-day count in Los Angeles, which claims the greatest automobile saturation, showed 61.3 per cent. A check made in Cleveland last year at 23 of the largest stores indicated that 64.2 per cent of the customers came by street car. It is in such cities as these that the large double-truck car is still essential.

State Street, Chicago, where the bulk of the traffic is handled by the cars of the Surface Lines

Digitized by Google

Undoubtedly the gasoline vehicle has slowed up what used to be the normal yearly increase in street car travel. It has hurt railway pleasure travel more than business travel. This is indicated by the fact that in St. Louis week-day travel in 1926, compared to 1925, increased 0.18 per cent. Saturday travel decreased 0.16 per cent. Sunday travel decreased 2.35 per cent and other holiday travel decreased 2.42 per cent. Night travel on all days also fell off. The foregoing figures indicate beyond doubt that the greatest competitor of the street car is the privately owned automobile. Not only has the normal growth of the street car business been curtailed but the loss at periods when it is easiest to furnish transportation makes the problem even more serious.

To meet present-day competition, whether from the bus or the private automobile, there are certain broad principles that the railway manager must adopt for his guidance. There are many little things which can be done with more or less success, such as publicity stunts, etc., but in the long run the fundamentals are:

Give as frequent service as revenue will permit.
Keep the cars on schedule and equally spaced.
So far as possible provide a seat for every passenger.
Establish as fast a schedule speed as possible with proper regard for safety.
Use plenty of paint to make the cars look attractive.
Keep the cars clean.

To accomplish these things is no easy task, because the street railways are a regulated industry and the public authorities controlling them have been slow to recognize their difficulties. Nevertheless progress has been made. The large double-truck street cars built 25 years ago were heavy and cumbersome. During the years 1903 and 1904 the St. Louis Transit Company and the St. Louis & Suburban Railway, predecessors of the United Railways, bought about 525 cars of this type. They are typical of many built in that period. Their principal characteristics are given in the table below, as well as those of 200 cars built by the United Railways from 1921 to 1923.

It is readily seen that the newer cars are much more efficient than those built twenty years before. In acceleration, in smooth running, in energy consumption, in weight per passenger and in convenience of loading and unloading they are far superior to the older cars.

Seventh and Broadway, Los Angeles, showing large cars used in city service

	Cars Bought 1903-04 St. Louis Transit Company	Cars Bought 1903-04 St. Louis & Suburban	Cars Bought 1921-23 United Railways
Length	46 ft. 2 in.	48 ft. 5 in.	50 ft. 6 in.
Weight	48,800 lb.	52,000 lb.	39,400 lb.

Standing capacity, passengers	60	50	60
Weight per seated passenger.	856 lb.	912 lb.	657 lb.
Weight per total passenger..	417 lb.	486 lb.	328 lb.
Kilowatt-hours per car-mile.	3.219	3.343	2.826
Motors	4–40 hp.	4–40 hp.	4–35 hp.
Diameter wheels	33-in.	33-in.	26-in.
Height of floor	39-in.	39-in.	31-in.

Data are available on 6,273 double-truck cars purchased by 55 companies since the World War. These

Digitized by Google

figures are not so complete as those on the older and heavier cars, but they are interesting:

4,041 cars weigh less than 40,000 lb.
2,231 cars weigh more than 40,000 lb.
6,273 cars average 36,100 lb.
4,624 cars have wheels of 26-in. diameter

From these figures it will be seen that the typical modern car is a very different vehicle from that in use twenty years ago.

During the past two years certain radical departures from established practice have been made. At the Cleveland convention of the American Electric Railway Association in October, 1926, the Cleveland Railway exhibited an aluminum car which was 51 ft. long, weighed 30,000 lb. and seated 49, with standing room for 91 additional passengers. It is commonly believed that aluminum will soon come into more general use in car construction than at present. At Springfield, Mass., and at Joliet, Ill., two worm-drive cars are in service. These cars are light in weight and are somewhat experimental in their construction, in that the axles are those made by the Timken-Detroit Axle Company for heavy truck service and the motors used were designed and built for gas-electric bus service. Similar trucks have been ordered by St. Louis for one car, by Pittsburgh for two cars, by Detroit for one car and by Montreal for two cars. The St. Louis truck and probably the others will have rubber shock absorbers on the ends of the springs and a rubber insulation between the wheel center and tire, with connecting bonds to complete the electrical circuit to the track.

Advantages of these innovations are expected to be in smoother and quieter running of the car. Brake screech and clatter, wheel ring, journal box, gear pedestal and bolster noises, and general noises due to vibration, it is confidently expected, will be eliminated or much reduced. In St. Louis a special body is being built using aluminum to some extent. This car will have the load-carrying capacity of the front-entrance, center-exit car described earlier, but it is to weigh 5,000 lb. less. Thus by improvement in the design of large cars for heavy city traffic it is to be expected that a vehicle will be developed which will meet the demands of this kind of traffic and provide better and more attractive service than is being given at present.

According to the census of 1920 there were sixteen cities in the United States having populations in excess of 400,000. Several other cities were so near this figure that it is safe to say that there are now twenty cities in this class. They constitute the primary field for the operation of the large double-truck car. Of these cities, New York, Chicago, Philadelphia and Boston have more or less extensive rapid transit systems. But this has by no means eliminated the large car as a factor in their local transportation facilities. It is a fact not generally realized that surface cars are carrying more than 40 per cent of the total traffic in New York City, despite conditions that are more favorable than exist anywhere else for the development of rapid transit; large surface cars are used intensively also in Chicago, Philadelphia and Boston, and in the cities without rapid transit vehicles of this type are carrying the bulk of the traffic. In cities of less than 400,000 population the large double-truck car can sometimes be used to advantage on certain lines. Generally speaking, however, its field of greatest usefulness probably will be found in the twenty largest cities, particularly in those where geographical and other conditions are unfavorable to the development of extensive rapid transit systems.

Large surface cars play an important rôle in Philadelphia's transportation system

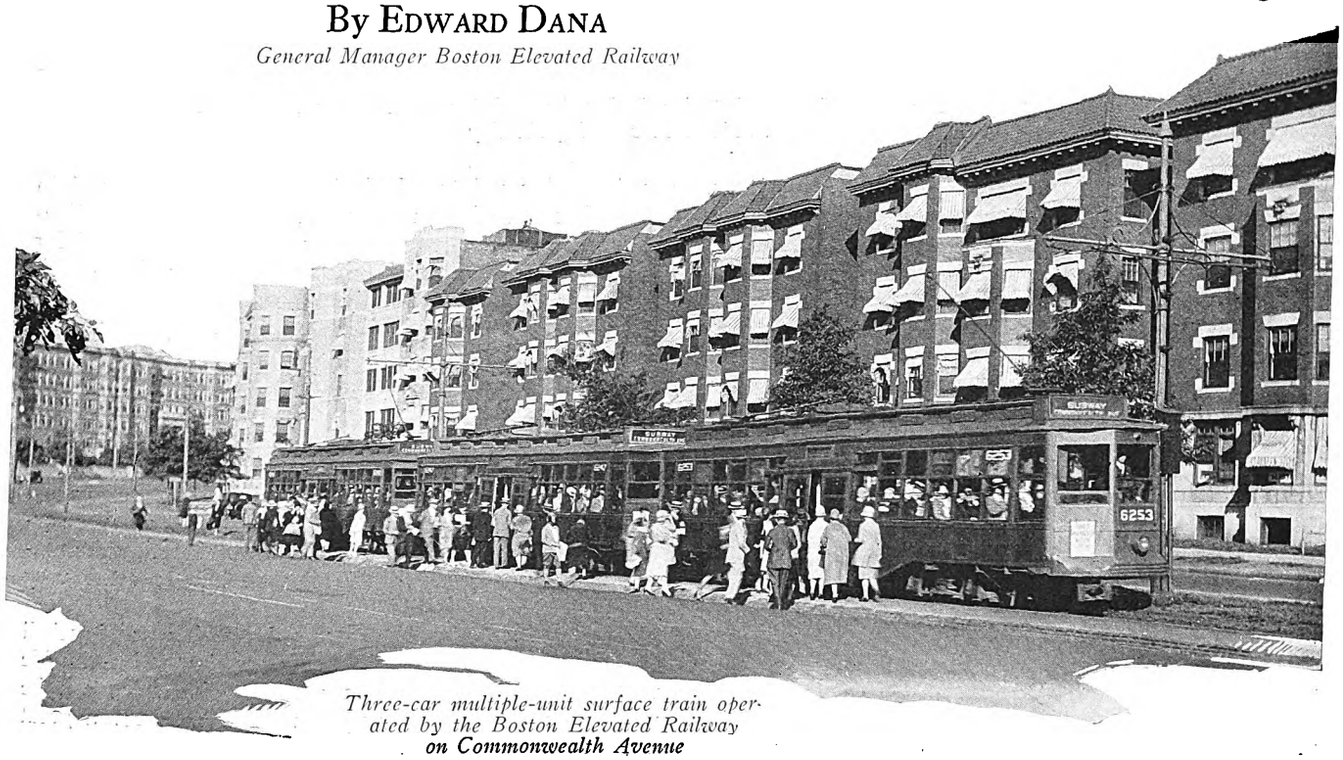
Congestion Demands Use of

Surface Line Trains

For Economy

By Edward Dana

General Manager Boston Elevated Railway



Three-car multiple-unit surface train operated by the Boston Elevated Railway on Commonwealth Avenue

SO MUCH has been said and written in recent years regarding theory and practice of surface-train line operation that the fundamental principles of success in this field are generally understood. The practice of adding cars to an operating unit to care for greater volume of traffic dates back to the beginning of large-scale transportation. Steam railroads have practiced it as far as possible, because with them each train unit requires a locomotive. Conditions are entirely different in street railway operation, but the same fundamental principle applies, namely, to furnish the desired service at a minimum of cost.

City surface-line operation is distinguished from others by certain characteristics, the main one being the interference of vehicular traffic with car movement. Another is the demand of patrons for frequent service, and a third is the relatively short distances between stops. All of these factors unite to render difficult the maintenance of uniform headways, particularly in rush hours. That is where the train helps to solve the problem.

The increasing use of trains of two or three cars in surface-line operation in large cities is due to the application of three general principles:

1. A train of cars permits more rapid operation through congested traffic than do separate cars. This follows because all of the cars in the train go through traffic as a single unit. Other vehicles can interfere less with a train than with a corresponding number of single units, and a single signal from a traffic officer insures passage of the entire train. The tendency of single units in heavy traffic is to bunch; in other words, they are forced to form what is essentially a train. This is a condition which suggests train operation.

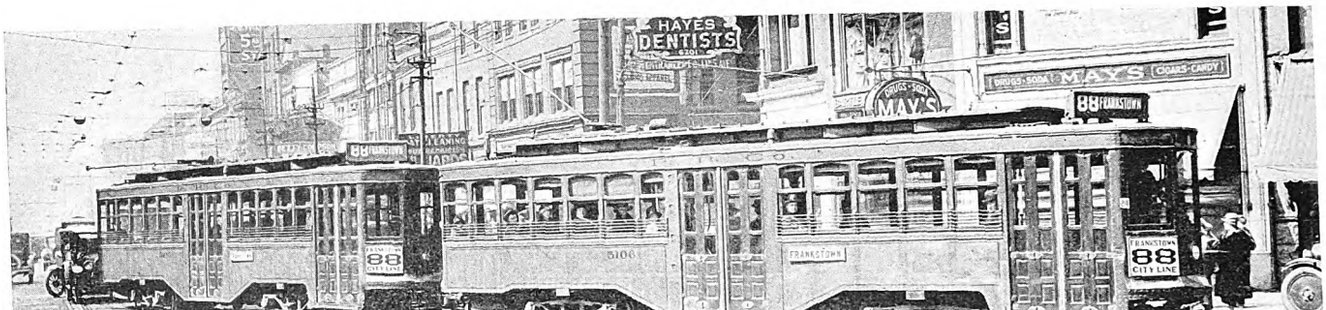
2. When passenger traffic on a given line is sufficiently heavy to permit train operation without too great an increase in headway, trains can be operated at lower labor cost per car-mile than single units. One motorman operates a train of any desired length, hence the share of his wages chargeable against each car is inversely proportional to the number of cars in the train. This comparison is, of course, with two-man cars, which would usually be operated under traffic conditions favorable to train operation.

3. The train furnishes a flexible transportation unit, the capacity of which can be readily adjusted to service requirements. Whether trains consist of multiple-unit cars or motors and trailers, it is practicable to add or drop cars as the traffic demands and thus keep the equipment in service efficiently.

Experience in Boston

The first regular two-car train operation in Boston was inaugurated on May 24, 1915, on the line from Watertown to Park Street, although experiments along this line had been tried earlier, perhaps 25 years earlier. This method of operation was introduced to utilize in rush hours the greater carrying capacity of the train, with lower platform costs, on lines where the headway under train operation is not detrimental to the service. The first trains consisted of motor car and trailer, involving, of course, provision for looping trains at the terminus of the line and ample kick-off tracks for the storage of the trailers. The arrangement offered opportunity to purchase equipment at minimum expense, because the trailer is so much lighter and, being without

Digitized by Google



Pittsburgh Railways operates many multiple-unit trains during the rush hours. These are disconnected and operated as single cars during the day

motors, so much less expensive than the forward car. It so happened that by slight changes in motor cars which had not originally been purchased to haul trailers it was possible to introduce train operation without expensive changes in our so-called No. 4 type motor car.

At the present time there are 220 trailers on the Boston Elevated system operated on fourteen lines. Shortly after the successful installation of train units the center-entrance multiple-unit car was introduced and today there are 190 of them on the system, running as trains in two or three-car lengths on eight lines. Experience with center-entrance multiple-unit train operation has shown that dead mileage can be reduced to a minimum by trains that can be turned back on crossovers, not requiring the expense of installation of loops or the operation of the two-car units to the end of the line.

Recently on a heavy crosstown line where traffic congestion had become so extreme that individual cars were running practically in trains the introduction of two-car train rush-hour service has equalized the load and improved the service without seriously impairing the frequency of the service. Conditions at the Park Street loop of the Boylston Street subway, a heavy main artery, are such as practically to demand rapid transit operation. A close approach to this could be obtained only by two and three-car trains. During the rush hours all lines passing through this tube are operated in either two or three-car-train units, which makes it possible to pass a greater number of cars through Park Street station than would be possible with individual units and individual operators.

Under favorable conditions it ought to be possible to utilize multiple-unit trains somewhat after the fashion of steam railroad operation, where cars are picked up at certain major points. This has not yet been tried in Boston because of the relatively short length of the lines leading to rapid transit terminals, but there is a field for such operation, because it gives most economical distribution of the seating capacity. However, careful studies are required in advance to determine the proper fields for it.

After the East Boston tunnel, originally built for surface car operation, reached its saturation point with single units, it was speeded up materially by the introduction of surface-car multiple-unit trains. After again reaching its saturation point it was converted into a rapid transit steel-train line. Had it not been possible to use the surface-line trains the expenditure for transforming the tunnel into a rapid transit tunnel would have come very much earlier than it did.

In the handling of large crowds, such as at baseball games and circuses, we find train operation of inestimable value, because a maximum amount of service can be rendered without calling upon regular men for a great deal of overtime work.

It is easy to go too far in the extension of train operation, because headways can become too long if a certain economic limit is exceeded. Just what this limitation is depends largely on local conditions and must be determined on the basis of accurate traffic studies. Patrons are entitled to a certain frequency of service, which of course depends in part on the business handled by the line. Sometimes, however, service must be given locally at a loss in order to insure reasonable standards.

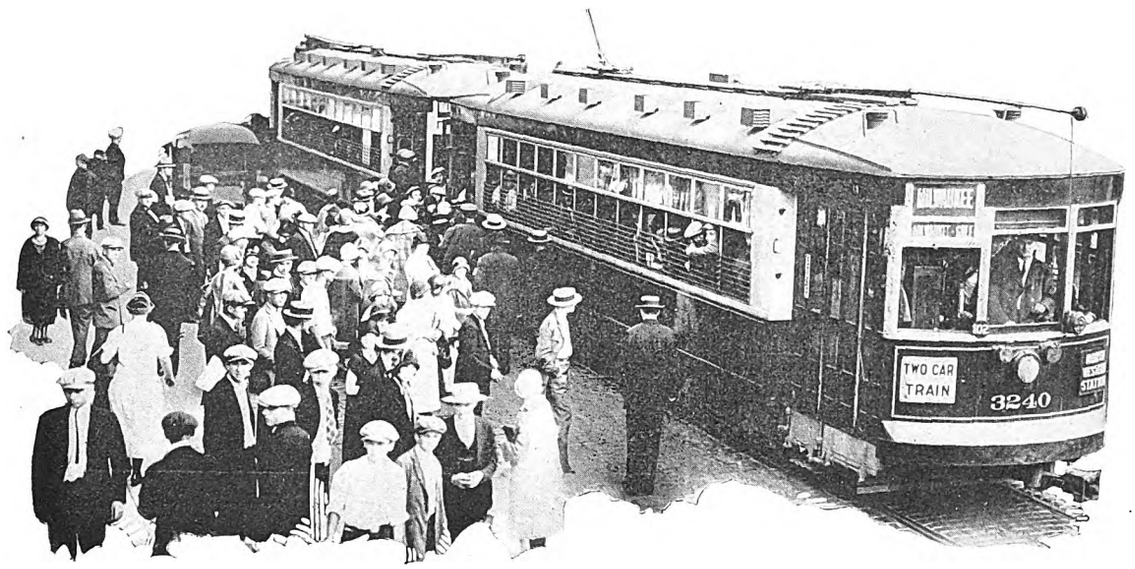
In considering train operation, it is necessary first to determine the loads carefully. For purposes of comparison several sets of data must be worked out to calculate

Train operation has been found to have many advantages on the lines of the Key System Transit Company

Digitized by Google

suitable headways with single-unit operation, with various combinations of short-line service, partly with trailers and partly with single cars, and with various train combinations, covering the entire length of the line. It is surprising to note from any set of traffic load figures the number of variations which must be studied before a final decision can be made. Such determination includes the best arrangement of train operation, if such operation is justified at all. In this connection the probable change in the complexion of the line must be given very careful consideration, because if the center of gravity of traffic should change by even ½ mile the relative values of these various combinations would be quite different.

While our experience in Boston may be considered typical, other localities have different conditions which affect the use of trains. In the preparation of this article valuable co-operation has been received from several managers and their experience will be summarized briefly:



Chicago Surface Lines has found the reversible feature of multiple-unit trains to be of great advantage

At Baltimore the United Railways & Electric Company has 62 cars equipped for multiple-unit train service. Practically all of these cars are of the "pay-enter" type, operated on the high-speed Sparrows Point-Bay Shore Park line. Peak-hour service on this line is nearly all given with two or three-car trains, made up in various combinations, i.e., one motor car and one trailer, two motor cars, two motor cars and one trailer, or three motor cars. The line is double-track, 16 miles long, largely on private right-of-way, with three fare zones. The company considers this one of its most successful lines.

The company also operates motor car and trailer trains on six one-fare city lines. Trailers are operated only in the morning and evening peak hours. At first the motor cars were underpowered, but early this year they were completely remotored, with four 65 or 67-hp. motors each. This operation is now entirely successful. The company owns a total of 100 trailers.

Saving of labor is considered to be the main advantage of train operation, but incidentally there are also savings in power and in accident costs. There is an increase in track capacity because automobiles cannot get between cars of a train. In congested districts service is speeded up because the entire train can proceed past a traffic signal after the front end of a train receives a "go" signal, regardless of whether changes are made in the "stop" position or not. The "skip-stop" has been helpful in connection with train operation. To secure equal loading of the cars of a trailer train, as is secured on the articulated units, remains somewhat of a problem.

This company also uses 24 cars permanently coupled to form twelve two-car trains. This is an economical arrangement from the standpoint of equipment, but the company has been so successful with its articulated trains, with their lower platform labor costs, that no more trains of this type will be built.

The Key System Transit Company at Oakland, Cal., operates three distinct classes of service involving trains, namely, motor-trailer operation, multiple-unit street railway two-car trains and multiple-unit trunk-line trains. The first of these is not entirely satisfactory, requiring a wye or loop at the end of a line and lacking flexibility in coupling up and cutting off. It is not conducive to making as good time as is secured with the multiple-unit trains. Local interurban service is furnished with one and two-car units built up and cut down to meet the requirements of traffic during rush hours. The cars are equipped with automatic couplers. The trunk-line service consists of trains of one to thirteen cars with automatic couplers, built up and cut off to meet the requirements. They are operated intact over the trunk line and cut at three points beyond it. The first section is operated express, the second is diverted to another route and the third furnishes a local service over the route traversed by the express. Cuts are made while the train is in operation without loss of time. On the trunk line the company is operating as many sections as can be accommodated, hence it is necessary to operate trains intact over that section and cut them after they branch off.

Experience on this system shows that train operation reduces accidents, eliminates congestion in streets, decreases man power with the same carrying capacity and is convenient, expeditious and flexible. The use of automatic coupling is an important feature in operation on this system.

Multiple-unit trains are operated on only one line by the Cleveland Railway—a rapid-transit line built into an outlying residential section. This type of operation

Digitized by Google

gives more rapid acceleration than is possible with trailer trains and there is smoother operation. For this service 25 cars were rebuilt for multiple-unit operation and geared for about 40 m.p.h. They are operated singly and in two and three-car trains.

Trailer trains are operated extensively in Cleveland, all motor cars being equipped with four 40-hp. motors. This equipment is not too large for single-car operation and is sufficient for train operation during the rush hours. Cleveland is very flat and there is little overheating of the motors during the few hours of trailer operation. The motor cars weigh 22½ tons and the trailers 13 tons. At present in the evening rush hours a maximum of 792 cars and 432 trailers are scheduled. All heavy lines operate trailers morning and evening, the duration depending on the length of the line and the loading characteristics. On the Euclid Avenue line, the heaviest of the system, trains are operated all day, but even here there is no danger of overheating of the motors. This company favors trailer trains because the investment idle eighteen to twenty hours a day is less.

On the Euclid Avenue route, which is the heaviest in Cleveland, trailer trains are operated throughout the day

On account of the short, narrow streets in Pittsburgh and lack of elevated or subway facilities the trains are made up of but two cars. These are operated only during the morning and evening peak hours, excepting Saturdays and holidays, when they are operated for periods of ten or twelve hours. Three kinds of trailers are used by this company in making up trains, namely, multiple unit, motorized and non-motorized. The multiple-unit cars contain four 37½-hp. motors each. The motorized trailer, which cannot be operated as an individual car, has two motors of 33 hp. each, and it can be operated only with a certain type of car containing four motors of 37½ hp. each. When the two cars are connected they are known as a six-motor train. The dead trailer is operated only with a certain large and heavy type of car having four motors of from 60 to 75 hp. capacity each.

Of the 1,426 passenger cars in operation 155 are dead trailers, 380 are equipped to haul trailers, 160 are multiple-unit cars, 70 are trailers with two motors and 88 are six-motor-train motor cars. The remaining 573 cars include one-man and others that operate singly. Of this equipment the dead trailer is the least satisfactory and it is the intention of the management eventually to motorize all trailers. The operation is jerky and the large and heavy cars equipped with oversize motors necessary to haul the trailers are uneconomical. Since the trailer is used only four or five hours a day ordinarily, the operation of these heavy cars during the base schedule hours is costly.

The multiple-unit train has the advantage of greater acceleration on grades, which is important in Pittsburgh, where a few of the grades are as steep as 10 to 12 per cent. In such districts the multiple-unit equipment is the only kind that would stand up for a long period. The ability of the multiple-unit equipment to operate for a longer period without harm to the motor is an important one. It is also more flexible, a good operating feature around the carhouses, as it can be shifted under its own power. As trains are made up and disconnected twice a day, this is an important consideration.

Offsetting the disadvantages of train operation, i.e., longer headway, delay in getting starting signals to motormen and longer headways than with single cars, all of which are relatively insignificant, the Pittsburgh Railways finds, among the advantages of trains, smooth and comfortable operation, ability to handle surging crowds and smaller labor costs. As to types of trains, the multiple-unit type gives more service, is more durable and produces better acceleration.

The Chicago Surface Lines has 66 multiple-unit trains in operation on four heavy traffic routes and 95 trailer trains on three other similar routes. An advantage of the multiple-unit trains of special value in Chicago is that they are reversible at any point on the route, which minimizes interruption to service on account of fires, blockades, etc. A disadvantage is that the jumpers must be cared for when trains are disconnected on the street.

With trains composed of a motor car and center-entrance trailer it has been found in Chicago that there is difficulty in splitting up the load, as compared with the loading of multiple-unit trains where both cars are motor

Digitized by Google

cars and the loading is all done at the center of the train.

The San Diego Electric Railway operates multiple-unit trains in all scheduled runs on three suburban lines, operating on common track to a junction point 7 miles from the center of the city. Here the rear car is cut off and takes a branchoff, the second car being dropped at a junction point farther out. The remaining car continues to the end of the line. The three cars of a train are designated by three route numbers. The crew of the first car comprises a motorman and a conductor. On the second and third cars are conductors, who merely collect fares as the train is operating as a whole in either direction. Beyond the junction point the men on the second and third cars operate merely as motormen, not having to bother with fares.

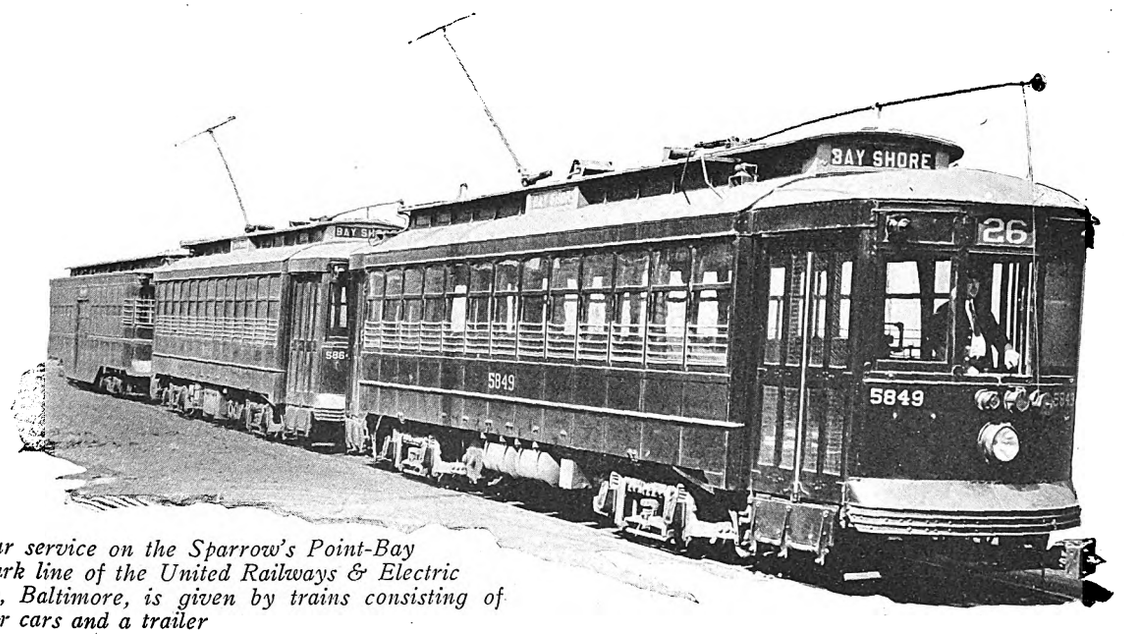
Due to the use of automatic couplers, little time is required to make up or break trains at junction points, this being done in less time than is necessary to handle the passengers at these points. The coupling equipment is so arranged that it will make or break two air lines (main reservoir and brake), the bus, control and signal lines, all through the use of a push button at the motorman's position on the car. With this equipment a following car can be dropped under way, while in making up a train the mechanical connections are made by impact and the push-button connection performs the other operations. During periods of specially heavy traffic trains up to six cars are operated on this line to three beach resorts, the trains being made up and broken into groups for the several beaches.

San Diego is laid out with short blocks in the city proper, so that the congested area presents unusual traffic problems. With train operation better use can be made of the track due to the less space required as compared with single units and the better speed due to the grouping of units.

Experience in San Diego shows that for city service multiple-unit control is most desirable and successful when the equipment is such that the making and breaking of trains can be accomplished with a minimum loss of time; that is, by full automatic operation. Equipment requiring two jumpers for electrical connection between cars, previously used, caused considerable delay and car trouble.

Taking into consideration the experience of these various railways it is possible to make a few general statements which epitomize the whole problem of surface-line operation. When traffic has reached such proportions that all efforts to meet it adequately by short-lining routes has resulted in track saturation which is impairing the efficiency of the service as a whole, then train operation demands attention.

Train operation cannot be considered, *per se,* as an economical move. The problem is more fundamental than merely securing economy of platform cost. Train operation should not be embarked upon without a careful study of all possible alternatives, such as rerouting or distribution through other channels of the traffic load involved. The introduction and the distribution of such service must be determined by the character of the traffic handled and the work to be performed. Moreover, train operation on an all-surface-line system is markedly different from that on a system that has a backbone of rapid transit service or subways.



Rush-hour service on the Sparrow's Point-Bay Shore Park line of the United Railways & Electric Company, Baltimore, is given by trains consisting of two motor cars and a trailer

The manager who has finally decided upon the use of trains confronts the problem: Shall the trains consist of motor cars and trailers or shall multiple-unit equipment be used? In favor of the former are simplicity and lower equipment cost. In favor of multiple-unit equipment are greater traction and greater flexibility. There is no question about the greater flexibility of the multiple-unit train in its ability to meet varying traffic conditions and in the ease with which it can be modified as conditions change. The choice as between trailers and multiple-unit cars largely depends on original costs, the possibility of utilizing older equipment as trailers and whether the line under consideration is of major or secondary importance.

On main lines, with the possibility of operation in subways, our experience would favor multiple-unit train operation. On the other hand, on short lines of less importance the operating economies and lower first cost make it possible to adopt train operation with trailers where multiple-unit operation would not be justified. Accident hazards with trains are less than with single units, because the smaller the number of individual operating drivers, the more concentrated is the responsibility and the less the likelihood of collision and other accidents.

Articulated units have proved economical in city service in Baltimore

Articulated Units

Are Useful for Mass Transportation

By S. E. EMMONS

Assistant General Manager
United Railways & Electric Company, Baltimore, Md.

IN THIS and other countries the cost of operating electric railways has been increasing so rapidly that every endeavor to increase sales and to reduce operating expenditure has deserved careful consideration. The dead weight per seat of modern cars is large, and any considerable reduction is of the utmost importance. The usual practice of employing two four-wheel trucks per car involves considerable unnecessary weight when the units are used for train formation. It was this fact that led car designers to develop the articulated principle of serving two adjacent car ends with one truck. Results have been extremely satisfactory, a saving of from 10 to 14 per cent being effected in two, three and four-car units, and savings of more than 20 per cent being obtained on the larger assemblages.

Articulated units have five distinct advantages: (1) Reduced first cost; (2) reduced weight; (3) reduced operating costs; (4) improved riding qualities, and (5) simpler electrical construction.

First cost is reduced because of the need for less equipment—trucks, couplers and other costly parts. With fewer trucks the construction is simpler, and this, too, reduces the first cost. Reduction in weight is effected by employing fewer trucks and other equipment and in doing away with vestibules at the adjacent ends of the cars in an articulated train. The saving of weight per passenger amounts to more than 20 per cent in some trains. Operating cost is reduced considerably because fewer men are required to operate an articulated train and the energy consumption is much less. Two cars, not joined, would require two men each, or a total of four men. The same two cars if articulated could be operated by two men, or just half the other number. With less weight and fewer trucks and other equipment, maintenance costs are certain to be lower, not only on the cars but on the track as well.

Improvement in riding qualities is very marked due to the fact that there is no overhang of the bodies beyond

Digitized by Google

the trucks, the adjacent ends of each body being carried on one truck center. The most comfortable part of an ordinary car body is that situated midway between the truck centers, there being a minimum amount of lateral movement when entering curves and passing over crossings. The greatest lateral movement is felt at the ends of the body overhanging the trucks. In articulated units there is no overhang. The tendency of ordinary coupled cars to "roll" is often noticeable. This is absolutely impossible where the two ends are pivoted on one truck. Nosing, an annoying feature of double-truck cars in a train, is reduced when the articulated principle is employed. The bodies do not wander from side to side, but follow the true center line of the track. Better interconnection of passengers is made possible by the cylinder-type vestibule used. Better location of electrical control is made possible in the combined units, and wire connections are much simpler.

Although articulated units have many advantages, there is one serious objection to their use on surface railway operation to a point far beyond pre-war or even war-time figures; so that, even with increased rates of fare, it is no longer possible to operate on the pre-war basis. All street railway companies have been searching for the means whereby they can offset these mounting costs, and we find such changes as one-man car operation, train operation, rerouting, skip stops, lightweight cars, etc., almost universally adopted.

The United Railways & Electric Company of Baltimore met the situation in the usual manner, with the operation of one-man cars on several lines, extensive trailer operation, multiple-unit train operation, etc., and was successful in stemming the first tide of rising costs. However, expenses still continued to mount, and it became imperative to make further economies. One-man operation on a larger scale was the logical solution, and, in the study of the problem, the question, "Why not one-man operation, but in the form of two men to two cars?" kept coming up. Obviously, such a scheme would eliminate many of the drawbacks of the ordinary

Washington, Baltimore & Annapolis Electric Railroad finds articulated units extremely satisfactory for interurban service

lines. Traffic in most cities does not warrant the use of such large units except during rush hours. The articulated units are not so flexible as are the double-truck cars designed for multiple-unit operation. Were it possible to fill all the available space of the cars during a larger portion of the day, the problem would be solved. However, such units have been used in a number of the larger cities and in most cases have proved to be a success.

Articulated surface car operation has been carried farther in Baltimore than in any other American city. The transportation problem there, since the war, has been typical of all our large cities. Wages and material costs have risen, traffic congestion has become increasingly more serious, people have moved farther away from the business center, and the competition of private automobiles has made heavy inroads on off-peak traffic. The elimination of "all day" parking downtown has only served to increase the difficulty, as these people have been thrown back on the street cars in the peak hours, and the parking places left vacant by them have attracted persons traveling in off-peak hours who formerly used the cars, with the result that there is an increasing demand for peak-hour service, with a marked falling off in off-peak traffic.

All of these factors have increased the cost of street type of one-man car operation, particularly on heavy traffic lines.

The difficulty to be overcome was that of providing a safe passageway for passengers between cars. The articulated center compartment between cars, as had been tried in Boston and Richmond, was discarded, on account of the possibility of opening up when the cars split switches. The idea of mounting the trucks at extreme ends of the cars, to reduce end overhang and allow covered passageways between cars, was found to be impracticable. It was even thought that end doors, interlocked with the control circuit, so as to allow for movement only when the cars were at rest, might be the answer. But in the end the articulated two-car, three-truck combination then being used in Milwaukee and on several steam railroads in Europe was felt to be the best solution.

In September, 1924, the first articulated unit was placed in service. It was constructed from two double-truck, semi-convertible cars, seating 44 passengers each. One platform was removed from each car and the adjoining trucks were taken off, the two bodies then being joined, bulkhead to bulkhead, through a special center truck and cylindrical passageway, which form the point of articulation. The transverse seats were taken out of

Digitized by Google

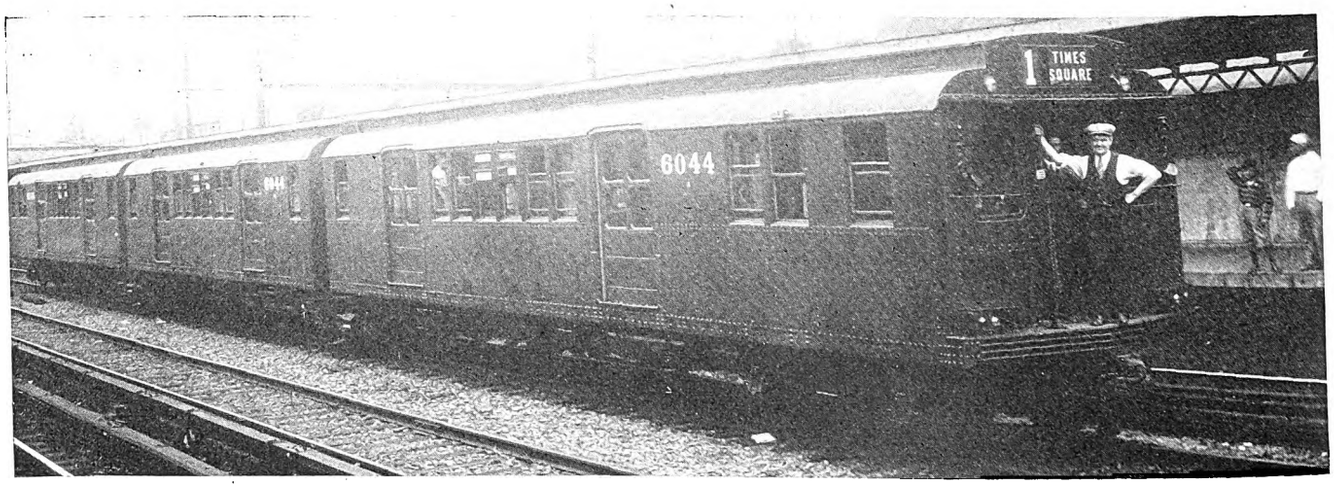
the body which formed the leading half of the articulated unit and longitudinal seats were substituted, while the other body was equipped with the maximum number of transverse seats and a "bay window" seat in the rear. New folding doors and steps were constructed at the forward end of the rear body, and the old doors and steps at the rear platform were removed. A conductor's station was provided in the front end of the rear body, immediately behind the passageway leading from the forward body. The seating capacity of the completed car was 87.

The first train was a success from the beginning, and soon proved to be the most popular piece of equipment on the system. Twenty-one similar units were placed in service in 1925, and twelve more in 1926, making a total of 34 now in service.

The best way to describe the method of operating articulated cars is to describe the operation of line No. 15, Baltimore Street-Gay Street line, before and after the introduction of articulated cars. The old time-table called for 20 cars on the base, and 60 cars on the peaks. Obviously, 40 cars were formerly tied up for peak-hour service only, and these cars were manned by 80 men. Under the articulated car program, these 40 cars were combined into 20 articulated units. The base operation is still carried out by 20 single-car units, but on certain trips in the afternoon, using the evening peak for illustration, the base crews exchange their single cars for articulated cars. This doubles the capacity of the line without adding anything to the labor cost. On the extreme peak, the 20 single cars, previously turned in by the base crews, come out again, manned by 40 men. The saving amounts to 40 men on this line, and the net saving, after allowing for all interest charges, etc., amounts to approximately $2,300 per year per articulated unit, at the present scale of platform wages, and after allowing for spares.

After nearly three years of experience in the operation of articulated cars, the operating officers of the company are agreed that they furnish the most satisfactory means of handling heavy traffic. Articulated cars are suitable for any kind of service where the traffic is heavy enough to warrant reasonable headways. Assuming that five minutes is felt to be the maximum headway, consistent with good rush-hour service, and using Baltimore figures, articulated cars can economically be used to replace any single-car operation of four-minute headway or less. Of course, when five-minute articulated-car service is furnished, in place of four-minute single-car service, the saving is small, but the public has the advantage of a 60 per cent increase in seating capacity. The full advantage of articulated car operation is obtained when they are used on operations requiring $2\frac{1}{2}$-minute headways, or less, with single-car units, assuming that the same seating capacity is furnished in each instance.

Adoption of the articulated type of car by the Washington, Baltimore & Annapolis Electric Railroad was perhaps the most significant application of this type of construction. The articulated design was adopted after a careful study of conditions on this particular property, and the ten units put in operation early this year were constructed to suit its specific requirements. The main-line division from Washington to Baltimore competes with two steam railroads and, therefore, is required to maintain a high-speed, non-stop, comfortable service. At the time of the study the main line had experienced a slight falling off in traffic, but since articulated units have been in service the line has been able to hold its own.



Intercommunication between cars and lower operating expenses are advantages of articulated units used in subway service by the B.-M.T.

Operation of articulated units by the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., is extensive and has proved to be extremely satisfactory. At the present time the company has 75 units of three cars each. All of these are in subway service. The three-car units may be coupled together and run in multiples, making trains of nine or twelve cars as desired.

The city of Detroit built its first articulated unit about three years ago. This consisted of a three-car train with four trucks and was designed as a rush-hour unit to handle the enormous crowds from the automobile factories of the city. Its operation required men who had been specially broken in and when extra men were called upon to operate it in the rush hour, this condition was the cause of some difficulty. The length of the cars made its operation on the congested city streets rather cumbersome. It was found also that on the outskirts it was necessary to make practically all of the stops because there was usually some one to get off at each stop. Therefore, on a close headway this unit had to make every stop, whereas with the single-car operation on the same schedule stops were occasionally skipped.

Modern elevated railway structure in Chicago is a marked improvement over older types

Determining the Relation of Rapid Transit *in a Transportation Plan*

By E. J. McIlraith
Staff Engineer
Chicago Surface Lines

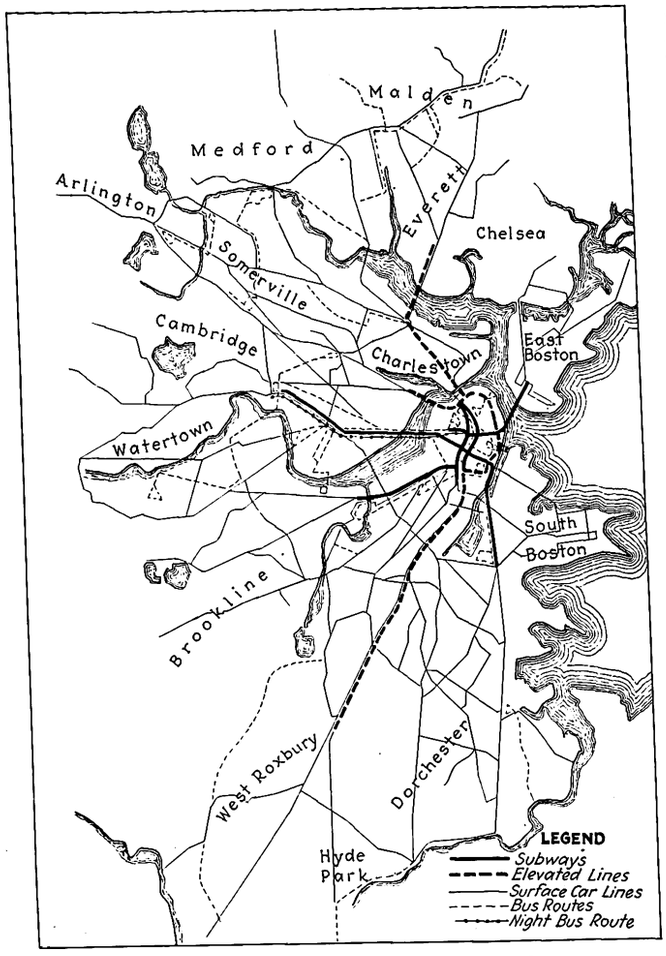
ONCE when the spirit of promotion was running strong and enthusiasm prevailed for building railway lines of all types, it was seriously believed that rapid transit could be financed by private corporations and would yield a profit from operation. The original lines of elevated railway or of subway were classed as sound ventures in transportation for which car riders would pay the cost and a profit on the investment as well. It has been proved, however, that the car rider cannot carry all the burden of cost without an excessive fare. Moreover, on economic grounds the car rider should not pay all the carrying charges of the investment in addition to the cost of operation. Such procedure amounts to special taxation of part of the citizens for the benefit of all and to provide special profits for a few.

Today there is general acceptance of the idea that rapid transit is in reality "special right-of-way" transit that provides an additional street. It benefits (1) the city as a whole more than several new streets or boulevards on the surface would do if they were created; (2) the owners of the property the value of which is enhanced because of its increased accessibility; (3) the automobile owner or others using vehicles which have greater freedom of movement on the street because the majority of persons are carried on the new right-of-way; (4) the car rider, who moves faster and can have a wider choice of home district or of locations for employment.

Street congestion due to the general use of private automobiles creates a new demand for separation of the various kinds of traffic to avoid excessive interference and permit the greatest possible use of existing streets for transportation in individual automobiles. If trucks, electric cars, and even pedestrians can move on different streets or on different levels from the private automobile, each class of traffic will be much better served. The most effective separation comes from moving the electric car to a new level. One four-track electric railway on specialized right-of-way (in subway, on elevated structure, or on embankment) can serve more people in the rush hour than seven streets used by surface cars, buses and other vehicles, or ten boulevards for buses and private vehicles, or 25 boulevards used by private vehicles alone. The street area vacated by the cars that formerly carried the people on the surface can serve more of the other vehicular traffic.

The present-day value of such new street levels is

Digitized by Google

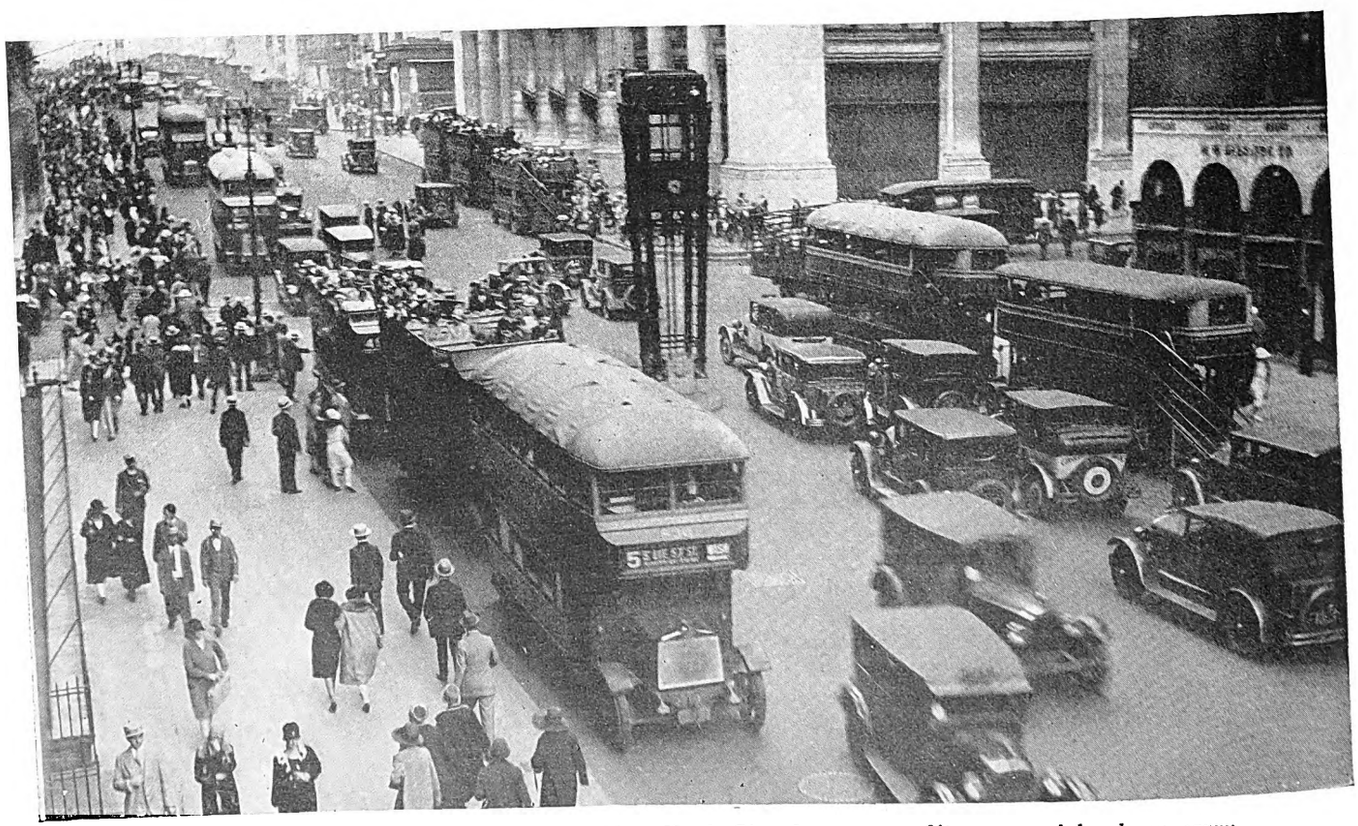


Surface car subways are an important element in Boston's rapid transit system

more vividly apparent than it could have been even a few years ago, when the demand for street space was much less intense. It is now clear that the creation of a rapid transit line is the most effective form of street widening project, and can well be undertaken as a civic betterment rather than as a project financed by the car riders' fares.

There is a great need for increased service from city street area. Roadways are much too narrow for the intense use being made of the building area. Buildings of greater size are being erected, and the concentration of citizens in the central district of each city is mounting almost unbelievably. It is not uncommon in the largest cities to find more than 4,000 persons housed during the business day over a single acre of ground area, and the buildings they occupy are visited each day by at least as many others in the transaction of daily business. For obvious reasons the streets cannot be increased in number or in width in such districts. More use must be made of the existing widths by adding new levels for specialized segregated movement; that is, one level for pedestrians only, one, two or three levels for electric trains, and the surface of the street for the vehicles that must operate in open air. These vehicles must further be controlled or segregated for maximum conveniences by requiring service or delivery vehicles handling goods, supplies or waste materials to operate only at night.

Intensive concentration of the administrative, advisory or managerial functions of commercial development is fundamentally sound. Cities always have housed the leaders of business and dominating forces of the world's activities. Business leaders must have convenient contact and speedy access to each other, and the modern tendency to house such commercial functions in large buildings closely related and with convenient access to one another is not dictated by chance, but by sound logic



In the congested section of Fifth Avenue, New York City, buses on a fifteen-second headway carry approximately 9,000 passengers per hour at a speed of about 5 m.p.h.

Digitized by Google

and real economic necessity. It is vital to commercial effectiveness that the administrative leadership be centralized in strategically placed large cities, and that in those cities there be a concentrated central district for that group that must have convenient personal contacts with one another and with clients or customers from out of town.

Such density of use of central business areas will in reality simplify the problems of providing more effective time-saving conveniences and greater comforts. The cost of housing and land per person employed may be higher than in cities of low buildings such as London, but the greater effectiveness of American business methods is forcefully shown in the higher standards of comfort attained by each class of citizens in the cities in this country. Their earning power is greater because of their highly organized performance, and so their share of the world's luxuries is greater.

Rapid transit elevated railway is not considered objectionable in this high-class Chicago residential district

In Boston the buildings are low under city regulation in an effort to promote a widespread business area, yet it only increases the difficulties of getting convenient accessibility. It means longer walks, more time lost, and more people moving farther horizontally on the streets instead of riding farther vertically by fast elevators. It necessitates more miles of streets and increases the mileage of transit track for the same service rendered.

Cities approaching a million in population can well justify some development of special right-of-way transit. In the central section the earlier construction should provide a nucleus for the complete system, yet it need not be extensive at first to serve the purpose of creating new street space and consequent improvement in convenience for movement of pedestrians, vehicles, and electric cars in the busy area.

It is probably better to start with a system of subways for surface cars, thus removing the cars from all streets in a restricted central district and affording good distribution of service by appropriate routings and combinations. As the city grows some or all of these short sections of special separate underground street will be extended outward and may be built also through outlying business centers. As the density of use grows it will become necessary to develop train service over sections of the system, much as is now being done between stations in Boston. There the surface lines serving each section run to a convenient terminal a short distance outside the busy city center, where the passengers walk across a platform to a train that operates into the center of the city, and across to a similar station on another side of the city. Thus the surface cars do the collecting and deliver the passengers at convenient points to the terminus of a short rapid transit line, which uses track space in the center of the city much more economically than would be done by routing all of the surface cars from the exchange terminal to and through the central district. As the city grows the rapid transit train service should be extended as fast as such operation can be justified.

The rush-hour crush on some of the rapid transit lines of New York and the jam of vehicular traffic on Fifth Avenue cause much mistaken moralizing on the futility or impracticability of having concentrated business areas in large cities. Huge buildings are still being built on Manhattan and are projected by sound business organizations. There is ample reason for such investments, and transportation facilities must follow. The troubles of the citizens are not due to the concentration of Manhattan but to faulty planning, faulty principles in financing, faulty theory in creating separate competing systems and faulty statesmanship in neglecting to correct wrong practices in financing and operation when they were recognized and found to be destructive of the city's best interests. Adequate planning could and would have prevented the present troubles and an expenditure that

Digitized by Google

is within reason can correct them, but the political and financial difficulties of changing face are so great as to seem nearly insurmountable. Other cities need not experience any such difficulties, and the present mood of the citizens and of officials in most cities indicates that more appropriate planning will be done to keep the transit facilities ahead of the needs of the community.

Take Chicago as an example. There has been general indorsement of the idea of special assessments for partial payment of the cost of rapid transit. The report of the Citizens' Advisory Committee to the sub-committee of the City Council (1926) reads in part as follows:

> The lesson to be learned from New York is that the city of Chicago should not build one foot of rapid transit structure, either elevated or subway, without the application of the principle of special assessment, lest Chicago be precluded from this important method of financing for all time to come.

The present city administration, as well as the previous one, has freely stated the necessity of a sound method of financing based on the theory of distributing the cost according to the benefits received.

Plans have been carefully worked out for the physical layout to give a thorough system to the city, based on a comfortable standard of service at all hours. There need never be in Chicago any of the excessive crowding in rapid transit cars that exists in New York. The development can always be far ahead of the needs of the riders, so that the cars and trains may be only appropriately filled in rush hours, not overcrowded. Jammed loading is quite unnecessary and cannot be tolerated.

Sharing the cost of construction and development of a single system comprising all forms of transportation units will permit competent development as fast as needed without undue burden on any one, and will provide good, co-ordinated service at a moderate rate of fare. However, it is absolutely vital that the correct principle be recognized and applied early in the development of a rapid transit system, so that a few land owners may not make enormous profits from unearned increase in property value at the expense of the car rider, or from all the citizens through their contributions to general taxes, either directly or in rents and increased prices of goods.

A city transportation plan should supplement and assist in logical development of the city by spreading the advantages for the good of all and permitting a normal growth for all sections.

A resolution adopted by the National Association of Building Owners and Managers in June, 1923, includes the following statement:

> Transportation is a servant and not a master. Urban transportation should fit the city. The city should not be fitted to the transportation.

Unfortunately, we have had examples of many miles of expensive rapid transit structures being built through open fields, as in greater New York, at times when the money should have been spent to relieve the highly undesirable crowding in the central business section of the city where the trunk lines are inadequate. The lines built were not planned to fit the city needs, and did not develop in the city's busy section to keep in advance of the needs for service.

Transportation lines should be built neither to exploit real estate nor to control a city plan. The growth and development of transportation should supplement and support the natural tendency of city growth. The expansion of a city street system by the use of subways or other special rights-of-way should be planned toward a comprehensive ideal system, permitting the ultimate economic development of the city, and serving through the various stages of its growth to give all parts of the city reasonable advantage in using, enjoying and profiting from the investments and developments.

Lower end of Manhattan Island, where concentration of business activities in tall buildings exceeds that found anywhere else in the world

Single-Truck Cars

Best Meet the Needs in Smaller Communities

By Horatio Bigelow
Superintendent of Railway
South Carolina Power Company

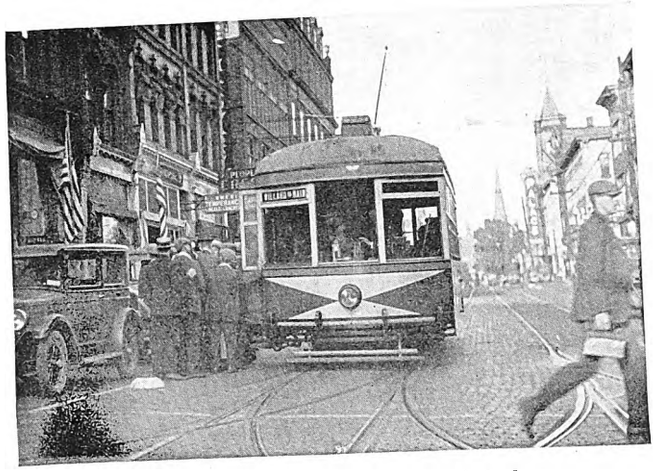
More frequent service is given in Charleston, S. C., by Birney cars than would be possible with double-truck cars

SINGLE-TRUCK cars still have an important part to play as public transportation vehicles in cities under 100,000 population. Systems operating them, however, are faced with a real problem in putting them on a sound operating basis. Experience not only in Charleston, but in many other cities of comparable size, indicates that the salvation of these properties depends on holding operating costs to a minimum.

The automobile has made its greatest inroads on railway operating revenues in cities of this size. The parking problem is not so important in these cities as it has become in larger centers, and does not limit the use of the private vehicle for ordinary travel. When the geographical layout of a city between 50,000 and 100,000 population is such that homes and places of business are comparatively close together, those who do not own automobiles always have the option of walking, and do so on comparatively slight encouragement. Under this combination of circumstances the single-truck car, which permits frequency of service to be given at minimum cost, often is the best vehicle to meet the transportation needs of the community.

There is only one serious objection to the use of such cars. That is the poor riding quality on rough track. The length of the rigid wheelbase on a single-truck car necessarily is limited to negotiate the short curves encountered on the average city property. With such cars it is particularly important that track be in first-class condition, or the ride will be so uncomfortable and unattractive as to discourage patronage. It is probably due to this limitation of the single-truck design that many small properties have been led to the adoption of cars much too big and heavy for the density of their traffic, resulting in a serious increase in operating cost as well as long headways. Because of this, costs have been increased to the breaking point on many properties, and

Digitized by Google



In Jamestown, N. Y., operation of de luxe single-truck cars has increased revenue 7 per cent in eight months

there has been a decrease in number of passengers due to the long waits between cars.

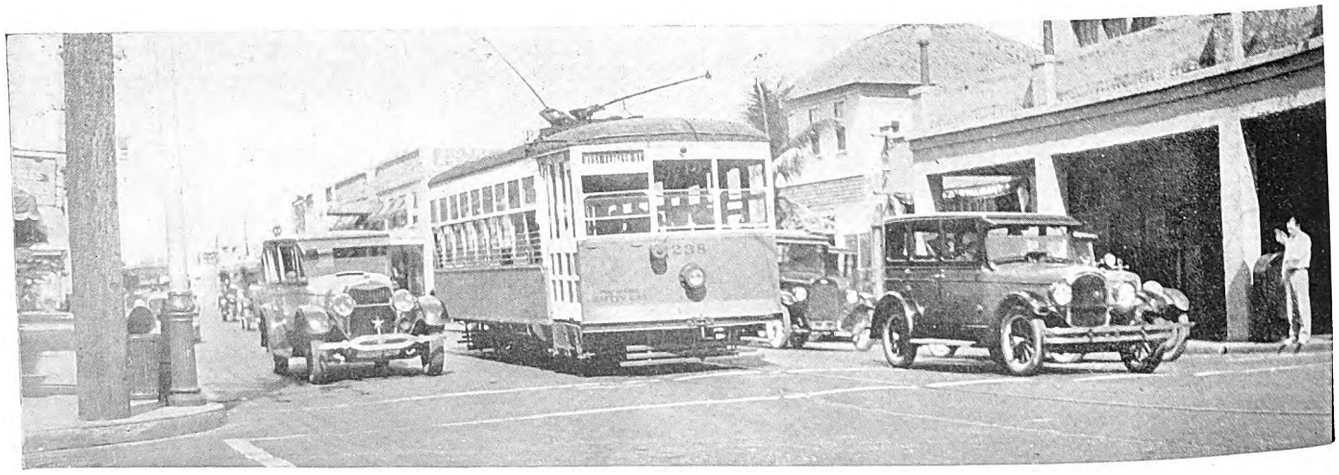
An example of what can be done to solve the problem of reducing operating costs is afforded in the experience of the railway system of the South Carolina Power Company at Charleston. In this city of 70,000 population there is no mass movement or peak load of importance on its urban lines. Distances are short. The city is level. The streets are well paved. Three years ago there were five types of cars in regular service on the system. These were: (1) Birney cars; (2) semi-convertible, wooden, single-truck cars rebuilt for one-man operation; (3) one-man, double-truck (maximum traction) steel cars; (4) wooden two-man, double-truck cars, and (5) steel, center-entrance, two-man cars with multiple-unit control. With this equipment the average energy consumption was 2.18 kw.-hr. per car-mile and the average maintenance cost 2.65 cents per car-mile. For the year 1923 the system showed a ratio of operating cost, including taxes, to gross revenue of 107 per cent, with a consequent loss of many thousand dollars. The edict then went out that the railway department had to be self-supporting if it were to continue operation.

Accordingly, the railway commenced a thorough rehabilitation program. All city operations were placed on a one-man basis. This necessitated the changing over of many of the old cars. During the three ensuing years, although the gross receipts fell off $150,000, there was a decrease in operating expenses of $220,000 and an improvement of 15 per cent in the operating ratio.

The cars converted were seventeen years old on the average, weighed 14 tons each and were equipped with two 40-hp. motors. By 1927 more than half of them had been placed in storage because of the need for extensive repairs. The railway was thus faced with the necessity of adding to its equipment. As the city was just starting a four-year repaving program, with which the company's track rehabilitation had to be co-ordinated, it was deemed inadvisable to purchase new cars at that time. Accordingly, used single-truck, improved Birney-type safety cars, averaging five years old but in good operating condition, were purchased for the same cost as the repairs necessary on the converted cars. These cars weigh 8¼ tons each and are equipped with two 25-hp. motors. It was estimated that they would save ⅔ kw.-hr. per car-mile in energy and ½ cent per car-mile in maintenance over the converted cars. Actually, they are saving $\frac{8}{10}$ kw.-hr. per car-mile in energy consumption instead of ⅔ kw.-hr. per car-mile as estimated, and it is believed maintenance figures when obtained will bear the same relation to the estimated figure. The total annual saving per car from this substitution, considering only energy and equipment costs and neglecting maintenance of track and roadway, should amount to $600. Substantial increase in the proportion of single-truck cars on the property has made it possible to produce operating economies that have prevented further cutting of schedules to meet depleted revenues.

Similar results have been obtained elsewhere. In Knoxville, Tenn., the single-truck car is an important agency in meeting the transportation needs. Features of additional comfort and attractiveness have been incorporated in the design of these cars. On June 1, 1924, the company replaced four old-type, heavy, two-man, single-truck cars with six modern, one-man, single-truck, safety cars on a line which serves the best residential section of Knoxville. This is a route that requires practically the same headway throughout the day. Service was increased 33½ per cent, from a fifteen-minute headway to a ten-minute headway, and revenues increased proportionately.

This substitution resulted in reducing expenses for energy, maintenance of equipment and maintenance of way from 9.1 cents per car-mile to 5.6 cents, a saving of 3.5 cents.



Single-truck cars of the Miami Beach Railway have large platforms with double doors to facilitate passenger movement

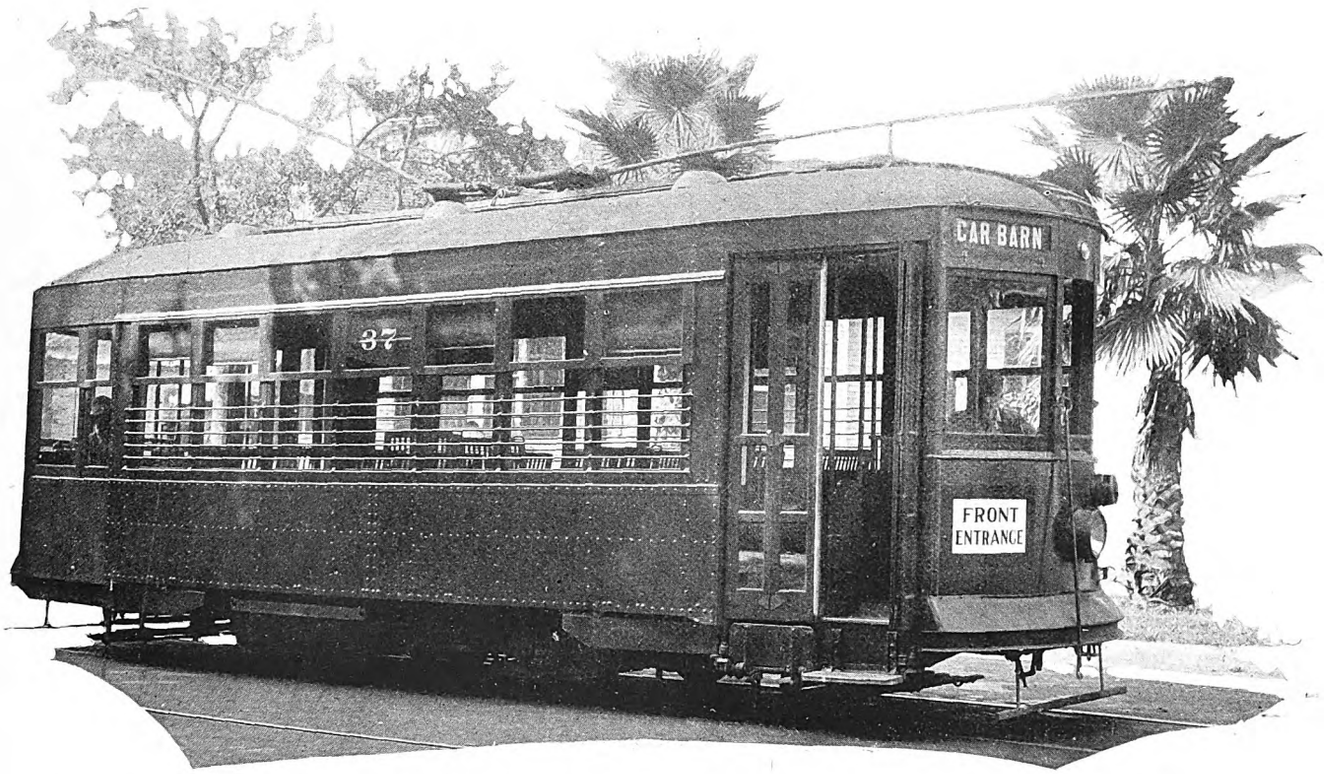
Digitized by Google

In Zanesville, Ohio, twenty new single-truck, one-man safety cars were put in operation in 1925, in connection with the reorganization of the local railway system, which had emerged from a receivership the year before. Savings made possible by this move helped to reduce operating expenses more than $48,000. Despite a loss in gross revenue of 10.4 per cent, net revenue for the year increased $24,000. Power expense has been decreased $14,000, or from 4.71 kw.-hr. per car-mile at the switchboard to 3 kw.-hr. A comparison of maintenance of equipment costs for 1924 and 1925, the year before the new cars were installed and the year after, shows a saving of $11,572 in this account or 58.6 per cent.

Despite arguments in favor of double-truck rather than single-truck cars, it was thought better to provide shorter headways with single-truck cars rather than longer headways and larger cars. Like the Knoxville cars, those units can be operated either front entrance and exit or front entrance, rear exit. The rear door is controlled by a separate valve from the motorman's position. Two rear vision mirrors are used, one inside and one outside the vestibule. An auxiliary red lamp on the rear dash is arranged to light when any of the doors are open and warn approaching motorists that the car is taking on or discharging passengers. Seats and backs are of spring construction and are covered with taupe plush of a design harmonizing with the interior finish. The single step between the street and the platform is recessed, the folding doors protecting the step when in the closed position.

The Mobile Light & Railroad Company, Mobile, Ala., ordered some single-truck, Birney, one-man cars during the war period. On a subsequent order for cars to be delivered this year, a more strongly built unit weighing 10 tons was specified. In this design there is a wider aisle so that passengers can pass backward and forward from their seats in the rear of the car without brushing against seated passengers. Platforms are larger with both exit and entrance doors, and there is a rear exit, controlled by the motorman, for the use of colored passengers. A drop platform makes access to the car easy. This platform is 5 in. below the car body, the first step from the street is 12 in. above the rail, and the second step is 11 in. below the platform.

In Mobile these single-truck, safety cars are operated on the streets where the automobile traffic is the heaviest, while the majority of the two-man cars are operated for the greater part of their routes on tracks within parkways or on private right-of-way. Despite this the number of accidents per car-mile is 13 per cent greater on two-man cars than on one-man cars. On the one-man car lines more frequent service is given than formerly when two-man cars were used, while track maintenance is less than on the two-man routes. Moreover, schedules are more easily maintained on the one-man routes on account of the quicker acceleration and stopping.



Better speed is maintained in Mobile, Ala., with single-truck, one-man cars of this type than with two-man cars on account of quicker acceleration and stopping

Certain unusual features have been incorporated in the design of the latest single-truck, one-man, safety cars of the Miami Beach Railway. The warm, humid climate of Florida has a harmful effect on the materials used in car construction. In order to prevent rapid oxidation of the metal, these cars utilize copper-bearing steel plates extensively. All wood has been treated with preservatives in order to guard against destruction by insects and to give long life. All cars are double-end with wide double-stream doorways. In contrast to the new cars at Knoxville and Zanesville, the cross seats are of wood slat construction.

De luxe single-truck cars were recently purchased by the Jamestown Street Railway, Jamestown, N. Y., for

Digitized by Google

city operation. These cars are designed with convex sides, round ends, and arch roofs. The exterior painting scheme has a pyramid gray body color, blue belt rail, desert sand letterboard, and cream sash, all blocked off by a horizontal black stripe. The car roof is gray and the trucks black. Interiors are finished in mahogany with white veneer headlining and gray trim. Broad seats with deep spring cushions and padded backs are covered with genuine Spanish leather. Thirty passengers can be seated comfortably. Ample knee room is provided by the spacing of the seats at 31-in. centers. Floors are covered with inlaid rubber tiling colored to blend with the interior finish. This tiling serves to deaden truck noises. Peerless ventilators installed on the roof are fitted with grille and register. Cars are heated with individual double-coil, truss plank heaters, and the temperature is regulated by thermostatic control. The one cab heater is supplied with a separate control. An unusual number of safety devices have been incorporated in the design, including even an emergency exit door on the left side at the extreme rear. Large, folding, selectively-controlled, air-operated doors permit easy entrance and exit. When the door is open a stop sign attached to the exit door acts as a warning to approaching vehicles that passengers are alighting. The cars are provided with brilliant interior illumination: three two-lamp dome fixtures on the ceiling and two door lights, besides the usual farebox, sign, tail and head lights. A stop light on the rear shows red when air brakes are applied. Resistance grids with suitable covering, permitting proper ventilation and preventing entrance of rain and snow, are installed on the roof instead of beneath the car floor. All platform control apparatus is inclosed in mahogany cabinets, creating a ship-shape platform appearance. Large section, plate-glass windows in the vestibule insure an unobstructed view at all times. Seven large windows on the right side of the car and nine on the left side, with cross-bar window guards, provide clear vision without danger of injury from passing cars.

There is no doubt that passengers should be made as comfortable as possible on street cars so that they will "come again." On suburban and interurban lines and on the longer city routes, where double-truck cars are operated, spring seats and backs neatly upholstered attract patronage and increase revenue. Floor covering to deaden truck and equipment noises and adding to the finish of the car also pays. With single-truck, safety cars operated on the short routes it is a question whether or not it will pay to equip them with upholstered seats and floor covering? It costs approximately $600 per car to do this. On three of the railways mentioned above, i.e., Knoxville, Zanesville and Jamestown, the single-truck safety cars are provided with such seats and on two of the properties, Zanesville and Jamestown, with floor covering. Decreased industrial activities in Zanesville have made it difficult to determine the gain in revenue produced by the installation. In Jamestown, N. Y., the de luxe, single-truck cars with the equipment in question have increased revenues 7 per cent in eight months. Despite such showings not all railway managers feel that the expenditures for these features are justified.

The primary question in determining the field of the single-truck car is whether there is any pronounced mass movement during the day? If there is, the single-truck car is like "Dobbin" in the early days, it can't pull the load. The single-truck, one-man, safety car still holds its own on the smaller systems where there is no mass movement and on the light traffic lines of the larger systems. Given good track, the light-weight, one-man, single-truck, safety car furnishes the most economical type of transportation known.

Rear exit is provided on single-truck cars operated in Knoxville, Tenn.

Light interurban cars have played an important rôle in the rehabilitation of the Chicago & Joliet Electric Railway

Radical Changes Save the

Light Interurban

By J. R. BLACKHALL

Vice-President Chicago & Joliet Electric Railway
Joliet, Ill.

SOME ONE has defined competition as "the keynote of success," and certainly it is true that competition has been responsible for many radical changes in American industry. In the early days there was the destructive competition of rates and prices. Gradually, however, this has passed so that present-day competition more generally concerns service and quality, rather than rates and prices. In the transportation field competition has been responsible for many changes in operating practices.

On the whole competition has been felt more keenly on interurban lines than on city lines. This has made it imperative to develop some remedy. Following experience with lighter weight cars in city operation, and the encouraging results obtained with their use, it appeared logical to adopt lighter interurban equipment with some changes of design. This would require less capital investment, make it possible to reduce labor costs, allow faster schedules with the ever-increasing number of stops, and attract additional passengers. About the time of the introduction of the Birney car, several companies began experimental operation of light-weight, double-truck cars that not only rode easier and were more attractive to the public than the cars then in common use, but also promised large reductions in operating costs. When the trial operation of the new type equipment demonstrated greater operating efficiency and increased traffic by virtue of better and more regular operating schedules, many other companies were led to the adoption of such equipment.

Among the roads that first demonstrated the feasibility of the light-weight car for interurban service was the Kentucky Traction & Terminal Company. This company was in a situation about as difficult as it could be, with traffic decreasing rapidly as a result of jitney and other competition and high operating and maintenance costs. The story of the rehabilitation of that property to a dividend-paying condition is history now and need not be repeated here. Introduction of the light-weight car by this company was its salvation.

The Chicago & Joliet Electric Railway, operating an interurban line between Joliet and Chicago, although never having had really heavy cars, nevertheless found itself in a difficult position when operating costs in-

Total kilowatt-hours saving on new cars	280,340
Total increase of gross earnings	$18,966.11
Total savings platform expense	12,113.45
Total savings power costs	5,214.36
Total earnings and savings	$36,293.92

creased. After a careful study of the results obtained by other companies that had adopted light-weight cars and the results of its own operation of light-weight cars in city service, the company concluded to replace its equipment on the interurban line with modern, light-weight cars. Ten cars were purchased, constructed to design and specifications furnished by this company, including several new features. They were delivered and placed in service in September, 1926. Six of them are of the single-end, one-man type for through interurban service, the four other cars are of the double-end, one-man type for local interurban service.

The new cars weigh 39,000 lb. each, compared with an approximate weight of 62,000 lb. for the old type cars. They are equipped with four 35-hp. motors as compared with four 100-hp. motors on the heavier cars. With the old heavy type equipment adherence to the schedules was fast becoming an impossibility. To determine the motor capacity for the new cars, a thorough analysis of service requirements was made by the company's engineering department in collaboration with the manufacturer. The lighter weight cars have been able to maintain schedules in the face of a continual increase in number of stops per mile.

As the outward appearance of the car makes the first appeal to prospective passengers, considerable thought was given to securing a pleasing, streamline effect and painting the cars in an attractive color combination. The general interior appearance has been improved by concealing all air piping, switches, meters, etc., in mahogany finished cabinets. All side windows are fitted with window guards of the disappearing type that rise with the sash, affording better visibility for passengers and adding to the attractiveness of the car. Interior lighting is of the semi-indirect type, a soft illumination being furnished from overhead dome fixtures that eliminate all glare. Car seats are of semi-individual type, comfortably upholstered in leather and plush. The characteristics noted above are relatively new for cars of this type and have a distinct appeal to the public. The ramp of the floor from the vestibule entrance permits a low step height and eliminates the necessity of any additional step from the vestibule to the car. Contrary to usual practice, sliding doors were provided, adding to the general clean-cut appearance of the car. This has reduced noise and maintenance. Floors are covered with battleship linoleum.

Prior to the purchase of the cars, it was estimated that by their adoption an annual reduction in operating expenses of approximately $30,000 would be made and also an increase of $10,000 effected in revenue, or a total increase in net revenue of $40,000 with a capital investment in the new equipment of $168,000. While an increase in wages of operators that went into force on Jan. 1, 1927, materially effected the estimated saving, the reduction in operating expenses, not including any reduction that can be attributed to maintenance of track and roadway and equipment, amounts to $17,327. Gross earnings for eleven months show an increase of $18,966. On this basis, the increased net will about equal the estimate for the year. No definite figures can be given of savings in maintenance of track and roadway and equipment, but it is reasonable to assume that there will be a saving in

Comparative Gross Earnings of Interurban and City Lines Before and After Ten New Interurban Cars Were Put in Operation

Digitized by Google

each of at least 1 cent per mile. On that basis there would be an additional saving of more than $10,000 by the adoption of the lighter weight equipment, or a total increase in net of $50,000. That is a return of 30 per cent on the money invested in this new equipment.

The increase in gross earnings amounts to an average of 6.06 per cent, whereas the earnings had previously remained practically stationary and in decided contrast to a decrease of $44,072, or an average of 1.22 per cent during the same period on the Joliet city lines operated by the same company. The increase in revenue can be attributed to prompt appreciation by the car riding public of greater riding comfort of the new cars and the better maintenance of schedules with a slightly higher average speed, this being the result of more rapid acceleration and braking of the lighter type equipment.

An average energy saving of 20.5 per cent has resulted from the weight reduction of the new cars. The old type car consumed an average of 2.76 kw.-hr. per car-mile against a consumption of 2.20 kw.-hr. per car-mile for the new equipment. One-man operation has effected a saving in platform expense of 2.46 cents per car-mile during the eleven-month period, or an equivalent of 35.9 per cent. While as yet there are no definite figures available on savings in maintenance of equipment and roadway, from the experience of other railway properties light-weight equipment should result in a reduction in track maintenance costs of approximately 30 per cent and a like amount in equipment maintenance. The experience of other companies that have adopted light-weight, double-truck cars during the past eight or ten years has been generally similar to that of the Chicago & Joliet Electric Railway.

It must be admitted that the riding qualities of light-weight cars on poorly maintained tracks are apt to be poorer than those obtained with heavier cars, making it imperative that tracks and roadway be maintained in better condition than has been the practice of many companies heretofore. However, once the track is placed in good condition, maintenance is considerably less than for a track over which cars weighing from 60,000 to 105,000 lb. are operated. Illustrative of adequate track maintenance, two views of a section along the interurban line of the Chicago & Joliet Electric Railway are presented. One photograph was taken more than 25 years ago when the road was first constructed, and the other in August of the present year. The original 70-lb. T-rail is still in service, and judging from its present condition it has an additional life of at least twenty years under existing operating conditions. During the period between which the photographs were taken the original angle bar joints have been replaced with Weber joints, ties have been renewed as required and additional ballast added where necessary.

One-man operation is an important feature of the light-weight car from more than one angle. In addition to the large reduction in platform expense, such operation affords greater safety to the public, for with one-man operation there are actually fewer passenger accidents because responsibility and control of the car are centered in a single individual instead of being divided, as is the case on the two-man cars. As an additional factor of greater safety in transportation, many companies are now adopting safety car appliances on interurban equipment similar to those on city type cars.

The experience of some eight to ten years operation of light-weight, double-truck electric cars throughout various parts of the country under many different conditions clearly indicates that this type of car will stand up as well as if not even better than the old, heavier type of cars. At the same time the great riding comfort and higher speed average afforded have resulted in increased passenger traffic, while the savings in maintenance and power costs have more than justified the expenditure of capital invested in such equipment. The results obtained by companies that have adopted the modern type, light-weight car challenge the attention of even the casual observer and warrant the most serious consideration for still greater improvement in the field of car design.

At the present time this company is building an all-aluminum car body for city service that will be mounted on trucks that are a distinct departure from the standard trucks now in common use. The car complete, with electrical equipment and motors, will weigh approximately 22,000 lb. with a seating capacity of 50. It is entirely feasible that a car embodying the same principles, with some modifications of design and capacities, can be developed for higher speed interurban service, effecting even greater economies than are being obtained by the operation of the interurban car that has been described herein.

Above all, the future success of the interurban railways depends entirely in having the good will of the public they serve in order to secure its patronage and co-operation. To obtain and hold that good will it is necessary to deal honestly with it and render the very best possible service. The modern light-weight interurban car offers one medium of securing that good will.

Modern all-steel heavy interurban train on Chicago, South Shore & South Bend Railroad

Heavy Interurban

Meets the Urge of Automobile Competition

By C. H. JONES
General Manager
Chicago, South Shore & South Bend Railroad

RADICAL changes have come over the transportation business during the past decade and what was once considered almost a monopoly is now a highly competitive industry. This has been brought about by the vast strides made in the manufacture of automobiles and the building of many fine highways, which have made it possible for every automobile owner to compete with organized transportation companies. The effect of this competition, however, has not been entirely detrimental to the railways as it has created in the minds of people the desire to travel and has thereby made potential patrons for them, thus broadening the field from which business can be drawn.

The natural field for heavy interurban operation lies adjacent to the centers of population, where the potential possibilities are large. Such territory is generally well supplied with good highways, making the competition keen. The novelty of driving an automobile is wearing off for many people, however, while the desire for traveling is still with them. With service that satisfies them and plenty of hard sales effort and advertising it is possible to wean them away from the highway to the rails, especially with the aid of congestion, which is becoming worse daily.

In a number of instances, railways which operated under such conditions have been lifted out of the hole and converted from run-down interurbans to high-class electrified railroads, getting their share of the traffic in their territory and creating business that had never existed before. It is along these lines that the greatest possibilities lie for making the electric interurbans again a predominating factor in the transportation field.

A recent example of this is the South Shore Line, running from Chicago, Ill., to South Bend, Ind., a distance of 90 miles. This line was built in 1908 and 1909. For a few years it seemed to have a rosy future. But due to competition and the fact that it did not keep up with the transportation requirements of the territory, it gradually declined in popularity. It was just about ready for the scrap heap when it was modernized, and within the short period of a year has become a popular transportation agency, clearly demonstrating that the public appreciates good service and will give its patronage when such service is furnished.

To meet the demand for better transportation many physical changes on the line were required. One of the most important of these provides a first-class entrance into Chicago, delivering people into the heart of the city. This was done by arranging for operation over the tracks of the Illinois Central Railroad. This one thing probably had more to do with building up the business than any other single step which was taken.

Digitized by Google

Car equipment comes under the closest scrutiny of the traveling public. In the case of the South Shore Line this question presented a problem of considerable magnitude and received most careful consideration, since the old equipment was worn out and had to be replaced. Our standards have been raised and are now based on the luxurious finish and comfort of the modern sedan automobile. Increase in business has required the purchase of a second group of cars, and on these an effort was made to add improvements over the first lot. While these improvements have been minor in character they have brought forth much favorable comment from patrons, showing that they are recognized and appreciated.

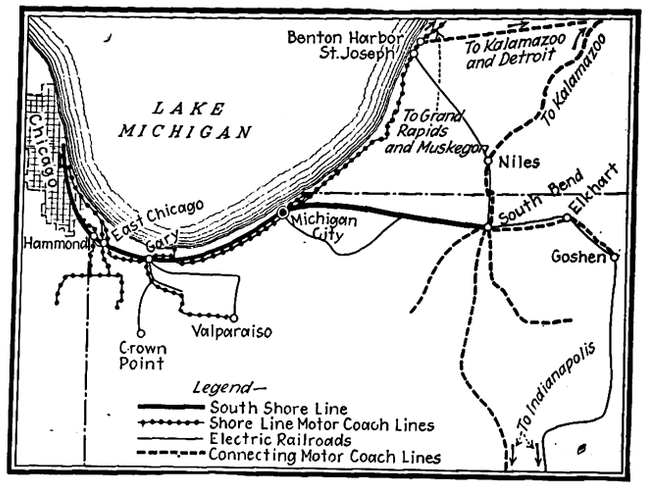
The pleasure of a journey depends to a large extent on the smoothness of operation, and this can only be had over a roadbed which is well maintained. To this end a great deal of work has been done on track that was originally laid with 70-lb. rail. New joints have been installed on the old rail until such time as it is financially possible entirely to replace all rail with 100-lb. section, for which a very definite program has been laid out and is being followed.

Station facilities deserve careful consideration, as in many cases they are the patron's first point of contact with the railroad and create either favorable or unfavorable impressions, depending on whether his necessities are provided for in the way of waiting quarters. We have found that well equipped and operated concessions serving light lunches, beverages, cigars, cigarettes, candy, etc., go a long way toward making interurban stations attractive and satisfying the passengers' wants.

With all these facilities must go good service, because that is what a railroad has to sell, and all of the things mentioned before are only the tools used in providing the service. Frequent and fast service, together with maximum reliability, is what influences most the traveler's choice. In many instances it is necessary to put on increased service considerably in advance of the business justifying it, because with the schedule in effect the road has something on which can be based effective advertising and sales work. The speed of operation should be just as high as possible with safety and absolute certainty that the schedule can be maintained nearly all the time.

A considerable part of the South Shore Line is single track. Hourly service is operated over the entire line daily with half-hourly service over 25 miles of single track on Saturday, Sunday and holidays. This requires well laid out passing tracks at meeting points. A journey that is continuous is a great deal more pleasant than one on which it is necessary to back in or out of sidings. This has been overcome on the South Shore Line by making the sidings long and double ending them, using special trackwork that will allow operation through them at high speed. This arrangement has worked out well and many of our patrons believe that we have considerably more double track than we actually have, as there is practically no stopping at meeting points. Operation has been materially aided by making the maximum use of signaling.

Heavy electric railway service resembles closely that of the trunk line railroads, and the traveler who uses it expects practically the same conveniences that the latter offers. We believe that the operation of dining and parlor cars is a necessity, if the commercial traveler is to be catered to, as he is accustomed to it and uses it to



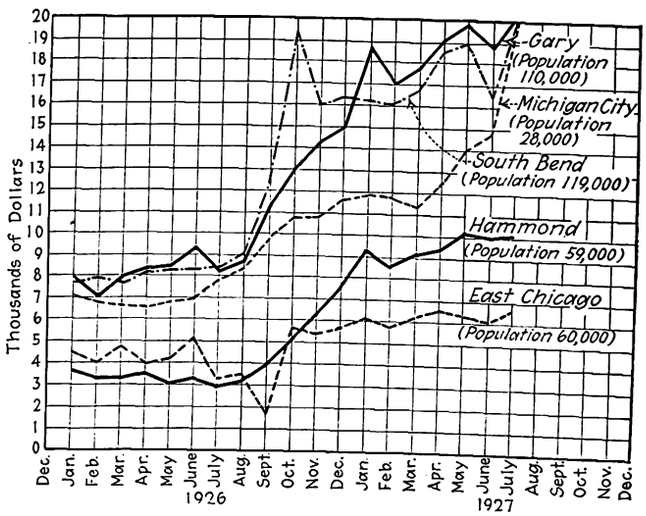
Chicago, South Shore & South Bend railroad and bus routes

conserve his time. This type of service, to be attractive and really get the best results, requires that everything in the way of service, food and prices must be exceptionally good.

With all of the above facilities provided the problem is then one of selling the service to those who want to travel for business or pleasure, and to create business where it did not exist by selling the territory served to those living outside of it.

The selling of transportation service is a comparatively new art and on its success largely depends the properity of the railroad. Enlisted in this sales organization must be every employee of the railroad. Each has a definite part to play. Those in the train and station service, who come in direct contact with the public, have it in their power to make the patron's journey a pleasant one and induce him to use the service again and to advertise it to his friends, thus making him a booster for you; or they can create an unfavorable impression and make him a knocker.

The South Shore Line and its affiliated companies in the metropolitan district of Chicago have felt for some time that their best chance for success and maximum service to the public lies in the way of creating business by popularizing the territory served, and to that end a new department of the railroad was created, which is known as the Outing and Recreation Bureau. This



Revenue has increased greatly since new equipment was put in service

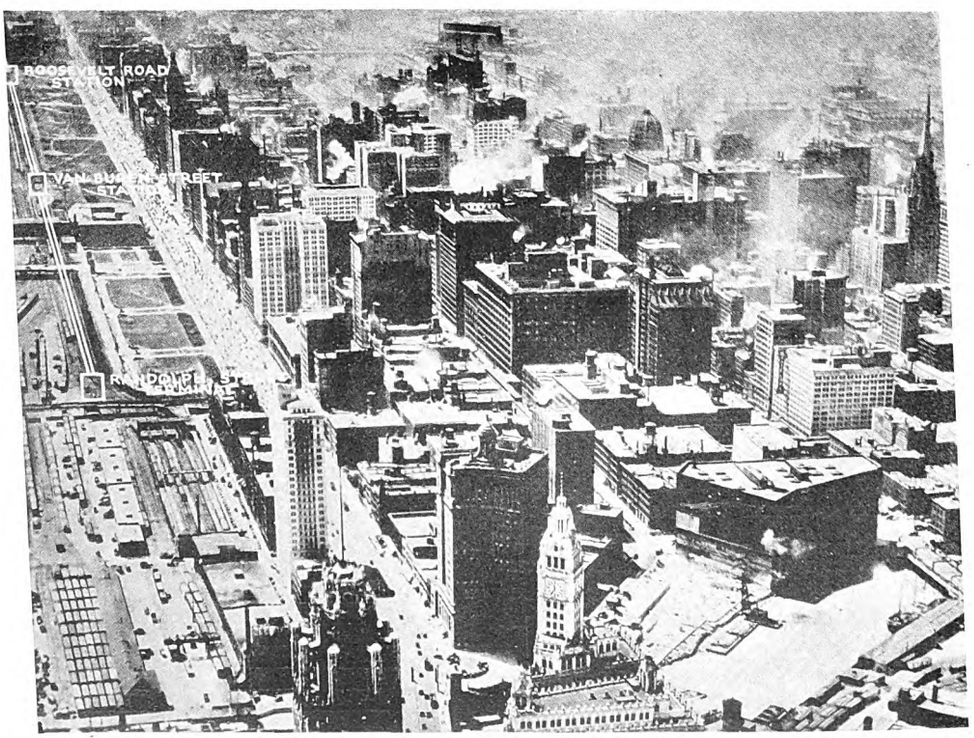
Dining and parlor car equipment are needed by the heavy electric interurban that desires to attract high-class patronage

bureau has gathered together all the available facts about the territory, put them together in form that is readily accessible and easily referred to, and has opened up an office and invited the public to ask questions with reference to the territory, what it has of interest, how it can be reached and how much it costs. The response of the public to this new feature of the railroad service has far exceeded all expectations. We are positive that our efforts along these lines have already produced a great deal of new business and feel that the future possibilities are almost without limit.

With the building of good roads and development of the automotive industry, a new competitor has sprung up in the motor coach. In a great many localities the coaches have made very serious inroads into the business of the electric railways.

Meeting this competition has been a difficult matter and in general was effected by entering the motor coach field ourselves, paralleling the rail line and in some instances serving towns off the line. We are gradually altering the coach lines and concentrating our efforts in their operation to creating a co-ordinated rail and motor coach service that will be of real value to the communities.



Centrally located terminals are essential for successful interurban operation. Cars of the South Shore line now operate into the heart of Chicago over tracks of the Illinois Central Railroad

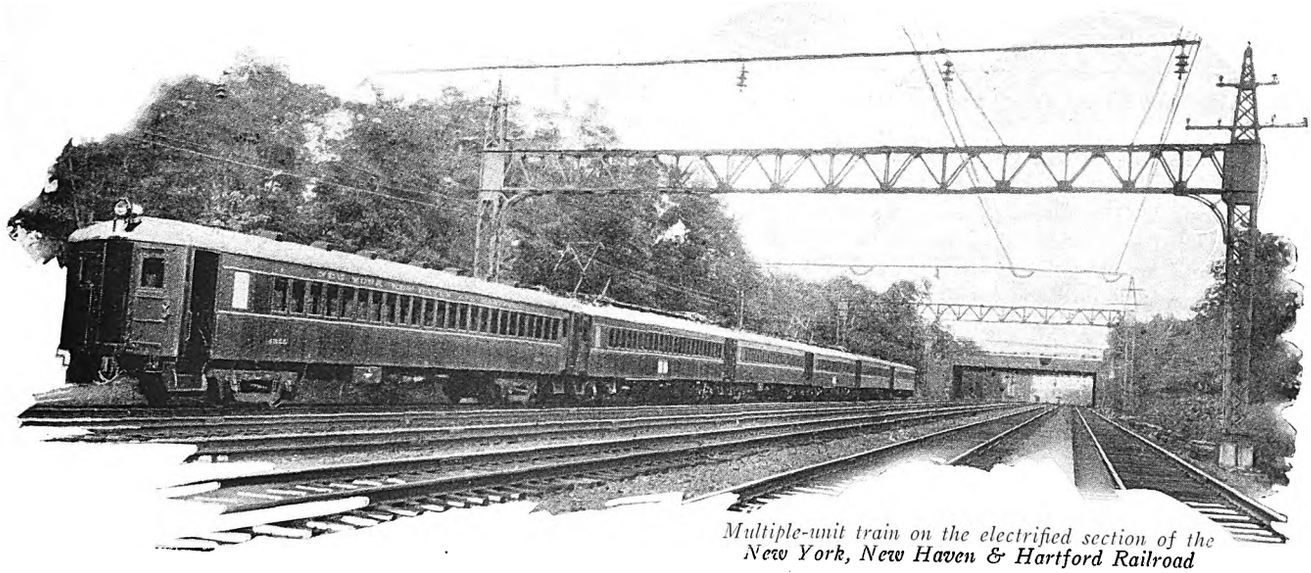
Electrification of Railroads

Makes for High-Grade Suburban Service

By H. F. Brown
Chairman Committee on Heavy Electric Traction, American Electric Railway Association
Assistant Electrical Engineer New York, New Haven & Hartford Railroad



Multiple-unit train on the electrified section of the New York, New Haven & Hartford Railroad

STEAM railroads serving the larger metropolitan districts of this country have from their earliest beginnings been among the leaders in foreseeing and solving the problems of community transportation. Even before the rapid transit lines in Chicago, Boston and New York were electrified during the period from 1900 to 1905 some of the steam railroads had turned their attention to the use of electricity for a motive power.

Certain difficulties are inherent to all suburban service on steam railroads. This class of service is tremendously exacting. Schedules must be maintained even more rigidly than for long-haul business. The casual traveler, or one traveling from a long distance, is not so prone to be critical of delays as are those who commute daily, even though the delay is slight. Further, when train movements are at their peak during the rush hour in a congested terminal, with but short headway, a delay of even a few minutes is of far more serious consequence to all other terminal movements than in the case of a delay to the through train. Electrification, by increasing reliability, has greatly reduced delays of this nature.

Notable among the earliest installations were the electrification in June, 1895, of the Nantasket branch of the New York, New Haven & Hartford Railroad for passenger service and the Baltimore tunnel of the Baltimore & Ohio Railroad for freight and passenger service, in the same year. While neither of these installations was for suburban service in the strict sense of that term, their success proved the adaptability of electric operation for heavy traction and paved the way for further installations.

By 1898 electric passenger service had been installed between Hartford and Bristol, Conn., and between Stamford and New Canaan, Conn., on the New Haven system, and also, in 1900, on the same system connecting Providence, Bristol, R. I., and Fall River, Mass. All of these installations were at 600 volts d.c. and were suburban as well as interurban in character. The Hartford-Bristol electric service was later abandoned for various reasons, but the electric service connecting Fall River, Bristol and Providence is still in successful operation, and the Stamford-New Canaan branch has been since re-equipped for 11,000-volt a.c. electric operation.

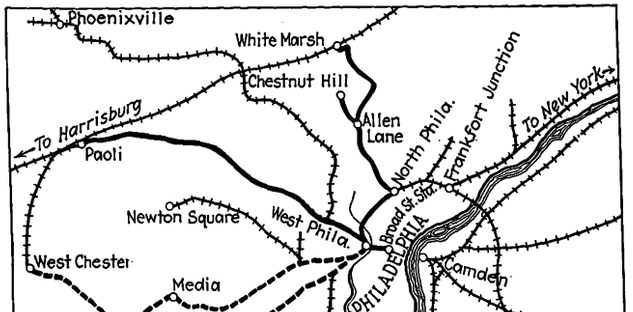
Summary of Suburban Electrifications

Railroad and City	System Electric Traction	Date	Type of Equipment
Long Island, New York	650 volts d.c.	1904	Multi-unit cars
New York Central, New York	650 volts d.c.	1906	Multi-unit cars and elec. locomotives
New York, New Haven & Hartford, New York	11,000 volts a.c.*	1907	Multi-unit cars and elec. locomotives
Southern Pacific, Oakland	1,200 volts d.c.	1911	Multi-unit cars
New York, Westchester & Boston, New York	11,000 volts a.c.	1912	Multi-unit cars
Pennsylvania, Philadelphia	11,000 volts a.c.	1915	Multi-unit cars
Baltimore & Ohio (Staten Island) New York	650 volts d.c	1925	Multi-unit cars
Illinois Central, Chicago	1,500 volts d.c.	1926	Multi-unit cars

*Operates also over 12 miles route 650 volts d.c. joint with New York Central

Development of the multiple-unit control system at about this time gave a great impetus to the application of electric traction to train service. In operating several cars, each equipped with motors, from one point of control, it was obvious that higher acceleration rates and

Digitized by Google



Philadelphia electrified zone of Pennsylvania Railroad

consequently higher speeds between stations short distances apart could be obtained than with locomotive-hauled trains. Terminal switching also could be greatly simplified. Electrification of the elevated and subway lines in the larger cities quickly followed this development, coincident with the installation of electric motive power on three of the steam railroads entering New York, carrying a very heavy suburban traffic. The Long Island Railroad, in 1904, was the pioneer steam road to electrify its suburban service, followed in 1906 by the New York Central and the New Haven in 1907.

Since these earlier installations other railroads have adopted electrification for the solution of their own suburban service problems, until at the present time the list includes no less than eight railroads operating this type of service electrically.

Two outstanding facts are apparent in the tabulation on the preceding page, as follows:

1. Multiple-unit cars are the most popular type of equipment for this class of service.

2. Every system of electric traction, with one exception, now in use in the United States is being successfully used for suburban service at the present time, the one exception being the 3,000-volt direct-current system. This does not mean that this system is not suitable for this service, but it is a fact that multiple-unit equipment of this type has not yet been produced commercially.

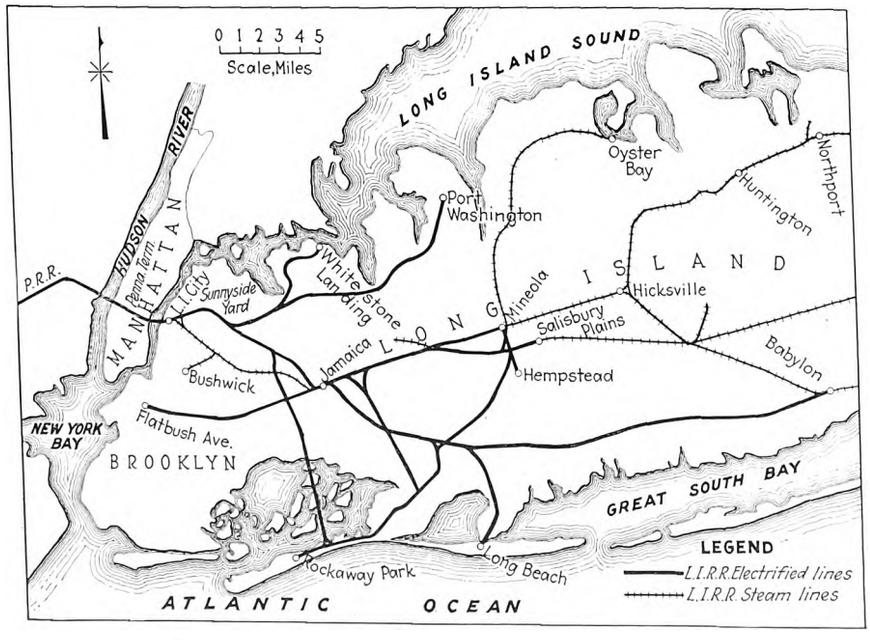
The reasons why these railroads have electrified afford perhaps the best explanation of the conditions under which it is possible and desirable to furnish electrified suburban service and explain also in a measure the reasons for adopting the type of system used. Tunnel operation was a large factor in all the earlier installations, and legislative enactments in addition gave some of the roads no other choice, making electrification of the suburban service incidental to electric operation of the terminal, including terminal movements of through trains.

Long Island Railroad Handles Heaviest Traffic

The original Long Island Railroad electrification was made in connection with the depression of its tracks serving the Atlantic Avenue terminal and the substitution of tunnel operation for surface operation with the attendant grade crossings throughout the Borough of Brooklyn. Later, coincident with the construction of the Pennsylvania Terminal in Manhattan, the tunnel entrances to this terminal precluded the use of steam, and the electric service was extended to include this terminal and the additional suburban routes served from it. Further recent expansion to include all the branch lines carrying passenger service in Greater New York has placed the Long Island in the very front rank of electrified steam roads. No other railroad in this country, steam or electric, handles so many commuters daily as does the Long Island, which has more than 100,000 commuters riding daily each way. More than 60 per cent of its entire passenger traffic is of this nature, and during the rush hour, for which equipment and all facilities must be provided, nearly 100 per cent of the traffic is of this character. The total daily movement consists of more than 870 trains, many of which are of the maximum length of eleven cars. In the summer months these trains carry more than 300,000 passengers per day.

Trains on this system are made up of motor cars and trailers, up to eleven cars per train. Motor cars weigh approximately 58 tons and are equipped with two 225-hp. motors and compose at least 70 per cent of the train make-up. All cars are of steel, of standard vestibule design, and the latest types of a seating capacity for 80 passengers each. With the receipt of those now under construction this road will have approximately 1,000 passenger cars equipped for electric operation. Electric energy required for this service is supplied from the Long Island City power station of the Pennsylvania system.

The New York Central and the New Haven, as joint occupants of the Grand Central Terminal and its approaches, were obliged by an act of the New York State Legislature in 1903 to substitute within five years some form of motive power other than steam for the operation of the Park Avenue tunnel. The New York Central decided to elec-



Dense traffic is handled on the Long Island Railroad's network of electrified lines

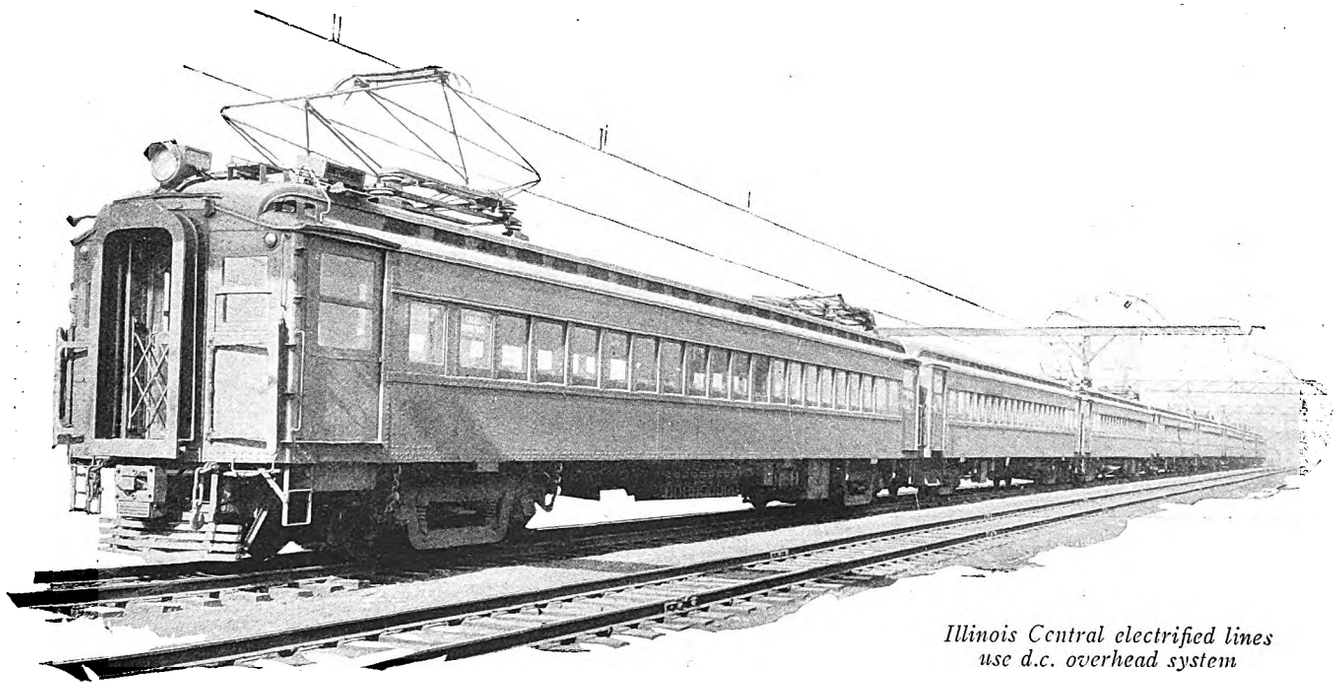
Digitized by Google

trify this terminal, together with those parts of the two main routes of its system which served the suburban territory. The system adopted was the 650-volt d.c. third rail. Suburban service, which now extends to Croton on the main line and to North White Plains on the Harlem division, is handled with multiple-unit motor cars, equipped with two 200-hp. motors. Some trailers were originally used, but these have since been equipped with motors, making a total at present of 325 motor cars in this service. The latest type cars are of steel, weighing approximately 65 tons each and seating 100 passengers. Train make-up varies from two to twelve cars. Energy for this electrification is entirely supplied from the railroad's own generating stations.

Suburban service on the New York, New Haven & Hartford Railroad system from New York terminates at several fairly large communities distributed along its main line, New Rochelle, Port Chester and Stamford. Steam locomotive terminals were maintained at these points for this service prior to electrification. Two courses were open to the New Haven in connection with its use of the electrified Grand Central Terminal. It could establish an engine change terminal at Woodlawn, where its line joins the Harlem division of the New York Central, and haul all trains from there by means of 600-volt d.c. locomotives, or it could electrify its own line to include all of its suburban service. Investigation of the first course showed that it would be very costly to acquire the property necessary for such a terminal, which would be adjacent to highly improved park and residential areas, and that such a terminal would create intolerable delays to the suburban service, especially during rush hours, for the power change. Further, the number of motive power units required would not be appreciably less than would be required for the complete electrification of the various suburban services involved, so that the latter course was clearly indicated and was decided upon.

It would have been perhaps the easier course to have followed the plans of the terminal company and to have adopted the 650-volt d.c. system, but the New Haven executives foresaw the necessity for selecting a system which in the future could be extended to include all classes and requirements of railroad service, heavy through passenger, heavy main line freight, and the operation of large terminal freight yards, as well as the suburban passenger service. It was this prospect which, after careful consideration of the various systems available, led to the adoption of the 11,000-volt, single-phase a.c. system for electrification.

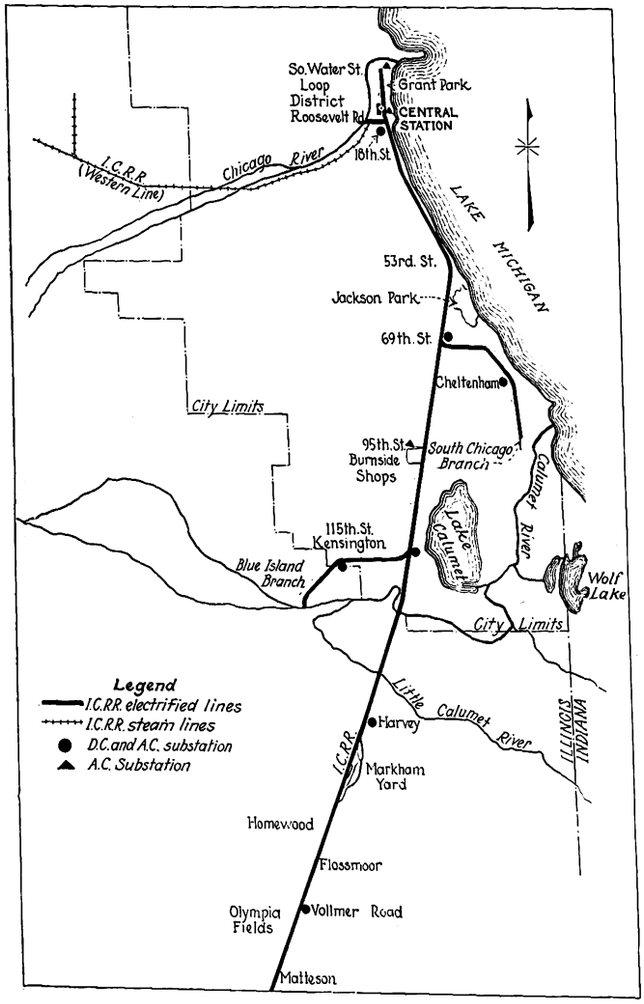
For that time it was a bold move and much pioneering work was done in the early years of operation, but there have never been any doubts in the minds of those responsible for its operation concerning the wisdom of the choice made. Today the successful electric operation of more than 650 miles of track covering more than 150 miles of route, over which all classes of service operate, from the 4,000-ton freight train to the single motor car; from the high-speed 180-ton locomotive, with the all Pullman limited, to the 80-ton switcher, with its drag of freight cars in the yard, places the New Haven electrification foremost in the world, not only on account of the magnitude of the traffic electrically handled, but also because it is the only electrified system on which all these classes of service are being electrically operated at the present time.



Illinois Central electrified lines use d.c. overhead system

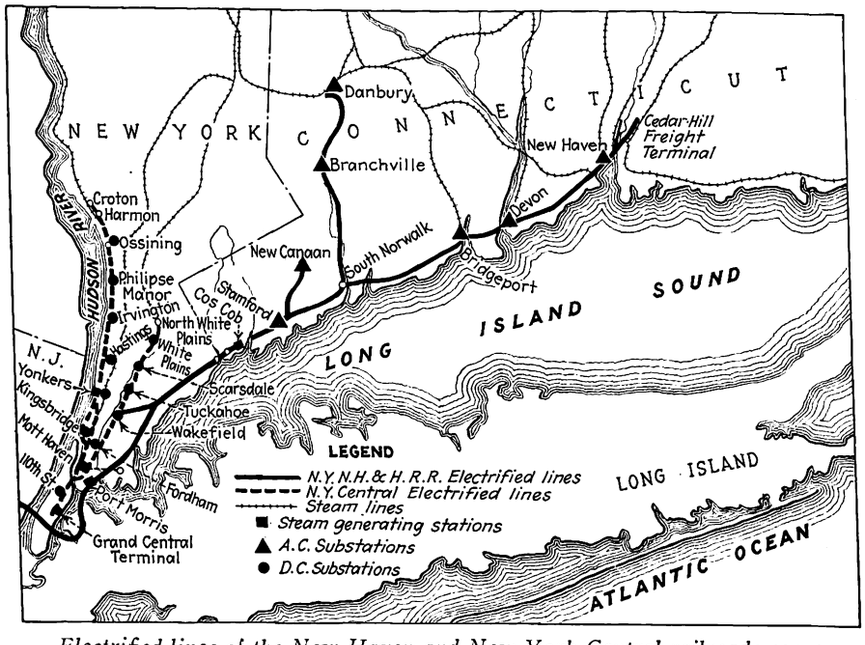
Because of the large investment in new passenger equipment for suburban service just prior to the electrification, this service was handled for some years after the inauguration of electric operation by means of electric locomotives. Motor cars and trailers with multiple-unit control have gradually been substituted for this service, until at present there are 63 motor cars and 104 trailers in this service, which take care of practically all the New Rochelle and Port Chester business, as well as a large part of the Stamford business. All cars are of steel and, with the exception of six, are equipped for operation on the 650-volt d.c. third rail of the Grand Central Terminal, as well as for the 11,000-volt main line. The latest motor cars are of dimensions approximating the standard steel vestibuled railroad coach, weigh approximately 87 tons each and have a seating

Digitized by Google



Traffic in Chicago suburban zone of Illinois Central Railroad is handled by multiple-unit electric equipment

capacity of 120 passengers each, with a three and two seat arrangement. Each motor car is equipped with four 175-hp. motors and is capable of hauling two trailers



Electrified lines of the New Haven and New York Central railroads serve an extensive area in New York and Connecticut

Trains up to ten cars are made up in the proportion of at least 33 per cent motor cars.

Considering the large seating capacity of these cars and that one motor car operates two trailers, the total weight per passenger is very light, notwithstanding the fact that the motor car must carry both a.c. and d.c. control apparatus. All cars are of course lighted and heated electrically. The energy for this electrification is supplied partly from the railroad's own generating station and partly purchased.

The Southern Pacific, New York, Westchester & Boston and Staten Island electrifications belong properly in the category of rapid transit lines and are mentioned merely to show that the steam railroads of which these systems are subsidiary lines have availed themselves of all the advantages that electrification gives to this type of service. In each of these instances the choice made of system of electric traction was largely governed by the other systems with which they connect at present, or may connect in the not distant future.

Pennsylvania Railroad Electrification Relieved Congestion

For several years prior to 1914 the Broad Street Terminal of the Pennsylvania in Philadelphia was congested by suburban traffic. Electrification was decided upon to relieve this terminal congestion, to include first the main line suburban service to Paoli, which was effected in 1915, and later the service on the Chestnut Hill branch, which was completed in 1918. Multiple-unit cars were adopted for this service, and by their use train movements through the throat of this terminal, where the congestion was the greatest, were reduced between 16 and 20 per cent, due to the fact that the movements of the steam locomotives to and from their terminal beyond this throat were entirely eliminated. Further, because the multiple-unit cars were ready for departure very soon after their arrival, the terminal capacity was increased by the equivalent of two additional platform tracks, or 12½ per cent. This increase in terminal capacity and relief from congestion has been sufficient to take care of the growth during the past twelve years, and has postponed for this period the large increase in terminal capacity and the major changes to this terminal now being contemplated by the Pennsylvania. Plans are now made, and construction is already under way for the similar electrification of the suburban service on the main line south to Wilmington, as well as on the Westchester branch.

Choice of the 11,000-volt, single-phase a.c. system of electric traction was, as in the case of the New Haven, not based so much upon the suburban requirements alone as on its being the system best adapted to the future general electrification plans of the railroad.

Cars used in this service are of the standard type of Pennsylvania steel coach, re-equipped with one new truck, on which are mounted two 225-hp., single-phase motors, with multiple-unit control. A total of 138 cars so equipped are now in operation for this service. The

Digitized by Google

seating capacity is 68 passengers per car, and the weight, with equipment, is approximately 60 tons. No trail cars are operated in these trains, which are made up of from two to eight cars. All the power for this service is purchased from the Philadelphia Electric Company.

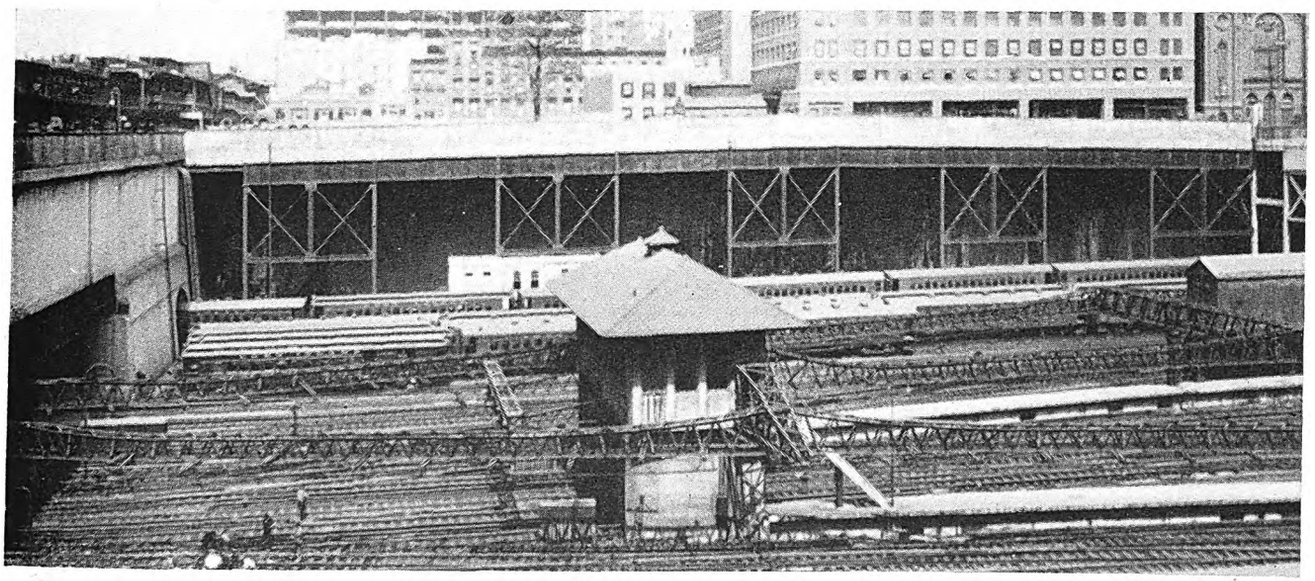
Illinois Central Electrification Uses 1,500 Volts D.C.

The most recent steam railroad suburban electrification is that of the Illinois Central, in Chicago, which was placed in regular service in August, 1926. For many years this railroad has operated a frequent steam train schedule for the heavy suburban traffic which has been growing on its main line as far south as Matteson, and on the South Chicago and Blue Island branches which join the main line at Kensington and 67th Street, respectively. In 1919, by agreement with the City Council of Chicago, the Illinois Central committed itself to the electrification of this suburban service prior to February, 1927. After a study of the various systems available, the 1,500-volt d.c. system was selected on the basis "that it was a terminal electrification only, with no prospects for immediate extension over adjacent main line divisions." Energy is collected from an overhead contact system. Notable improvements over the former steam service have been effected by means of electrification. The running time between terminals has been decreased from 10 to 24 per cent and the service has been greatly improved not only by faster and more frequent trains but in the matter of greater comfort and safety to the commuter, as well. The magnitude of the service provided for is shown from the fact that 482 trains are operated each weekday, carrying a daily average total of 80,000 revenue passengers. In addition to the above, 72 trains of the Chicago, South Shore & South Bend operate each weekday over this system from Kensington into the terminal.

This traffic is handled entirely by 130 motor cars, to which are permanently coupled one trailer each. These cars seat 84 passengers each. The motor cars weigh approximately 70 tons and the trailers 44 tons. The former are equipped with four 250-hp. motors and trains are made up of from two to eight cars. Energy for this service is all purchased on a 1,500-volt d.c. basis from the Commonwealth Edison System.

As compared with the through traffic which usually shares the same terminal, suburban service fails to bear anything like its proper share of the cost of facilities required and used. Cars, tracks, terminal space, power supply, transmission and distribution systems, signal systems; in fact, all facilities must be provided for the maximum peak demand, which is out of all proportion to that of the through traffic.

Thus, the load factor is poor. It means that a large number of cars and locomotives must be idle from the morning rush hour until used again during the evening rush hour, and then remain idle again through the night. Terminal tracks and leads must be of a capacity to handle this peak traffic, even to the extent of signaling and using inbound tracks for outbound service, and vice-versa. Signaling is more expensive, blocks must be shorter for the short headway required to handle the business.



Yard outside Pennsylvania Station, New York City, the western terminus of the Long Island Railroad

Load Factor Poor in Suburban Service

Power supply and transmission and distribution systems must be designed for the peak loads. In the case of the earlier roads to electrify, the power demands could not be economically secured other than from railroad-owned generating stations. The roads which were obliged to make these heavy original investments for power supply have not yet found it desirable or economical to give up the use of these stations in favor of purchasing all their power, because of the high total demand charge which would result until such plants are amortized. Of late years, the development of large capacity central power stations has been so rapid that railroad demands, however large, are small in comparison with the average central station loads. Thus the power-producing companies are in a more favorable position to supply the railroad demands, and it may now be more desirable for the railroads to purchase all their power rather than make the heavy capital investment for a supply of their own.

What Leading Exec

Meeting the Demands for

P. S. Arkwright

President
Georgia Power Company
Atlanta, Ga.

THERE is a demand for better transportation, and meeting this demand is the job ahead of the electric railway industry. The progress made during the past few years is remarkable, but we must be prepared for still greater changes in the future. The desires and wishes of the public must be met. We must accept this as the cardinal principle of our success. It applies to us as much as it does to the dealer in shoes or cigarettes or structural steel. And the desire of the public is for quality transportation, a better quality than we have been providing. The great number of automobiles on our streets is all the proof we need that the public wants better transportation, that it is willing to pay a price far in excess of the fare we have asked, and that we have been negligent in permitting the automobiles to capture so large a place in a field which formerly was almost exclusively our own.

How to meet this demand is our problem. Is it through a more luxurious vehicle? Is it through a different type of vehicle? Is it through extension of supplemental motor coach facilities to give our service some of the range and flexibility which are among the chief attractions of the private automobile? Or is it through some entirely new idea in public transportation yet to be developed? These are questions which only the future can answer. I have faith that they will be answered, for I have faith in the industry and in the men at the head of it. But, with all this uncertainty as to the future, there is one thing that can be said now, positively and with conviction. There is no place in the industry for the hidebound executive. There is no hope for the executive with plodding horse car ideas in this high speed era. Those who are capable of meeting the demand for modern transportation by modern methods will succeed. Those who attempt to meet it with antiquated equipment and antiquated ideas are doomed to failure.

J. H. Hanna

President
Capital Traction Company,
Washington, D. C.

I HAVE felt for some time that competition with privately owned automobiles can be met only by furnishing, at a reasonable but sufficient price, facilities which are more convenient and comfortable than can possibly be furnished at prevailing street car fares. Our experience with the 25-cent parlor car bus, while not particularly encouraging financially, has shown that such a service is popular and meets a very general demand. Its success depends on its superiority over first-class street car service. Operators must be men picked for their courtesy, equipment must be comfortable and even luxurious, and no standing should be permitted. These facilities cannot be furnished for 25 cents if the route is more than 6 miles. Equal facilities could be furnished by electric cars, but no advantage in the way of increased speed could be provided on city lines.

Robert I. Todd

President
Indianapolis Street Railway
Indianapolis, Ind.

CONFRONTED as the industry is to-day by the keenest kind of competition from the privately owned automobile and the independently operated bus, the two big things to be accomplished seem to be the rendering of such street railway service as will attract the bus rider to the street car and persuade the owner of the automobile to use the street car instead of his automobile.

If this result is to be accomplished the street car must be made as attractive as possible in point of comfort, safety and speed. Better seats, such as those of the bucket type; improved trucks and running gear, clean, fresh paint and good maintenance, all appeal to the traveling public. Improved power supply reduces the running time, particularly in rush hours.

Decreased earnings, which have been experienced by some of the companies throughout the country, make it difficult to expend large sums for equipment, but the present equipment should be improved in every way

Digitized by Google

Executives Think on Better Transportation

possible to make the cars more comfortable and attractive.

It is conceded that where buses are needed to supplement the street car service they should be owned and controlled by the street railway company so that the service may be coordinated. The running of certain street cars or buses without stops as an express service to distant points, followed by local service, is being considered in many of our cities.

There is no doubt that there are opportunities for improvement of the street railway service in every city, and a constant study of these conditions is bound to improve the service and increase the number of riders.

T. E. Mitten

President
Mitten Management, Inc.
Philadelphia, Pa.

WHERE the city transportantion system has fallen short of success you will find that it has failed to keep its product on a par with the advancing tastes of its customers. The growth of the seat-for-a-fare motor bus and the door-to-door taxicab is not an accident. It is the expression of that same popular longing for greater comfort exemplified in those great American institutions, the bathtub and the automobile. Public transportation systems must develop according to this public taste or go to the wall. They must not only go into the bus and taxicab business, but must increasingly approach "a seat for every passenger" as a standard in street car and subway-elevated service.

T. Fitzgerald

Vice-President
Pittsburgh Railways
Pittsburgh, Pa.

FACTORS which affect the patronage of transportation systems are appearance, speed, comfort, convenience, reliability and economy. If the prestige of a street railway and its public relations are sufficiently good, there is no physical reason why street car service should not be reasonably speedy and also offer the best in appearance, comfort, reliability and convenience at a price greatly below the cost of any other form of transportation.

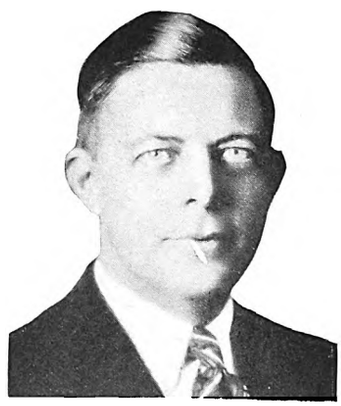
Few street railways under present-day conditions can compete with private automobiles in appearance, speed, comfort and convenience; but, so far as reliability and economy are concerned, street car service greatly excels. Because lack of credit makes unavailable the large sums of money necessary to improve these factors, many former street car patrons are using private automobiles. These private facilities are using the highways to the disadvantage of all forms of mass transportation facilities to an increasing degree. The immediate problem seems to be to furnish a mass transportation service that will offer effective competition with the private automobile and to such an extent as to reduce congestion and interference with the street cars.

This competition should probably take the form of a special service as nearly comparable to private car service as possible, and must, of course, be performed at a special rate.

In the matter of economy the street car has a tremendous advantage, and if street railway managements can improve in the other elements mentioned, as I believe they can, the earnings, prosperity and service of street railways of the country will win out over the automobile competition that is now affecting them so seriously. After this competition reaches its peak street railway traffic should resume the upward trend apparent before the year 1924.

W. E. Wood

President
Virginia Electric & Power Company
Richmond, Va.



LOCAL low-fare basic transportation service is essential to the welfare, growth and comfort of all cities of any considerable size. The widespread use of private automobiles with their many attractive qualities has had a tendency to cause the riding public to misunderstand the usefulness and essentiality of our basic transportation systems. The difficulty of earning a reasonable return on our investment in these systems has caused us to fail to keep pace

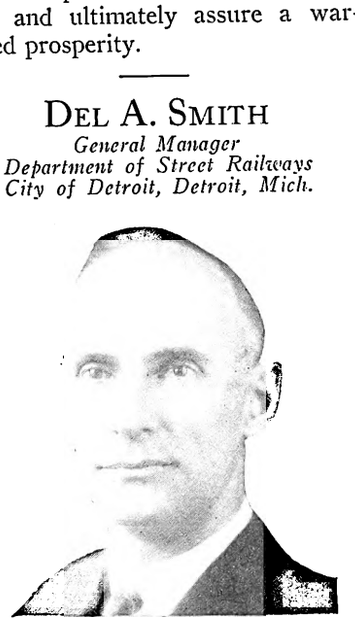
Digitized by Google

with the added and increasing comforts and attractiveness of the private automobile. There are many transportation requirements that our systems can fill more conveniently, comfortably and economically than the private automobile, and these riders, enough to assure successful and growing systems, are the ones we must hold or attract.

To do this it is necessary to provide not only good but attractive service and strive constantly to improve this; then, sell the good quality, convenience and economy of our service to the riding public. At the same time convince the general public of the value of our service to the welfare of the community and that our company and its employees are valuable citizens. Our equipment must be made attractive, comfortable and noiseless; our tracks smooth; our men efficient, courteous, clean and alert; both speed and safety must be obtained and the service must be sufficient and regular. Ingenuity in design and operation in keeping ahead of the trend of the times will keep our important place in the scheme of affairs and ultimately assure a warranted prosperity.

DEL A. SMITH

General Manager
Department of Street Railways
City of Detroit, Detroit, Mich.



AS TO the most pertinent factors in meeting the demand for better transportation, I will say that the imperative need of the industry today is more "Ponce de Leons" in the operating personnel. Our antiquated methods and ideas, inherited from the old school, must be immersed in "the fountain of youth." After this process of rejuvenation, we are then ready to consider the four cardinal attributes in the popularization of the transportation system, namely: accessibility, dependability, speed and comfort.

As the picture presents itself to me, the proper co-ordination of these qualities, together with the versatility of the operator in adapting himself to new ideas, is the only sure method of increasing patronage and winning favor in the ever-changing mind of the public.

D. W. HENDERSON

General Superintendent of Railways
Seattle Municipal Street Railway
Seattle, Wash.

THROUGH careful observation it is my opinion that the street railway industry is coming back into its own—perhaps not in all cities but in the majority of them. One cause for this is the automobile congestion and the difficulties in finding parking space in most of our cities.

The following are a few of the possibilities which should tend to improve and build up the industry:

First: New light-weight cars with exit and entrance built as low as possible in order to save time in the loading and unloading, seats upholstered and arranged for the convenience and comfort of passengers, cars properly geared and equipped with sufficient power to increase the speed over that of the present cars and equipment painted so as to be attractive to the public are all very necessary.

Second: Companies should take the public into their confidence and give it data as to railway conditions. They should also educate the public into realizing that without the street car industry the cities would not develop and grow by leaps and bounds as some of them have in the past.

Third: It is now a demonstrated fact that bus operation should be coordinated with the street railway in such a way as to give regular and dependable service, using the best kind of equipment on the market and making direct connection with street cars at transfer points.

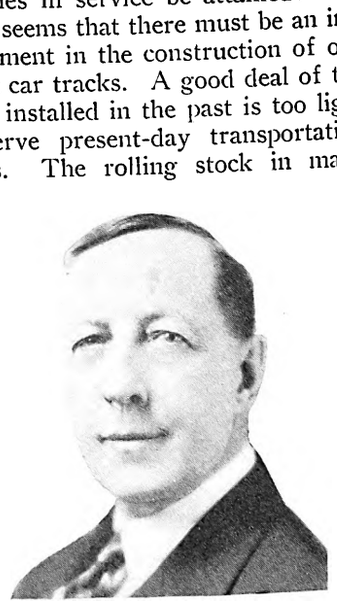
Fourth: Street railway companies should be careful not to raise the fare to the point where it might discourage the public from riding the cars. We would say that any fare averaging more than 8 cents would be prohibitive, except for interurban service.

A. W. MCLIMONT

President and General Manager
Winnipeg Electric Company
Winnipeg, Man., Canada

WITH the ever-increasing measure of comfort afforded by motor buses, and automobiles in particular, a new mark has been set for all transportation agencies to note and to endeavor to copy and surpass if possible. Apparently the riding public is not so much concerned with the cost as it is with the standard of service, and this is proved by the increasing number of higher priced automobiles which the public is buying. The public looks for speed, comfort and convenience in transportation, whether by automobile or by street car. The quality of service appears to be more important than the fare.

The problem before the street railway industry is: How can these qualities in service be attained? To me it seems that there must be an improvement in the construction of our street car tracks. A good deal of the track installed in the past is too light to serve present-day transportation needs. The rolling stock in many



cases has been too heavy. Unnecessary car stops must be eliminated. It is not too much to expect that in the near future a street car will be developed that will embrace most of the features of comfortable riding which are found today in the de luxe motor buses. From my experience I am convinced that the people will willingly pay a fare commensurate with the standard of service given.

Analyzing the reasons why so many street car patrons have turned to automobiles, we find that one of the principal reasons is facility of travel.

Digitized by Google

This element of competition must be met by street car operators speeding up service in every way possible, and where practicable providing supplementary bus lines. In the speeding up of electric railway service car manufacturers have an opportunity to develop lighter and more flexible vehicles—cars which are able to accelerate quickly and which can be brought to a quick stop.

F. G. Buffe

Vice-President in Charge of Operations
Kansas City Public Service Company
Kansas City, Mo.

CERTAINLY the industry can report progress in its efforts toward meeting the demand for better transportation. From every quarter come reports of rehabilitation and modernization. The old complaint that street railway operation was in a rut certainly cannot now be made. There has been a mental modernizing as well as a physical. However, the industry is not yet in the position of Alexander the Great, who wept because there were no more worlds to conquer. There is still much to do to carry on the program now started, as well as to venture into the field of new and comparatively untried ideas.

The public has accepted the fact that nothing can supplant street railway service for mass transportation. Very seldom nowadays is this fundamental dispute. Better service with modern equipment is being met with approbation, good will and increased riding. Aggressive advertising campaigns are being conducted. The bus is being fitted into the scheme of things, and is taking its place as the vehicle for supplying a preferential seat for every passenger service for the more exacting. At least two large companies are in the cab business. In every direction we have seen street car men become transportation men over night, constantly planning to fit urban transportation to the needs and demands of the people, and supplying services other than the low fare, base service wherever demanded and supported.

One-man operation on heavy lines in large cities is a success, and like all labor-saving inventions it must be adopted in the end. No community and no transportation system can afford to pay two men for a job that one can handle. One-man operation makes possible increased frequency and decreased loads, which brings us another step nearer the ultimate goal of a seat for every passenger.

When the very best possible service is given for the fare paid, the next step is to determine in each community whether or not the people are primarily interested in the very lowest fare and ordinary, good service, or in the very finest service money can produce at a slightly increased unit cost. The American people in every other direction have placed the emphasis on service and quality, with price secondary. It is very possible that this attitude will develop in transportation.

George Baker Anderson

Manager of Transportation
Los Angeles Railway
Los Angeles, Cal.

IF YOU enter a grocery store and ask the proprietor for applesauce, and he informs you that he has no applesauce but can give you some excellent cream cheese, you will be inclined to think in the vernacular, "Rotten management!"

But if he has the applesauce, and if you pay for it, assuming that it is good, fresh applesauce, only to discover upon tasting that it has turned sour, or has been made of partly decayed apples, you will have even greater warrant for concluding, "Rotten!"

The needs and desires of those who, either through choice or necessity, expect a public transportation company to deliver what its customers want and not attempt to foist unwelcome substitutes upon them must be met as nearly as possible by the seller if he aims to attract trade. His applesauce must be at least acceptable to the palate. Otherwise some of his customers will quit him, and those who stick will do so because of dire necessity, not because they like his wares. I know of nothing that will build up and popularize a transportation system more quickly and more surely than a satisfactory response to the public demand.

We can be courteous as we hand over the article purchased, and we can be sure that it will be difficult for the purchaser to find a much better article elsewhere.

Then as to speed—it *must be made*. Unnecessary congestion is very annoying and also costly and when fully understood by a community will not long be tolerated.

Above all other factors in meeting the demand for better transportation, conceding that progressive transportation managers are in accord on the essentials within the purview of corporate management, is leadership of the public—enlightenment and leadership.

Richard Meriwether

Vice-President and General Manager
Dallas Railway & Terminal
Company, Dallas, Tex.

IT IS difficult to discuss the outlook before the street railway industry and the matter of meeting the demands for better transportation without being conscious of the credit situation which has confronted the street railways for the past ten years or more, due to the difficulty of meeting the ever-increasing cost of operation while subject to the control of regulating bodies hesitant always to grant adequate fares, and, in addition, the

Digitized by Google

constant inroads of the private automobile on the business of the street railway.

During this period the street railway operator has had to contend with that vicious circle of circumstances wherein he could not secure new capital for necessary improvements to meet the demands for better transportation, due to insufficient net earnings. On the other hand, he could not increase his net earnings by reason of the fact that he could not obtain new capital to improve his property and meet the new and changing conditions in the transportation field.

As I see it, those street railways that have not already done so must first obtain an adequate fare, which, of course, will result in establishment of credit and earnings sufficient to rehabilitate the properties. This will mean the rebuilding of tracks and the scrapping of antiquated equipment, which must be replaced by inviting and comfortable cars.

The bus will constitute an increasingly effective and useful vehicle for public transportation. Especially will this be so for furnishing express service into outlying districts, which will meet a demand that surface cars cannot do. Through the use of a combination of buses and street cars, the former to render a special and improved type of service at a higher rate of fare, and the street car to meet the mass transportation situation, the local transportation companies should be in a position to furnish the variety and kind of transportation desired by the public.

D. W. Pontius

Vice-President and General Manager
Pacific Electric Railway
Los Angeles, Cal.

IN STATING my views concerning the outlook of the electric railway industry I am reminded of the story concerning a young lieutenant who was recommended to Napoleon for promotion because of rare skill and courage he had exhibited in a battle a few days before. "Splendid," the great Napoleon is said to have replied, "but what did he do the next day?"

More than ever before is impressed upon the wide-awake electric railway management the fact that there can be no resting upon past laurels and achievements. The well-being of the industry depends upon our advancing with the times.

The Pacific Electric Railway from

its inception has carried upon its emblem "Comfort—Speed—Safety," and I know of no other three elements now so essential to the industry.

For comfort of patrons constant consideration must be given to improvement of car design, taking into account factors of boarding, riding and leaving cars. Whether in electric cars or motor coaches, the trend is toward more comfortable seats, the modern automobile having created new ideas of comfort.

Further, the automobile has developed a greater desire for speed, and nothing should be left undone to shorten schedules. The matter of a few minutes' running time is a factor that will cause thousands to decide whether they will use their private automobile or the street car.

Safety is the one feature in which electric railways have kept abreast, and the use of steel equipment, wherever possible, together with modern signals and safety appliances, is a necessity with which we are all acquainted.

"Comfort—Speed—Safety" are the three factors that are ever before the officers of this company. In my judgment they constitute today, more than ever before, the elements most essential in "Meeting the Demand for Better Transportation."

H. S. Robertson

President
Denver Tramway Corporation
Denver, Col.

SOME form of mass transportation is a necessity. That fact is indisputable. The meeting of this demand without financial loss and with a reasonable profit is the problem.

The public and governmental authorities have a clearer and more comprehensive understanding of the situation than existed a few years ago and, while there remains much to do in an educational way, the fact that the average fare is now approximately 7.9223 cents, and in many localities unjust burdens such as paving have been removed, warrants the conclusion that not only has the necessity for mass transportation been recognized but also the fact that it cannot be rendered except upon a sound business basis.

Traffic congestion, coupled with more stringent parking regulations, will make the use of the private automobile less convenient. Convenience, rather than expense, seems to be the important factor with a large number of people, and in view of this the opportunity is now at hand for the industry to demonstrate that mass transportation facilities are not only the safest and most comfortable but, under present conditions, the most desirable and convenient.

In order to accomplish this the business must be conducted in the light of these changed conditions. This involves rendering adequate service, which from the standpoint of the public means good track and that equipment be kept clean and neat in its appearance, and made as easy riding and noiseless as possible. In other words, I do not believe the

public expects extravagant expenditures in this direction, but it does demand something that is up to date and that shows improvement and development, and a keeping up with the progress and advancement that transportation has made since the advent of the automobile.

The rate of fare must be sufficient to cover the cost of the service, and yet be held as low as possible consistent with proper and economical operation.

The industry must recognize that there are certain fundamental and underlying principles that are applicable to all companies, and the recognition of an unsound basic principle is not only poor business but affords those opposed to giving the industry a square deal the opportunity of citing the case as a precedent.

Public Square, Cleveland, the midpoint of the Carnegie-Clifton double-deck bus line of the Cleveland Railway

Success of

Double-Deck Bus

Depends on Special Conditions

By J. H. Alexander
President Cleveland Railway

OPERATION of buses is a necessary part of the transportation service which should be rendered by any street railway system in a metropolitan area. Buses do not and never can take the place of the street car for mass transportation, nor is it desirable that they should. It is our belief, however, that street railway managements generally should use buses for certain types of service, augmenting and supplementing rail service, and that by so doing the operation of their systems can be more efficient, economical and satisfactory to the public. Double-deck buses are valuable under conditions suited to their operation, but it must be admitted that their field of usefulness is limited.

The coming of the private automobile brought about a new period in local transportation in Cleveland, as it did generally over the country. The number of street car passengers carried in Cleveland during the years of 1900-1925 decreased steadily. Now it appears that the introduction of buses is causing a change in the riding habit. Instead of a decrease for the year 1926 as compared with 1925 there was an increase of 0.71 per cent in traffic.

The coming of the buses marks still another change—a transformation from the day when people own and operate their own transportation vehicles. The extent of patronage of the double-deckers, and especially the type of patronage, indicates that people are readjusting their habits of travel even to the extent of leaving their automobiles in the garage a good portion of the time. There is a growing discrimination as to how and when to use the bus, street car or private machine.

The double-deck bus line has not taken traffic away

Digitized by Google

from street car lines notwithstanding that it parallels them within a block throughout its entire length of 9.68 miles. Much to the surprise of early guessers, street car lines paralleling the main bus route have increased in patronage at a time when some other rail routes showed a decrease.

For some time the double-deck coach line has been showing a very substantial profit, income per month varying between 50 cents and 56 cents per coach-mile.

Analyzing the reasons for the ready acceptance of double-deck bus service and their constantly increasing popularity, certain points are apparent. The speed at which the coaches are operated, namely, between 12 and 13 m.p.h. during the base hours and approximately 11.5 m.p.h. in the rush hours, constituting what is probably the fastest double-deck line operation in the country, is especially attractive. Safety has not been sacrificed. Although this speed may be detrimental to equipment we believe that the actual attractiveness to passengers is more than sufficient to cover any additional maintenance cost. Another factor which has been important in bus operation is the skip-stop system, stops averaging approximately six per mile. The fare on double-deck lines is 10 cents for a through ride, there being no zone system such as exists on the cars requiring passengers to pay additional fare after passing the Public Square. Free transfers are issued to passengers originally boarding motor coaches, which are good as full fare on any intersecting car or coach line. These transfers are accepted as full fare from intersecting coach lines, while a 2-cent additional charge is made from intersecting car lines, where the fare is 7 cents with a 1 cent charge for transfers.

The rule of a seat for every passenger was adopted at the time the double-deck route was established and was continued until the limit of the number of buses available had been reached. Then, due to shortage of equipment, it was decided to permit passengers to stand with a limit of five per coach. This rule is now in effect and in general seems to be giving satisfaction.

We believe that there is a future for trunk lines of the double-deck type, but these lines should be confined to districts in which patrons reside who are able to pay a higher fare, and for the most part to boulevards and streets not having car lines. There is also a future for double-deck operation on lines running through parts and sections of the city of interest to visitors.

Used at Buffalo Only in Rush Hours

At Buffalo, N. Y., the International Railway has found that double-deck buses are best used to supplement single-deck bus service during rush hours. The one route on which double-deckers are used serves Delaware Avenue from Church Street through Buffalo and the adjoining village of Kenmore. Delaware Avenue is a high-class residential street, many large estates bordering on it. At its southern end is a specialty shopping section, while in the village of Kenmore there is a thriving local business center.

Riding, however, has not been heavy enough to warrant service more frequently than at ten-minute intervals, except during rush hours. Furthermore, climatic conditions in Buffalo are not favorable during nine months of the year for operation of open or semi-inclosed double-deck buses. As a result the International Railway began on Aug. 14, 1927, to operate single-deck buses at more frequent intervals but supplemented during rush hours by the double-deckers.

Popular for Chartered Trips in Atlanta

Establishment of double-deck bus service in Atlanta by the Georgia Power Company provided high-class transportation to two residential sections with no car lines. Because of the bitter feeling that had existed the

Double-deck buses are used in rush hours on the Delaware Avenue route by the International Railway, Buffalo, N. Y.

Digitized by Google

Chartered service is the principal use made of double-deck buses by the Georgia Power Company

company was influenced to select a coach of larger capacity than the actual transportation needs required, with hopes of building up sufficient business to justify their operation. After the first year, however, the loss was so great that it was necessary to substitute smaller coaches. Accordingly, ten single-deck coaches were purchased and used on the base schedules. The fifteen double-deck coaches are helping to carry the rush-hour crowds and are also much in demand, under a chartering arrangement, for picnic parties, convention delegations and other outings.

Baltimore Uses Double-Deckers on One Route

Operation of double-deck buses in Baltimore is confined almost entirely to the Charles Street route. That portion of the street over which the United Railways & Electric Company operates double-deck buses has the same significance that Fifth Avenue has in New York. At the northern or outer terminus of the bus line, about 3 miles from the center of the shopping district, there is a high-class apartment house development and Johns Hopkins University. Just north of the terminus of the bus lines is the entrance to Roland Park and Guilford, a fine residential section.

From a transportation point of view the section served by the bus line is adequately taken care of by a car line. However, a slightly greater convenience is provided in that the bus line remains entirely on Charles Street. The rate of fare on the street car is 7½ cents, with a 4-cent "half" fare, a 5-cent school ticket and a universal transfer system. The fare on the double-deck buses is 10 cents with no reduced fares or no transfers to street cars or other bus lines.

The operation on Charles Street is entirely double-deck, and with the exception of the summer months when travel is light the line uses eight on the base and eleven or twelve buses on the peak, with an eight-minute and a five-minute headway, respectively. In good weather the open-top buses are the more popular, but the semi-inclosed top is sufficiently satisfactory under that condition, and the advantage that the closed upper deck can be used to capacity during inclement weather more than justifies its use. For a climate such as Baltimore has there seems no justification for the expensive and heavy totally inclosed double-deck buses.

The following tabulation shows the number of passengers carried from 1915 to 1926 on the Charles Street line:

Year	Passengers	Effective	Fare	Additional Equipment
1915	484,800	July 25	5 cents	(Single-deck buses in use)
1916	1,438,900			
1917	1,515,000			
1918	1,950,300	Nov. 10	6 cents	
1919	1,958,900	Oct. 1	6.5 cents	
1920	2,026,300	Jan. 1	7 cents	
1921	2,165,100			
1922	2,214,600	July 1	10 cents	Four double-deck buses
1923	2,003,500	July 1		Four double-deck buses
1924	2,131,800			
1925	2,333,800	July 1		Six double-deck buses
1926	2,301,200			

Up to June 30, 1922, the accumulated deficit on this route was $136,960.61. When the fare was changed to 10 cents the line immediately became profitable.

The factors which make the operation profitable are: first, the 10-cent fare; second, the short route; and third, the comparatively good load factor. No attempt has been made to take care of all the peak-load traffic that could be obtained, as this function is left to the car lines. The comparatively low investment, together with the off-peak shoppers and moving picture and theater crowds, makes a profitable operation. In other words the bus line takes the cream of the business.

P. R. T. Has 250 Double-Deck Buses

Extensive use of double-deck buses by the Philadelphia Rapid Transit Company in Philadelphia has proved to be a success. Bus operation began in September, 1923, with ten double-deck buses that were placed in service on 5 miles of route on Roosevelt Boulevard. When all the new buses that are on order have been delivered the company will have 565 buses, of which 250 will be double-deck.

Three city routes and two intercity routes, the latter

Digitized by Google

between Philadelphia and Camden, N. J., are being regularly operated at the present time with double-deck equipment. In addition, double-deck buses are used in tripper service during rush-hour periods on three other city routes. The one-way length of route over which double-deck buses are operated is 49.35 miles, 10.5 of which is for tripper service only. The average operating speed of the double-deck routes is about 10 m.p.h.

Operation Profitable in New Jersey and Kansas City

A somewhat different type of double-deck bus operation has been established in certain New Jersey seashort resorts by the Coast Cities Railway and its subsidiary, the Atlantic Coast Transportation Company. This operation has been doing well financially despite the rainy weather that has been prevalent all over the East this summer. One rail line has been rerouted in Asbury Park, the center of the system, so as to save considerable car mileage. The buses are operated on a 10-cent zone fare system. While gross revenues have been less on account of the bad weather, the economies incident to the rerouting have made it possible to show a relatively small recession in the net.

The Kansas City Public Service Company has operated two double-deck bus lines since November, 1925. Each of these routes is over a boulevard and not in direct competition with car lines. They tap desirable apartment and small residential districts, running into the downtown district. One of these lines is 5.9 miles in length; the other is 6.5. Service is given by seven buses on one and eight on the other. The average rush headway is twelve minutes; base, thirteen minutes, and the afternoon rush ten. A total of 2,070 bus-miles a day are operated. The earnings for the seven months of 1927 were 34.2 cents per mile and the operating expense 29.0 cents.

The company also controls the Gray Line sightseeing franchise, and very frequently double-deckers are used in this service to accommodate large parties.

Residential Districts Served in Los Angeles and Milwaukee

Double-deck bus operations in Los Angeles are part of the rail operations, generally speaking, transfers being issued to the rail lines, and taxes being paid in exactly the same way. The operations are entirely within the city of Los Angeles, and there are but two lines using double-deck buses. The Pacific Electric Railway and the Los Angeles Railway have formed the Los Angeles Motor Bus Company, which operates one of the lines through territory served by both companies, while the other line is operated solely by the Los Angeles Railway. Both lines commence in the downtown business district, and extend into the residential district, although one of them passes the edge of the business district of Hollywood. The territory is well built up, but is not the most densely populated area in the city. Aside from short grades of 4 per cent, the streets are nearly level and improved with some form of permanent paving. Outside of some six to eight blocks in the downtown district skip stops, spaced six to eight to a mile, are used on one line, while on the other stops are still made at each street intersection. The average speed is approximately 11 m.p.h., including layover. The running time on one of the routes, 7 miles in length, changes six times per day, and varies from 29 to 35 minutes without layover.

The rate of fare on both double-deck lines is 10 cents, including transfer to car lines and also to other bus lines. To date these double-deck buses have not earned operating expenses. The reason for the continuing losses appears to lie in the low fare. While the trend of revenue is upward, the increased revenue off-peak, when seats are available and operating expenses are not increased, is offset by the increase in expenses during peak periods, when additional equipment is necessary.

Double-deck buses were purchased and placed in de luxe service by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., during the summer of 1923. A route was chosen beginning in a residential section, and passing through the downtown district to another residential neighborhood. It was operated as an independent service from other company transportation facilities, although it paralleled one of the company's car lines for parts of the route. The rate of fare was established at 10 cents with a seat for every passenger.

The company's experience after four years has been that Milwaukee traffic does not require double-deck buses for all-day service, but only during morning and evening rush hours. Even at these times it is believed that single-deck buses operated at more frequent headway would stimulate rush-hour business, although there is a question as to whether the increased investment in buses for peak business would be justified.

Kansas City Public Service Company makes extensive use of double-deck buses for sightseeing

Pittsburgh Motor Coach Company operates de luxe buses on four routes between outlying residential districts and the center of the city

Winning the Automobile User With

De Luxe Coaches

By THOMAS W. NOONAN

General Manager Pittsburgh Motor Coach Company

HUNDREDS of electric railways throughout America have made extensive additions to their systems or replacements of rail service by means of motor buses operated at trolley fares or at little more than trolley fares. A few of these companies, like those at Pittsburgh, Toronto, Washington and Cincinnati, have also undertaken high-fare, de luxe coach service of express character. In many ways this is a most attractive proposition.

Pittsburgh's situation with respect to the operation of bus service is in a class by itself. A total of 15.8 single-track miles have been removed since the end of the receivership on Jan. 31, 1924. Most of this mileage was of the "hold the franchise" variety and the service over the routes abandoned has not been replaced by that of buses. More track is booked for abandonment in line with the city paving schedule. Here and there track has been doubled or connecting curves added, but outside of the loop on Diamond Street to alleviate downtown congestion, no new track has been built. The net situation is that the Pittsburgh Railways now operates a total of 592 single-track miles, serving more than 1,000,000 people, without a trolley-fare bus in regular service.

Three factors have made this unique situation possible:

First, the high proportion of trackage to population.

Second, the traction agreement with the city of Pittsburgh and most of the other municipalities served, which

†Wages are 61½ cents an hour first three months; 66½ cents an hour next nine months; and 68½ cents an hour thereafter.

saves the management from the necessity of replacing track for the sake of avoiding unfair burdens. The company's obligation in lieu of paving and license fees is approximately $800 per mile of track. Public knowledge that the company's operations are continuously scanned by the Traction Conference Board and that its profits are limited to 6 per cent return on an agreed valuation reinforces the importance of this factor.

Third, the use of de luxe coaches at a 25-cent fare on short headways to give a service that will draw people from the private automobile and so help to clear the highways for business and trolley traffic. This operation is conducted by the associated Pittsburgh Motor Coach Company.

Both Trolley and Coach Are Self-Sustaining

The relative importance of the two classes of traffic can be gaged from the data for 1926, when the trolleys carried 396,697,675 passengers at an average fare of 5.37 cents and the coaches carried 1,149,283 passengers at a fare of 25¼ cents. The extra quarter cent comes from the higher average fare from chartered service. It is obvious that the difference in fare is great enough to produce appeals to widely different classes of patronage. Indeed, replies to our questionnaires prove that the coach traffic comes chiefly from private automobile riders, people who would otherwise not ride at all, taxi passengers and trolley riders in order of importance as named. The riders from the trolley are chiefly shoppers to whom the coach appeals as a pleasing variation from their usual shopping routine.

The reasons for developing the de luxe motor coach lines as we have done it in Pittsburgh were given in more detail than it is possible to give here, in a paper by the writer before the Central Electric Railway Association at its meeting last January. This was published in Electric Railway Journal for Feb. 12, 1927, page 298. In general, the lessons learned in our experience are that it is necessary to give the patrons a service which is sharply differentiated from ordinary street car service. Both in the design of the vehicles and in the matters of operation, such as routing, stops and schedule speeds, we have found this to be an essential to success.

De luxe bus service in the Pittsburgh district began with our acquiring from an independent operator a line joining the business and amusement centers of Pittsburgh and East Liberty. On Aug. 14, 1925, we originated a 5.7-mile route from downtown Pittsburgh to Squirrel Hill, a high-class residence district lying just beyond Schenley Park. For this service we installed 29

Table III—Summary of Operations of Pittsburgh Motor Coach Company

Route	Length Miles	Running Time—Minutes Inbound Peak	Inbound Base	Inbound Eve.	Outbound Peak	Outbound Base	Outbound Eve.	Headway, Min. Peak	Base	Eve.	Sat. Eve.
East Liberty	5.00	27	23	20	27	26	25	6	7½	15	..

Digitized by Google

and 25-seat buses. On May 24, 1926, we originated a 6.6-mile route to Point Breeze, another fine residence district. The vehicles put on were 29-seaters.

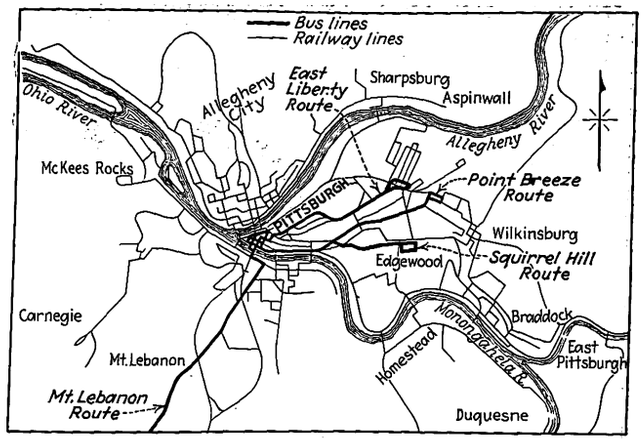
Both the Squirrel Hill and Point Breeze routes make use of 2 miles of boulevard terminating in downtown Pittsburgh. The Squirrel Hill route also makes use of Schenley Park and, in general, is not near trolley territory. The Point Breeze route, after leaving the boulevard, is on streets with railway tracks for a good part of the way.

Beginning on Dec. 6, 1926, we changed Point Breeze from 29-seat buses to 19-seat coaches. These coaches have a wheelbase of only 210 in. compared with the 225-in. wheelbase of the others. The over-all length is also only 24½ ft. against the 28½ ft. length of the older vehicle. The reduction of over-all width from 90 in. to 81⅝ in. has been found of substantial value in avoiding accidents and in getting by other vehicles. Because of the better clearance conditions and smaller capacity, we were able to cut the running time from 38 minutes to 30 minutes.

The most recent line to be established is that to Mount Lebanon and Dormont, which was opened on March 21 of this year. This route also serves a fine residential section.

The East Liberty route has the advantage of a business and amusement center at each end. Application has been made to extend the Point Breeze line to the Wilkinsburg station of the Pennsylvania Railroad. This extension would produce some two-way travel on that line. The Squirrel Hill route has been rerouted advantageously near its suburban terminus in order to serve a larger population.

Mileage, running time and headways for the present routes are given in Table III at the bottom of page 514. The running times shown do not include layovers. The routes themselves are shown in the map on this page.

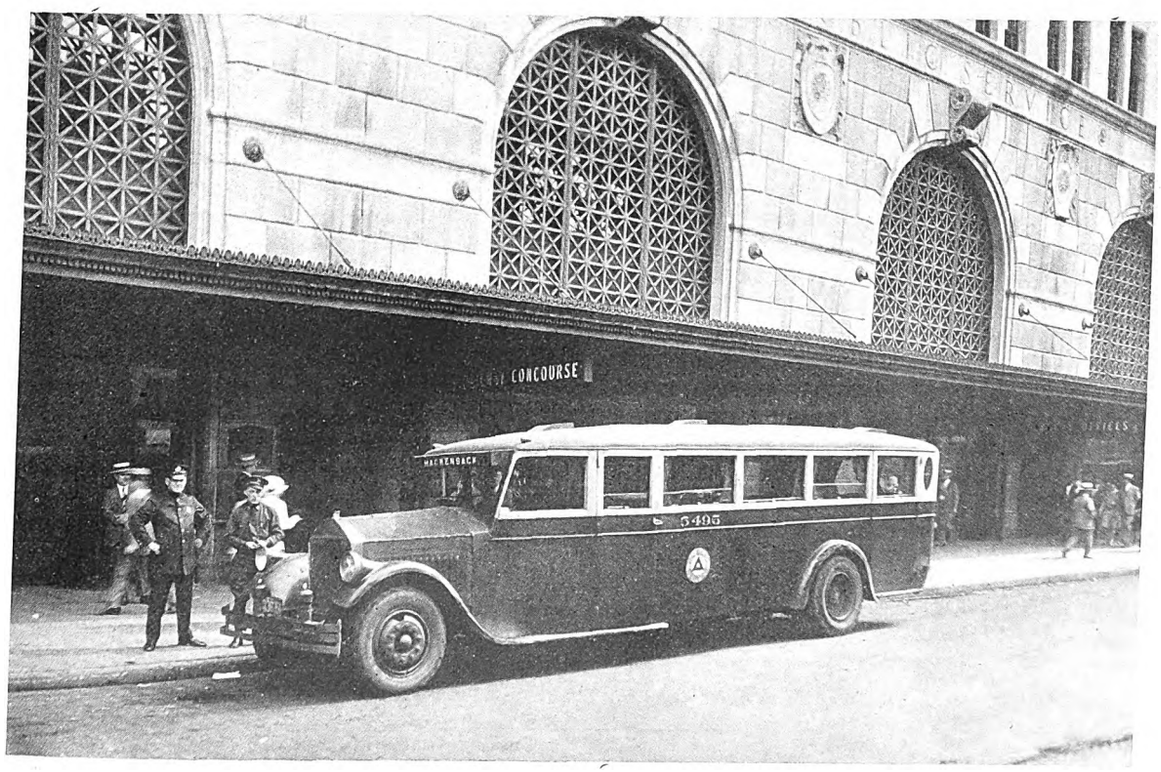


Service superior in comfort and speed to that of the street car is given at a higher fare by de luxe vehicles of the Pittsburgh Motor Coach Company

Details of the equipment owned by the Pittsburgh Motor Coach Company are given in Table IV on page 516. The latest equipments, which express the change to coaches of a more luxurious type and having smaller seating capacity, are the 19-seat Yellows.

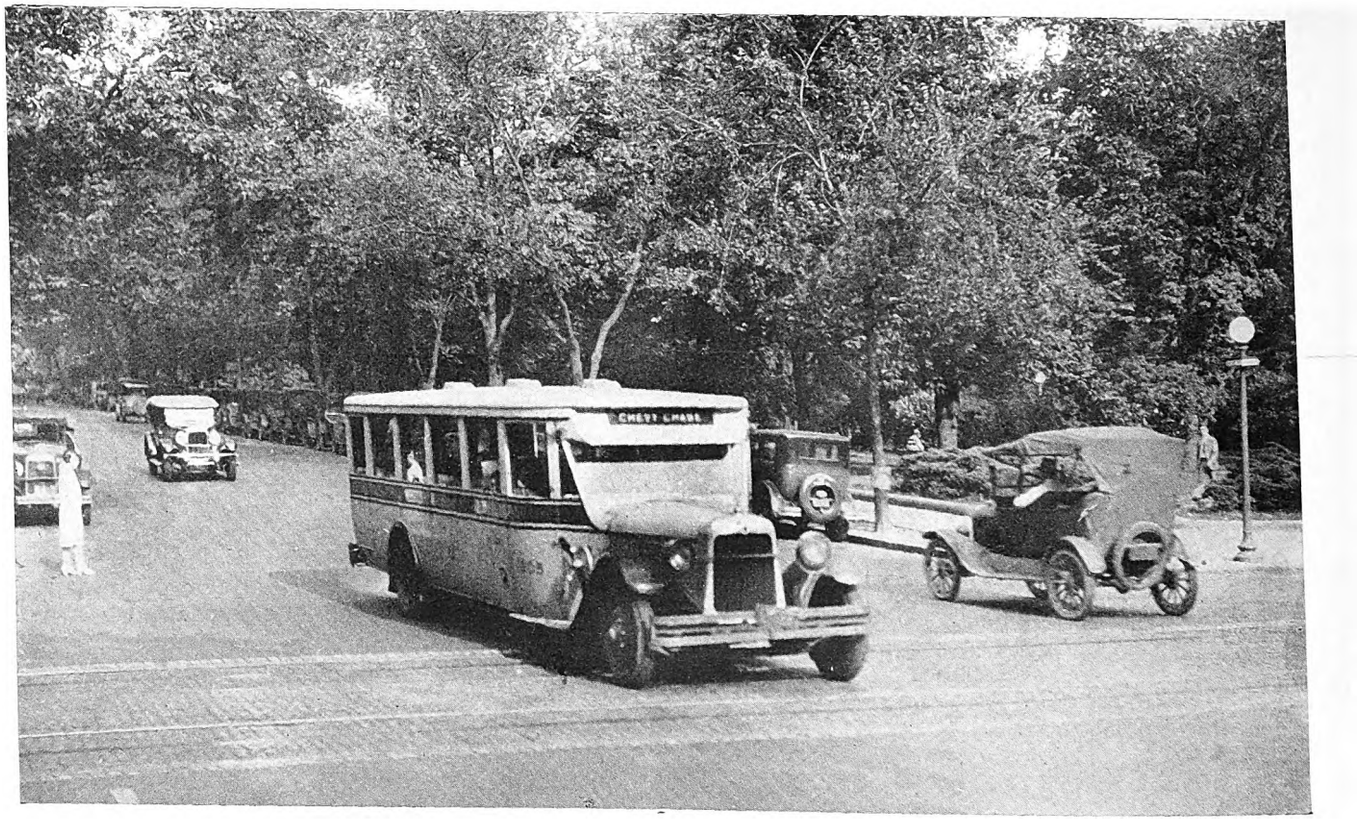
Earnings, Costs and Expansion of Coach System

The increasing popularity of the pioneer routes and the addition of new ones promise a large increase in business for 1927. Comparison for the first half of 1926 with the first half of 1927 shows that traffic has increased from 531,152 revenue riders to 846,972, while the corresponding rise in net income has been from $11,530 to $30,110. Meanwhile the total traffic on the trolley system increased from 202,578,931 in the first half of 1926 to 203,143,147 in 1927. The net coach income remaining after meeting all cost of service charges rose from $285 to $121.970.



Half-hourly service between Newark, N. J., and Hackensack, N. J., is maintained by de luxe buses of the Public Service Transportation Company

Digitized by Google



At Washington, D. C., the Capitol Traction Company operates de luxe bus service between the center of the city and Chevy Chase

So far, the Pittsburgh Railways has been spared the burden of carrying extensive unprofitable bus operations which might have led to higher average fares than those quoted. Although the cash street car fare with cross-town transfer privilege is 10 cents, less than 6 per cent of the revenue comes from this class of riders. Both the 8⅓-cent token and weekly pass fares are very popular. In addition, a straight 5-cent fare obtains for short-haul rides on fourteen routes, on all the Washington city system and on part of the McKeesport routes. One route in McKeesport has a 3-cent ticket.

The only regular low fare bus service in Pittsburgh was an operation between Millvale and Pittsburgh via the 40th Street Bridge, begun on June 14, 1926, and abandoned on June 1, 1927. This was operated jointly by the Pittsburgh Railways and the Pittsburgh Motor Coach Company. It failed to meet expenses by $400 to $450 a month on a fare of 10 cents with transfer privilege to trolley. Outside of this, the only bus operations by the Pittsburgh Railways have been of emergency character. It operated a sixteen-seat bus for shuttle service during the reconstruction of the North Washington route, and a second bus seating 29 was used during the reconstruction of the Beltzhoover line.

Variation in earnings and expenses in different months of the year are shown in Table I. Winter, with 39.44 cents regular passenger revenue, is the best earning time, for then the autoist is less inclined to use his own machine. In June, with less shopping and more personal automobiling, 30.91 cents revenue came from regular passengers, but 2.70 cents came from special service. July, with school closing, vacations and exceptionally rainy weather, produced only 26.77 cents, but the operation was saved from loss through the rapid growth of chartered coach service to beaches and parks. This added 5.03 cents per mile, despite very poor weather. Table II shows the costs in detail for June, 1927. These figures may be regarded as typical.

In developing chartered coach and sightseeing service we employ a solicitor and enjoy the courtesy of paragraphs in the *Transit Guest,* the weekly "take-one" publication of the Pittsburgh Railways. Chartered coaches handled during 1926 totaled 436, while for eight months of 1927 the number run was 676.

These figures summarize briefly the experiences of the Pittsburgh Motor Coach Company. We have found the operation of de luxe buses on short headways at a 25-cent fare to be a paying proposition. The private automobile developed a desire for faster and more luxurious transportation than can possibly be given by a low-fare electric railway or bus service. That desire has become so set with many automobilists that they are willing to subject themselves to heavy expense and much annoyance rather than return to what they deem lower-grade transportation. By giving service of superior quality at a higher fare, however, we have succeeded in attracting this kind of patronage and built up a profitable business.

In taxicab operation the driver is the salesman

Taxicabs

a Logical Element in

Complete Transportation Service

By J. A. QUEENEY
Vice-President Mitten Management, Inc.

"CO-ORDINATED TRANSPORTATION" is very much like the Constitution of the United States, so far as the ever-broadening interpretation of its meaning is concerned. Perhaps the first step in the co-ordination of urban transit was the elimination of competition between various street car lines, by joining them together into a single operating body. Next came the joining of rapid transit and surface lines. Then the bus appeared on the scene. Some sneered at it as a transitory fad. More far-sighted transportation men realized its possibilities and welcomed it into the fold. Last but not least the taxicab has been looked upon and found not unlovely.

Each of these steps has been considered by no small number of transportation men as a bold, even daring, maneuver. Each, in due course of time, has come to be accepted as a logical phase in the evolution of local transportation, though not without ranting by the demagogs and the necessity for careful educational work on the part of the transportation companies.

In April, 1926, after the approval of the city of Philadelphia and of the Pennsylvania Public Service Commission had been duly secured, the Yellow Cab Company of Philadelphia was purchased by the Philadelphia Rapid Transit Company for the sum of $3,000,000. At that time this cab company was the largest in Philadelphia and the third largest in the world, having 1,100 cabs available for operation and an experienced personnel of 3,000.

The decision of any established transportation company whether or not to enter the taxicab field must depend upon a vast number of purely local conditions. It may be stated as a general premise that, except in very extraordinary circumstances, this type of operation should be undertaken only when there seems ample evidence that a substantial profit may be earned within a reasonably short period. As a profit-maker, the taxicab may be a very welcome little brother to the street car and bus, since it serves to bolster the earnings of the company and at the same time ceases to provide ruinous competition in the heavy-riding districts.

But some communities are "taxi-riding" and others are not. Generally speaking, the more cosmopolitan the city the more profitable the taxicab field may be expected to be, unless cut-throat competition has already cut the business to pieces. Taxi-riding is essentially a luxury, indulged in by the wealthy and those in moderate circumstances alike, but only where the public has become educated to the use of this individual transportation service. In communities where the street car and the bus still meet the needs of practically all elements of the population the early career of a taxicab enterprise may be full of pitfalls. Hence the railway man who contemplates entering the taxicab field should ask himself whether he or any one else can make a success of the business. The safest plan, albeit the one with the greatest initial cost, is to take over an established organization which has already proved itself a money maker.

Digitized by Google

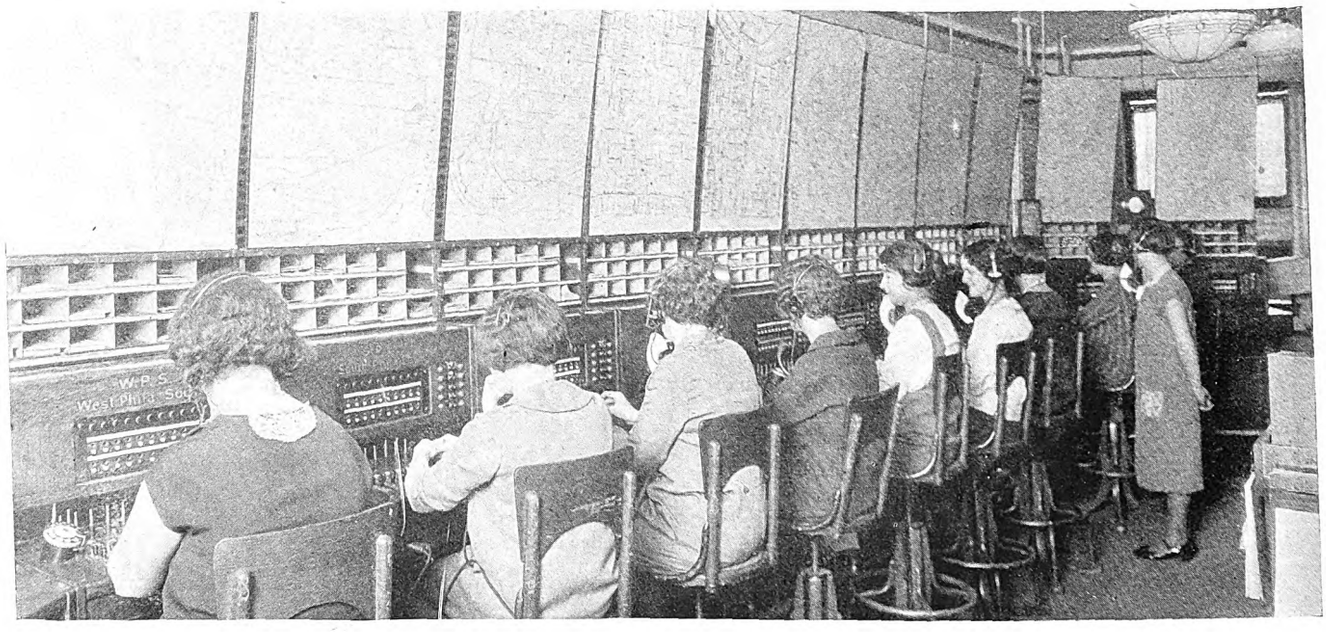
In this way the prime requisite of an experienced and able operating personnel will be provided. The merchandising of taxi rides is like no other merchandising problem. Taxis are not like street cars and buses, operating on definite schedules and relied upon by multitudes of people for regular transportation. A prospective taxi-rider will be a customer only if his vehicle is right at hand or can be furnished instantly. Otherwise he will avail himself of some other means of transportation or will walk. A trained taxicab operator knows all of this and has a thousand little schemes up his sleeve to provide that "Johnny-on-the-spot" service.

When Mitten Management entered the taxicab field that was the procedure followed. The Yellow Cab Company of Philadelphia, incorporated several years before, had increased rapidly in size and had so perfected its service that at the time of the purchase it was acknowledged as being in the van of cab organizations in the United States. During the year 1925 its gross revenue had been $5,000,000 and its net $425,000. Hence the purchase price of $3,000,000 was conceded to be a fair outlay for the property.

In taking over the property Mitten Management announced that no major changes in the operating personnel of the cab organization were contemplated. Such adjustments in practice as have been effected to date have been aimed solely toward more closely co-ordinating the cab service with the other public transportation mediums and taking advantage of such operating economies as might be put into effect.

In the main, it may be said that the public invariably stands to gain by a reduction in the number of more or less competing transportation agencies, with a corresponding centralization of responsibility, provided that the co-ordinated system which results is subject to the proper kind of regulation. The financial resources behind a great transportation system quite naturally inspire public confidence, since there can be no question as to the company's ability to make redress for injuries or fatalities.

Furthermore, the public has learned by experience that it may rely upon a street railway of the proper sort to maintain definite schedules and to keep up a fixed standard of service, regardless of slumps in the transportation business. It would like to find a similar degree of reliability in the operating standards of other transportation media, such as the taxicabs. It most emphatically does expect this standard of service when a taxicab organization is taken over by the larger transportation company. But the advantages do not lie wholly with the public. Quite naturally the building up of public confidence in a given organization leads to public patronage of that particular medium. Undoubtedly the prestige of any cab company would be enhanced by linking up service of this kind with the organization which operates the balance of the community's transportation facilities.



Expeditious handling of telephone calls is an important element in taxicab operation. Telephone exchange of the Yellow Cab Company, Philadelphia

Essentially, a taxicab company is a public utility in exactly the same way that a street car company or a bus organization is a utility. There have been many instances where this basic fact has been lost to sight by state and city regulatory bodies. It is true that a taxicab gives a preferential type of service, closely approximating that of the private automobile, but to the extent that it is available for the use of any member of the public and that it is subject to the same restrictions and many of the same taxes as are other public transportation media it is entitled to certain privileges as a public vehicle.

The established street railway, or co-ordinated system, which through long years has attained recognition as a public utility, already has an organization for fighting the legislative and financial battles which fall to its lot. It is equipped to take the taxicab organization under its wing and, in due course of time, secure for it the same consideration which is increasingly being accorded to the street car and bus. Where the railway has been fortunate in establishing a harmonious working relationship with the municipal government, the position of the cab company, as its subsidiary, would be immensely strengthened.

Digitized by Google

Without doubt there is tremendous value in fixing in the public mind the thought of one organization providing every desired type of public transportation. True, it furnishes the local quipsters with a fund of "digs" at the railway management. It provides inspiration for the newspaper cartoonist and columnist. But all this is excellent advertising and serves to root that picture of co-ordination ever more deeply in the public consciousness, provided that the established transportation company upholds its end of the bargain by making a convincing success of each new enterprise which it takes over.

The extent to which a taxicab organization may profit in reduced operating costs by consolidation with a street car and bus operating company depends entirely upon local conditions. If the transportation company's bus operations are not very large and its maintenance facilities are adequate, it is possible that the maintenance of a moderate cab fleet could be added, with minor adjustments in personnel and equipment. However, in the case of a large operation, such as the Yellow Cab Company of Philadelphia, this has not been possible.

Joint use of telephone dispatching facilities presents interesting possibilities, providing that the requirements of the street car, bus and cab operations do not conflict. Where the street car system possesses extra telephone cable privileges these might be taken over by the taxicab department, with a corresponding reduction in costs to both units. Established bureaus of the transportation company, such as engineering, accounting and public relations, may well be expanded to handle similar work for the cab organization, thereby eliminating duplication of effort.

Perhaps the thing most heartily desired by cab companies and municipal governments alike is a panacea for the wasteful and traffic-clogging practice of "cruising" for fares. But this is easier said than done.

It is the uncertain nature of the taxi rider, his readiness to take the first cab in sight or to do without one entirely, unless he can be "snared" at the psychological moment, that renders the situation so difficult. Unquestionably, however, a solution of the problem may best be found by considering cab operation in relation to the other phases of public transportation, so that this may be looked to as a future advantage of co-ordinated operation.

While by far the bulk of the cab business is done by "pick-up" in the central districts, the telephone dispatching service is nevertheless an important element. Telephone calls for cabs will be made just to the extent to which speedy and unfailing response to those calls is given. The Yellow Cab organization in Philadelphia has built up this phase of its business enormously during the past few years. A central telephone dispatching board, with a number of operators, is provided, and from this point calls are relayed to cab drivers at the more than 200 cab stands established in various sections of the city. Hence the "magic carpet" is at the door within a few moments after the telephone request has been made. The cab driver-salesmen have been thoroughly impressed with the point that, once having accepted a telephone assignment, that call must be gone through with, regardless of what "pick-up" jobs may appear on the streets. As a result it is only rarely that patrons complain of failure to respond to their order for cabs.

Inset—Individual service is given by the taxicab while the car handles the mass movements. At right—Equipment used by the Yellow Cab Company of Philadelphia is housed in a garage by itself, separate from other automotive equipment of the P.R.T., its parent company

Results from Cab Operation in Philadelphia

P. R. T. operated the Yellow Cab Company for eight months during 1926. Net earnings for this period amounted to $198,338, being at the rate of approximately

Digitized by Google

$300,000 per annum. The gross passenger revenue of the cab organization for the calendar year 1926 was $6,437,969. Last year was a good one for cab operation in Philadelphia, partially due to the presence of the Sesqui-Centennial Exposition in the city. Earnings thus far in the current year have not come up to those for a corresponding period in 1926. During the first six months of 1927 the gross passenger revenue from our cab operation amounted to $2,980,674. Something of a temporary industrial depression has manifested itself locally during the past few months and of course this has had a distinct influence on taxicab riding.

Cabs Operated by Railway in Minneapolis

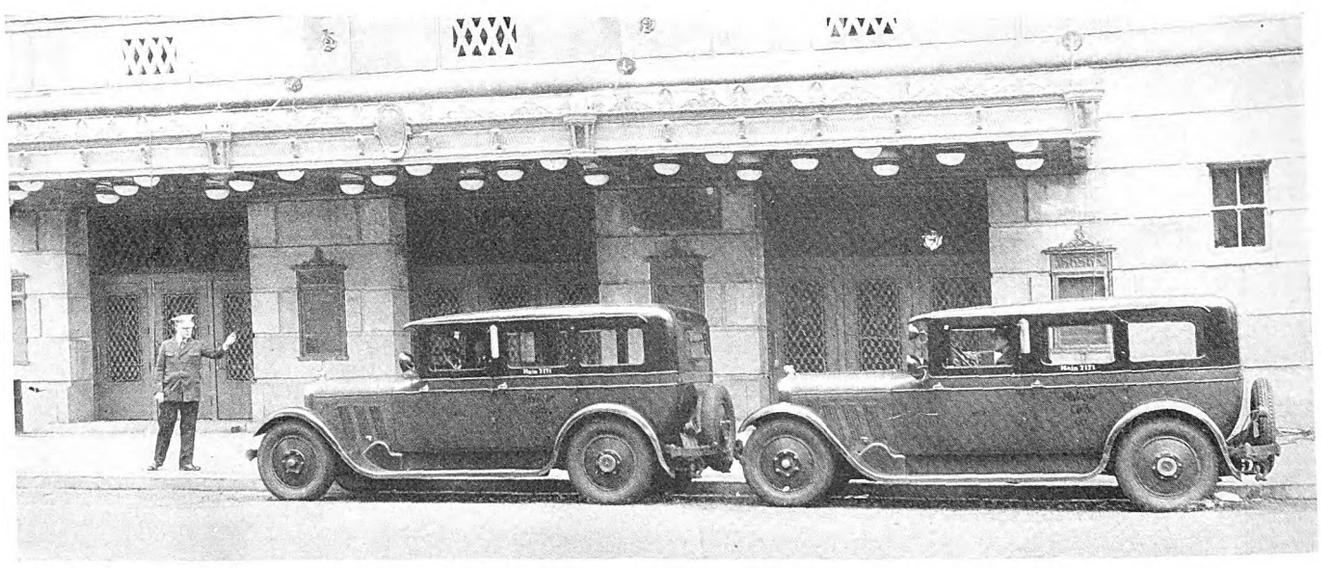
To date only one other established transportation system has undertaken the co-ordination of the taxicabs in the community which it serves. That company is the Twin City Rapid Transit Company, in Minneapolis and St. Paul. Other railway executives are delving into the possibilities of such a step, judging by the requests for information on the Philadelphia operation which are received. The question is frequently asked, "Is the taxicab business so much a cut-throat proposition that it is unsuitable for a responsible agency like an existing transportation company, or is it possible to eliminate cut-throat methods, either through regulation or by rendering service of a character so high that competitors cannot live?"

Answering the second part of the question first, it may be said that the so-called cut-throat methods are frowned upon by reputable independent operators. Where they exist, however, they cannot be eliminated by sheer quality of service, since, as has been pointed out before, a prospective cab patron is more interested in securing a vehicle at the moment desired than he is in waiting for a more comfortable and reliable cab.

Proper regulation of all cab operations in a given community by the police authorities and by the state public service commission will go a long way toward eliminating some of the most objectionable features of cut-throat competition. The established transportation company cannot afford to prejudice the success of its cab venture by entering into a rate war with independent operators unless he is literally forced into it by the direst of tactics on the part of his competitors. Cab rates may easily be lowered, but can be raised only over a storm of protest which may have far-reaching consequences.

Hence it is eminently desirable to establish the taxicab venture upon a sound earning basis at the outset and to maintain it at that point through thick and thin. If reasonable rates are backed up by a reputation for safety and courtesy and for financial responsibility, together with comfortable and well-maintained equipment, it will be a combination hard to beat.

In most cities there have been efforts on the part of hotels, theaters and similar institutions to reserve the street space in front of their respective places of business and to lease that space as taxi stands to the highest bidder. Without question this is a pernicious practice. The streets are public property and are no more subject to the control of the abutting property owners than would be the sidewalks in a question as to who should or should not be allowed to walk thereon.



Stand of the Yellow Cab Corporation of Minnesota at the Minneapolis Auditorium. This company is controlled by the Twin City Rapid Transit Company

The Yellow Cab Company of Philadelphia has never entered into such arrangements for exclusive privileges on public property. It is our belief that taxi stands should be provided at all points where patrons are apt to congregate and that such stands should be open to all legitimate cab organizations. The reservation of street space for cabs is justified by the public service which they render, but there should be no discrimination. Concessions on private property, near points of concentration, is another matter entirely. They are justified only if sufficient patronage is procurable at those points.

Unquestionably the office building of tomorrow will make provision for cab stands, so that its tenants may be afforded convenient cab service. The railroads have universally recognized the importance of making such provisions, stores in some of the larger cities have adopted the same plan and there is every reason to believe that the modern office structure will be planned along similar lines. Luxuries though cabs may seem to be, they are patronized almost as necessities by an ever-growing number of people.

Street Car Type Bus

Meets a Real Transportation Need

By John A. Miller, Jr.
Associate Editor Electric Railway Journal

BROADLY speaking, there are four kinds of service for which the street car type bus is well adapted. First, it may be utilized advantageously to serve districts not already served by rail lines and where the traffic is too thin to justify an extension of the railway. Second, it may be used to supplement car service on heavy traffic lines, either by furnishing local service while the cars run express or by giving express service while the cars do the local business. Third, it may be used to replace rail service where a large expenditure would be required to rehabilitate a light traffic line. Fourth, it may be used to replace rail service where the latter is not conveniently routed, or where operation is hampered by single track or other unfavorable conditions.

In making extensions into newly developed and sparsely settled districts beyond the limits of the railway system, the great advantage of the bus over the car is the smaller original investment required. It is customary in a situation of this kind to operate the bus service merely to feed the nearest rail line and to transfer passengers from one vehicle to the other where their routes meet. This practice is followed by the Boston Elevated Railway, the Winnipeg Electric Company and a number of other electric railways. Sometimes, however, the bus routes serving outlying districts have been extended into the center of the city. From the standpoint of the convenience of the passenger such an arrangement has advantages, but the number of buses required is larger, with a consequently larger capital outlay. Moreover, the cost of operation is increased in proportion to the increase in vehicle mileage and a certain amount of duplication of service is likely to result from this process. If the nearest available car line has sufficient capacity to accommodate the passengers from the bus line, it probably is better to confine the bus operation to purely feeder service rather than to establish it as an independent trunk line.

Serving a district lying between two rail lines is a somewhat different problem. When railway routes spread out fanwise from the center of the city, areas of considerable size may exist in the suburbs at some distance from the nearest car line. These districts may or may not be of recent development. In any event the coming of the automobile has changed the public point of view concerning transportation, and people today are unwilling to walk as far to reach a car line as they formerly did. Hence some kind of convenient service is needed. This may be given either by a crosstown feeder bus route with transfer of passengers to an adjacent rail line, or by through bus service to the downtown district. Sometimes it is

Buses Operated by Electric Railways Supplement the Car Service in Many Cities

Digitized by Google

possible to combine several crosstown feeder bus services into a route of considerable length. Usually, however, the most satisfactory way to serve a district lying between rail lines is by furnishing through bus service to the center of the city. An example of this is the operation of the Connecticut Company at New Haven.

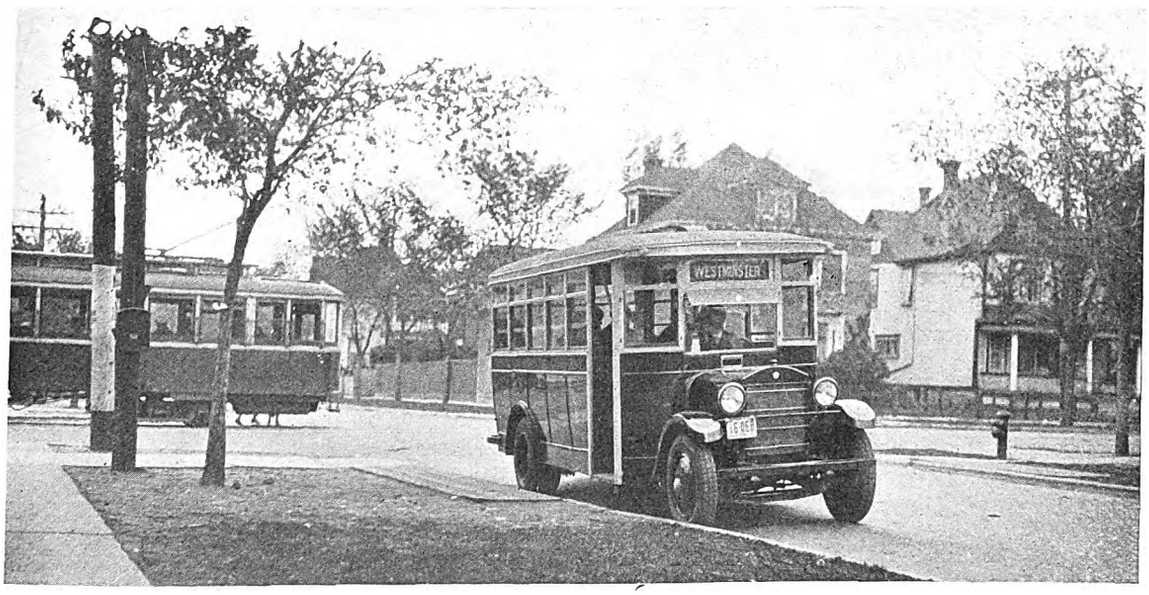
The rate of fare on a bus route operated as an extension to an electric railway is a matter of paramount importance. In general, new bus routes should pay the cost of their operation. The only alternative would be to absorb the loss in the earnings of the whole system. While it is true that bus extensions cannot be considered entirely independently of the general transportation facilities, and there are numerous instances of lines, both bus and car, that do not earn their cost of operation, the establishment of new lines of this character should be undertaken cautiously. Under ordinary circumstances, it is better to defer the establishment of feeder bus service until the traffic is sufficient to make the undertaking a financial success. The establishment of any considerable number of losing lines might easily force an increase in the general fare level.

Use of buses to supplement car service on heavy traffic lines has attractive possibilities. This can be done in either of two ways. The cars can be operated express from the center of the city to some point in the suburbs while the buses carry the local traffic. Such an arrangement has been in effect for some years at Providence, R. I., and has worked out well. A similar plan is being tried at Detroit. Attractive savings can often be made by a combination of express car and local bus operation. It is difficult, however, to operate satisfactory express service with cars, unless the street is sufficiently wide so that they are comparatively free from vehicular interference. Such freedom from interference may be secured by operating the cars on a private right-of-way in the center of the street, as is done to some extent in Boston, Baltimore, and a number of Southern cities.

A plan which has been more widely adopted is to have the cars do the local business and have the buses give express service. This is being done on a number of routes of the Public Service transportation system in New Jersey. The bus, being a smaller unit than the car, makes fewer stops. Moreover, it has greater flexibility in traffic and is somewhat less subject to delays. For these reasons the bus ordinarily is somewhat better suited than the car to render express service.

Whether or not this should be done at street car fares depends on a number of factors. In short haul railroad and in rapid transit operation, no distinction is made between the express passenger and the local passenger as regards the rate of fare. If the bus is simply acting as a supplement to the rail system, giving the same quality of service, the fare should be the same. On the other hand, if better equipment is used for express bus service, the so-called semi-de luxe type, it is reasonable to charge a fare higher than that on the cars.

Street car type bus service sometimes is used to replace electric railway service on light traffic lines. The extent to which such substitution has gone, however, is much exaggerated in the public mind. Because this has been done successfully in a limited number of instances, the layman is apt to have the idea that the bus is going to replace the car on all light traffic routes and perhaps on the heavily traveled routes also. As a matter of fact, comparatively little railway trackage has been abandoned in favor of buses. The electric railway industry as a whole in the United States and Canada has replaced rail service by bus service on only about 5 per cent of its trackage. This represents but an insignificant part of the present bus operation of the railways.



At Winnipeg, Manitoba, buses are used in crosstown feeder service connecting with car lines

Substitution of bus service in place of rail service usually is made because of the existence of conditions unfavorable to continued railway operation. It may be that the track has been allowed to deteriorate until extensive rehabilitation is necessary, or it may be that a big paving program is in prospect, either of which would cost the company large sums that it could ill afford to spend on a light traffic line. To avoid such expenditures the management may decide to substitute buses in place of cars. In many instances this plan has worked well.

When this is done there arises a serious financial prob-

Digitized by Google

lem. Under ordinary circumstances the railway is not likely to have accumulated sufficient depreciation and renewal reserve against any given piece of track, to permit writing it off the books when it is desired to substitute bus service in place of car service. For this the management cannot be blamed because the accumulation of reserve for depreciation and renewal is regulated by the state utility commissions. If the track to be abandoned is only a small part of a large system it can be written off from the general reserve fund, but if, as sometimes occurs, this track represents a fairly large part of a small system, this procedure is impossible, and the management is then faced with the problem of paying interest on the original investment out of the bus earnings. Since substitutions of this kind almost always are on light traffic lines this is a difficult matter. The ultimate solution appears to lie in a more liberal attitude on the part of regulatory bodies to permit earning and setting aside larger amounts for depreciation and renewals.

It frequently happens, also, that buses are substituted in place of cars when it is desired to make a change in routing, or when the cars are operated over single track with badly located turnouts. A number of substitutions of this kind have been made with marked success on railway systems. When the tracks were originally laid it was not possible to secure permission to follow the desired route all the way, and rather than delay the construction of the line a roundabout route was adopted. While this did well enough in the early days, it is no longer satisfactory because of the increased emphasis which the public places on speed in transportation. In other instances, the character of the neighborhood has changed somewhat since the original electric railway tracks were laid, and it is now found more advantageous to follow an adjacent street. Substitution of buses in place of cars permits this to be done with a minimum of difficulty and expense.

On single-track lines the spacing of turnouts determines the headway that can be operated. Often it is found desirable to change the headways from those used when the line was first built. This cannot be done unless the spacing of the turnouts is suitable for the desired headway. For example, to operate a six-minute headway with turnouts laid out for a 7½-minute headway, probably would cause intolerable delays. Under these circumstances the solution of the problem may be found in the substitution of bus service in place of railway service.

A complication often encountered in fitting the bus into its proper place in the general transportation scheme arises from the purchase by the railway of existing bus routes operated by independents. This has been done extensively by Public Service in New Jersey, where many routes were laid out with no attempt to prevent duplication of facilities. In fact, the principal idea of the original bus operators was to divert to themselves part of the traffic from some route already in existence, rather than develop new traffic. No real need exists for such duplication of service. Nevertheless, a certain part of the public finds it convenient, and has consistently opposed any change in routing. It is evident, however, that a substantial improvement could be made by shifting the buses to streets on which no cars are operated. This was done with marked success on one route early this year. The result was a substantial increase in the combined traffic on cars and buses serving the territory, showing conclusively that the convenience of the public as a whole was greatly enhanced thereby.

Used in its proper place, the street car type bus is a valuable adjunct to the electric railway. Its greatest usefulness, however, is not in merely duplicating rail service, nor in general is to be found in supplanting it, but rather in supplementing it on heavy traffic routes and in districts not otherwise satisfactorily served.

Possibilities of Profit in Interurban Bus Service

By J. L. SMITH

General Superintendent Gray Coach Lines and Superintendent Motor Coach Department Toronto Transportation Commission

ONLY in recent years has interurban bus operation been developed on a large scale, but a discerning public has made its voice heard and long distances may now be traveled by means of the modern parlor coach. In a number of instances this service is given by electric railway companies or their subsidiaries. In Canada, as yet, bus transportation is in its infancy and, with the exception of a few companies, operation is confined to city routes or short suburban feeders to the main city system. One of the principal difficulties encountered in the Northern states and Canada, with which the Southern states do not have to cope, is the severe winter weather and the accompanying problems of keeping the services operating. The solution of these problems should receive the most careful consideration of any company that proposes to inaugurate an interurban coach line because, once started, no route should be abandoned for a single day. Besides the loss in revenue that occurs if operation is suspended there is the more severe loss of prestige, which may prove disastrous to the whole undertaking. It is a matter of satisfaction to the management of the Toronto Transportation Commission that last winter not one single trip was lost between Toronto and Niagara Falls, a distance of 90 miles, the longest interurban route now operated by the Gray Coach Lines, Ltd., its bus subsidiary.

In 1921 four solid-tired city-type buses were all the automotive passenger vehicles owned by this company. Three years ago this had grown to a fleet of twenty. Now, in 1927, more than 120 modern buses are operated some 90,000 miles per week, or nearly 3½ times around the world. Four schedule trips each way per day are operated between Toronto and Niagara Falls, with a return trip mileage of 166 miles. Twenty-five trips per day each way are operated on what is known as the Lake Shore Highway between Toronto and Hamilton, a 43-mile run. These, together with three round trips per day between Toronto and Brantford, a distance of 70 miles, and three between Toronto and Cookstown, a distance of 55 miles, account for a considerable amount of this large mileage. Each week shows a steady increase over the preceding one.

No opportunity is neglected to increase business in every possible way. Arrangements have been made with the International Railway to make direct connection at Niagara Falls with Buffalo. Connections are made also at Niagara Falls with coaches operated by the Buffalo, Niagara & Toronto Tours. Coaches of the latter, in turn, make connection with coaches operated by the Buffalo & Erie Coach Company, the Cleveland & Conneaut Bus Company, and the Western New York Motor Coach Lines. Under this arrangement it is possible to make connection between Toronto, Buffalo, N. Y.; Erie, Pa., and Cleveland.

In addition to these services a Circle Tour has been arranged with the Canadian National Railways. This tour permits a passenger to travel one way by coach and one way by boat to Niagara Falls. Through tickets covering these services are sold at all Gray Lines offices. Time-tables are distributed at all offices, outlining the services with the direct connections that it is possible to make. Although started only a short time ago, considerable business has been worked up and it is felt that with additional advertising and the co-operation of agents of the Gray Lines, as well as those of connecting companies, it will be possible to establish a substantial traffic.

Interurban bus operators new in the enterprise may wonder what the prospects are for the future. With the rapid developments which are taking place this is somewhat difficult to forecast. It should be safe to say, how-

Digitized by Google

Interurban buses supplement the rail service of the Boston-Worcester Street Railway

ever, that this form of travel is only in its infancy, and its development will depend, to a large degree, on the quality of service given.

The question of road equipment is one of paramount importance. Seats must be as comfortable as possible and have fairly high backs. The air cushion type has proved eminently satisfactory, but if made up in two pieces the upper piece should be held in such a manner that it will not slip forward when the passenger reclines or stretches out. Windows must be so constructed as to provide easy movement. Anti-rattlers are necessary on all interurban equipment. Most companies find that smoking must be permitted on long trips, and proper receptacles must be provided for ashes and matches. Rules regarding smoking must be enforced by the drivers: firmly, but in a tactful way.

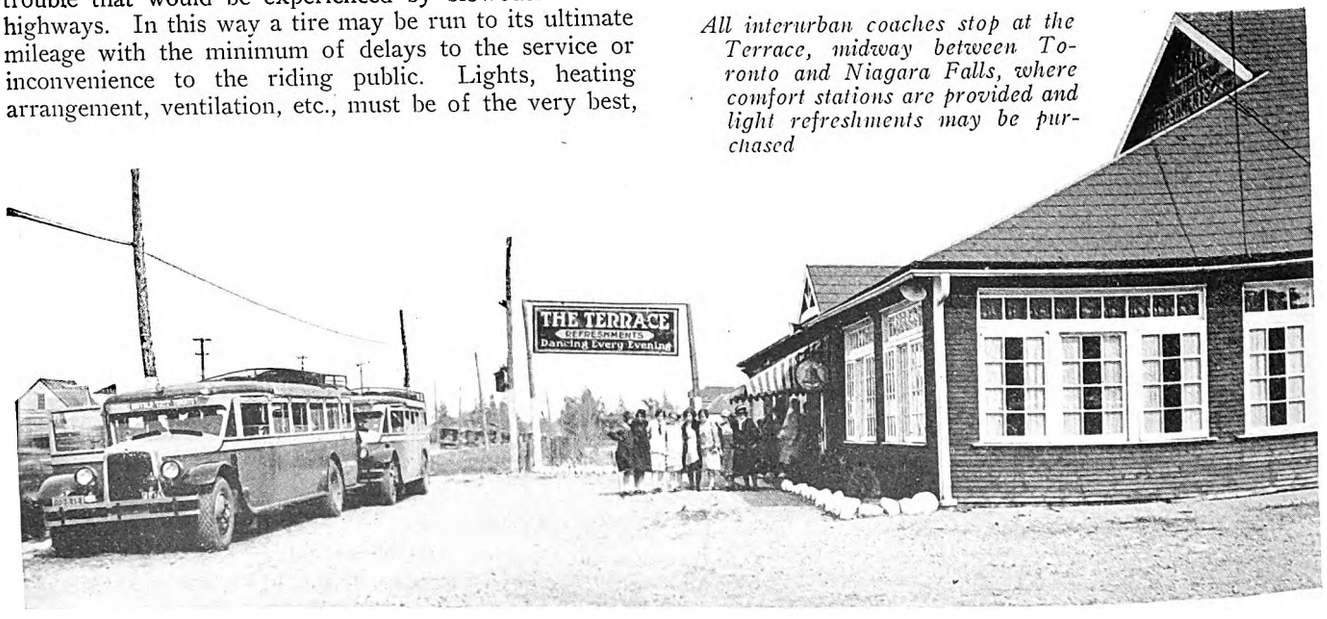
As interurban passengers will be likely to have baggage to carry, this problem must be given full consideration if the system is to run smoothly. The luggage rack on the roof should have a waterproof tarpaulin covering, and straps should be supplied to hold the bags securely in place. A system of checking should be in force. Tires are an important item in operation, and the plan of carrying two spares on every coach has proved very successful. When signs of wear are noticed tires are removed and placed on city lines, where a much shorter headway between coaches and nearness to the garage eliminate the trouble that would be experienced by blowouts on the highways. In this way a tire may be run to its ultimate mileage with the minimum of delays to the service or inconvenience to the riding public. Lights, heating arrangement, ventilation, etc., must be of the very best, and it is hardly necessary to add that the mechanical condition of the coach must be as nearly perfect as the garage forces can make it.

For the convenience of those along the route wishing to board after dark, all coaches of the Gray Lines are equipped with large green lights attached to the roof. The light can be seen at a considerable distance, and by reason of its height it is visible over the top of other traffic. An emblem recently has been designed and placed on all Gray Line coaches. This has a green disk, representing the green light on the coaches, in the center of a pair of wings above a shield. Illuminated signs of the insignia, with the green disk also illuminated, are being constructed and will be placed at all important terminals. Metal signs of the design are being placed at other stopping points, and arrangements are now being made to place signs at all stops on the various highways over which this company operates. Drivers are instructed to request passengers to "look for the green light." Aside from the advertising value, this arrangement has been of considerable convenience to the traveling public.

Perhaps no item on a long-distance run is more important than the selection of drivers. Besides being directly responsible for the safety of the passengers, they are the greatest selling force. A clean-cut, courteous and cheerful operator will bring more patrons to the coaches than hundreds of dollars worth of advertising. Obviously, drivers should be selected with the greatest care and, if possible, only men of large stature taken. They should be trained thoroughly on the route over which they are to run and impressed by every means with the necessity of not only looking for passengers at the various stopping points but of expecting them. When thoroughly conversant with the road, the agencies, and the various municipal laws affecting the operation along the route, then, and not till then, should they be given charge of coaches.

It costs a considerable sum to thus train a driver and it therefore follows that he should be kept on the chosen route as long as possible. Much is expected of the operating men and, in return, in order to keep the morale at the highest point, every facility must be given them to make their task as easy and as pleasant as possible. The following instance is cited as an example of what the

All interurban coaches stop at the Terrace, midway between Toronto and Niagara Falls, where comfort stations are provided and light refreshments may be purchased



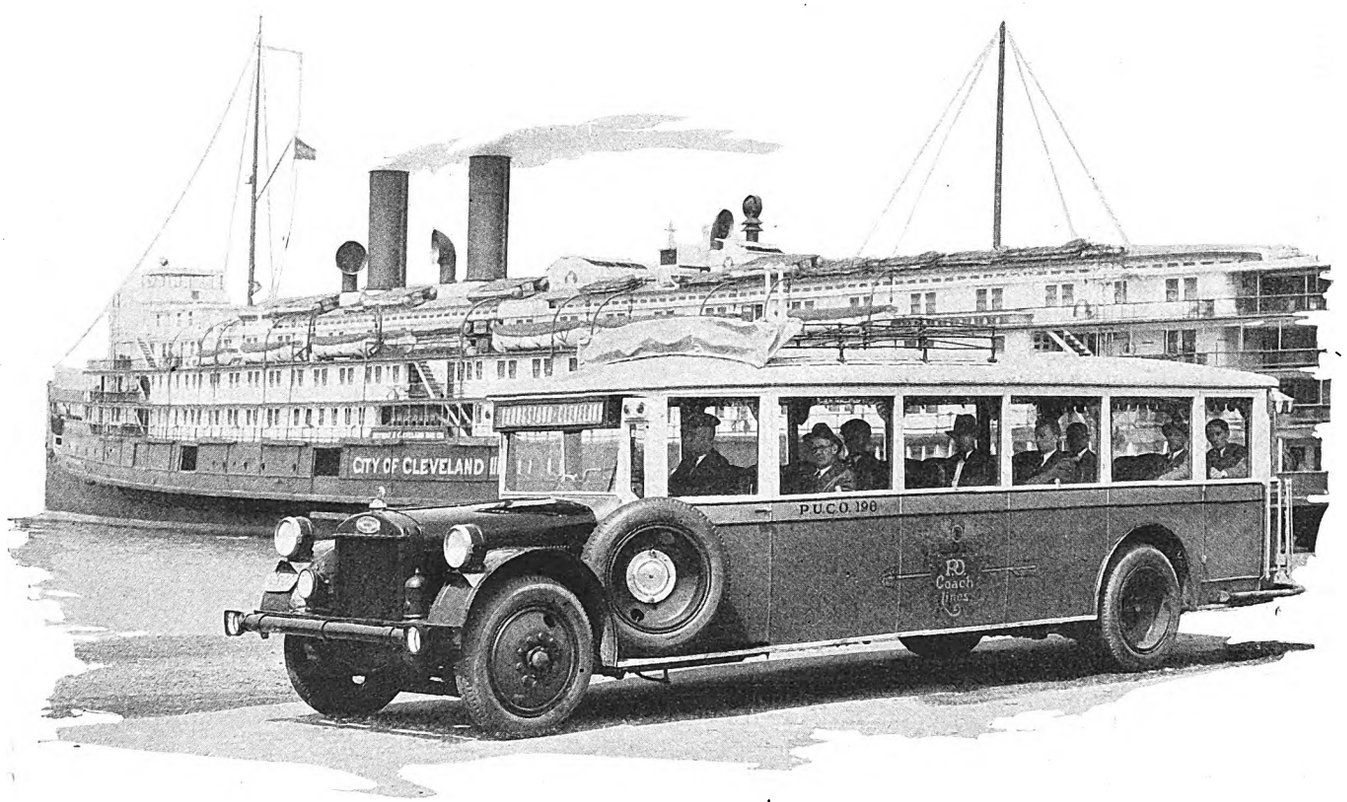
Digitized by Google

Gray Coach Lines do in this respect. During the two weeks period of the Canadian National Exhibition a special service, in addition to the regular service, is operated on all interurban routes. In one city alone, Hamilton, Ont., twenty extra drivers are required to handle the special service out of that city. A large office has been fitted up with beds to form the dormitory for these men. Wash rooms and shower baths have been engaged in the city's leading hotel, and every chance given the drivers to report for work in the morning as if they were coming from their own homes.

The local agent is a highly important advertising force. The company with which the writer is associated has gone to considerable length to establish in each municipality of any size whatever a competent and willing agent. Often he is the owner of the general store or, perhaps, the druggist; in any event, he is some one who knows the people and is in constant touch with them. After all, a little personal contact is worth a great deal of spasmodic advertising, and it is the experience of this company that the appointment of such an agent always increases the sales and the coach riding habit in that locality. A little authority granted to them will also help things, and some agents of this company who are not on the payroll are allowed to put occasional advertisements in their own local press and to check the service to a certain degree. This results in their taking an active interest in the operation. The relationship with agents should be kept friendly, and frequent visits from one of the officials and the discussion with them will do a great deal to help along this feeling.

In interurban coach operation as stopping points are reached the name of the place should be announced distinctly, as it must be borne in mind that many of the passengers are probably newcomers to the district and will not know their destination by sight. Ladies should be assisted in alighting from the coach and their baggage taken from the racks and handed to them. If tickets are used, they should be collected in a courteous manner and any information regarding the return trip accurately given. If a connection is being made with another coach line, full particulars of their operation should be known to the driver and their schedules outlined to the passenger.

When it is remembered that interurban coaches probably operate on a long headway, it is easily seen that a comfortable and convenient waiting room must be supplied at the terminals and, if possible, at important stations along the routes. The Toronto terminal of the Gray Coach Lines is provided with ticket counter, the tables, easy chairs and decorations, such as plants, etc., that make the place inviting to the traveler and a silent salesman for the company. Telephones, information booths, and proper toilet facilities for men and women are necessary. In building a bus terminal it should be borne in mind also that the architect may, in the exterior design, build a permanent advertisement of untold value.



Interurban service is operated by the Penn-Ohio Coach Lines between Youngstown, Cleveland, and Ohio

Along the routes comfort stations must be provided where the coach will stop for a few minutes. Such a station on the Toronto-Niagara Highway is shown in an accompanying illustration. Here the passenger has access to wash rooms, and light refreshments may be obtained.

Actual operation along the route will be influenced greatly by local conditions and topography, but the first and last thought must be safety. To a large degree this can be secured by the driving personnel, to which reference has previously been made. The coach itself, however, must be in the very best possible condition.

Meeting the Demands for Better Transportation in Europe

By H. W. Blake
Senior Editor Electric Railway Journal

Managers of electric railway, bus and rapid transit lines in Europe are keenly alive to the need of meeting the demand for good transportation in their several communities. Local transportation has been given in many European capitals for a longer time than here, but the development has been along somewhat different lines. Some of the methods employed appear to give better results than those followed in America. Others, while perhaps suited to European conditions, would not be adaptable here.

Roughly, it may be said that the fields of street car, bus and rapid transit service are the same as in America, though the situation varies widely in the different cities. Thus, in London, where street cars are not permitted to enter the principal office and retail business district north of the Thames, there has been great bus development. In Berlin, on the other hand, of the three facilities the street railways in 1926 carried about 75 per cent of the passengers, the rapid transit lines 15 per cent and the buses only 10 per cent. In Paris the proportions are about 45 per cent, 21 per cent and 34 per cent and in Hamburg 72 per cent, 27 per cent and 1 per cent. In the larger cities in Italy—Rome, Naples and Milan—bus operation is on a small scale compared with street railway operation and there are no real subways, although in Naples an extension of the government main line railroads passes under the city and does a little local business. Generally speaking, in all of these cities the street railways handle the bulk of the traffic. Where the bus and street railway lines are under the same management, the railway is considered more economical than the bus for mass transportation. Where there is a difference in fare, that on the bus is higher.

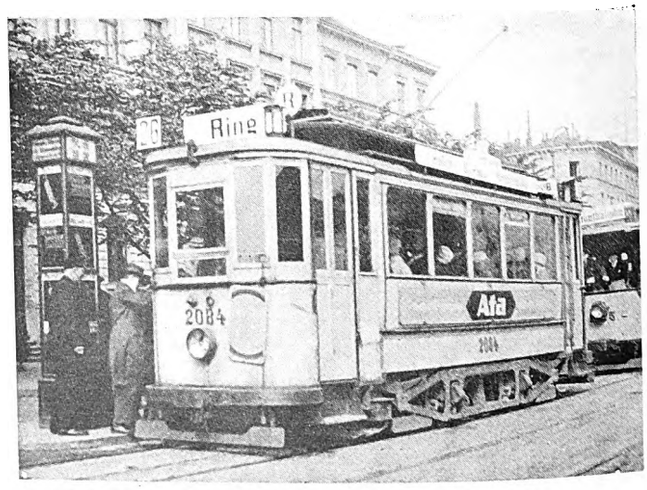
Many surface car trains are run in Berlin. Commercial advertising is often painted on the sides of the cars

Few Changes in Street Car Design

Street railway car body design in Europe has not gone through as many changes during the past twenty years as it has in America. One reason for this may be that most of the bodies in Europe are made in the country in which they are used, and each country has only a limited demand. Compared with the United States, the number of new cars built each year is much smaller. Then, too, a great deal of attention is paid in Europe to good body maintenance, especially painting. There is a corresponding tendency not to scrap cars until they are so injured in an accident as to be practically useless.

On the Continent of Europe the single-deck car is almost the only one seen. On account of the narrow streets and sharp curves, vehicles for city service have to be kept narrow, and are rarely more than 7 ft. wide over all, and often less. As cross-seats are generally used, this means that when two passengers are seated on one side of the aisle there is room for only one passenger on the other side. Reversible seats are occasionally seen, but the stationary seats in which half of the passengers face forward and the other half backward are more common. These seats are usually arranged in groups of two, facing each other, a plan similar to that in the standard European railroad coach, to which the public is accustomed. While some of the street railway seats are upholstered, slat seats are common, especially in southern France and Italy. Open cross-bench cars are occasionally seen, but they are going out of use.

In France and Belgium, the division of the interior of cars for the accommodation of both first and second-class passengers is common. The two compartments are not usually separated by a bulkhead or door, but often

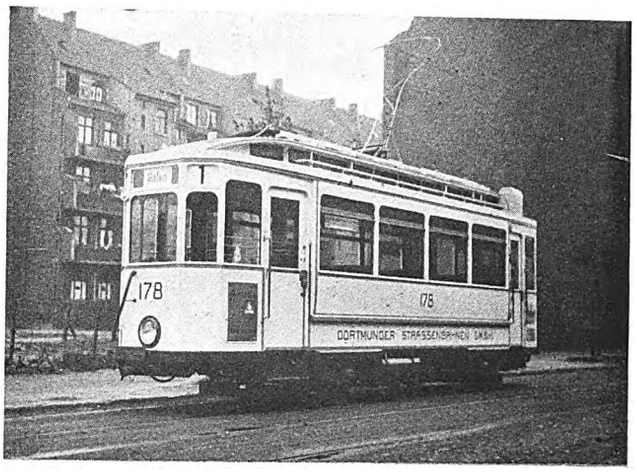


Cars in Hamburg are well supplied with route signs

Digitized by Google

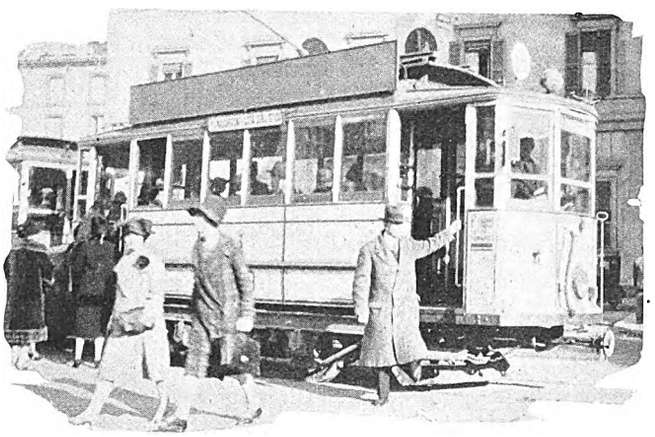
by a bulkhead only, or simply a stanchion on each side of the aisle to indicate the dividing line. The principal difference between the two compartments is that the seats in the first-class compartments usually are upholstered in plush and those in the second-class compartments are either not upholstered or covered in rattan or tapestry of a color different from that in the first class. Where center-entrance cars are used, one end is for first-class and the other for second-class passengers.

Most of the cars are double ended with end entrance and exit, though lately there is a tendency, as exemplified by the latest cars in Paris and Berlin, toward center entrances. With end entrances some companies make an effort to require passengers to board at the rear, though as hand collection of fares by the conductor passing through the car is common, the method of entrance is not important. On some lines the front platform is reserved for smokers. Where two classes of fares are collected, passengers standing on the platform pay only second-class fare, hence there is a tendency for both platforms to be crowded, even when there are empty seats in the first-class compartment inside. This means that extra support for the ends is necessary.



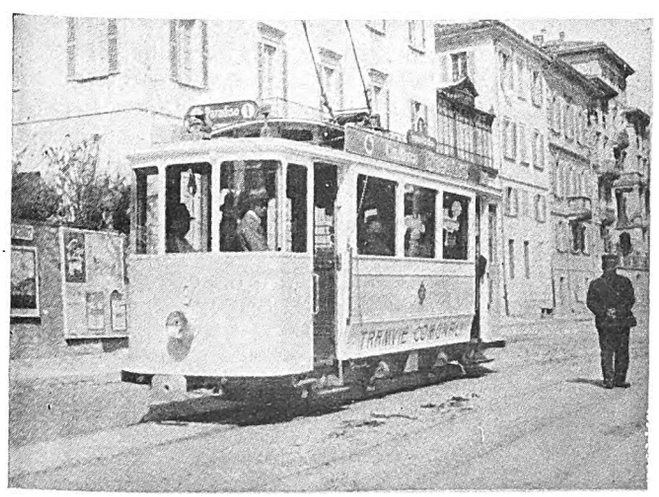
The latest type of Dortmund city car has Cardan drive

The principle of the closed platform for safety's sake is almost unknown on the surface and bus lines of Europe, and on most of the rapid transit lines the door arrangement seems much cruder than that used in this country. When a surface car or bus approaches a stopping point, passengers expecting to leave there prepare to disembark and often do so before the car has come to rest. The same is true of passengers boarding cars and buses after they have left the stopping point. While there are sometimes notices in the cars that passengers are not allowed to board or leave the car or bus while it is in motion, it seems to be customary that these notices are disregarded.



Milan is encouraging the use of the rear platform for entrance and the front platform for exit. This shows the front car of a two-car train

Most surface cars in Europe have platform doors or gates which are kept closed on the side away from the curb but they are kept open on the loading side to facilitate the rapid entrance and exit of passengers. Sometimes, as in Paris, the door opening on the curb side of the car is protected by a slight barrier, such as a chain, to prevent passengers from being thrown from the car while it is in motion, but it is attached to the side posts only by snap links and can be taken off by a passenger as the car approaches a stop. The only surface cars which the writer remembers seeing in Europe equipped with platform doors or gates operated by the motorman were some one-man cars in Amsterdam, a few trial cars recently received by the Berlin Surface Lines, and one double-deck car now on trial service on the lines of the London County Council Tramways.



This car in Lugano, Switzerland, is painted a baby blue

Double-Deck Cars Popular in England

Double-deck cars are very popular in Great Britain, but are not used to any extent on the Continent. The only single-deck cars operated in London are on lines where there are overhead obstructions which prevent the use of double deckers. Modern British practice favors the closed double deck.

Cars of the London County Council are built 7 ft. 2 in. wide on the upper deck but only 6 ft. 10 in. on the lower deck, the difference being to allow space for a man to stand between tracks when cars are passing each other. The upper decks on these cars can accommodate, therefore, four passengers on transverse seats, but there is not room for that number on the lower deck. In consequence, the lower decks on most of the L.C.C. cars in the past have been equipped with longitudinal seats, but realizing that cross seats are more popular, the management has been changing to cross seats. This meant not only a loss of five seats on the lower deck but a reduction in the carrying capacity of the car by more than five, because standees are permitted on the lower deck only up to one-third of the number of seats on that deck, and

Digitized by Google

Double-deck cars are the standard in London

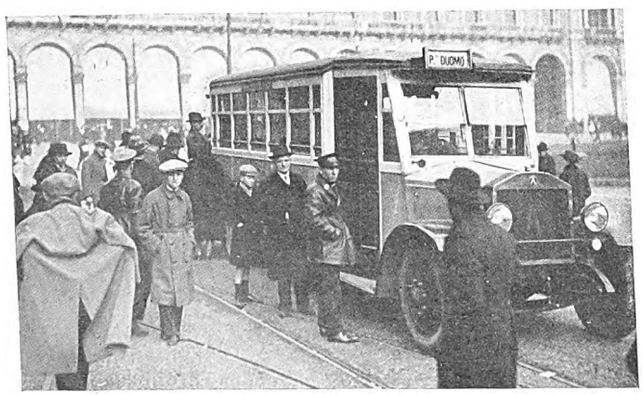
none are allowed on the platforms or upper deck. The County Council changed 100 of its cars last year to this new arrangement, and expects to change 250 more during 1927. It is fitting all of the seats of the lower deck with cushions and taking the opportunity while these cars are going through the shops to provide better inside and outside lighting and other improvements. All cars so changed over on the London County Council lines are being painted red instead of chocolate for the side panels and dash to help the prospective passenger to distinguish them.

Single Trucks General on the Continent

Outside of Great Britain, single-truck surface cars predominate in city service. In a few of the larger cities, like Paris and Berlin, there are some double-truck cars, but for the most part they are old equipment and no more are being ordered. Where double trucks are used the maximum traction type usually is employed.

One reason for the extensive use of single trucks is that the narrow streets require the use of short cars. Where more capacity per unit is required, two-car trains are used, usually a motor car and a trailer. To prevent the grinding of the wheels on short radius curves, a good deal of attention has been given to radial trucks, but their use does not seem to be increasing.

On the London double-deck cars, maximum traction trucks are the rule, though in Great Britain outside of England there are still a good many single-truck cars. Even in London, four-wheel cars are used on the London County Council Tramways on routes where the grades are steep. For such service, however, the L.C.C. is now designing an eight-wheel, four-motor car to have carrying capacity equal to its maximum traction cars. This new car will use 26-in. wheels.



Loading a Milan bus at Cathedral Square

Efforts are being made in a few cities to test the Cardan drive. Paris leads with 475 cars equipped with this form of drive. Berlin comes next with 20 or 30. There are perhaps 40 more cars in Europe with this form of drive, most of these latter being of what is known as the Albrecht pattern, named from the designer, Mr. Albrecht, general manager of the Dortmund Street Railway. The manufacturer for the Albrecht drive is the Krupp Company of Essen. While the users of these equipments speak well of them, they should still be considered as in the experimental stage.

Roller and ball bearings for both motor armatures and car journals are used more extensively in Europe than in this country. The Berlin surface lines have used roller bearings on all new equipment for three years and during this time have added more than 1,000 cars to their rolling stock. Many other companies are making them standard equipment on all new cars, and the users of the Cardan drive system say generally that roller bearings are essential in its operation.

Careful Attention Paid to Painting

A feature of all European cars, but especially those on the Continent, is the outside finish. On the surface cars light colors predominate, and white is not unusual. Another popular color is a baby blue. These colors are used not only because of the pleasing effect which they produce but also because the cars can thereby be seen a long distance away. This is both a safety measure and of help to waiting passengers. Varnish is used lavishly, so that the exteriors of the cars in many cities really have the so-called "piano finish." Subway cars in Europe do not run to the same light colors, but their exterior finish is well maintained. Instead of paint, Paris is using a vitreous enamel on the side panels of its cars. Hamburg has two cars finished in this way.

Advertising on cars, both on surface cars and on rapid transit cars, is carried far beyond that which is considered good taste and even effective in America. It is often placed on the windows in the form of etching or small transparencies, on the backs of seats, on the step risers, on the hand straps, on the outside car panels, on the trolley poles and even on the trucks.

Wood Predominates in Surface-Car Body Construction

Outside of a few of the latest cars in Great Britain and Germany, most of the street railway rolling stock in western Europe is of wood, occasionally with steel girders for side sills. Aluminum, however, is used extensively for such parts as dashes and side panels to reduce car weight. The reason given for the general use of wood is that the number of cars ordered by any one railway at one time usually is so small that templates necessary for the construction of steel cars would be too expensive. Nevertheless, efforts are being made to keep down the weight, although with only three seats across the car, the weight per seated passenger is not particularly low. Thus in the latest "light" car of the Paris surface lines, which is 37 ft. 1 in. over all, the weight of the car empty is 28,160 lb. As this car seats 30 passengers the weight per passenger seat is 939 lb.

Berlin's latest cars are of steel, and there are a number of steel interurban cars in Germany and some in other countries. While investigation has been made of

Digitized by Google

the possibility of using light metals in both car and bus construction, more has been accomplished along this line in rapid transit car body design. The Berlin rapid transit lines are building two cars of light metal and expect a saving of from 6 to 7 tons per car. At present the standard Berlin rapid transit trailer weighs 24 tons and the motor car 32 tons.

Although no special study has been made of means for reducing noise on surface cars in Europe, they are noticeably more quiet than the average car in the United States. The reasons for this and an account of the extended noise reduction experiments of the London Underground Electric Railways Company, with comments on other features of rapid transit car design, will be given in a later article.

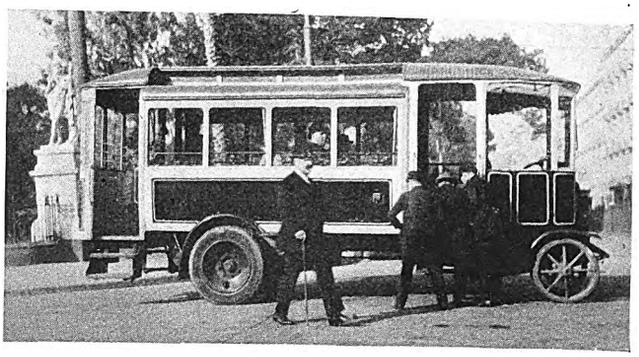
Bus Body Construction and Design

The statement in regard to the use of wood and steel in surface car bodies, made above, applies generally to bus bodies also. The largest user of steel bus bodies is Hamburg, the last twenty bodies added to the equipment there being of steel. Practically all of the bus bodies in Berlin, Paris and London are of wood.

Nearly all the Berlin and London buses are double deck. Of the 4,000 buses owned by the London General Omnibus Company only 180 are single deck and these are on routes where overhead obstructions prevent the employment of double deckers, and a few that run on suburban routes. The Berlin bus company also has a few single-deck buses for special service, but its standard city bus is double deck. Both in London and Berlin the upper deck is inclosed in the latest type of buses. In Hamburg and Paris only single-deck buses are used.

Paris is the only one of the cities mentioned which has two classes of bus fares, first and second. All buses in city service in Paris reserve the front end of the bus, usually sixteen seats on a 38-passenger bus, for first-class fares. For the 22 passengers who ride second-class there is room for twelve seated and ten standing passengers.

Cross-seats are the rule in all of the cities mentioned. In Berlin the upper deck arrangement is unusual, with a side aisle and benches holding three to four passengers each. This plan was adopted to allow a higher entrance to the lower deck, which has a center aisle. It has permitted also a reduction of the over-all height of the bus from 13 ft. 1½ in. to 12 ft. 10½ in., in a later low-floor design. The carrying capacity of the Berlin double-deck bus is 54, allowing three to a seat for the seven seats on the upper deck and 24 seated and nine standing on the lower deck. The over-all width is 6 ft. 11 in. The seats are upholstered in moquette.



Naples bus at its Public Gardens terminal

The entrance to the Paris bus is unusual in that it faces to the rear, an arrangement that the management feels has safety features. The entrances in the other cities mentioned are at the side of the rear platform. All the properties are developing low-floor buses in which the rear platform is the first step and there is a riser from this platform to the floor of the bus. Fifty of these have been built for Paris. In nearly all of the cities, the driver's seat is alongside the engine or over it, to save over-all length.

As with street cars, extended use is made of aluminum in bus construction in Europe, particularly for side panels and dashes. Studies in the use of other light metals, such as lautal and elektron for body construction, have been made by the Berlin General Omnibus Company, which is using elektron now to a considerable extent in parts of the chassis, as well as for pistons, gear housing and wheels, with considerable saving in weight.

Solid tires are used almost exclusively in city service, but most of the companies have some buses fitted with pneumatics for suburban and interurban service. Hamburg leads with proportion of six-wheel buses owned, 85 of its 90 buses being of that type, and all of them being equipped with pneumatic tires. Paris also has a number, but London has only one and Berlin two or three. One double-deck six-wheel bus in Berlin has balloon tires.

A novel feature of the Paris tires is a device to prevent them from splashing mud on nearby pedestrians. It consists of a thin fin of rubber which is outside of the tire tread. It is the same diameter as the tread and is molded as part of the tire. Paris was the only city in Europe in which this method of protection was noticed by the author of this article.

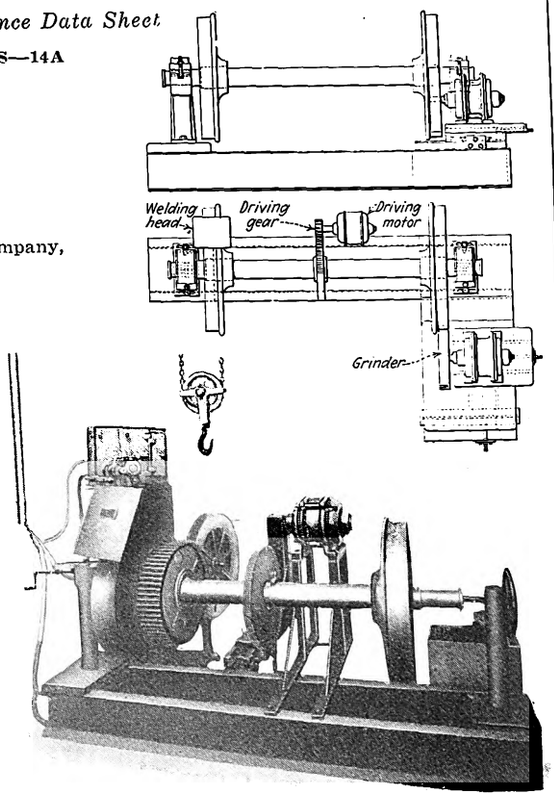
Grinding and Welding Wheels at the Same Time*

BY JAMES A. DUFFY

Superintendent of Equipment Monongahela-West Penn Public Service Company, Fairmont, W. Va.

BY MEANS of a special machine in the shops of the Monongahela West Penn Public Service Company steel wheels are ground to proper flange and tread contour while the automatic electric welder builds up worn portions. By this arrangement one man can grind wheels, weld them with the automatic head and at the same time do miscellaneous hand welding. This has eliminated the wheel lathe as a necessary machine tool and the work has been speeded up considerably. A saving in machinist's time has resulted of about three hours per pair of wheels.

The machine consists of a bedplate with two upright brackets with bearings for supporting the mounted wheels. A variable speed motor drives the wheels through gearing which is attached to the center of the axle. This gives 5, 7 and 13 in. per minute of peripheral speed. The welding head is of an automatic type and is attached to the machine. While welding up the flanges on one wheel, the opposite wheel is being ground. Special shaped grinding wheels are used so as to shape the tread and flange properly, and these grinding wheels are motor driven. The machine and gearing were made in the railway shop.



Machine arranged to hold a pair of wheels while the flanges and treads are being built up by welding and then ground

TRACK AND WAY DEPARTMENT—9

Hacksaw with Quick-Release Latch for Blade*

BY JOSEPH MERCIER

General Foreman Track Service Division, Montreal Tramways, Montreal, Canada

A STURDY hacksaw in which the saw blades are held tightly for use or release instantly when desired has been developed by the track service division of the Montreal Tramways, Montreal, Canada. The frame is constructed of a mild steel bar 1 in. x ⅜ in. x 34 in. long, and is bent to form three sides of a rectangle with one leg an inch longer than the other. This longer leg is slotted to receive the saw blade, which is secured in place by a pin fastened conveniently to the frame by a short chain.

The opposite end of the saw blade is held by a mild steel "Z"-shaped latch which straddles the end of the other leg. This latch revolves on a pivot and may be tightened to bring any degree of tension to the blade desired by pressing on the sliding ring that secures it. A substantial ¾-in. mild-steel handle is riveted solidly to the frame.

With this hacksaw the blade is held rigid at all times, and yet on the approach of a car the blade may be released instantly to be left in the rail providing it will clear the wheel flange. Formerly many blades were broken while being removed quickly from a tight cut.

Adjustable Mandrel for Babbitting Journal Brasses*

BY CHARLES HERMS
General Foreman San Diego Electric Railway, San Diego, Cal.

THE accompanying drawing shows a mandrel used by the San Diego Electric Railway for rebabbitting its journal brasses. This is adjustable so that various types can be poured on the same mandrel so long as the bore does not vary.

The adjustable feature of the mandrel reduces the time necessary for setting up to rebabbitt a bearing and assures perfect alignment so that additional machining is unnecessary. They can be placed in service without danger of their running hot due to improper alignment with the axle. By means of the side adjusting plates, an odd brass can be rebabbitted to the same thickness as standard brasses.

In pouring, the bottom of the mandrel base plate is marked to indicate the position of the back of the brass, in order to insure that this squares up and has the proper thickness at the bottom. The top is then adjusted to a gage, and the thumbscrews on the side of brass are tightened. The side adjusting plates are then moved up so as to close the gaps at the edges of the brass. The sides are then sealed with molder's clay and the babbitt is poured.

LINE DEPARTMENT—3

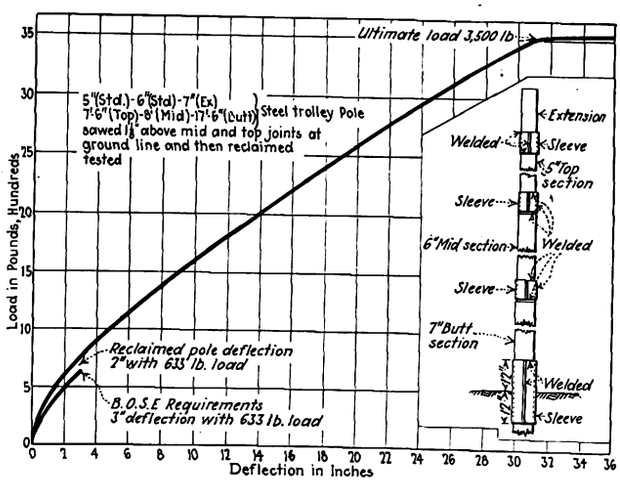
Reclaiming Steel Trolley Poles by Electric Welding*

BY E. M. MILEY
Chicago Surface Lines, Chicago, Ill.

ORIGINALLY it was standard practice with the Chicago Surface Lines to set steel trolley poles without ground sleeves and with ornamental cast-iron collars around the joints. This method did not give protection to the poles from rust at the ground line and the ornamental collars formed rust pockets at the joints. As a result, after 25 years of service they are ready for the scrap heap. There are probably 25,000 poles on the system now in this condition.

Reclamation of these poles is now being carried out by a patented electric welding process that consists of welding a 24-in. beveled split sleeve to the pole at the ground line and an 8-in. beveled split sleeve at the joints. To determine the results of this method, a pole was cut into four pieces and was welded together with sleeves. When tested it was found that the welded pole had less deflection than a new pole under the same load. The results of the test are shown in the accompanying graph.

Recently two streets were widened to a 70-ft. roadway which required 500 steel poles, each 32 ft. long. In order to save the cost of new poles for this job, old 30-ft. poles were reclaimed and extended by using welded collars.



Load deflection curve on reclaimed 30-ft. 5-in., 6-in., 7-in. steel trolley poles. Insert shows method of installing sleeves on poles

Poles can be welded either in the yard or in place on the line by use of the patented copper defining bar, at 40 per cent of the cost of new poles. When welded in place the labor of resetting and stripping the pole is saved, which amounts to approximately $75 per pole.

News *of the* Industry

Seven Cents in Fresno

Following authorization by the California Railroad Commission the Fresno Traction Company, Fresno, Cal., has put into effect 7-cent fares. Three rides are given by the company for 20 cents. The increase of 1 cent was allowed on the application of the company.

To increase further the earnings of the company a general rerouting of the various lines has become effective. In the opinion of the commission this rerouting and increased fare will enable the company to earn 6 per cent on its investment of $1,325,000.

Wage Increase on Aurora Line

A three-year wage contract has been signed by the Chicago, Aurora & Elgin Railroad, Aurora, Ill., and its 450 employees providing for an increase of 1 cent an hour each year during the period. The rate for the current year will be increased from 75 to 76 cents for operators and from 63 to 64 cents for collectors until the maximum of 78 and 66 cents, respectively, is reached. Negotiations have been in progress since the expiration of the contracts last June.

Fare Testimony in Baltimore Continues

Charles D. Emmons, president of the United Railways & Electric Company, Baltimore, Md., testified before the Maryland Public Service Commission in a hearing on an application for an emergency rate pending action on a 10-cent permanent fare. The hearing has been under way for several days. Mr. Emmons was the first witness for the company. The municipality and several organizations are co-operating with the people's counsel in opposing an emergency rate.

In support of the company's application Mr. Emmons pointed out that the passenger revenue for the first eight months of 1927 shows a decline of $293,329 compared with the corresponding period of last year. Since 1920, he said, there has been a loss of 28,678,548 revenue passengers, or 11.29 per cent.

The president gave the percentage of earnings for each year since 1920 as follows: 1920, 5.5; 1921, 4.95; 1922, 5.33; 1923, 5.43; 1924, 5.39; 1925, 5.47, and 1926, 5.39. He pointed out that in the last seven years the company had not earned the 6 per cent minimum established by the courts as a fair yield. This has not been earned, he said, despite fare increases and the practice of the greatest economies.

Mr. Emmons held that the automobile was one of the principal reasons for the decrease in car riders. He submitted a chart to the commission, in which he dealt with this subject. It was his contention that the company had lost in 1926 70,000,000 passengers who otherwise would have used the service of the railway.

Operating costs also have increased, Mr. Emmons testified, due principally to the fact that many persons have moved to the suburban sections, thereby increasing the number of car miles necessary to haul the passengers.

Higher Rates Sought in Michigan City

A petition for an increase in fare from 5 to 7 cents on local city lines in Michigan City, Ind., was filed with the Indiana Public Service Commission on Sept. 3 by R. R. Smith, receiver for the Chicago, South Bend & Northern Indiana Railway. The petition requested that the company also be authorized to sell four tickets for 25 cents with free transfers. It was brought out in the petition that a deficit of $25,245 existed at the end of 1926.

Rapid Transit Practical for Cincinnati

Beeler report suggests tying in line with city railway under co-ordination of all forms of local transportation. Report well received by Cincinnati Street Railway and by local papers

THE Beeler report on rapid transit for Cincinnati, Ohio, was delivered on Sept. 9 to the Rapid Transit Committee. It is a document of 166 pages. The studies which he made led John A. Beeler, the author of the report, to the following conclusions:

1. The rapid transit line, if it were to be operated independently and without a system of transferring between it and other transportation agencies in Cincinnati, would carry only 6,060,000 revenue passengers the first year.

2. If it were to be operated as a part of a unified system comprising also the cars and buses of the Cincinnati Street Railway, the rapid transit line would carry 37,400,000 revenue passengers the first year, but most of these would be drawn from the present street railway system without the possibility of a saving in surface car service sufficient to offset the loss

3. With a gradual merging of the independent bus lines with the unified system under a plan that would require the least expenditure on the part of the system, thus adding substantially to the traffic on the rapid transit and street railway lines, the operating loss from taking over the subway would be gradually overcome.

4. All of these conclusions are based on carrying out a number of important additions to the subway and changes in the existing surface system, among the most important of which are:

(a) Extending the subway from Central Parkway and Walnut to Fountain Square.

(b) Extending the line to Oakley and tying it in by a surface connection with Madisonville and Mariemont.

(c) Relocating the Ludlow station at Knowlton's Corner.

(d) Securing the Cincinnati, Hamilton & Dayton Railway as a tenant and serving the College Hill territory by that line.

(e) Establishing prepayment stations for the easy and rapid interchange of passengers between surface and rapid transit cars.

Mr. Beeler says the practicability of a rapid transit line in Cincinnati has long been a moot question since most of the interurbans seeking better entrance to the business center have been eliminated. Upon the proper settlement of the question of the advisability of rapid transit as a betterment to the local transportation facilities may hinge the future greatness of the city. The population of the Cincinnati metropolitan district is about one-third that of Boston or Philadelphia, one-fifth that of Chicago, and less than one-tenth that of New York, but its transit project is not disproportionately large. In fact, the rugged topography and the wide spread of the industrial sections emphasize the necessity for it there.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Sept. 19-23—American Welding Society, national meeting, Book-Cadillac Hotel, Detroit, Mich.

Sept. 26-30 — National Safety Council, annual congress, Hotel Stevens, Chicago, Ill.

Oct. 3-7—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.

Oct. 18-21—National Association of Railroad and Utilities Commissioners, thirty-ninth annual meeting, Baker Hotel, Dallas, Tex.

Oct. 26-27—Public Utilities Association of West Virginia, annual convention, Parkersburg, W. Va.

Oct. 26-27—Society Automotive Engineers, Transportation Section meeting, Hotel Sherman, Chicago, Ill.

Digitized by Google

As Mr. Beeler sees it, Cincinnati's topographical condition is responsible for the inception of the rapid transit line and for most of its local transportation troubles. Since the local transportation situation has recently been made the subject of negotiations resulting in the settlement of many troublesome questions, Mr. Beeler sees a clear field for mutual consideration of this important matter and a basis for working out a plan of operation that should leave little room for differences of opinion. According to him with a fixed return on the company's investment and a control by the city that wisely exercised must work to the distinct advantage of the public, an ideal condition exists. He says:

There is a general and prevailing belief in Cincinnati that the Rapid Transit Line to be used and useful must be a part of a city-wide system. In our opinion, too, this is a prerequisite to the whole undertaking. It is, therefore, quite unusual in that the city finds itself in the unusual position of negotiating through one branch of its government with the company for the operation of the Rapid Transit Line and of having the authority to approve or disapprove through another branch of its government the results of these negotiations. Far from opening the way to a disagreement or a deadlock, however, this condition will act toward facilitating an agreement on a sound basis far beyond what might be expected if the company were not under city control.

The problem, therefore, simplified and stated bluntly, is whether the people of Cincinnati, having put $6,100,000 into an enterprise that is useless unless $10,600,000 more is spent, can spend the additional amount on the ground that it will be of great advantage to the city as a whole and can ultimately be expected to pay a return on the additional investment at least. To answer this question explicitly, we would say that it can be done, but only with the maximum amount of co-operation, patience and fostering care, especially in the early years, and involving as the first step the unification of all local mass transportation into the one city-controlled system and diverting all possible business to the unified system, through such city control.

He expresses this opinion:

The new line will open up such sections and make it possible to reach an enlarged territory with a minimum cost.

The mere building of the line will advance business activity, while its operation will do much to force Cincinnati ahead, add to its prestige, relieve the ever-increasing congestion of traffic in the center of the city, increase property values and aid industrial enterprises by supplying their employees with rapid transit at a low cost. Of so great an advantage will this undertaking be that the community can well afford to pay the cost of carrying the investment for the early years, at least, if there is a reasonable hope that it can be made to pay its way later, and our conclusion is that this can be realized.

The city that 50 years ago built its own railroad through two states to the south to increase its commercial prosperity and pioneered with the greatest municipal university to perpetuate its social and cultural life should not be daunted today by a relatively small expenditure to insure its future prosperity. The foundation for a great city was laid by the forefathers who reckoned in results and not in first costs.

Be There for the Opening!

FOR the first time in the history of the American Electric Railway Association the executive committee has agreed to open the convention exhibit on Saturday. It urges early attendance. The New York special train leaves Friday night, arriving Saturday morning. Special cars carrying delegates from St. Louis begin to leave that city Friday. Some of the other delegations, however, are not scheduled to arrive until Monday.

Despite the fact that Wednesday will be set aside entirely for the inspection of exhibits, the tendency among delegates is to see the show at once upon arriving. By getting to Cleveland early this can be done before the sessions are scheduled to begin and without detracting from the value that attaches to the all-day inspection on Wednesday. There is a great deal to see. Get there early if it is at all possible to do so! The executive committee urges it. Moreover, you owe it to yourself to do so.

The significant question Mr. Beeler propounds is: "Will the present generation falter, even though the project cannot be made self-sustaining from the start?"

It was the need of obtaining a disinterested and enlightening answer that led to the employment of the Beeler Organization by the city of Cincinnati and the Cincinnati Street Railway, the first representing the taxpayer and the second the car rider, upon whom in some proper proportion will fall the cost of completing and operating the line if that is decided upon.

How the Railway Feels

Walter A. Draper, president of the Cincinnati Street Railway, said that a complete and definite opinion of the Beeler report could be given only after it had been carefully analyzed. He said in part:

The conditions which Mr. Beeler states as requisite and precedent to the successful operation of the rapid transit line are not easy of accomplishment; in fact, it cannot be stated with certainty that all of these necessary conditions can be accomplished. One necessity he points out is the diversion to the rapid transit and surface system of all riders along routes of that system or in territory tributary thereto. In other words, there would have to be an elimination of any duplication of service and motor coach lines would be limited to territory that would not be served by the rapid transit and surface system. It is questionable how soon and how completely this could be accomplished. Other necessities are the serving of College Hill by the interurban line now there together with bus feeders, and also the serving of Cumminsville by the rapid transit line with bus feeders. These, and similar things which he indicates must be done in order to insure the success of the operation of the Rapid Transit Line, cannot be done arbitrarily. The report is very clear on these matters and points out just how much will be lost to the new system by inability to carry out any one of his suggestions.

I have previously outlined the position of the Cincinnati Street Railway that if the rapid transit line can be operated in connection with the surface lines as part of one system so that a reasonable rate of fare will provide for the operating costs of the enlarged system plus the taxes and fixed charge of the present system as operated by this company, we are desirous of joining with the city in putting this structure to good use. It is quite desirable that the rapid transit line even to the extent now built shall not lie idle and unused.

On the other hand, it is a prime necessity that the existing transportation system, which is being improved each day to serve more adequately the people of Cincinnati, shall not be impaired or endangered either physically or as to its credit, since even with the completion of the rapid transit line the greater number of the traveling public will have to depend wholly or in part on the present system.

Under the plan of city control and a provision that the rate of fare shall be no more than the actual cost of giving the service, including a fixed return to the investors, the city is vitally interested in seeing that no mistake is made by which its transportation system might be called upon to assume a greater burden than it can carry.

How Shall the Cost Be Met?

The question of practicability not only is involved, but there is also the problem of how the cost of building and operating the rapid transit line shall be distributed equitably between the general tax payer and the car rider. It is recognized, as Mr. Beeler has so clearly pointed out, that the operation of the rapid transit line will be a benefit to the city in relieving traffic congestion and in making new and remote sections of the city more readily accessible, thus opening up new territory for development and adding to the taxable values. It will add to Cincinnati's importance and prosperity in manifold ways. In these circumstances the public which uses the transportation facilities, that is, the car riders, should be called upon to pay for the additional and improved facilities offered by the rapid transit line only to an extent that is consistent with a reasonable rate of fare, adequate service and the maintenance of the system in good condition.

Fortunately the problem of dividing these costs equitably is one on which with proper understanding it is impossible for the company and the public to be arrayed on opposite sides, because the public itself is just as much interested as the company in seeing that any arrangement made is one that will be both practicable and equitable.

Mr. Draper promises a careful and detailed study of Mr. Beeler's report without delay from the point of view of the principles established in the city control and service-at-cost franchise, under which the company is operating and which so clearly fixes the responsibilities and protects the interests of the city, the riders and the company.

All four Cincinnati papers received the report favorably. The opinion of all of them was, perhaps, best reflected by the Cincinnati *Enquirer*, which for several years has included under the caption "The *Enquirer's* Platform for Cincinnati" the item "Building of Rapid Transit System With a Workable Plan of Operation."

New York Bus Hearing Sept. 26

The New York Transit Commission has set Sept. 26 for the first hearing on the application of the Equitable Coach Company for certificates of convenience and necessity covering the operation of bus lines in Manhattan, Brooklyn and Queens. Franchises for these were granted to the company by the Board of Estimate several weeks ago. It is expected that there will be strong oppositions to the granting of certificates. The Fifth Avenue-New York Railways interests in Manhattan are expected to oppose the granting of certificates for the cross-town lines in Manhattan and the Brooklyn-Manhattan Transit Corporation interests are expected to oppose certificates for Brooklyn, as the Coney Island & Gravesend Bus Corporation, a subsidiary of the Brooklyn-Manhattan Transit, was an unsuccessful bidder for the Brooklyn franchises. The franchises are subject to the approval of the commission on the basis of the convenience and necessity of the service intended to be given.

The Surface Transportation Corporation, a subsidiary of the Third Avenue Railway, has been granted a certificate of convenience and necessity by the Transit Commission authorizing it to operate twelve bus lines in the Bronx. The plan of financing the new bus service was also approved, the corporation being authorized to issue 1,000 shares of capital stock of a par value of $100 a share, to provide working capital of $60,000 and $40,000 as a guarantee to be deposited with the City Comptroller. Slaughter Huff, president of the bus company, stated recently that it was the intention of the management to purchase 104 buses.

Fares on the bus routes will be 5 cents, with a 5-cent transfer fee to ten lines which the company has applied for in the Borough of Manhattan.

Buses to Run in Reno

The Reno Traction Company, Reno, Nev., suspended operation on Sept. 7. The line is to be scrapped. Buses have supplanted the railway system. The system was one of only 8 miles. It was until recently the sole survivor among the few roads built in that state.

Trial Service on Decatur, Ill., Route

The Illinois Power & Light Corporation has started bus line service on the Riverside route in Decatur, Ill., for a six months test period and suspended the railway service in that district. Two large buses are in the service.

Buses to Operate Between Chicago and Aurora Terminals

The Western Motor Coach Company has been granted a certificate of convenience and necessity to operate buses between the Chicago and Aurora terminals of the Chicago, Aurora & Elgin Railroad. Col. Edward Blair, general manager of the road, said it would be about Nov. 1 before service was instituted. Six daily trips each way are proposed. Permit to operate between Geneva and Chicago and Elgin and Chicago is also to be sought.

Higher Fare Sought in St. Paul

The St. Paul City Railway, St. Paul, Minn., has petitioned the Minnesota Railroad and Warehouse Commission for an increased rate of fare to enable it to pay 7½ per cent on a valuation of $16,503,557. A hearing has been set for Oct. 14. Fixed tentatively in 1926, the rate is 8 cents cash and six tokens for 40 cents. It is believed that a minimum rate of 7 cents or more will be required to avoid a deficit which was shown in 1926 and which is the outlook for 1927. The petition cites that the return in 1926 was 4.42 per cent and based on figures for seven months will be 4.64 in 1927. The company arrived at the figures mentioned by taking the commission's valuation of 1925 and adding capital improvements made by the railway up to Jan. 1, 1927, or more than $300,000.

In a fare decision of two years ago the commission said a higher rate of fare than then specified should be allowed the company, but it suggested certain remedies by the Council to let the rate be as low as in Minneapolis. An enabling city charter amendment presented to the voters was turned down in the fall of 1926 and again Sept. 6. This amendment allowed the city $200,000 a year to take care of paving between tracks, sprinkling, sweeping and cleaning the tracks of snow and ice, and would have saved the company something like $115,000 annually in a relief from these duties specified in the city charter.

T. Julian McGill, vice-president of the Twin City Rapid Transit Company, the holding organization, said that after exhausting every effort for two years "we have failed to get relief from unnecessary and unfair expenses which the carrier must pay. The company is now facing the necessity of refunding in the near future its bonded indebtedness and therefore it is essential that the earnings of the St. Paul City Railway be brought up to that authorized by law and agreed to by the City Council, the Railroad and Warehouse Commission, the United States Court and the company. The company will continue to give St. Paul its fullest co-operation."

Although the company is earning a reasonable return in Minneapolis at 8 cents and six tokens for 40 cents, St. Paul earnings in 1926 were $500,000 below the necessary figure at the same rate of fare.

Economies recently proposed in St. Paul included the introduction of one-man cars, operation of short lines, re-routing of four lines and the elimination of owl cars on every other parallel line.

Details of Oklahoma Railway Purchase Made Public

Purchase of the majority of the preferred and the common stocks of the Oklahoma Railway, Oklahoma City, Okla., by a group of Oklahoma City citizens was officially announced on Sept. 6. The sale was made by the Southwest Securities Company to the following Oklahoma City people: William Mee of the Security National Bank, T. C. Thatcher of the Oklahoma City Mill & Elevator Company, A. E. Monroney of the Doc & Bill Furniture Company, H. R. Hudson of the Oklahoma City, Ada & Atoka Railway, O. A. Campbell of Campbell & Price, contractors, and G. A. Nichols of G. A. Nichols, Inc., real estate. New officers of the company will be: H. R. Hudson, president; G. A. Nichols, vice-president; Charles Hoopes, secretary; Reba Zimmerman, treasurer. The latter two are at present officers of the company.

The price paid to the Southwest Securities Company was $275,000 for 29,828 shares of the common stock and 8,522 shares of the preferred stock. This is approximately 70 per cent of the outstanding stock.

The financial structure of the Oklahoma Railway is as follows:

Common stock issued, par value $100 a share	$3,800,000
Preferred stock issued, par value $100 a share	1,795,900
Junior mortgage 6 per cent bond due Jan. 1, 1927	290,000
An unsecured 5 per cent note for	100,000
Collateral trust note 8 per cent, due Jan. 1, 1928	825,000
Underlying and first and refunding bonds, due in 1928 and 1941, 5 per cent	4,947,000

The purchasers have also acquired a majority of the $290,000 junior mortgage bond issue and the unsecured 5 per cent note for $100,000, also the Belle Isle Boating Company, a subsidiary of the Oklahoma Railway.

The property purchased comprises 65 miles of city railway and 75 miles of interurban railway. The lines are equipped with 129 cars. In addition, there are 26 buses. The power plant belonging to the company furnishes current for railway consumption and for the cities of Edmond, Guthrie, Cashion and Yukon, and the many industries located on its lines.

The Oklahoma Railway has been in the hands of the receivers since Dec. 27, 1924. The results of operation under this receivership have been better than in any previous years. The rapid growth of Oklahoma City is largely responsible for increase in business, according to those who are interested in the company, and anticipated future growth furnishes the motive for the purchase of the property.

Immediate operation of the property will remain unchanged, as it is necessary to confer with the court for its approval of the reorganization plan. The purchasers hope to lift the receivership within the next 30 days. Engineers have been employed to study the physical property and suggest additions and betterments.

Personal Items

Rochester Shoppers Use the Street Car

Eighty-nine per cent of the shoppers of Rochester, N. Y., use the street cars in going downtown, it was revealed by a survey conducted by Boy Scouts under direction of the Rochester Engineering Society. The Scouts interviewed all shoppers in sight and found only 11 per cent went in automobiles. A proposed ordinance to eliminate parking downtown between the hours of 4:30 and 6 p.m., the rush hours, brought about the survey, the results of which, backers of the proposal claim, showed that such a plan would not inconvenience any large proportion of the public.

Bond Application of Brooklyn Company Denied

The New York Transit Commission on Sept. 7 denied the application of the Brooklyn-Manhattan Transit Corporation for a rehearing on its proposal for an issue of $20,000,000 of ten-year 5 per cent gold bonds for equipment purposes, the bonds to be sold by the New York Rapid Transit Corporation, the operating company, to the B. M. T., the holding company, at a price of 80.

The original application of the company was denied several weeks ago after the proposal had been condemned by Samuel Untermyer, special counsel for the commission. In its application for a rehearing the company said the commission had exceeded its powers, confusing its duties as a regulatory body with its duties as agent for the city under Contract No. 4.

It is expected that the company will appeal to the Appellate Division for a writ of certiorari, thus making certain a court review of the matter. This, too, had been anticipated and the application for a rehearing was regarded as a necessary preliminary to court action.

Mr. Untermyer contended that the selling of the bonds of the operating company to the holding company at 80, inasmuch as it would yield only $16,000,000 to the operating company, would cause a loss of $4,000,000, ultimately, to the city, in the event of the recapture of the city-owned lines as provided for under contract 4 and as contemplated in the proposed unification plan.

Gain in Rides on Chicago Surface Lines

For the first seven months of 1927 the increase in riding on the Chicago Surface Lines, Chicago, Ill., over a similar period in 1926 was 9,656,768. Only June and July showed decreased business. The report showed that nearly 71,000,000 of the July rides were on original payment of fare and nearly 54,000,000 were on transfers. Free passengers totaled 3,600,390. For July divisible receipts were $268,682 after expenses, taxes, interest on purchase price and other charges, against $417,814 in June and $310,840 in July, 1926.

Messrs. Venning and Clark Among Cincinnati Men Promoted

Several important promotions in the operating departments of the Cincinnati Street Railway, Cincinnati, Ohio, have been announced by J. H. Stewart, general manager. These advancements, which became effective on Sept. 1, are designed to take care of the company's new system of power distribution.

F. J. Venning will continue as superintendent of power, but in addition will have jurisdiction over the Pendleton power house and all operations incident to the production of power. He will have charge over the transmission lines to the point where current is delivered to switches in the substations and all feeder lines from the time they leave the substations, as well as the overhead trolley lines. Mr. Venning affiliated himself with the company in 1910 as superintendent of construction.

W. P. Clark, paving engineer, was promoted to assistant superintendent of track and roadway and will work under the supervision of J. H. Sundmaker, superintendent of maintenance of way. Mr. Clark will assist Mr. Sundmaker in handling the large program of track reconstruction work which is being carried on by the company.

H. L. Swift, assistant superintendent of maintenance of way, was appointed superintendent of substations and will have jurisdiction over the maintenance of present stations and the construction of the new stations, including the installation of the equipment. Mr. Swift formerly was with the American Window Glass Company, Monongahela, Pa.

J. A. Noertker, who entered the employ of the company in 1921 as a draftsman after his graduation from the University of Cincinnati, was appointed electrical engineer. He will look after the electrical engineering details connected with the installation of the new substations.

H. C. Genrich, who started with the company in 1895 as trouble lineman and rose to the office of electrician, was appointed chief electrician. He will continue to supervise the inspection and the maintenance of the present substations and will assist in the work of constructing the new ones.

Messrs. Robinson and Murray Advanced

A. E. Robinson and W. H. Murray have been made assistant purchasing agents of the Georgia Power Company, Atlanta, Ga. While Mr. Robinson has been assigned to the parent company, Mr. Murray will be connected with the Empire Construction Company, a subsidiary. F. A. Jordan, supervisor of purchases, announced the promotions.

Mr. Robinson has been with the Georgia utility for more than fourteen years, having served in the purchasing department for the past twelve years. Mr. Murray has been with the company for four years, the entire period having been spent in the purchasing department.

Changes in Wisconsin Property

John I. Allen has been named assistant secretary-treasurer of the Wisconsin Gas & Electric Company, Milwaukee, Wis. In this capacity he succeeds the late Emil Jorgenson.

G. N. Bingen was appointed auditor. He succeeds Mr. Allen.

H. R. Hudson Heads Oklahoma Railway

H. R. Hudson, elected president of the Oklahoma Railway, Oklahoma City, Okla., by the new owners of that property, is president of the Oklahoma City, Ada & Atoka Railway, which operates steam railway lines from Oklahoma City to Shawnee, Ada, Atoka and intermediate points.

OBITUARY

ZIBA F. GRAHAM, who established and built the first Washington, Ind., railway system and operated it until a few years ago, when he sold the line to the city of Washington, died at Conway, Mich., on Sept. 6. He also owned the electric light plant in Washington at one time. Mr. Graham was 74 years old. He was the father of Joseph B., Robert C. and Ray A. Graham, prominent automobile manufacturers.

FRANK GRAHAM JONES, former general manager of the Memphis Street Railway, Memphis, Tenn., died on Sept. 9 at the Mayo Clinic in Rochester, Minn. He went to Memphis from New York State in 1893 and became general manager of the old Citizens Railway. Under his management this company did much development work including the taking over of smaller lines and the double tracking of the east end line. He served as manager until the line was merged with the former Memphis Power & Light Company. In the ownership of the Memphis property he was for twenty years a partner of G. K. G. Billings. In 1918 Mr. Jones was appointed a fuel director for the District of Columbia by the United States Fuel Administration. He was 69 years old.

A. W. WEYKER, long connected with the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., and in recent years in charge of the railway lines of that company in Racine, died recently.

Manufactures *and the* Markets

Delegates Urged to Attend Exhibits Opening Oct. 1

Members of the exhibit committee are urging delegates to arrive in Cleveland in time for the opening of the exhibits at noon on Oct. 1, as this will permit leisurely inspection before the convention rush. Exhibits will be open to the public on Oct. 2, from 2 to 5 p.m. and on Oct. 5 from 7 to 10 p.m. The public showing is under the auspices of the Cleveland convention committee. By arriving on Saturday and viewing the exhibit en family, so to speak, delegates, it is thought, will gain a better idea of the big show, and will have time to discuss the features in a technical manner undisturbed by the public and the pressure of other convention business.

Virginia Electric to Double-track Ocean View Line

Officials of the Virginia Electric & Power Company, Richmond, Va., express their intention of beginning the double-tracking of the Bay Shore-Norfolk Street car line to Ocean View as soon as the right-of-way is clear. The company recently allocated $207,000 to the project.

Most of the right-of-way for the second track is clear and the company does not expect to have serious difficulty in completing it.

$750,000 for Power System Announced in Cincinnati

Contracts involving the expenditure of $750,000 for a complete new power distribution system of eighteen substations have been awarded by the Cincinnati Street Railway, Cincinnati, Ohio. The eighteen substations will be situated at various points throughout the city, and as soon as the new equipment can be placed in operation the railway company will purchase its entire power supply from the Union Gas & Electric Company, a subsidiary of the Columbia Gas & Electric Company, New York.

Officials of the railway state that the new arrangement not only will result in economy in operation but will provide the system with an adequate power supply, permitting faster and more dependable service throughout its system. With the thought of eventually obtaining all of its power from the Union Gas & Electric Company, the Cincinnati utility, in 1921, entered into a contract with the union company for the purchase of one-half of its power. The power the Union Gas & Electric Company generates is 60-cycle alternating current, while the generating equipment of the railways is 25-cycle. This has prevented an interchange of power between the two companies and the substations which were supplied with the Union Gas & Electric Company's power were equipped with converters which could not be hooked up with the Pendleton station supply. At times this condition caused considerable difficulty, as it made it impossible to feed sections of the system normally applied by one source with current from the other source.

Engineers of the railway have been engaged for more than a year preparing plans and specifications for the new substation layout.

First Come First Served Rule on Track Exhibit Space

Before he left on Sept. 15 for Cleveland, where he will establish headquarters of the exhibit committee in the Cleveland Auditorium, Fred C. J. Dell announced that in order to avoid traffic congestion near the auditorium the rule of "first come first served" will hold for exhibits to be placed on the track space.

"Assignments of track space have been forwarded to all exhibitors whose applications have come in," explained Mr. Dell. "While tracks have been assigned to certain companies, much depends on how the exhibit cars arrive in Cleveland.

"Charles H. Clark, engineer of maintenance of way Cleveland Railway, who is chairman of our special sub-committee on car exhibits, will have charge of placing all of the car equipment upon exhibition tracks. Owing to the necessity of eliminating any traffic delays on the busy thoroughfares near the auditorium, Mr. Clark will seek to handle cars so as to economize time in getting them placed in the exhibit area set aside for car displays."

"This means" explained Mr. Dell, "that while a certain company may have been assigned to a certain track, that carries no assurance that the company's car or cars will go on that track. These cars are to be placed in the exhibit area with the aid of a portable curved switch. The switch must be moved with a crane, attached to a work car and it is not practical to move the switch from one track to another, because every time it is moved the street cars on St. Clair Avenue and the automobile and truck traffic is delayed, at least that portion of it going in the westerly direction.

"Liberty" Wants a Statesman

ONCE more the street car is put on the defensive. Once more it is labeled "archaic." Even the editor of a high-pressure magazine like *Liberty* falls into the rut of opinion expressed by those who know little about the facts of traffic and local transportation. While calling upon the motor car manufacturers to produce a "Statesman of Transportation," in an editorial published in its issue of Sept. 17, 1927, *Liberty* summarizes the situation as follows:

> Numerous solutions of the problem [traffic congestion] have been offered, of course, but no one of them will do the job. *Street cars are on their way out as archaic.* Buses, taxis and subways give congested populations greater mobility. Chicago was the first to try double-deck streets. Other cities will follow.
>
> Two-level streets speed up traffic movement. In spite of these makeshifts, people get in one another's way and automobile jams are growing worse.
>
> The automotive industry has the most at stake in this situation.

Here are a number of statements which are of great interest to the local transportation industry. Taking the last one first, *Liberty* apparently starts with the wrong premise. The automotive industry has a lot at stake, to be sure. So also has the $6,000,000,000 electric railway industry. *Liberty* joins with Walter P. Chrysler and L. F. Loree in the superficial conclusion that the street car is on its way to the scrap heap. If these gentlemen are really interested in the status and future of street cars a trip to Cleveland during the week of Oct. 2 would help considerably to clarify their thinking.

It is not the automotive industry that has the most at stake in the traffic situation. It is the community itself which is losing the most and which will be called upon to foot the bill for whatever relief plans are undertaken. "Two-level streets speed up traffic movement," says *Liberty*. But who is going to pay for them? The automobile manufacturers? Certainly not! They didn't pay for the two-level street in Chicago, and their primary objective in producing a "statesman of transportation" would be to make sure they don't pay for them anywhere else. Of course, there isn't anything wrong with that. The responsibility of providing adequate thoroughfares for the movement of people in cities belongs to the community and to the property owners, the latter because greater accessibility increases the value of their holdings.

Even *Liberty* will probably agree that the community should and probably will pay the bill for facilities to reduce traffic congestion. It seems reasonable to assume also that the primary purpose of traffic relief is to permit people to move about in cities with greater speed, comfort and convenience. If that premise is granted, where does it lead? Certainly, our premise precludes the conclusion that traffic relief should be undertaken from the point of view of increasing the market for more automobiles.

It is at least interesting to pursue this reasoning just one step further. In the Sept. 17, 1927, Annual Convention Number of the JOURNAL, on page 485, E. J. McIlraith, staff engineer of the Chicago Surface Lines, expressed in rather vivid language some figures on relief of traffic congestion that are the outcome of several years of careful study and analysis. He says that one four-track electric line on specialized right-of-way can serve more people in the rush hour than 25 boulevards used by private vehicles alone. Certainly that is of some importance to the community which undertakes to meet the bill for traffic relief!

Liberty calls on the motor car manufacturers to take the lead and promises that the 20,000,000 car owners will gladly follow. What about the 16,000,000,000 passengers who annually depend for transportation on the electric railway lines of the country? Are they not entitled to consideration in approaching the problem of traffic relief? The country needs a statesman of transportation. But it won't get what it needs if he represents the very manufacturers whose product has caused our present congestion.

Onus for Delay in St. Louis on City

HOPE has been renewed that something tangible may come out of the moves now being made in St. Louis in connection with the affairs of the United Railways. These moves have to do with an appeal to the Public Service Commission for the approval of the securities intended to be issued under the terms of the reorganization plan and with the granting of a new franchise to the St. Louis Public Service Corporation, the proposed successor to the United Railways.

Many things have militated against the lifting of the receivership, not the least significant of which has been the attitude of the city toward the franchise and the financial affairs of the company. Some things, however, appear to be clearly defined. While Mayor Miller has outlined four tentative modes of procedure, one of which contemplates municipal ownership, he is set against this procedure. In this, of course, he is wise. He apparently is reconciled to a service-at-cost proposal, but has split with the company over the allowed rate of return. In addition he has not seen his way clear to accept the value of $60,000,000 which the reorganization committee made plain it was willing to have fixed for its property. This appears to have been a real concession, for the general belief is that the commission, if the company insists upon it, must fix a value for the property much in excess of this amount.

Meanwhile the city talks through the Mayor about the need of it having expert advice. Such advice it has had in the past and is entitled to in the future. Only recently one of the country's most prominent utility experts has reported to the Mayor findings not yet made public in full, but said to contain recommendations for co-ordination, with operation on a service-at-cost basis. St. Louis is entitled to all the advice it can get, but it does seem that the city has not availed itself fully of recommendations that have been made in the past. That is unfortunate.

Not all the moves made in a receivership that has

Digitized by Google

existed since 1919 can even be indicated in comment of this kind, but one thing is certain, the disposition on the part of the representatives of the security holders has not been to prolong the receivership. In fact, the decks were cleared for financial action about three years ago. The city should develop a policy and proceed to the work of negotiating with determination; determination that will take fully into account the rights of the company and the city's future needs so far as it is possible to prognosticate them. Let it not seek the unattainable. As Federal Judge Faris pointed out in approving the sale of the St. Louis properties at foreclosure, any suggestion of a return to the 5-cent fare is not even respectable nonsense, pointing out that while fares have advanced from 5 to 7½ and 8 cents, the expenditure for wages, equipment and materials by the company in the same period have advanced 81 per cent. This seems generally to be realized in city circles. So with the need recognized that the company must have a living wage, it ought not to be difficult, if the city approaches the matter in the right spirit, to adjust satisfactorily the matters that have up to this time militated against the settlement. The onus for the delay appears to be clearly upon the city.

The Wording of an Ordinance Penalizing Transfer Abuse Is Important

EVEN in doing a meritorious act there is always a right way and wrong way. The city of St. Louis found this out recently when an effort was made to enforce one of its ordinances punishing abuses of street railway transfers. The ordinance declared it to be unlawful to sell, barter or exchange for any consideration a street railway transfer, or even to give it away to enable another person to use it, or for any person to whom such a transfer was not issued to attempt to use it, or for him to punch or alter the punching of such a transfer, or to attempt to make a round trip by use of a railway transfer. Agents and employees of the railway company issuing transfers to passengers lawfully entitled to them were excepted.

The purpose of the law was entirely meritorious. In a prosecution under it, however, the Supreme Court of Missouri in a decision rendered June 27, 1927, held that the ordinance prescribed the use that might be made of transfer tickets and thereby invaded the province of the Public Service Commission. If, for example, the commission should make these tickets transferable, the ordinance would then be in conflict with the commission's ruling. The fact that the ordinance prescribed a course which coincided with the rulings of the commission did not help the situation because "the city of St. Louis was without the power to regulate to any extent, directly or indirectly, the rates of a public utility, or to prescribe regulations or practices which affect such rates."

While the court thus condemned the wrong way of stopping transfer abuses, it also pointed out the right way. This, it said, was to require under penalty that the individuals composing the public in their dealings with the utility shall observe its rules and regulations, as these rules presumably have had the approval of the Public Service Commission. An ordinance of this kind would avoid any invalidity on the ground that the city was exercising, or attempting to exercise, a control over rates and charges.

It may be assumed that with this legal background the city will amend the ordinance accordingly.

Two Track Reports of Unusual Interest

IN THE American Electric Railway Engineering Association this year two committees in the way and structures division have been working on subject assignments in which way departments throughout the industry are vitally interested. One of these committees is investigating the use of alloys other than manganese steel for special trackwork and the other is studying the subject of rail corrugation. While it is not expected that either committee will be able to conclude its work this year or that definite conclusions may be presented, it is reasonably certain that both committees will have some interesting data to present and that the reports will represent valuable contributions to the present knowledge on the respective subjects.

Manganese steel has served its purpose very well, but without heat treatment it is very difficult to secure a good weld, and heat treatment in the field is not practicable. These things have led the electric railway engineer to seek a substitute that would lend itself more readily to field welding and at the same time possess the necessary shock and abrasion resistive qualities, and thus postpone as long as possible the date of replacement. The advances made in the art of electric welding, both in the matter of equipment, technique and welding material employed, have been largely responsible for this demand for a substitute for manganese steel.

The cause of rail corrugation and its cure have long been subjects for discussion among street railway men. Rail corrugation also has attracted considerable public attention because of its noise-producing effect. Much has been written about it and many reasons advanced as to its cause. Still it seems to occur under so many different conditions that it would appear we really know very little about it. Considerable scientific study has recently been given the subject abroad and it is sincerely hoped that we may finally diagnose the ailment correctly and thus remove one of the most annoying and expensive troubles with which the street railway engineer has had to contend.

"Hand Grasps Hand, Eye Lights Eye"

TENSION is growing throughout the industry as the opening day for the Cleveland convention draws near. Machines and appliances that will tell the physical story of progress are being rushed to the exhibit hall. Those who are charged with revealing the mental story of what has been achieved, of what they believe lies beyond the inscrutable veil of the future are weaving thoughts into words. Speaker, exhibitor and delegate are realizing the great responsibility that such a congress imposes. It is inspiring to think of this great machine of human and material parts gradually gathering momentum and tuned for full speed ahead when the president's gavel shall give the signal.

Yet the whole concept of machines, speeches, debates and constructive legislation is as sounding brass and tinkling cymbal if one neglects the spirit that motivates the gathering. For more than twoscore years men of the electric railway industry have seen mechanical miracles in their field. They have seen a crude crawling vehicle, an unstable experiment, become the swift and powerful servant of mankind. They have trod the heights of success and groped through the valleys of failure. Spurred on by machines? No! but by the faith and trust of their co-workers. That has been revealed through gradual

Digitized by Google

culture of kind intercourse. Confidence in a man's friendship has meant more than the stereotyped phrases of a contract; faith in each other's word more than the scintillating perfections of steel and wire. To deny that acquaintanceship is the loom upon which is woven the material good of these conventions the JOURNAL thinks is impossible in the light of its years of observation. Impossible, when each of us has found that these contacts are "the mysterious cement of the soul, sweetener of life and solder of society."

What joy, then, is in store for us during the first week in October, when

> Hand clasps hand, eye lights eye
> In good friendship
> And great hearts expand
> And grow one in the sense of this world's life.

Discretion in the Payment of Income Bond Interest

ANOTHER interesting financial question which involves the issue of the possible substitution of the judgment of outsiders for that of the corporation management has arisen in New York. A holder of $35,000 par value of adjustment income bonds of the Third Avenue Railway threatens suit to compel payment of the full 5 per cent annual interest, although on this issue there is a present accumulation of 27¾ per cent as of Oct. 1.

It is a nice point in corporate management that is raised. Under some circumstances the threatened action might be justified, but not in the present instance. At the outset there is dispute about a question of fact between the threatening litigant and the management. The man about to sue says he has employed counsel to estop the company from using the property of the bondholders for capital purposes "in direct violation of the trust indenture securing the bonds." The management says that the indenture provides that disbursements on the bonds are at the discretion of the directors. The latter seems to be the more reasonable of the two provisions, for it is in accord with the general theory which applies to an issue of this kind.

Questions of law and of fact may have to be passed upon, but there can be no question about the wisdom of the policy of the management. It would seem reasonable to assume that the holder of a security of this kind labors under no delusion about the type of security he is purchasing. He knows that financially its ownership implies hazards. And those hazards are lessened for him only as the management exercises caution. It might, it is true, seek as soon as possible to liquidate the payments that have accumulated and denude the property of cash so quickly as to leave it again in the position out of which grew the necessity for issuing the income bonds. If it did that knowingly, it would not be true to its trust. And the present management of the Third Avenue Railway has been true to its trust.

Operations for the year ended June 30, 1927, showed approximately $250,000 above the 5 per cent on the adjustment bonds, but some of the last year's earnings were non-recurrent in character. So well did the company do, however, that extraordinary payments of about $650,000 were made out of surplus for expenditures not chargeable to operating expenses. The credit of the company is, of course, none too good, and in order to avoid the sale of securities at a sacrifice, the company has for the last ten years financed itself out of the surplus. Despite this the railway has in its treasury available for all purposes about $1,500,000. This is none too much considering that the company has been confronted with conditions extraordinary in their possible adverse affect. These have not been entirely removed by the granting of bus franchises to the railway in the Bronx, though the action of the Board of Transportation in so recommending would appear to have helped the situation immeasurably. The owner of the bonds, however, sees the matter differently. He pretends to scent disaster ahead in impending expenditures for bus operation.

Under the fast changing conditions in New York City with respect to population and modes of movement available to the prospective passenger, transportation men are agreed that its management has in many respects worked wonders with the Third Avenue Railway. But that apparently is not a judgment which weighs very much with the holder of these securities, by their very nature speculative in character, to whom immediate prospects are much more important than future potentialities. The projected suit deserves the dignity of mention only because it shows the length to which the holder of securities will go who is intent upon exacting his immediate pound of flesh.

Replenish Your Well of Ideas

FEW men generate ideas. Rare is the individual who can draw water from his own well, for that is one of the marks of genius. We cannot all aspire to genius, but we can nevertheless progress and improve by utilizing the experience of others. The coming convention affords a well of ideas, constantly replenishing, from which every member may draw a bucketful of transportation working facts.

The meetings of the American Association and affiliated associations will present a valuable picture of the industry as well as a cross-section of it. Financing, traffic regulation, franchises, advertising, fares, valuation and other subjects of importance will be discussed at round-table conferences. The progress in the industry will be stressed; feature accomplishments of the year on properties in different parts of the country related in five-minute talks by operating executives.

Questions to be asked and answered include "Does aggressive property-wide rehabilitation pay?" "How are you meeting the transportation needs of your community?" "How did you change an unprofitable bus operation to a highly profitable one?" and others vital to the industry. At the meeting of the affiliated associations important problems and various phases of accounting, claims, engineering, transportation and traffic will prove other wells from which to draw.

It is indicated that there will be some surprises in store for delegates in the way of new car and truck designs which will prove well worth studying. It is also promised that this year "the exhibit will be the greatest display of local transportation equipment the world has ever seen." De luxe cars and buses, articulated cars, the latest designs in lighting, heating and ventilating and upholstery will be displayed. Fare boxes, motors, track equipment, car and bus seats, wheels, steering gear and the many other exhibits all offer suggestions for providing better transportation.

Delegates to the convention will have a real opportunity to draw deeply from a well that sparkles with new ideas—provided they go to Cleveland determined to get full value for their money.

Fountain Square, Fifth and Walnut Streets, Cincinnati—Proposed terminal of the rapid transit line

Co-ordination Essential for Rapid Transit in Cincinnati

ARTICLE I

Report of Beeler Organization to the city shows that the only practical way to use existing investment in subway lines is in conjunction with the street car and bus system. This article, the first of two, shows the physical plan for extending the subway line

UTILIZATION of existing facilities to the greatest extent is the outstanding feature of the report on rapid transit recently made by the Beeler Organization of New York. The report was presented to the special committee representing the Council and Board of Rapid Transit Commissioners of the city of Cincinnati and the Cincinnati Street Railway on Sept. 9, as outlined briefly in this paper for Sept. 17, page 534.

The report goes into great detail to determine what should be done to provide rapid transit for Cincinnati, and whether a rapid transit system should be operated independently or in conjunction with other facilities. The following article and the one to appear next week are abstracted from the report, which is a printed volume of 166 pages.

In many respects the transit situation in Cincinnati is unusual. As early as 1912 a rapid transit commission was appointed, the primary purpose being to construct an entrance into the central business district for the various interurban lines reaching the city. Later studies modified the plan and in 1916 the construction of a line was authorized and funds were appropriated. Due to the war the project was deferred, but since then the entire amount of $6,100,000 has been spent in construction of the line. About 10 miles of double-tracked right-of-way is largely completed.

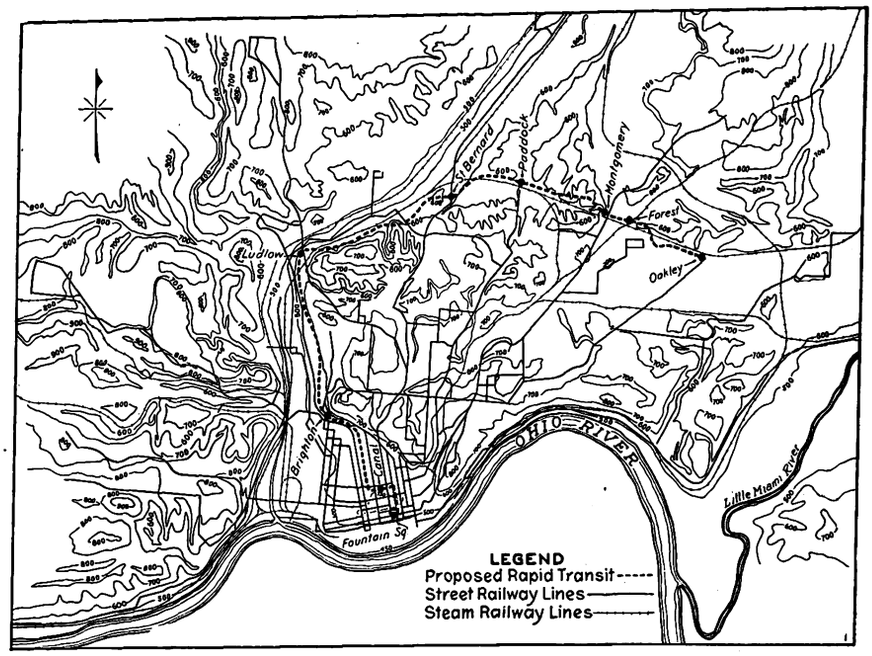
A portion of the route is along the bed of the old Miami and Erie Canal, which has long been abandoned. The topographic map on page 543 shows the location of the line. The portions between Canal and Walnut Streets and Fountain Square and between Forest and Oakley have not been built. The remainder is a combination of subway and open cut. The stations are completed only in the rough, and none has been built between Clifton and Oakley or at Fountain Square.

In the intervening period since the project was begun most of the interurbans have been abandoned and those remaining have suffered decided decreases in their busi-

Digitized by Google

ness, so that the construction of the rapid transit line is not justified from an interurban standpoint. As the rugged topography of Cincinnati imposes unusual difficulties on its transportation facilities, the easy grades of the partially completed rapid transit line appeared to present a possible solution to real rapid transit service within and adjacent to the city. If such service can be provided at a cost that will warrant its undertaking it will benefit a large area of rapidly growing territory and at the same time enable the city to receive benefit from the large investment already made.

The purpose of the present report is to set forth the results of an investigation of the rapid transit situation made for the purpose of determining if the project (a) should be abandoned; (b) should be equipped and operated as it now exists; (c) should be completed and operated in accordance with any existing plan, or (d) should be completed and operated in accordance with other plans. If the line is to be completed and operated a feasible plan is needed, stating (a) whether or not the line should be operated independently or co-ordinated with other necessary transportation agencies; (b) what changes should be made in existing transportation facilities as the result of operating the rapid transit line, and (c) the financial results of operation of the rapid transit line.



Topographical map of Cincinnati and vicinity

Topography of City an Important Factor

Cincinnati grew up as a river town and in the days of its early great expansion all of its commercial and industrial life depended on the river. The topography of the city is important. In Cincinnati there are more hills and valleys than in any other city in the Union. It is the hilltops that have given the city suburbs unequaled for variety and beauty. These hills and valleys are a problem to industry. The level plain on which the old city was built has long been well filled. It is inevitable that Cincinnati should look for its future expansion to far-flung industrial districts with distances from Fountain Square that might be called metropolitan.

The business section, known as the Basin, is located on a plateau about 2 square miles in area, bounded by the Ohio River on the south and surrounded by bluffs from 200 to 300 ft. high on the other sides. Most of its residential population lives on these bluffs, so that the transportation problem largely becomes one of carrying people up and down the heights. The situation is shown on the topographical map. There are only three level approaches to the Basin district, two along the river, east and west respectively, and a third along Mill Creek, which follows a semi-circular path in getting into the Basin. All three approaches are narrow and are utilized to capacity by steam railroads, highways and street car lines.

About a Half Million People in District

About 410,000 people reside within the corporate limits of Cincinnati. The local transportation agencies, however, serve some 460,000 people in Ohio. The city of Norwood, with 30,000 people, is almost surrounded by Cincinnati, while the municipalities of St. Bernard and Beechwood Place, with an aggregate population of 11,000, are entirely within its corporate limits. The smaller contiguous municipalities served make up the Ohio total. In addition the territory across the river in Kentucky, including the cities of Covington and Newport, and the smaller adjacent communities, with an aggregate population of 125,000, increases the transportation requirements of Cincinnati, as about 70 per cent of the working population in that territory is employed in Cincinnati.

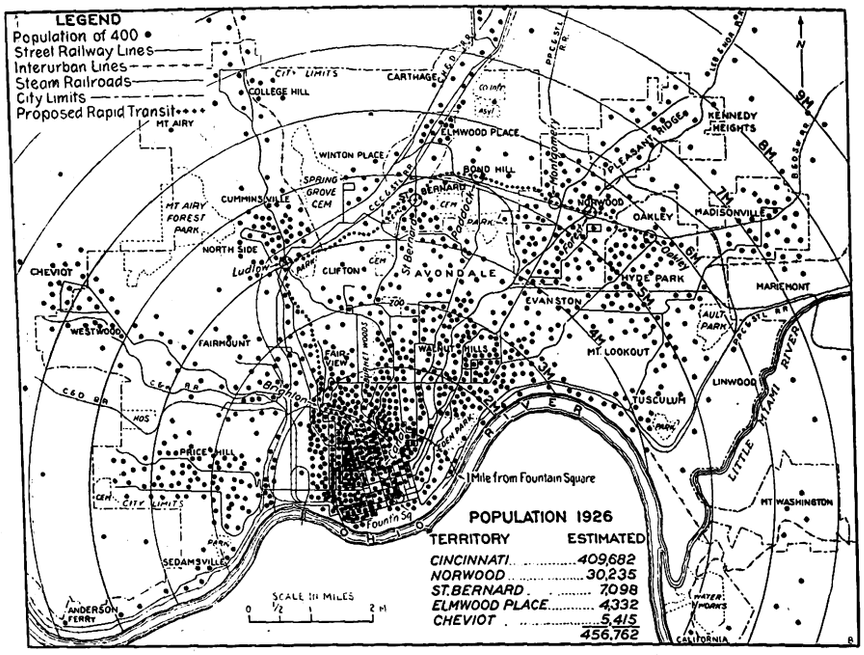
The increase in growth for various periods is shown in the chart on page 546. The curve for Hamilton County gives a more nearly correct picture of conditions. The curve for Cincinnati is affected by annexations. The city had its greatest growth between 1840 and 1850, increasing 150 per cent.

Local transportation on the Ohio side is cared for by the Cincinnati Street Railway, independently operated buses and the private automobile; local traffic handled by the steam railroads is almost negligible. The fare on the street cars is 10 cents cash or three tickets for 25 cents. The minimum fare on all buses is 10 cents, and this is increased by 5-cent steps on some of the longer routes.

The trend of passenger traffic is shown by the chart on page 546. The number of revenue passengers increased at quite a definite rate until about 1913. From then until 1920 the number of passengers continued to increase, but at a lower and more irregular rate. Since 1920 the curve has been very irregular and quite decidedly downward. This can be attributed to at least three factors—increases in the rate of fare, increases in the number of automobiles, and more recently to independent bus competition. Independent buses commenced operating in large numbers in 1925, but the number of passengers carried in that year is not shown because no data are available.

For the last few years the company was losing patronage up to Nov. 1, 1925, when under a change in operations and a new franchise a reduced fare went into effect, resulting in an immediate upward trend in passengers carried. Since it engaged in the operation of

Digitized by Google



Distribution of population, Cincinnati and vicinity

buses early in 1926 the rate of increase has been accelrated, but unfortunately bus operation is increasing its total operating cost faster than its total revenue.

Besides the railway company's buses there are sixteen independent bus routes owned by five different companies and operating approximately 90 buses in local service. These buses are operating about 5,311,000 bus-miles and carrying some 13,300,000 local passengers annually. No information is available as to the financial results of their operation. In addition to these, 23 interurban bus lines have their terminal in Government Square, but do no local business within the city limits. It is questionable if any of these can be routed to the rapid transit line without lowering the quality of their service, as passengers, especially those with baggage, object to a transfer en route. It may be, however, that the rapid transit line may furnish a valid reason for terminating some of these interurban bus lines, especially the shorter ones, at its stations, thus removing just that much more traffic from the downtown streets and giving the rapid transit lines more business without impairing the service, because while a transfer will be required from bus to subway it will give a quicker ride.

Automobile an Important Factor

The private automobile is a factor in the local transportation situation which merits serious consideration. In the last five years the number of automobiles has increased 111 per cent in the state and 126 per cent in Hamilton County. There are now 88,000 passenger automobiles registered in the county. Checks in other cities have shown that about 15 per cent of the registered automobiles enter and leave the downtown section of the city daily. On this basis the automobiles of Hamilton County would carry some 16,000,000 riders in and out of the Basin annually. This makes no allowance for automobile rides which do not enter the Basin or for passengers carried on trucks. With these figures in mind it is not difficult to understand that the automobile has a serious effect on public transportation agencies.

Generally speaking, daily movement of the people originates and terminates at their residences, though of course other movements are made between the time they leave home and return. No census or even estimate of population by districts had been made since 1920. It was considered most desirable to obtain population figures for 1926, because while there has been no rapid growth in the total population of Cincinnati and vicinity, quite appreciable differences have taken place in the distribution of the population. Several methods were considered for bringing the 1920 census figures up to date, but the only two that were found sufficiently helpful to warrant their use were extensions of the 1920 census and a study of the report of the city planning commission, which established factors between total population and elementary school enrollment for each school district. As a result of these studies, the estimated population was derived as follows: Cincinnati, 409,682; Norwood, 30,235; St. Bernard, 7,098; Elmwood Place, 4,332, and Cheviot, 5,415, making a total of 456,762 in the territory. There is a further population of about 23,000 in the various other communities immediately surrounding the city and about 112,000 in the Kentucky territory immediately tributary to Cincinnati, making a total of approximately 600,000 people who may be considered as living in and immediately adjacent to Cincinnati.

On account of rapid changes in conditions, the riding on the public transportation lines was determined for the months of September and October, 1926, rather than an average for the year. It was found that the cars of the Cincinnati Street Railway carried on an average 7,600,000 passengers per month and the railway buses 583,000 passengers, or 98,200,000 passengers carried annually by the street car and bus lines of the company. It was estimated that the independent buses carry about 13,300,000 local passengers annually, making a grand total of 111,500,000 revenue passengers to be moved annually by the local transportation agencies in the Cincinnati district. It was also estimated that 4,400,000 annual rides were taken on the Cincinnati lines by persons residing in Kentucky.

Deducting from 111,500,000, the total rides in city service, the 4,400,000 rides originating in Kentucky, and the 3,792,000 originating in other outlying sections, 103,308,000 rides remain as the number originating from the 462,000 people accounted for in the area studied. Dividing the number of rides by the population results in a figure of 224 as the average number of rides per capita. Dividing 111,500,000, the total annual rides, by 224, indicates that the local transportation lines are serving the equivalent of a population of 515,000. Further calculation was made to obtain the riding by districts.

Buses on Central Parkway No Solution

Calculations were made as to the number of riders that buses operating on Central Parkway would serve and save time as compared with present facilities. The time saving to the sections in the eastern portion of the city as compared with the present more direct routes downtown would be practically negligible or negative. Under ordinary circumstances it was estimated that the

Digitized by Google

running time of buses operating between Knowlton's Corner and Fountain Square by the Parkway would be 21 minutes each way. This compares with 28 minutes required at present by street car, 25 minutes by bus and 12 minutes on the proposed rapid transit line. The run between Fountain Square and Knowlton's Corner represents the maximum saving in time possible by buses operating on the Parkway. On the assumption that all riders who could save time would use buses instead of street cars and that the public would be satisfied with bus service instead of street car service in this territory, it was estimated that 16,200 people would use buses daily between Knowlton's Corner and Brighton and 10,200 more between Brighton and the Basin, making a total of 26,000 daily or 8,972,000 rides annually. This estimate is based on the supposition that all the riders now using the car lines beyond Brighton would be carried on the buses that would operate over the Parkway. Buses at the rate of 78 per hour north of Brighton and 138 per hour south of Brighton would be required to transport these riders during the peak load periods. As in the case of the rapid transit lines, these buses to serve the riders properly must operate to some point in the vicinity of Fountain or Government Squares. The addition of 138 buses per hour in each direction to the present downtown rush-hour traffic would of course be a backward step in minimizing traffic problems.

Looking north along Central Parkway, prior to completion of automobile roadway

It will be seen from comparing present street car schedules with those of the proposed bus and rapid transit lines that buses will reduce the running time to Knowlton's Corner 25 per cent, while the rapid transit line will reduce it 58 per cent. From a standpoint of time saving alone buses will benefit approximately 9.000,000 riders annually, while the rapid transit will benefit more than four times that number. A rapid transit car with a carrying capacity several times that of the bus can be operated at a cost not to exceed that of the bus. The rapid transit is underground in the congested district and on its own right-of-way elsewhere, so that its operation improves traffic conditions by removing all of this traffic from the street surface, while the bus does exactly the opposite. The engineers could not, therefore, find any ground upon which to base further consideration of the use of buses on the Parkway as a substitute for the rapid transit line.

Stops Should Be Minimized

The primary purposes of rapid transit are to save time, reduce street congestion and increase the metropolitan area of the modern city in order that its citizens may live in more healthful and inviting localities than alongside their work. In Cincinnati the problem is threefold: (a) To get the people in and out of the Basin; (b) to distribute them quickly to various communities necessarily quite widely separated because of topographic conditions, and (c) to enlarge the area available for industrial and residential development.

Speed, regularity and frequency combined are essential to the success of rapid transit in Cincinnati. Only in this way can patronage be attracted to the line and thus reduce the number who desire to enter the congested section on the surface by public or private conveyance.

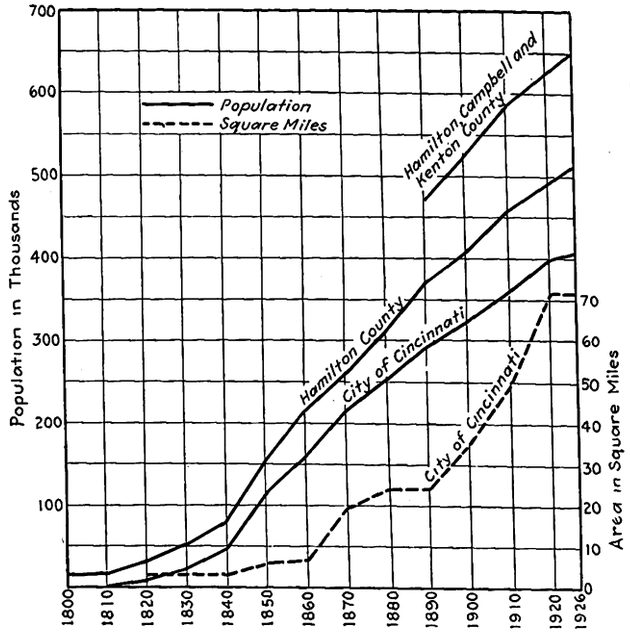
Factors influencing the speed and regularity of a rapid transit line are the grade and alignment of the route, power conditions, motor equipment, length of stop and number of stops. The last is by far the most important. The effect of adding a station, which of course involves an additional stop, on the rapid transit line is such a serious matter that it is well worth while to consider what it means, for it looms large not only in the dollars and cents cost, but in destroying the very thing that rapid transit is designed to accomplish—speed. The effect of a stop depends on so many variable factors such as the number of trains, the number of cars in the train, cost of station operation and cost of the station itself. For the type of service proposed for Cincinnati the cost of operating the rapid transit system would be increased $35,000 to $40,000 per year for each added station. Besides this it delays every person using the service other than those using that particular station about 1½ minutes on each ride. This means that each station stop adds about three minutes to the scheduled running time of each trip. With a three-minute space between trains an added train must be placed in service for each stop.

Obviously there is little question but that the greater portion of the existing line that is graded can judiciously be made a part of any rapid transit line recommended because service can be operated much cheaper on a rapid transit line than on a surface line if the cost of providing the rapid transit right-of-way is disregarded, which may be done in this case since the investment is already made and if not utilized will be a total loss. The problem in Cincinnati then becomes one of determining whether at a cost that will not be prohibitive additions or changes can be made in connection with the existing line to make it possible for it to function so as to provide the city with a practical rapid transit service.

Several plans for a belt line, utilizing the existing rapid transit line with a return through Duck Creek valley, were investigated. On account of the relatively small population that would be served none of these plans was approved.

It is recommended that the line be extended from

Digitized by Google



Population Cincinnati and vicinity, 1800-1926

its present terminal to Madison Road, Oakley, as it will increase the territory served by a material amount at a relatively low cost. The reservation is made, however, that this will hold only if no more stations are permitted than those specified in the report, as otherwise the time saving to Oakley would not be sufficient to warrant the extension and operation of the line.

Extensions Will Enhance Existing Lines

It also is the opinion of the engineers and others that the possibility of its successful operation is contingent on extending the line from Central Parkway and Walnut Street to some point in the vicinity of Fountain Square, which would better serve 47 per cent of the people who would use rapid transit. A rough estimate indicates that about 40 per cent of the line's total patronage would be contingent on its extension to Fountain Square.

An investigation was made to determine whether the route of the rapid transit line as already built is the most satisfactory or if changes could be made to advantage. Particular attention was given to the location of the Ludlow station. The line follows the old canal running east of Mill Creek and the B. & O. Railroad in the vicinity. The existing station is located at the south end of the Ludlow Street viaduct. This is at the end of the Central Parkway and automobile traffic will be heavy over the viaduct to Knowlton's Corner, as the Parkway will become the main artery between downtown and that part of the city lying to the north of the point where the Parkway will intersect Ludlow Avenue. To have the surface cars and motor buses that should feed into the rapid transit line cross the viaduct would add materially to the congestion and it would be much relieved by having them reach the rapid transit line at Knowlton's Corner.

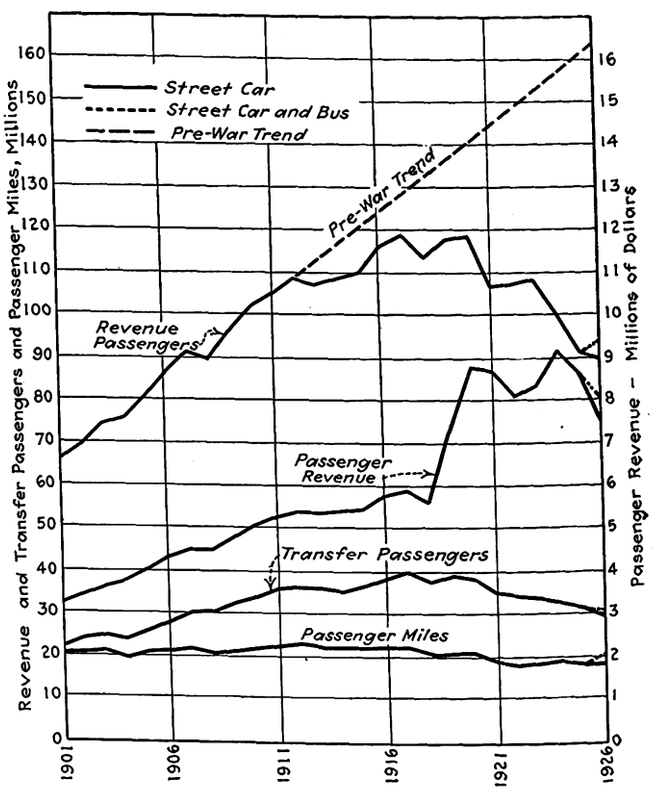
It was estimated that with the station located as at present some 2,356,000 people will enter and leave it annually, while if it is relocated as proposed the number would be increased to 4,036,000. In the former case practically all would have to be transported, as 1,600 ft. is farther than people will walk, especially if car service is available. It would require five or six minutes time to walk to the station and from two to three minutes to ride to it from Knowlton's Corner. In the new location the additional 1,080,000 rides which would originate at the rapid transit station if located at Knowlton's Corner would continue to use the surface cars if the station is not relocated. It is estimated that the line can be relocated at a cost of $716,000, the amount covering the cost of construction of the line and station, acquiring the right-of-way, and any incidental damages involved. The loss of investment in the present right-of-way and station probably does not exceed $150,000.

Studies were also made of the locations of several of the other stations along the line. Those at Liberty Street, Marshall Street and Clifton Street were found unnecessary and their abandonment was recommended. It was also recommended that all stations yet to be constructed be built with island platforms, with a mezzanine floor above. This will allow one attendant to sell tickets or make change for trains in either direction.

Prepayment areas into which surface cars and buses can be run for transfer of passengers to the rapid transit line without the use of paper identification tickets are recommended at Brighton, Ludlow, St. Bernard, Montgomery and Oakley stations. The plan proposed is similar to that used by the Boston Elevated Railway at various points.

Interurban to Serve Suburb

The Cincinnati, Hamilton & Dayton Railway, which passes through the College Hill territory and terminates at Spring Grove Avenue, is the only remaining interurban in a position to benefit by utilizing the rapid transit line as an entrance to downtown Cincinnati. With suitable equipment its cars could operate over the proposed rapid transit line directly to Fountain Square. Both the interurban and the Cincinnati Street Railway use the same street through the center of the College Hill territory. If the interurban were to run through and would give



Passengers, revenue and miles, Cincinnati Street Railway, 1901-1926

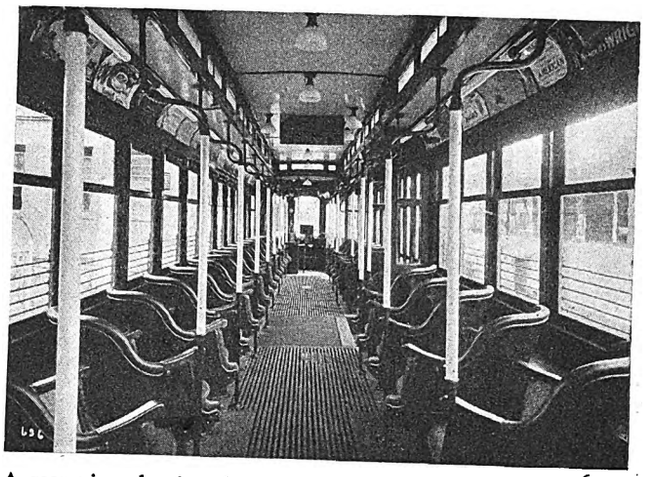
Digitized by Google

local bus service in College Hill to enable the residents to reach the car line it would serve the territory much better than the Cincinnati Street Railway.

There are some 3,003,609 annual riders in this territory, of whom 1,620,600 are carried by the street railway and the remainder are divided between the C., H. & D., the steam railroads and the interurban buses. Assuming that the rapid transit line is completed by 1930 it is estimated that the traffic will increase to 6,655,310 riders by 1940 and 8,434,011 by 1905. The running time between Fountain Square and College Hill, now 42 minutes by street car, would be 26 minutes. The time from Fountain Square to the railroad station and thence to Hamilton by the fastest steam railroad train is 66 minutes and by bus 75 minutes; the new time on the interurban will be 55 minutes. Other points will be affected accordingly.

By making this arrangement the total undeveloped land area which could be reached within a total time of 60 minutes would be increased from 2,313 to 10,405 acres.

Should the interurban be accorded the right to operate to Fountain Square via the rapid transit line it should agree substantially to (a) pay a rental based on the miles operated; (b) provide the type of equipment necessary to conform with that operated on the rapid transit line; (c) connect its line at Spring Grove Avenue with the rapid transit line by means of a viaduct extending over Mill Creek, eliminating the grade crossings of Spring Grove Avenue and the B. & O. Railroad.



A rear view showing the seating arrangement of the chair car, the stanchions and the one-level floor

Pittsburgh Introduces a New Chair Car Service

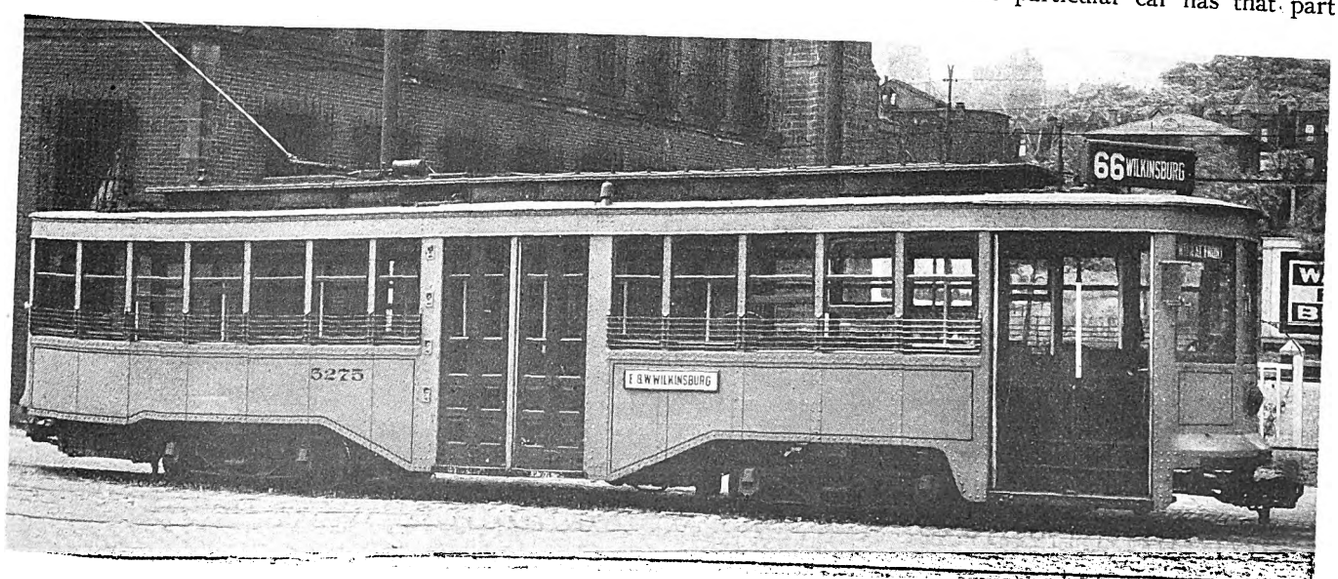
INDIVIDUAL bucket-type seats have been used by the Pittsburgh Railways in the equipment of one of its latest type low-floor, one-man, two-man cars. These seats have spring cushions and cane covered backs with leather binding around the top. The rear side of the seat back is covered with sheet steel to prevent the cutting and marring that frequently happens with cane covering.

Arrangement of the seats is unique in that they are in a single row along each side of the car. Each seat is placed at an angle of 45 deg. with the side of the car, thus forming the "saw tooth" line-up as may be seen in one of the illustrations. This gives the desirable effect of privacy to each seat which could not be so well obtained in any other way without the sacrifice of considerable space.

Access to these seats is free at all times for the reason that one does not interfere with the one next to it. Patrons may be seated quickly and may reach the doors easily when leaving since each seat faces the aisle.

An additional convenience and safeguard is provided in the porcelain enamel stanchions which are placed beside each alternate chair throughout the full length of the car. The stanchions on one side of the aisle are staggered with respect to those on the opposite side, thus providing one upright for each seat space along the aisle. These stanchions, together with the longitudinal hand rod above the seats, replace the porcelain enamel hand straps which are standard equipment on this series of cars.

Another feature which is being tried out in this unit is the straight floor line throughout the car. Up to the present time the standard arrangement for low floor cars with center doors has consisted of a low floor at the center doors with a ramp leading to the front and rear sections of the car. This particular car has that part



The chair car ready for service. Note the low floor of the car

Digitized by Google

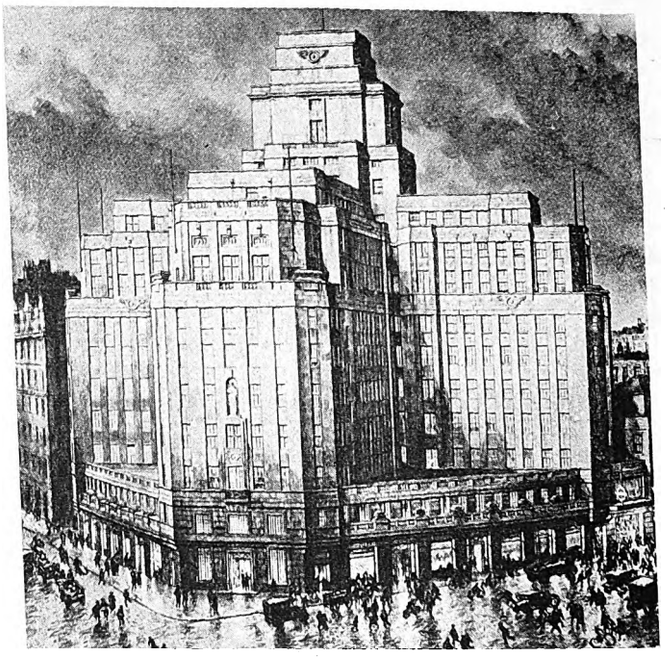
of the floor raised to the same elevation as the rest of the floor. This necessitates an additional step at the center doors but does not appear to have any appreciable effect in slowing up loading. In the remodeled car, which is now arranged for one-man operation only, the center doors with the additional step could have practically no effect because these doors are used only at heavy loading and unloading points in the city loop, which is only a small fraction of the number of stops the car would make in a trip.

There is no doubt that the appearance of the car in the interior is improved by this new floor arrangement. There is, however, a distinct advantage in this arrangement to passengers who are walking in the aisle when the car is in motion. It is not nearly so difficult to keep one's balance on the straight floor as it is on a sloping one. This type of floor, together with the many stanchions, thus makes it safe for many women patrons who would otherwise not risk their footing in a moving car. A package shelf is another convenience afforded in this unit. This has been placed between the seats and the sides of the car.

Provision has been made for a bulletin board which extends from the ceiling in the center of the car. On this board is carried a notice asking for comments on the seating arrangements of the car. The notice has brought to the commercial department many comments of praise and congratulations on the agreeable type of service this car is providing. Some automobile riders have expressed their complete satisfaction with the unit as a substitute for their own private cars for trips to the city. In fact, all who ride the car appear to be favorably impressed by it.

The car has been operated from the Craft Avenue carhouse on several routes where one-man units are in service. It will later be tried on several other lines of the system which are operated through the better residential districts and where automobile competition is very noticeable. The results of these trial runs will have a distinct bearing upon the future of this type of service in Pittsburgh. If it is found that off-peak traffic can be sufficiently increased by this service, it is very probable that one or more chair cars of this type will be built.

London Railway Headquarters to Cost $1,665,000



Head office building to be erected by the Underground Electric Railways Company of London

CONTRACT for the construction of the large new building to be erected upon the triangular site of the London transport combine at Westminster, London, to serve as the headquarters of the London underground railways, the London General Omnibus Company and associated companies, has been placed with a London concern on a tender of £333,000 ($1,665,000). The building will require 4,500 tons of stone and 2,500 tons of steel for the frame of the structure. It will have ten stories and a tower and will be 173 ft. high.

The building is scheduled for completion at the end of 1928.

Berlin's latest surface motor car has two center doors and is fitted with Cardan drive. This method of operation is still under trial in Berlin

Berlin Practices Co-ordination in Transportation

Policies of rapid transit, bus and surface car line directed by a single commission. Traffic is constantly growing. Operating problems differ somewhat from those in America's largest cities

By Henry W. Blake
Senior Editor *Electric Railway Journal*

BERLIN is one of the very few large cities in the world in which the bus service, rapid transit lines and street railways are under one management. This is not true of London, where the buses and rapid transit lines are under one control and the principal street railway lines under another, nor is it true of Paris, or of New York or Chicago. In Philadelphia all of these services are under a single management, but free transfers are not given between all of them. Boston also has them under one management, but Boston is much smaller in number of inhabitants than Berlin.

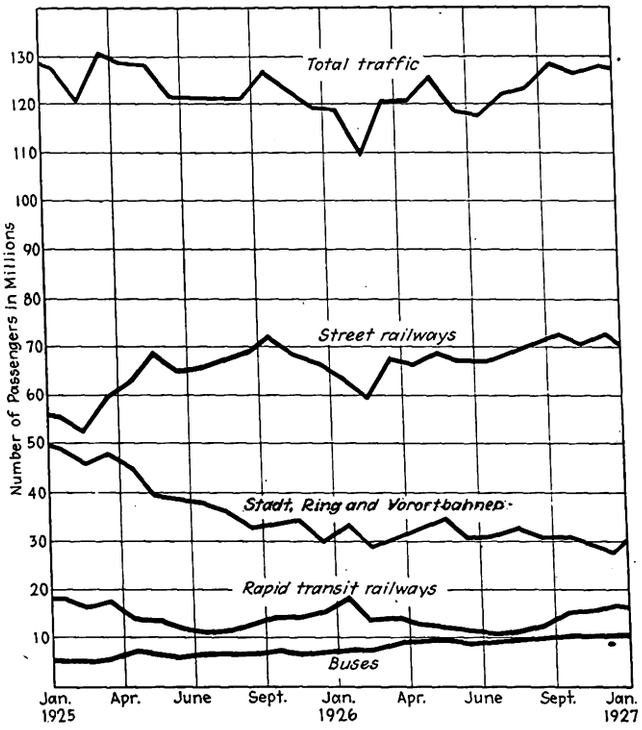
The Berlin situation was brought about by the outright ownership by the city of one of these properties and a purchase by it of a majority of the stock of the other two, following the close of the war.

The city owns the entire surface line system, having taken it over during the inflation period for 20,000,000 gold marks (about $5,000,000). As a conservative estimate of the value of the property before the war was 300,000,000 marks, it will be seen that the city acquired the property for only a small proportion of its real value.

In each of the other transportation agencies the city has a majority stock interest. The elevated and underground system was organized in 1897, largely by the Siemens & Halske Company and the Deutsche Bank, and began service in 1902. It continued under private direction until 1926, when control was taken over by the city. Under this arrangement the company, which is known as the Hochbahngesellschaft, first absorbed two other rapid transit systems in Berlin, which had been built later and physically were really extensions of its own lines but had been financed independently. These properties were taken over by the exchange of their stock for stock of the Hochbahngesellschaft. Then the city purchased 69,755,000 marks par value of the Hochbahngesellschaft stock, paying therefor in 7 per cent interest-bearing certificates, leaving only 8,517,000 marks of Hochbahngesellschaft stock outsanding.

Of the capital stock of the bus operating company, the Allgemeine Berliner Omnibus Aktien Gesellschaft, the city owns about 8,000,000 marks, leaving only about 2,000,000 marks floating.

Digitized by Google



Monthly division of traffic between different agencies in Berlin

It has been the policy of the city to continue to operate these systems by private companies with separate officials for each, but to secure unity of policy and co-ordination of service through a single directing commission.

A governing reason for the retention of operation by stock companies was that the original owning corporations had outstanding obligations in regard to bond retirements and other matters which could be fulfilled better by a private company than by the city. Practically, also, there is no doubt that the retention of the company form of operation tends to remove the direction of the companies farther from politics than otherwise it might be.

TABLE I—PASSENGERS CARRIED (IN MILLIONS) 1911–1926 ON THE VARIOUS SYSTEMS IN GREATER BERLIN

Year	Surface Lines Number of Passengers	Surface Lines Per Cent of Total	Stadtbahn System Number of Passengers	Stadtbahn System Per Cent of Total	Bus Lines Number of Passengers	Bus Lines Per Cent of Total	Rapid Transit Lines Number of Passengers	Rapid Transit Lines Per Cent of Total
1911	606	50.6	370	31.0	154	13.0	64	5.4
1912	638	51.1	388	31.1	159	12.7	64	5.1

1924	530	42.9	474	38.3	48	4.0	183	14.8
1925	772	53.6	442	29.3	74	5.1	172	12.0
1926	813	55.8	371	25.5	113	7.5	163	11.2

Governing Commission of Sixteen Members

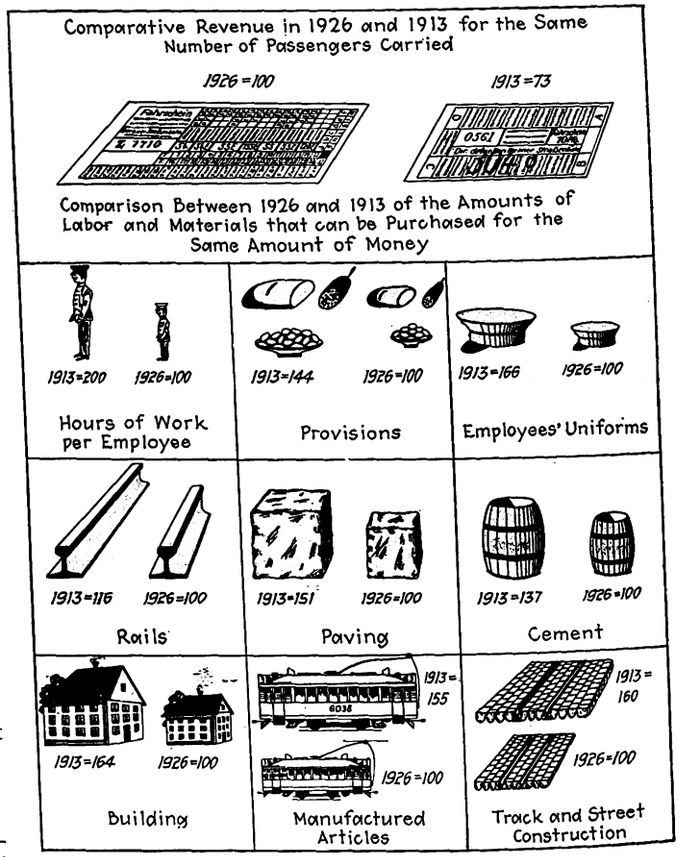
The single governing commission for the three operating companies consists of sixteen members, made up of eight members of the Board of Aldermen, four representatives of the city administration, two distinguished citizens, who are selected for their knowledge of transportation matters, and two employees of the operating companies.

While the Aldermen are elected, there is not as much change in Germany in officials of this kind as in the United States, so that these members of the board are more permanent and less likely to be influenced by politics than probably would be the case in the United States. The four members of the city administration are the city councillor for traffic, its chief engineer, its adviser on traffic and its treasurer. These officers are appointed, not elected, and in practice have long terms.

The labor members vary with the topic considered by the board; that is to say, two representatives of the employees of the rapid transit lines sit with the board when the topic to be considered relates to the rapid transit lines, two from the surface lines for surface line questions and two from the bus company when the question at issue affects bus operation.

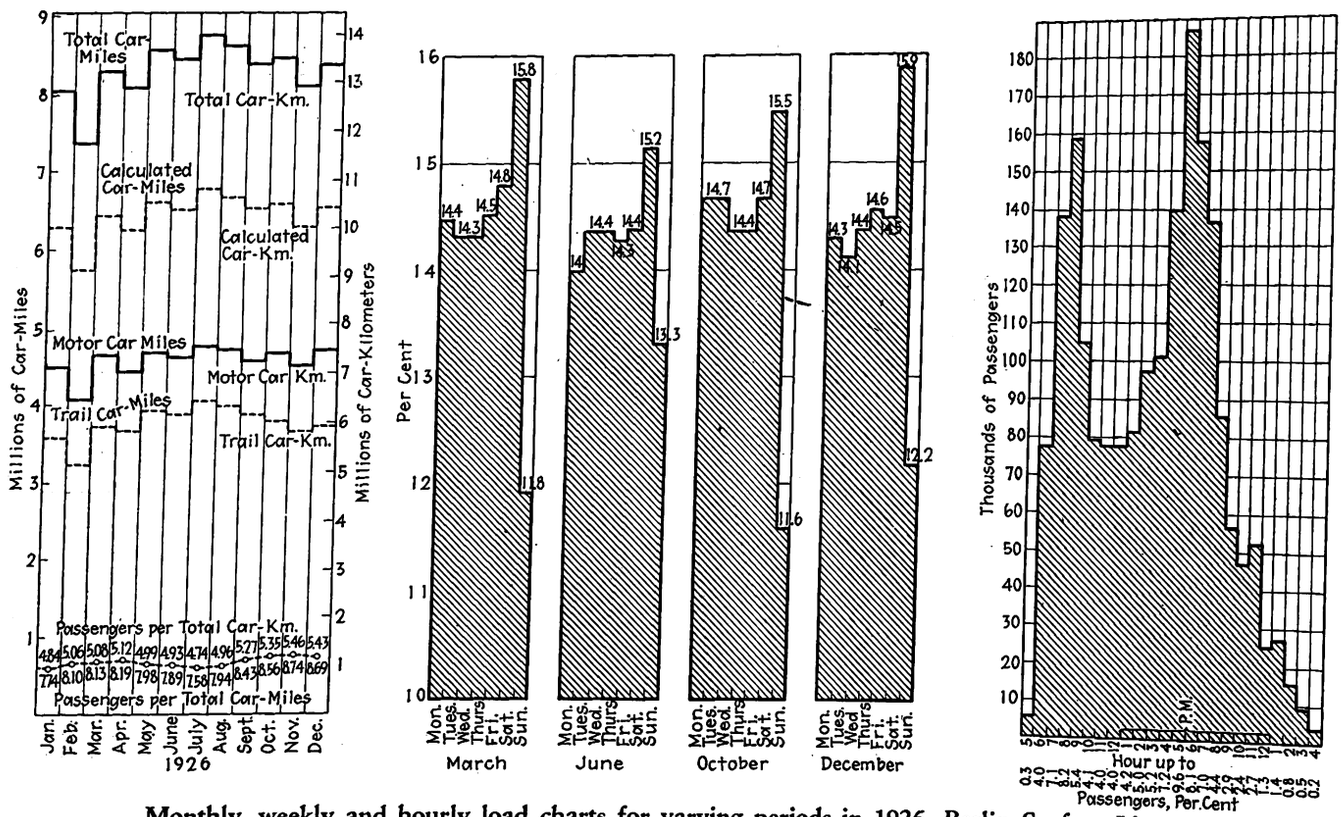
The Stadtbahn Also a Factor

While this commission directs the policy of the three companies mentioned, it does not control all the Berlin urban transportation agencies because of the existence of the Stadt- und Ringbahn, a standard-gage railroad extending around and across the city and with suburban extensions. This road is part of the German State Railroads system and was built some 50 years ago to form a physical connection for the steam railroads which enter Berlin from several sides. It also had certain military value in the mobilization of troops. Owing to its location, this road has always done considerable city and suburban passenger transportation business.



This chart was published by the Berlin Surface Lines to illustrate the comparative increase in the cost of material and labor used in street railway operation during the last thirteen years and the much smaller increase in the charge for transportation

Digitized by Google



Monthly, weekly and hourly load charts for varying periods in 1926, Berlin Surface Lines

At left, monthly load chart of car-miles and car-kilometers, Berlin Surface Lines, for calendar year of 1926, also rides per car-mile and per car-kilometer. In center, weekly load chart in per cent of total, Berlin Surface Lines, for four typical months during 1926. At right, hourly load chart of passengers, Berlin Surface Lines, for Wednesday, Dec. 5, 1926.

Operation of this line has been by steam locomotives up to within recently, largely because the government railroad authorities could not decide whether it should be equipped with alternating or direct current. A decision was then reached to equip two of the four tracks with the third-rail direct-current system for urban service, the question of the arrangement to be adopted later when through single-phase trains enter the city to be determined when the through trunk lines entering Berlin are electrically equipped.

With its new direct-current equipment, this transportation system should play an even more important part in Berlin's city transportation than in the past, at least in number of passengers carried. Whether it will increase its proportion of total passengers remains to be seen, because the street railway, rapid transit and omnibus systems are also making important improvements at the present time.

How the Traffic Is Divided

The diagram on page 550 shows the division of traffic between the several agencies by quarters during 1925 and 1926, and Table I, the division by years from 1911 to 1926 inclusive. In the latter the fluctuations in recent years, particularly between the two principal transportation systems, will be noted. Thus, the street railway proportion, which was 69.2 per cent in 1918, fell to 25.5 per cent in 1923, but in 1926 had returned to 55.8 per cent.

Conversely, the Stadtbahn system, which carried only 22.6 per cent in 1918, was responsible for 57.5 per cent of the traffic in 1923. Its local traffic in 1926, amounting to 371,000,000 passengers, was about the same numerically as before the war and represented 25.5 per cent of the total. The period of its spurt, 1920-23 and extending into 1924, corresponds roughly to the time of great currency inflation in Germany, when the street railways under private ownership were trying to raise fares rapidly enough to meet their financial obligations, whereas the fares on the Stadtbahn, under government ownership, were less susceptible to the devaluation movement in the currency.

TABLE II—DEVELOPMENT OF GREATER BERLIN TRAFFIC SINCE 1890

Year	Inhabitants Within the Boundaries of the Present Greater Berlin	Total Passengers Carried	Yearly Rides per Inhabitant
1890	1,960,000	234,315,000	119
1891	2,022,000	253,669,000	125
1892	2,084,000	268,226,000	129
1893	2,146,000	290,161,000	136

† Estimated. All other population figures are taken from official municipal publications.

Digitized by Google

A still more striking evidence of the influence of the war and the inflation period following it is shown in the figures of passengers carried on the buses. In the years 1911-14 these varied from 154,000,000 to 170,000,000, but in 1918 had got down to 8,000,000 and reached their minimum of 6,500,000 in 1920, when rubber and gasoline were very costly. The 1926 figure of 113,000,000 is still somewhat less than the pre-war average, but during the first half of 1927 the bus traffic has been growing rapidly.

Table I shows a notable increase in total passengers carried during the past four years. This appears in a more extended way in Table II, giving total traffic figures for the past 36 years, with the population of the district known as Greater Berlin and the rides per inhabitant.

Adoption of Universal Transfer a Notable Event

The most notable event in Berlin traffic history since the acquisition of the three local systems by the city was the decision this year to adopt the same fare for all lines with practically universal transfers. The fare chosen was 20 pfennigs (5 cents) and includes a transfer from bus to rapid transit or surface line and between these two. As yet transfers are not given by them to the buses, but this is only because of temporary shortage of bus equipment. When this condition is remedied by the receipt of new buses on order it is expected that the transfer privilege will be universal.

This universal transfer plan went into effect March 15, 1927. In addition to the 20-pfennig adult rate, the company sells school tickets at half price. These are good for scholars between the ages of six and fourteen. This rate is also available for scholars up to eighteen

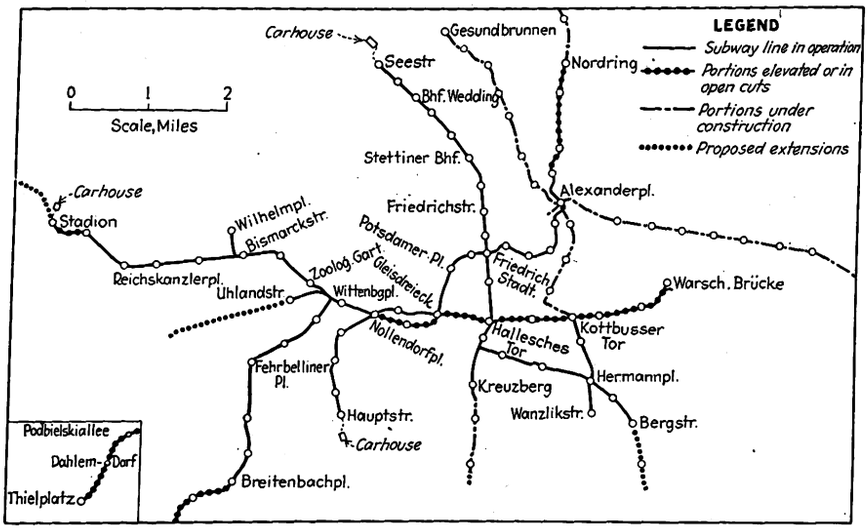
Digitized by Google



Map showing the rapid transit system in the city of Berlin, Germany

years of age who have secured an official certificate that their financial circumstances call for a reduction in fare. The hours and days on which these school tickets can be used are limited, as in the United States. The reduced rate is also available to crippled war veterans under certain circumstances. Several varieties of monthly passes are also sold by the Berlin Surface Lines and rapid transit system. A purchaser can buy such a pass, good for an unlimited number of rides during the month over one, two, three or all lines of either the surface or rapid transit system, or he can buy one pass good over both the surface and rapid transit lines.

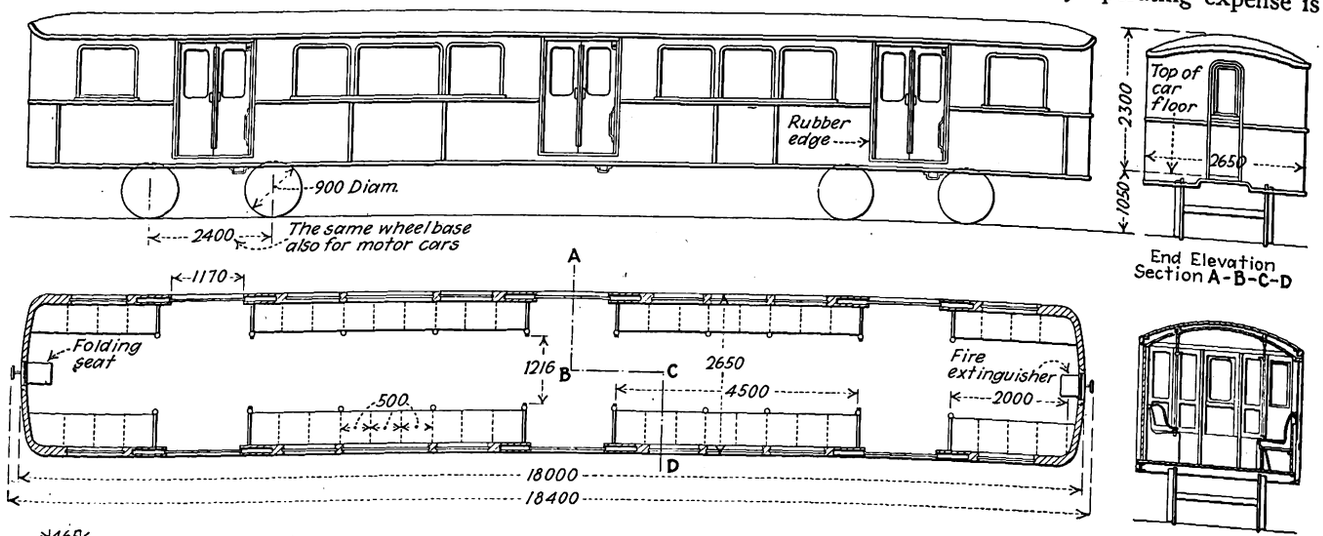
The universal transfer in force is limited to one change and also as to time. The initial trip must be taken within 1½ hours, including the time required to make the transfer. This period was selected after a consideration of the length of trips on individual lines and length of time required for transfer. However, by proper selection of lines a person can take a three-hour trip over a distance of 22½ miles for a single fare, but the trip must always be in the same general direction.

In this connection it should be remembered that many railway costs, particularly for labor, are much lower than in the United States. Statistics on labor costs in Berlin were published in an article by the writer in the issue of the JOURNAL for Aug. 27, 1927. Nevertheless, German railway costs of the present day are much higher than they were in 1913, although Germany has stabilized its currency. These increases in operating expenses have been effectively pictured in a chart issued by the Berliner Strassenbahn Betriebs Gesellschaft (the title of the street railway operating company). This chart is reproduced on page 550.

In a number of other respects the operating problems that have to be contended with in Berlin are less acute than those encountered in the larger cities of the United States. This is particularly true in the matter of street congestion, which is notably less severe, since with a population of about 4,000,000 there are only about 50,000 registered automobiles and parking regulations are enforced. On the other hand, there are many bicycles and motorcycles, commercial trucks and taxicabs on the public streets.

Table III gives for the city of Berlin the number of street accidents caused by these various types of vehicles during 1926, an accident being so classified when serious enough to become part of the police records. An attempt in this table has also been made to give an idea of the extent of use of the public streets by these various classes of motor vehicles. Obviously, this could not be done by the number of such vehicles registered. Instead, a count was made on Dec. 31, 1926, and the figures in the first column of Table III are based on this count.

Another factor of street railway operating expense is the extent of fluctuations in traffic, monthly, weekly and hourly, which have to be cared for by the transportation system. Broadly speaking, these fluctuations in the number of passengers carried are less in Berlin than on a great many of the large city properties in the United States. Charts of this kind for the Berlin Surface Lines are published on page 551. On the yearly chart the line



Berlin's present standard rapid transit car has three doors on each side

Digitized by Google

"calculated car-miles" shows an arbitrary figure made up by adding to the motor-car-miles half of the trail-car-miles. This is considered in Europe a very convenient unit for measuring certain expenses, particularly labor expenses. A notable feature of this chart is the comparatively large number of passengers per car-mile, varying from 7.58 to 8.74. Another is the comparative evenness of the load line, though the demand for passenger transportation seems to be slightly greater in summer than in winter. The weekly curve line indicates that Saturday is the big day and Sunday the low day during all periods of the year. The hourly load chart, based on a count of passengers on Wednesday, Dec. 5, shows a good mid-day load, with the rather unusual feature of a broader afternoon peak than morning peak, due probably to the large number of Christmas shoppers. Generally on German street railway lines the morning peak is higher and narrower than that in the afternoon, due to the fact that the opening hours for business in different fields are closer together than the closing hours.

Equipment of Existing Lines

To care for this traffic the Berlin Surface Lines had, at the beginning of 1927, 1,920 motor passenger cars and 2,008 trail passenger cars, besides 244 service cars, 21 electric locomotives, 206 freight trail cars, 23 postal mail cars and other miscellaneous equipment. To operate its system it had 13,735 employees. Its latest type of motor car, using Cardan drive, is shown in the illustration on page 549 of this article. Full particulars of this and other types of the company's cars were given in two articles by Manager Pforr of the Berlin Surface Lines, appearing in Electric Railway Journal for Jan. 29 and Feb. 5 of this year.

The rolling stock equipment of the Elevated and Underground Road at the beginning of this year consisted of 427 motor cars and 390 trail cars. It had 50.4 km. (31.5 miles) of route and 127 km. (79.4 miles) of track. It has cars of two widths, because one of the later extensions, the Nordsüd line, was built with wider clearances than the original Hochbahn. Both properties now belong to the same company and all future lines will be built with clearances like the Nordsüd cars. A diagram on page 553 shows a plan and elevation of the trail car which has been adopted for all new equipment. The motor car is just like the trail car except that one end has compartments for the motorman and conductor. All dimensions are given in millimeters.

As will be seen this car has three doors on each side. The trail car has accommodations for 53 seated and 112 standing passengers and weighs empty 29.4 metric tons (64,680 lb.). The motor car has accommodations for 44 seated and 117 standing passengers and weighs, with equipment but without passengers, 40.6 metric tons (89,320 lb.). No ventilators are shown on the accompanying elevations, but the Flettner type will be used on all new cars. The older cars have low monitors. Other particulars of the equipment will be contained in a later article by the writer in Electric Railway Journal.

About one-fourth of the cars in each train are smokers and are painted red on the outside so as to be easily distinguishable by waiting passengers. The non-smokers have yellow as an outside body color. Divisions as to classes by fare have been given up within the last year and only one class of fare is now charged.

Before the war the underground conduit system was used by the surface cars in the center of Berlin. All cars were fitted with trolley poles, and those cars which passed through the center of the city had to have plow equipment also. During the war the company received permission to equip these sections with overhead wires as an emergency measure to reduce maintenance costs. After the war the overhead wires were allowed to remain. There is now no underground conduit operation in Berlin.

The standard train on the Nordsüd line has four cars, of which the two end cars are motor cars and the other two are trailers. This train is increased to one of six cars by the addition at one end of a motor car and trailer.

The cars on the Hochbahn proper are considerably smaller, on account of smaller clearances. They measure only 12.83 m. (42 ft. 1½ in.) long and 2.26 m. (7 ft. 5 in.) wide. The motor car accommodates 26 seated and 56 standing passengers and the trail car 33 seated and 55 standing passengers. Both have two doors on each side. The longest train which can be run on the Hochbahn at present consists of six cars, three motor cars and three trailers, but when the few remaining platforms are extended it will be possible to run trains of eight cars each.

The bus system in Berlin is operated by the Allgemeine Berliner Omnibus A. G., which on the first of this year had 490 buses, with 100 more on order. By far the greater number are double-deckers with solid tires.

Kansas City Company Tells New Car Story in New Way

IN ORDER to acquaint the public of Kansas City with its $1,500,000 remodeling and rehabilitating car program and at the same time to present graphically the improvements the Kansas City Public Service Company is using the advertising columns of the daily press, employing such copy as is shown elsewhere on this page.

Besides graphically pointing out the new features with numbered key paragraphs, the company, in a box in the righthand corner of each advertisement, is announcing this policy:

In line with our policy to give greater Kansas City an unexcelled urban transportation system, we will spend in the next twelve months approximately $1,500,000 to remodel and rehabilitate all of our 745 cars. These cars, to be turned out at the rate of twelve each week, will be equipped with all of the recently invented labor-saving devices, embodying some new features developed in Kansas City.

Forty-five of these de luxe cars, the first series to be completed, will be placed in service on the Country Club line early in July. Later they will be rotated on other lines. In addition to the new mechanical and air features, these 45 cars will be equipped with rubber tile flooring Kemi-suede seat covering, new lighting fixtures, sun visors and steel skirts which cover the trucks, minimize the noise and give the car a streamline effect.

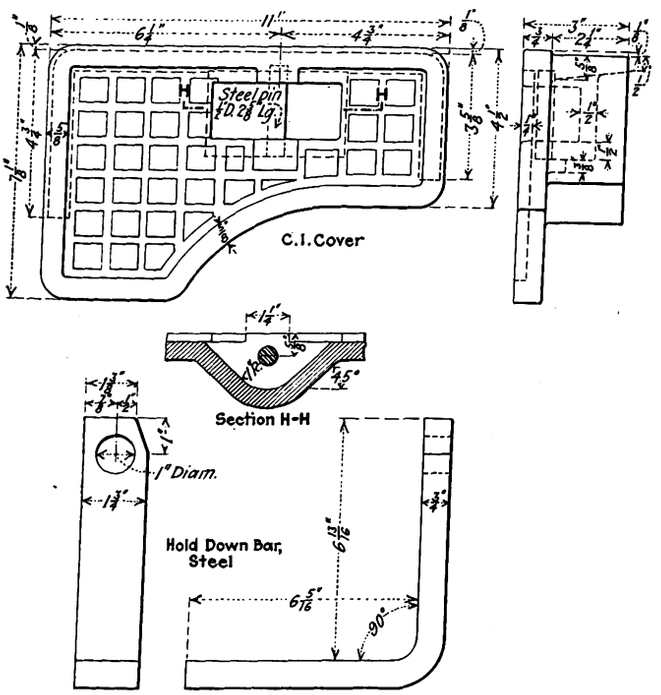
Standard Tongue Switch Designed

Study begun in 1924 by committee on way and structures has now been completed. Luncheon conference to be held at convention to discuss proposed design

FOR the past three years the committee on way and structures of the American Electric Railway Engineering Association, acting through a special committee, has been working out a design for a standard tongue switch. This work has now been completed and through the courtesy of one of the manufacturing companies two of the proposed switches will be on exhibition at the Cleveland convention.

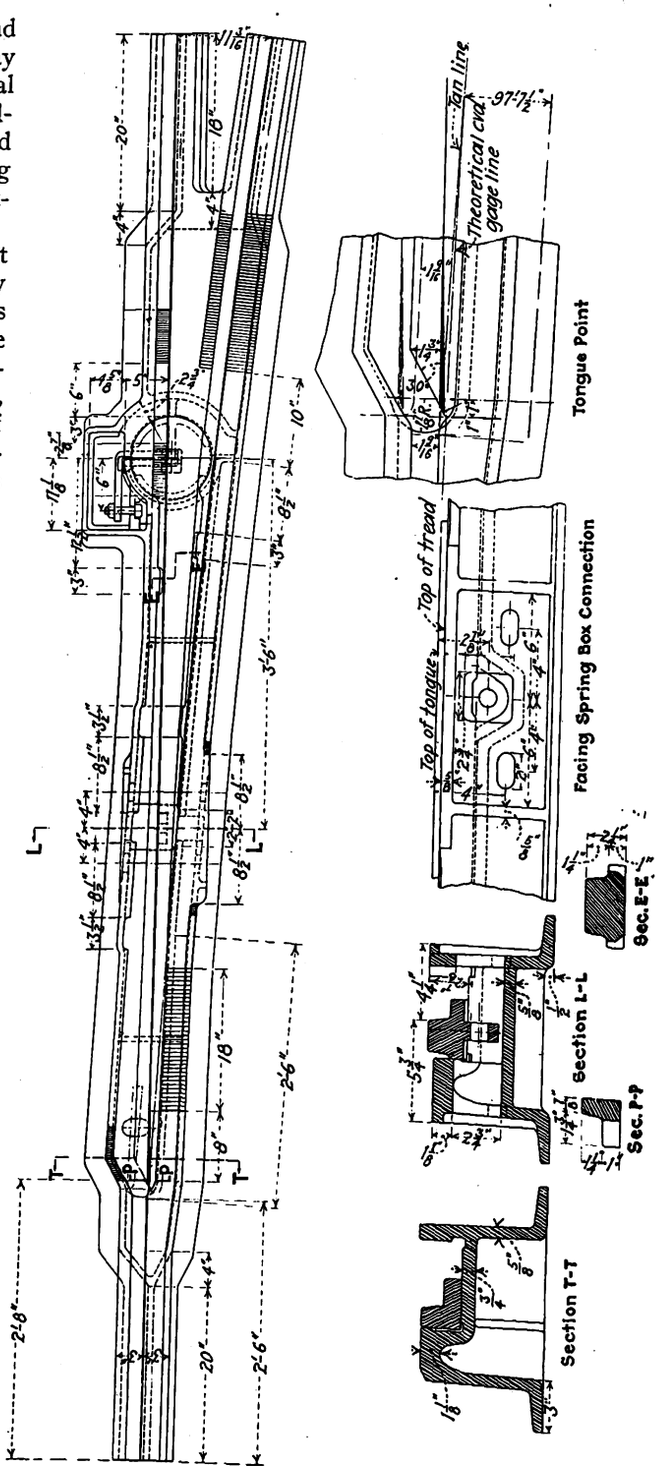
The average street railway has on its lines a great variety of tongue switches, there often being many different styles from a single manufacturer as well as entirely different designs by other manufacturers. The difficulty and expense of maintenance under these conditions is well known to all way engineers. As a result, some of the larger companies have adopted standards of their own, all the way from specifying certain overall lengths to complete designs covering all details. This



Details of tongue pin holding mechanism

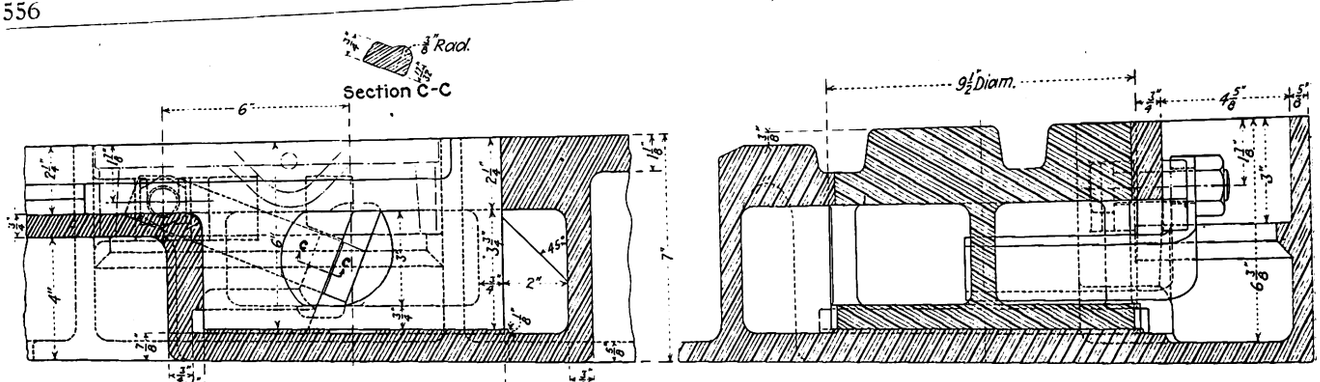
has forced special trackwork manufacturers to carry a still greater variety of patterns. The cost of such multiplicity of designs is, of course, necessarily borne by the industry.

In designing a standard tongue switch it was kept in mind that to be satisfactory the switch must be not only as good as or better than existing designs but must be no more expensive. It is felt by the committee that these conditions have been met and it is desired that the new design should be tried out widely so as to demonstrate as quickly as possible whether or not it is satisfactory.



Proposed A.E.R.E.A. standard solid manganese steel tongue switch, 97 ft. 7½ in. radius, showing detail of tongue point, facing spring box connection, and four cross-sections. The type of heel and heel-fastening device is novel in several particulars. The pin is of the tadpole type of 9½ in. diameter and is carried down to a bed on the base of the 7-in. casting.

Digitized by Google



Sections at heel of proposed standard switch

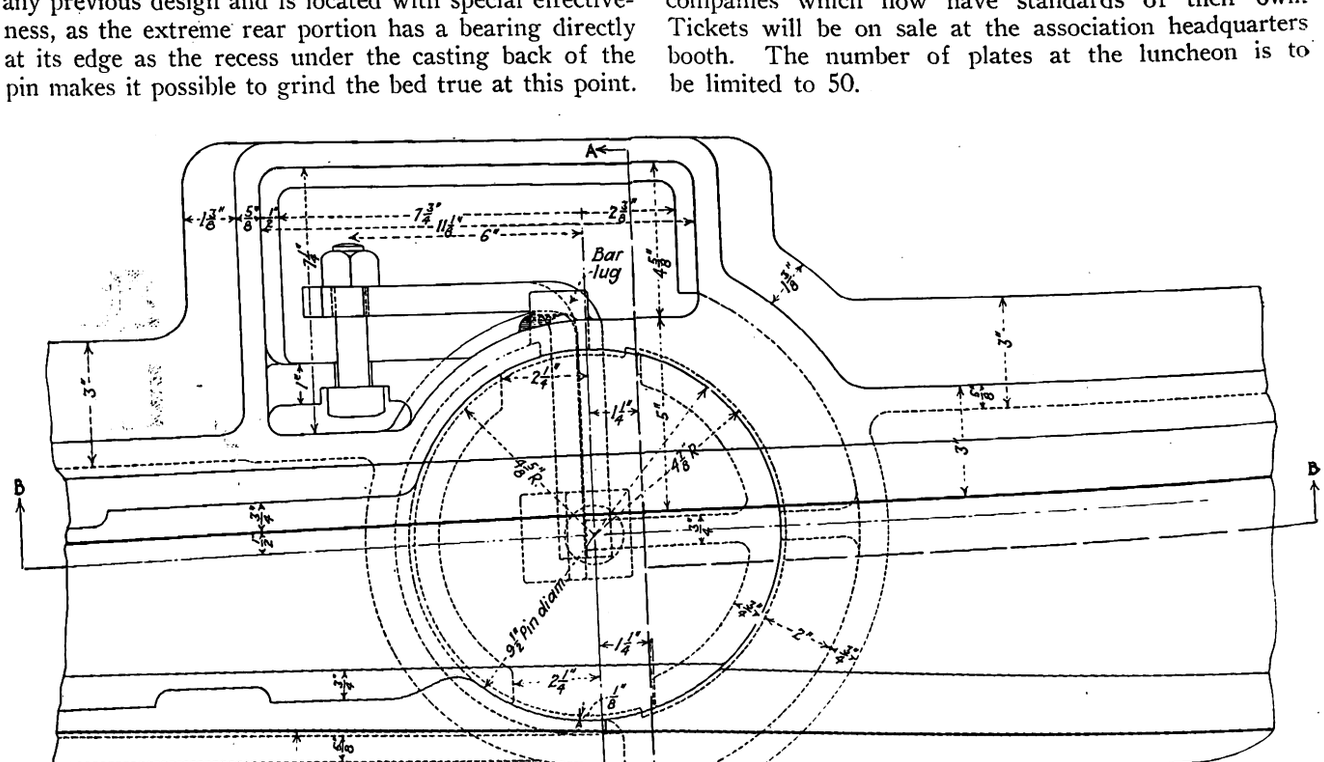
Detail drawings are shown herewith for a "100-ft." solid manganese switch, showing the general plan, the plan of heel, sections at heel and pin-holding device.

The type of heel and heel-fastening device is novel in several particulars, but is believed to be thoroughly sound and to present several marked advantages. The heel or pin is of the tadpole type, of 9½ in. diameter, and is carried down to a bed on the base of the 7-in. casting. This provides a vertical wall of large dimensions which resists any forward motion of the tongue under trailing traffic. The distributed wear on this wall will be very slight, even if the holding device is not kept in operative condition, so that the joint between heel of tongue and casting should not increase materially during the life of the switch.

The supporting area under the heel is as large as in any previous design and is located with special effectiveness, as the extreme rear portion has a bearing directly at its edge as the recess under the casting back of the pin makes it possible to grind the bed true at this point. This same recess extends all around the back of the pin, providing a space to be filled with oil or grease in the summer or salt in the winter.

The fastening device holds down and back as well. It consists of a lever held in place by a bolt which is readily accessible. The lever makes contact with the heel on an inside diaphragm at the center of revolution, thus providing rolling motion instead of frictional wear. The diaphragm also stiffens up the floor of the heel.

Arrangements have been made for a luncheon conference at the Hotel Hollenden, Cleveland, at 1 o'clock on Wednesday, Oct. 5, to talk over the desirability of the general adoption of this proposed A.E.R.E.A. standard tongue switch. This will provide opportunity for an interchange of opinion among those competent to pass on the design and bring together representatives of those companies which now have standards of their own. Tickets will be on sale at the association headquarters booth. The number of plates at the luncheon is to be limited to 50.



Plan of heel of proposed A.E.R.E.A. standard tongue switch

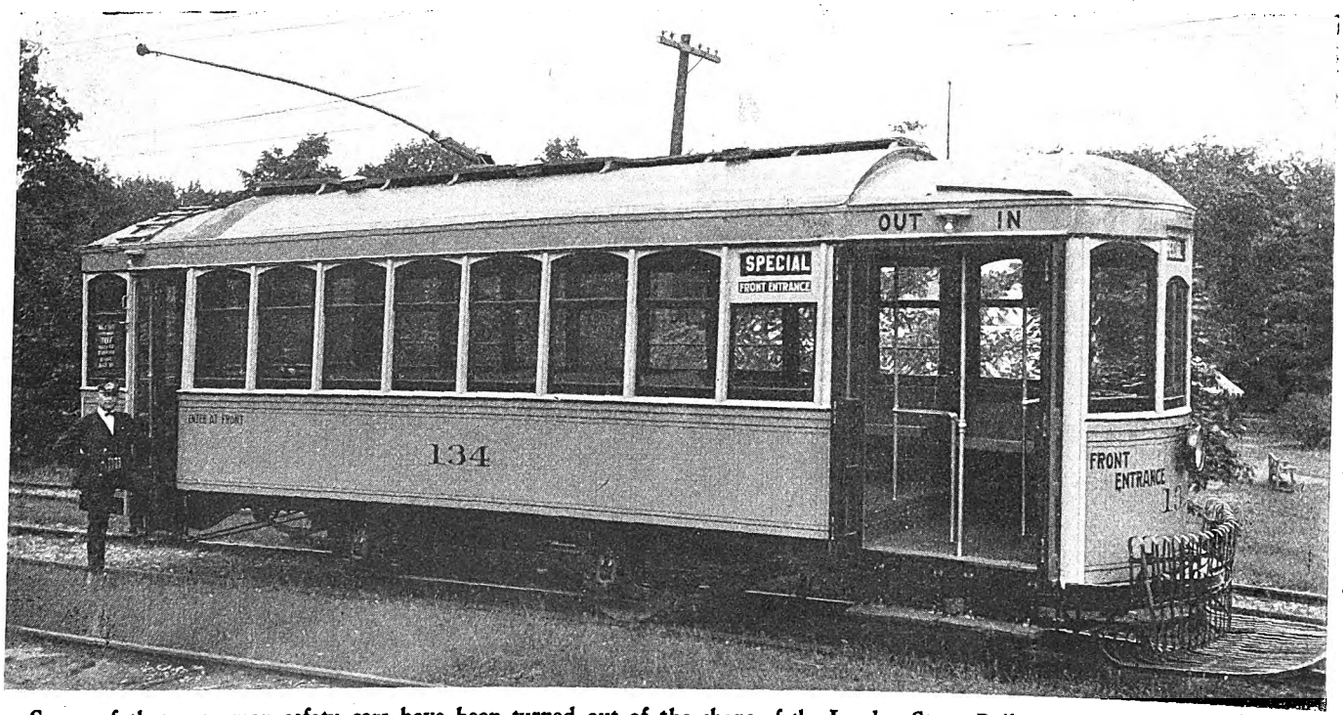
London, Ont., Cars Converted to
One-Man Safety Operation

By L. Tait
Manager and Secretary-Treasurer
London Street Railway, London, Ont.



Seven of these one-man safety cars have been turned out of the shops of the London Street Railway, London, Ont., Canada. They were converted from two-man, single-truck units

LAST fall the London Street Railway, operating in London., Ont., Canada, converted one of its two-man, single-truck cars to the safety type, with double doors in front and a treadle exit door in the rear. This work was in the nature of an experiment because the company's plan to convert fifteen of its two-man cars was not considered favorably by the City Council and it was therefore necessary to demonstrate that this equipment could be satisfactorily converted into up-to-date safety cars. Careful plans were laid to embody in the design all the requirements of an adequate safety car. Although some changes have been made from the first car converted, these have largely been in the nature of additional improvements, the most important being the installation of a unique back-up arrangement placed on the car for the purpose of turning it around "Y's" and also for backing out of the carhouses. The company's equipment all has single-end control and many of the lines have "Y's" at terminals. Because of increasing auto traffic and the use of a "Y" located on Dundas Street East, which is the main provincial highway through Canada between Detroit and Buffalo, it became increasingly necessary to devise some plan to back up safety cars in order that this equipment could be operated in safety around these "Y's" and without delay to traffic.

Many schemes were considered by the staff, including one to have the operator remove the controller and air brake handle from the front and carry them to the rear of the car. This was discarded on account of the work entailed in removing the handles. Likewise a plan to place the air line at the rear of the car with a small removable air brake handle was vetoed because it was felt that failure of an operator to remove the air brake handle after backing might result in operating troubles.

It was finally decided to use an ordinary hand brake at the rear, and the National Brake Company's Peacock staffless brake was selected and placed between the back cross seat and the small seat on the side of the car. In this way no seating space has been lost on account of the installation of the hand brake.

Directly above the hand brake on the side of the car a circuit breaker was installed, so that this apparatus can be operated with the left hand and the hand brake with the right. Wiring between the front of car and the rear circuit breaker is carried through the roof and along top of car. A heavy type knife switch mounted on a slate base and inclosed in a wooden box with only sufficient space for the travel of the handle is placed on the side of car to the left of the controller. This switch is connected at the top terminal to the front circuit breaker and at the bottom terminal of the switch to the

Digitized by Google

controller. The bottom terminal of this cut-out switch also has a wire connection through a conduit up the left front vestibule post, the wire running through the roof of the car and along the top to the circuit breaker at the rear. Final connection is then made between front and rear circuit breakers.

Operation of this device, which was described in the Maintenance Data Sheet Section of the JOURNAL, issue of Aug. 20, page 319, is as follows:

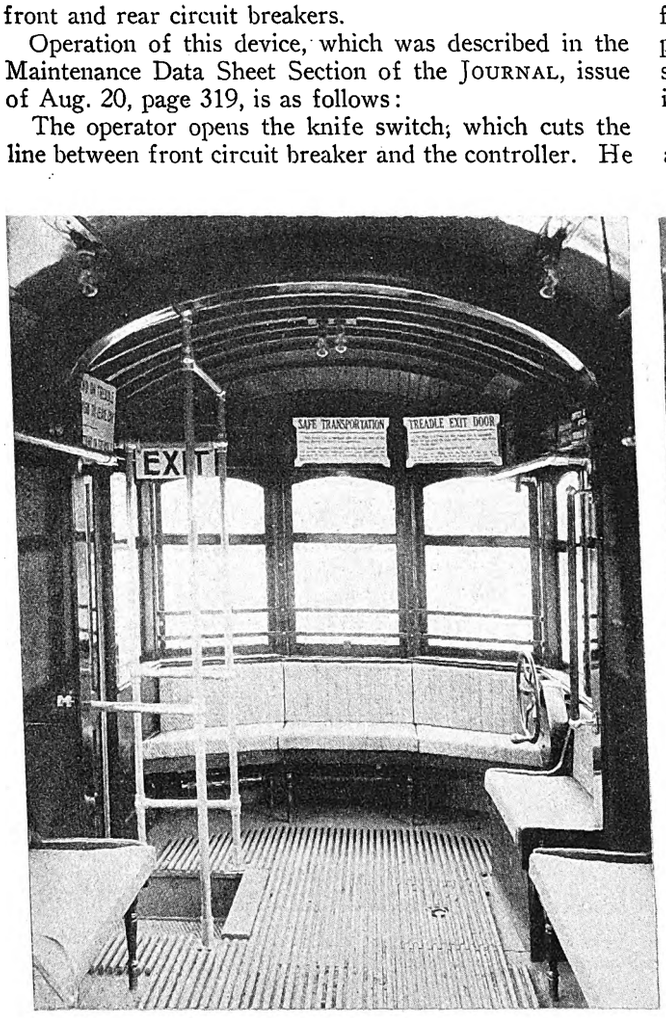
The operator opens the knife switch, which cuts the line between front circuit breaker and the controller. He then places the controller handle on the first position and hooks down the dead man controller handle with a special hook. This hook is so designed that it can be used only on the first notch. The controller is placed in reverse and the air brake released to the brake-off position. The operator then walks to the rear of the car and immediately operates the circuit breaker to close the circuit, using the hand brake to stop the car. The current flows from the trolley through the front circuit breaker, then through the rear circuit breaker and direct to the bottom connection of the knife switch, on to the controller set on the first position. After backing the car, the operator then proceeds to the front vestibule, removes the hook from the controller handle, adjusts the reverse controller lever and throws in the knife switch. The car is then ready to move forward.

This back-up device has now been in operation for six months and is proving entirely satisfactory, giving one-man operators a clear view of the roadway when backing the car. Previously, operators were having considerable difficulty in backing their cars in traffic, particularly backing up in winter with frosted windows.

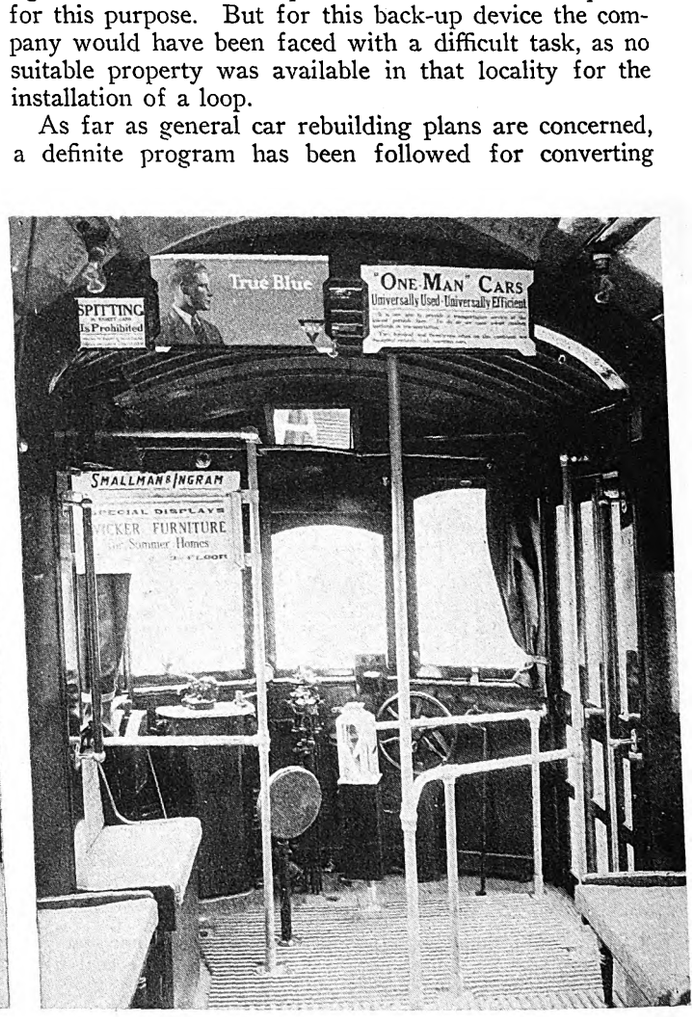
Reconstruction of the company's London West line of 1.1 miles was begun in August and the company has secured authority from the City Council to install a "Y" at the end of this line in a new location. One leg of the "Y" will be placed on a 40-ft. lot acquired for this purpose. But for this back-up device the company would have been faced with a difficult task, as no suitable property was available in that locality for the installation of a loop.

As far as general car rebuilding plans are concerned, a definite program has been followed for converting the two-man cars with safety equipment. This consists of completely stripping the cars and removing and thoroughly overhauling each truck, after which rehabilitation proceeds along these lines: Each unit is equipped with Canadian Westinghouse air brakes and safety devices and National Pneumatic door equipment, the latter consisting of two door engines for operating the entrance and exit doors at the front and treadle door equipment at the rear. The treadle door engine and its equipment have been placed in a well between the new floor of the car and the old floor of the drop platform at the rear. Installed directly opposite the treadle step and under a small seat placed lengthwise of the car, the well at first was fitted with a trapdoor which completely covered the treadle door engine and its equipment. Some difficulty, however, was experienced last winter in operating the treadle door engine during the very cold snaps, and this difficulty was overcome by boxing in the seat immediately over the well, cutting off half the trap cover and lowering the electric heater under this seat so that the well area could be heated during the winter.

Every car is equipped with two Hunter route signs,



View of rear platform of converted units, showing, at right, wheel which controls special back-up device



Motorman's position in new safety cars. Here may be studied, with the aid of the text, the mechanism which controls the back-up device specially constructed for "Y" operation

Digitized by Google

placed one in front and one over the first right-hand window. To distinguish safety cars operating at night from two-man rear-entrance cars, the boxes containing the route signs are made large enough to install a "Front Entrance" sign immediately below them. By this arrangement the two lamps used for the Hunter sign are made to serve a double purpose.

In addition, the units are equipped throughout with aluminum hand railing and stanchions. A mirror has been placed just above the front Hunter sign box so that the operator may see the treadle step and door when the curtains are drawn. All lamps in the front vestibule are fitted with shades and two heavy curtains shield the operator. These curtains slide on rings on rods, bent to proper position. One curtain is immediately back of the operator and the other extends from the front right-hand corner post to the fare box. Curtains at night shut out all reflection from the rear, but allow sufficient opening so the operator has a clear view to the right to observe passengers boarding and leaving car and for fare collection.

Consolidated car heaters with thermostatic control are being placed in each car. All wiring is alongside the cross seats on the right-hand side of the car and is carried in conduit. Air pipes are carried in racks, one pipe above the other on the left side of the car under the longitudinal seat which extends from the front to the rear bulkhead. In front the vestibule air pipes are racked on the side of the car just above the two front door engines. Special seats cover the door engines, these seats being closed in to the floor and provided with a removable face board so that the door engines may be adjusted. All air pipe lines in the vestibule are fitted with unions as well as the air pipe lines immediately connecting with the air brake valve head. This facilitates removal of the valve head for repairs without the necessity of disturbing other connections. Galvanized pipes are now used on all air lines to overcome scale. With all door engines fully inclosed and all air lines off the floor in racks, no difficulty is experienced in sweeping and cleaning under the seats.

Under the new plan the seating capacity has been increased to 41 passengers, a gain of seven seats over the old style two-man type.

Remodeling of Cars Has Pleased the Public

To date seven of the converted cars have been released from the shop, each unit being remodeled for approximately $2,700. The company recently obtained authority from the City Council to operate ten safety cars of this type in regular service. Incidentally, five small safety cars with no rear exit door, operated since 1922, had caused considerable unfavorable comment from time to time when safety car operation was under discussion. The converted car, however, is proving quite satisfactory to the public and many favorable comments are now being received by the management.

Full credit should be given to R. H. Welburn, formerly master mechanic, who is now acting in the capacity of consulting engineer, for the simplicity of the back-up device placed on this car and for many of the details for the conversion of the equipment. Although Mr. Welburn has been in the service of the railway since 1895, a period of 32 years, and recently celebrated his 80th birthday, he is still as actively interested in the equipment of the railway as any of the younger men in the organization.

Readers' Forum

Calculating Rail Tonnage

Upper Darby, Pa., Sept. 17, 1927.

To the Editor:

Reading the article by Edward A. Roberts in Electric Railway Journal of Sept. 10, setting forth a simplified method of calculating the amount of rail in a given length of track, called to mind the following formula:

Tons rail per mile track = weight rail per yard multiplied by 11 and divided by 7.

This can be readily verified by arithmetic. It is set forth on page 817-b of the 1911 edition of Trautwine and I would not be surprised if it were given in the first edition. Such a formula is easily memorized (just think of the galloping dominoes) and from it a table of quantities for various rail weights and lengths of track can be compiled.

L. E. Summers.

General Engineering and Management Corporation
New York City, Sept. 17, 1927.

To the Editor:

I note Mr. Roberts' method of calculating rail tonnages on page 426 of the Sept. 10 issue of the Journal. As most of the problems involving rail tonnages in the street railway field are calculated in feet and not in miles, I developed a simple formula of calculating rail tonnages when track measurements are in feet, as follows:

Number of lineal feet of track multiplied by weight of rail per yard, divided by 3,360.

This formula is correct for all weights of rail. While it may not be original with me, I have never seen it in print before.

Mr. Roberts' formula is, of course, built up on the familiar fact that 1 mile of 70-lb. rail weighs 110 long tons, by which, of course, rail is always bought. His formula is comparatively simple when rail weights are in even tens, but as a great deal of street railway track is built of rail with odd weights per yard there would be some difficulty in applying Mr. Roberts' rule.

C. G. Keen,
Railway Engineer.

Philadelphia, Pa., Sept. 12, 1927.

To the Editor:

In your issue of Sept. 10 is mentioned a rather longer method of applying a simple old formula which has been used in the rail trade for well over half a century. There are 1,760 yards per mile, so that for 2 miles it would take 3,520 yards of rail. There are 2,240 lb. in a ton, and 3,520 divided by 2,240 equals 11/7. There is therefore required per mile of road 11/7 of 1 ton of rail of 1 lb. per yard. Multiply 11/7 by pounds per mile and number of miles of single track to be equipped and you have the total number of tons of 2,240 lb. each of rails required. This formula of 11/7 multiplied by miles and pounds per yard is, I think, the simplest formula obtainable, though it can be shortened where the number of pounds or the number of miles is divisible by 7. For instance, if pounds per yard is 63, one would simply multiply 11 by 9, getting 99 tons per mile.

Francis Ralston Welsh.

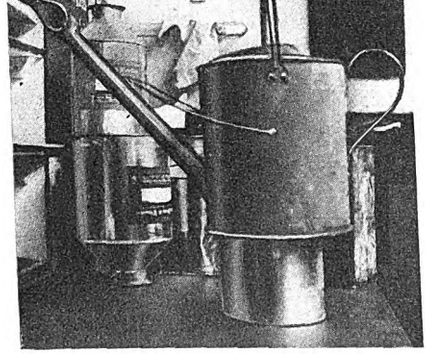
Maintenance Methods *and* Devices

Body Painting by the Flow Method

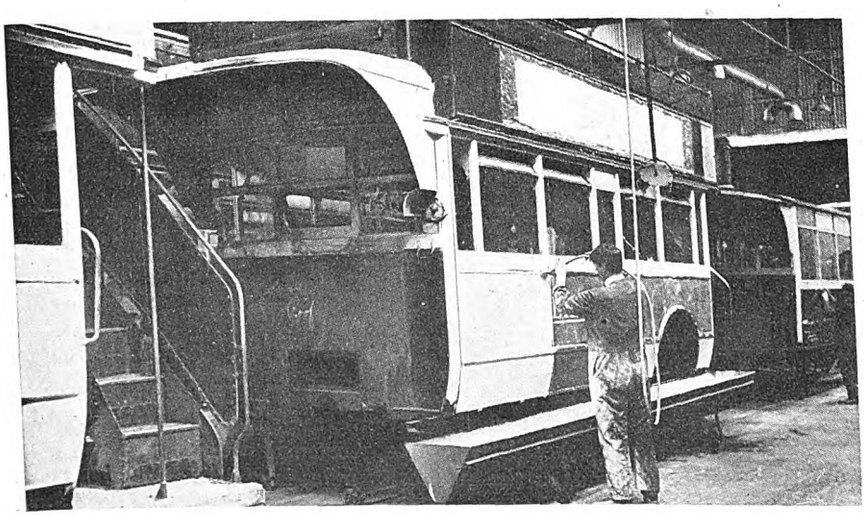
PAINTING bus bodies by the flow method, which is considered much more rapid than by the spray method, has been adopted in the Chiswick shops of the London General Omnibus Company. Briefly, the paint is allowed to run from a nozzle over the sides of the bus body in a broad thin stream. One coat by this method is considered equivalent to two by the brush method. It is used only for the final coat, the priming coat being put on by hand, and only about one minute is required by the flow method to paint one side of the body up to the waistline. The roof and top deck are painted by a spray gun and the interior of the lower deck (and of the upper deck in the case of covered top buses), the side posts and certain other parts of the exterior are painted by hand.

Keep your bearings from burning, while the car wheels are turning, by modern and improved lubrication learning.

When the flow method is used the paint may be put on in either of two ways, as shown by the accompanying illustrations. In one, the paint is contained in an overhead reservoir and flows by gravity through a flexible hose through a nozzle to the bus body. With the other method the paint is put on by a can which holds about 1½ gal. and looks very much like an ordinary watering can but has the same kind of a flat nozzle as that used when the paint flows through a hose. In both cases a V-shaped trough is used to catch the surplus paint which drops off the side of the bus.



Watering can for painting side sills



Bus bodies up to the waistline are painted by the flow method in the shops of the London General Omnibus Company. Only about one minute is required to paint each side. Paint is applied through a hose or by a can

When to Discard Wire Rope

JUST when to discard wire rope as worn out is a problem which depends on the local application of the rope and the degree of maintenance attention accorded during its period of service. Metallic area apparently unharmed cannot alone be taken as a criterion, since two ropes from the same reel, showing the same degree of wear and number of broken wires, may show under test a variation of 25 per cent in reserve strength.

There are several reasons for this variation, the principal one of which may be that one rope may have been subjected to excessive acceleration stresses which greatly fatigued the steel and caused considerable loss of strength, whereas the other rope may have operated under a more uniform tension and was never overstressed. Another factor might be the presence or absence of proper lubrication, which, of course, would affect greatly the degree of corrosion.

Wire ropes for shop cranes, electric or pneumatic hoists should be discarded when there are four or more broken wires in any one strand, when the outer wires have been worn to two-thirds of their original diameter; that is, when one-third of the wire diameter is worn off, or when loss of area exceeds 15 per cent for combined wire wear and broken wires.

When inspecting crane and hoist ropes it is always advisable to examine that section of the rope passing over the equalizing or compensating sheaves, as there is a slight movement of rope over these sheaves, causing abrasion or breaking of wires, which at times may prove dangerous.

When employed in the work of hoisting elevators or skips the wire rope should be discarded when there are more than three adjacent wires broken in any one strand, when the outer wires have become worn to two-thirds their original diameter or when marked corrosion appears.

The United States Bureau of Mines in Technical Paper No. 237 advocates that after shaft ropes have been in service for a period of three years, even if idle, they shall not be used unless tested for ultimate breaking strength. Indeed, any rope that has remained idle for some time should be submitted to the test of cutting off and examining the interior wires for possible corrosion and wear. The factor of safety on a deteriorated rope in this class of service should be 4 as minimum.

For boom topping lift, fall or hoist-

Digitized by Google

ing lines, the rope should be discarded when there are six or more adjacent wires broken in any one strand or when the outer wires have been worn to one-half their original diameter.

Holding, closing and boom lines on locomotive cranes should be discarded in conformity with the rules given for the "derrick ropes," but when examination of ropes is made, attention should be given that part of the rope passing over equalizing sheaves.

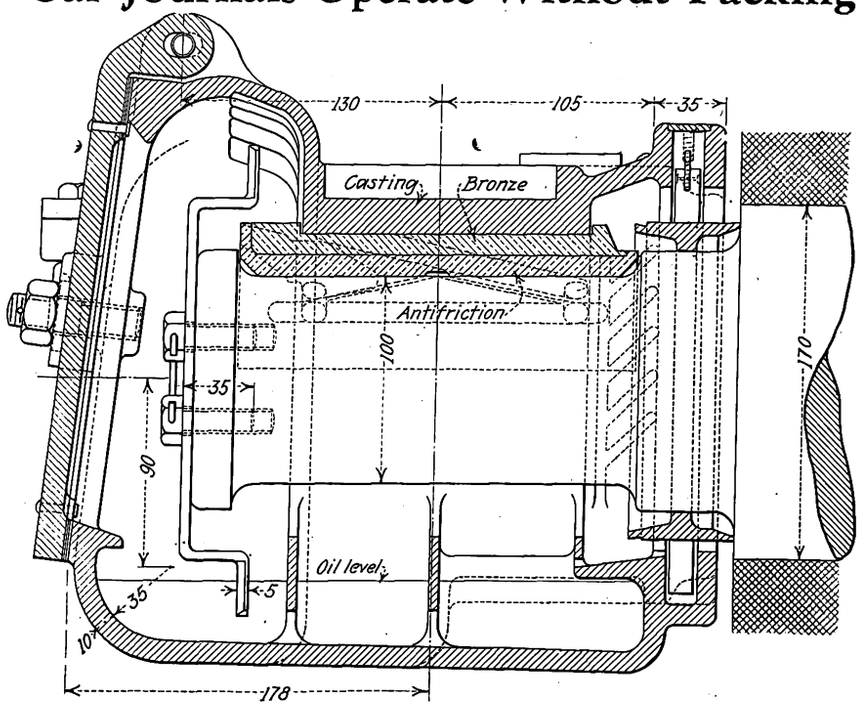
In the discarding of wire rope consideration should be made of the type of rope employed. It has been known, for instance, that a length of preformed wire rope, discarded as completely worn out, was capable of giving nearly twice the amount of service secured.

There are many places where life or limb will not be endangered by the breaking of a wire rope, such as car hauls, car transfers, spotters, etc. In such application a wire rope might conceivably be used until an entire strand breaks, but this general rule, of course, has no application to installations that might, in case of emergency, endanger workmen.

Weed Whipper Installed on Snow Sweeper

TO OVERCOME difficulties experienced from weeds growing between tracks, the Southern Ohio Public Service Company, Zanesville, Ohio, has arranged one of its sweepers with a weed whipper attachment. The rattan was removed from the rotary block of one of the brooms and the block was then incased entirely with angle iron bolted securely together. Holes were drilled through the iron to allow steel cables to be passed through and fastened with clips. When rotated these steel cables are given a whipping action so that weeds as they are starting to grow in the spring are destroyed. During midsummer, when the foliage becomes heavy, the cables have little effect.

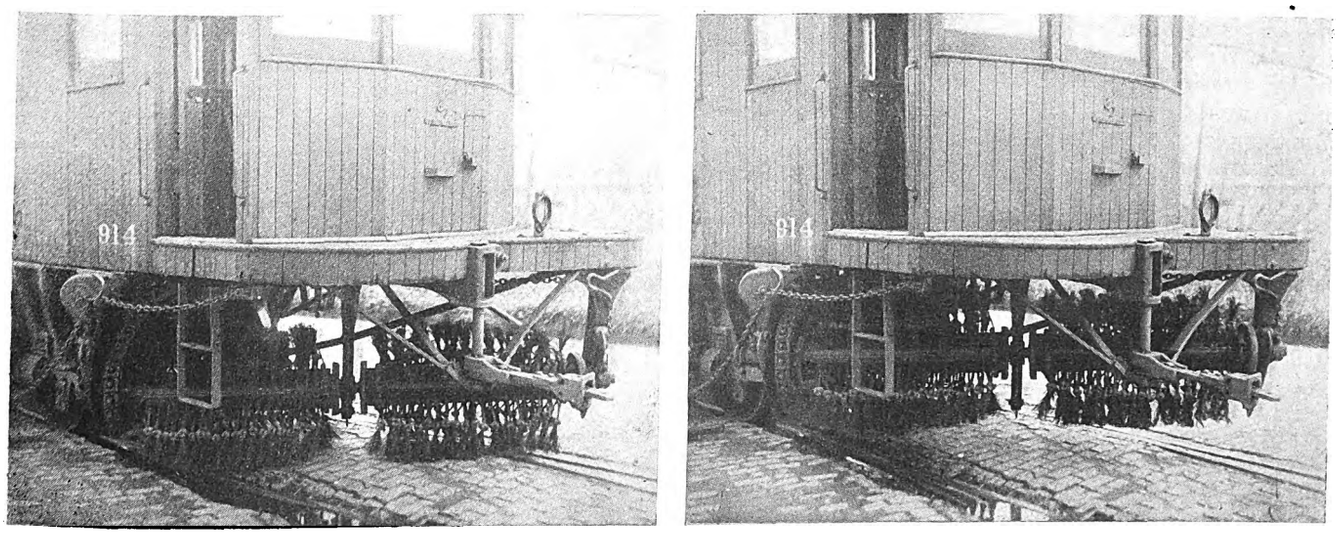
Car Journals Operate Without Packing



Longitudinal section of car journal, Paris subway car, showing splash plate (dimensions are in millimeters)

AN INGENIOUS method of splash lubrication for car journals is used by the Chemin de fer Metropolitain of Paris, which operates the subway and elevated system in that city. The construction is shown on the accompanying drawing.

The bearings are of anti-friction white metal and a small curved splash plate, 50 mm. (2 in.) wide and 5 mm. ($\frac{3}{16}$ in.) thick, is screwed on to the end of the car journal. The lower end of this plate dips in a reservoir of oil at the bottom of the housing and as the axle revolves oil is carried over and around the journal. No packing is used. An inspection of the journal is made every four or five days to see whether there is sufficient oil, but usually none is required. The records of the company show that the average consumption of oil per journal box is 16 grams per 1,000 car-km. (5.64 lb. per 100,000 car-miles) run.



At left, weed whipper attachment in lowered position; at right, raised position of weed whipper

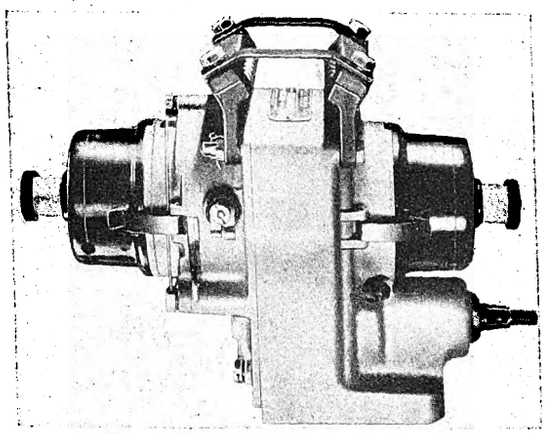
New Equipment Available

Heavy-Duty Ignition of Dual Type

DESIGNED especially for bus and truck use the North East Electric Company, Rochester, N. Y., has brought out a heavy-duty ignition unit of the dual type. It is used with two distributors and two coils furnishing two sparks to each cylinder. The unit has semi-automatic spark advance, uses four ball bearings and is built for magneto base mounting.

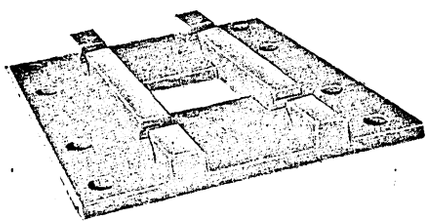


Dual type ignition unit

New Joint and Tie Plates of Hamburg Elevated Railway

NEW types of joint plates and tie plates manufactured by the Klöckner Works of Osnabruck have recently been adopted as standard by the Hamburg Elevated Railway of Hamburg, Germany. The two principal features of these plates are heavy ribs on the plates to hold the rail in place and a method of attaching the rail to the plate independent of the attachment of the plate to the tie. Among the advantages claimed for this plate are the following:

The strains from any movement of the rails do not come directly against the screw spikes holding the plate to the tie, hence they do not tend to work in the hole, become loose and pull out.



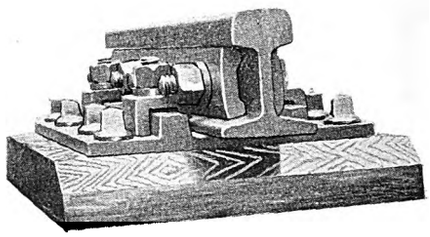
This joint plate rests on two ties

It is not necessary to change the screw spikes when a rail is changed.

The base of the plate completely covers the portion of the tie on which it rests, so that water does not get through the ties and start decay. The illustrations show a joint plate which is designed to rest on two adjoining ties. The tie plate is similar in construction to the joint plate except that it is less than half as long and has holes for only two screw spikes on each side. The heavy ribs between which the base of the rail rests are shown clearly in both illustrations.

The illustration above shows the clips for attaching the rail to the plate. Each attachment consists of four parts, as follows: (1) A U-shaped clip spannning the rib, one side resting on the base plate, the other on the base of the rail; (2) a bolt with a triangular head to fit into the triangular opening in the rib; (3) a nut which holds the rib to the base plate, and (4) a lock washer to hold the nut in place. The grip on the rail is so solid that it is expected longer sections of tracks can be welded when the track is exposed without danger of trouble from expansion and contraction.

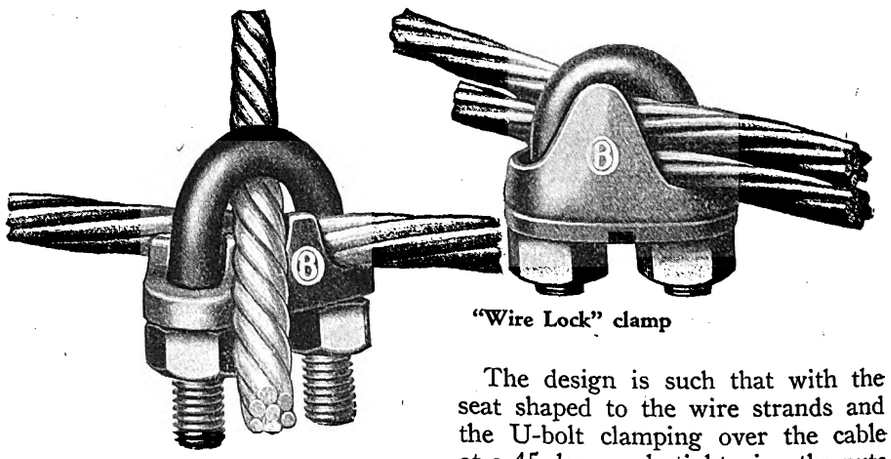
An adjunct to the plate not previously mentioned is a thin strip of poplar wood between the base of the rail and the plate. This sheet, which is treated for preservation against rot, is 5 mm. (0.2 in.) thick and is capable of being compressed to 3 mm. (0.12 in.) thick. The edges of this wooden strip, which bear no load, tend to swell and form ridges which prevent the rail still further from shifting in the plate.



Method of fastening rail to tie plate

Clamps for Two Wires

DESIGNED to hold two parallel or cross wires when making splices deadends, etc., the Ohio Brass Company, Ohio, is offering the "Wire Lock" clamp. The shaped seat or groove of the saddle and the angle at which the U-bolt clamps the strands are said to give great strength and holding power. These features permit the clamp to be installed easily and quickly without damage to the wire strands.



"Wire Lock" clamp

The design is such that with the seat shaped to the wire strands and the U-bolt clamping over the cable at a 45-deg. angle tightening the nuts draws the wires downward against the faces of the upright lugs in the shaped seat at the bottom. This provides both lateral and vertical compression on the wires over the greater part of their circumference.

The clamp is furnished in bronze or forged steel, either of which is recommended by the maker for use by electric railways and in overhead and distribution systems generally, the bronze clamp being particularly recommended on interurban and steam road electrification installations, where bronze or copper stranded cables are used.

American Association News

Car Lighting Demonstration at Convention

OF PRIMARY importance among the factors which contribute to the comfort, convenience and safety of electric railway passengers artificial illumination has been accorded special attention by rolling stock committee No. 4 of the American Electric Railway Engineering Association. Supplementing its 1927 report, the committee has prepared a special lighting exhibit at the convention showing a number of recommended illumination systems. The Cleveland Railway has provided a car for this demonstration and installed the lighting equipment. This consists of four independent lighting systems, on separately controlled circuits. The car has a seating capacity of 55 with transverse seats at the rear and longitudinal seats at the front. These two arrangements of seats provide interesting comparisons of the amounts of light available from the various systems of illumination. The arch-shaped headlining is finished in a light color which gives the greatest efficiency in the utilization of natural and artificial light.

System No. 1 consists of five 12-in. ceiling type inclosing hemisphere fixtures (two qualities of glassware), each containing lamps that may be changed at will, but ordinarily totaling approximately 200 watts. The inclosing bowls are spaced at 8-ft. intervals on the longitudinal center line of the car. Pressed glass deep bowls and blown glass shallow bowls of the diffusing type will be used with this installation.

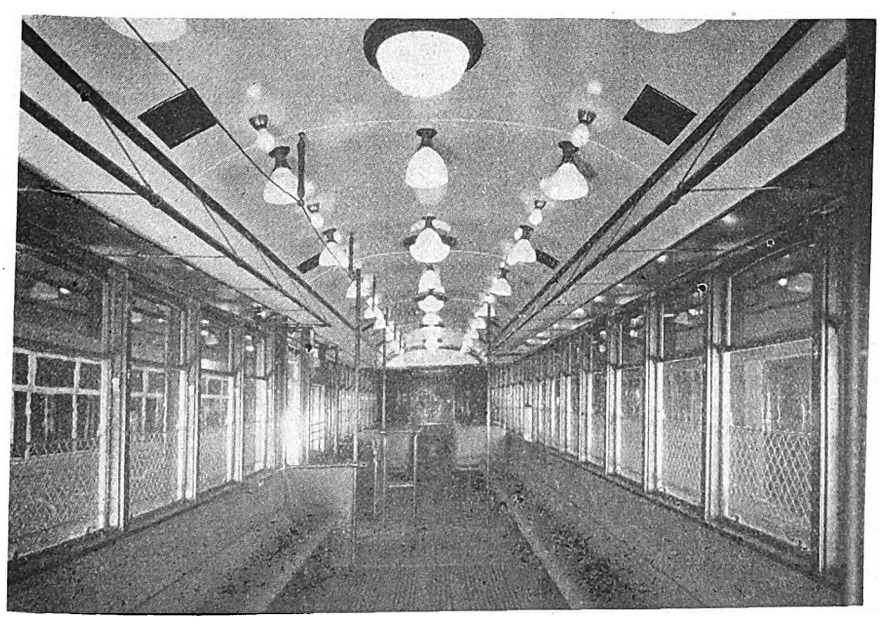
System No. 2 is composed of ten pendent type fixtures equipped with medium density deep bowl open glass reflectors and 56-watt, 115-volt, S-21 clear-bulb Mazda street railway lamps. The units are spaced at 4-ft. intervals on the longitudinal center line of the car.

System No. 3 has twenty pendent type fixtures equipped with open diffusing glass deep bowl reflectors and 36-watt, 115-volt, S-19 clear-bulb Mazda street railway lamps. These units are arranged ten in a row, one row on each side of the car over the seats on 4-ft. longitudinal centers. Both medium and light density glass reflectors will be shown with this installation.

System No. 4 employs 25 bare 36-watt, 115-volt A-19 inside-frosted bulb Mazda street railway lamps. They are mounted in two rows of twelve on each side, above the seats, with the remaining lamp placed in the center at the rear end of the car.

A summary of the average light intensities obtained on the horizontal and 45-deg. planes for transverse and longitudinal seats with each system of lightings is given in the table.

System No.	Reflector Glassware Density	Total Watts	Foot-Candles: Average Horizontal Illumination	Foot-Candles: 45 Deg. Plane Illumination Transverse Seats	Foot-Candles: 45 Deg. Plane Illumination Longitudinal Seats
1	Light	1,000	11.57	9.10	6.63
1	Medium	1,000	9.11	7.08	5.29
2	Medium	600	9.27	7.27	5.13
3	Light	800	8.67	6.30	5.00
3	Medium	800	10.13	7.93	6.67
4	None	1,000	11.68	9.33	7.00



Interior of Cleveland Railway car equipped with four lighting systems on separately controlled circuits

For convenience in reading fine print, such as newspapers and magazines, the committee has recommended a minimum light intensity of six foot-candles on the reading plane. This is defined as the 45-deg. plane at the normal sitting position at a point 33 in. above the car floor. Each of the four installations described will provide an average of six foot-candles or more on the reading plane at the transverse seats when lamps are operated at average rated voltage.

The fixtures and glassware were loaned by the Adams & Westlake Company, the Electric Service Supplies Company and the Macbeth-Evans Glass Company. The lamps were furnished by Mazda lamp manufacturers.

A cordial invitation is extended to all visitors at the convention to inspect this exhibit. The car will be open for inspection at all times and committee members or their representatives will be in attendance to demonstrate the various installations.

Many Special Acts Scheduled for Theater Party

CHOICE seats are still available for the theater party to be held at Keith's Palace Theater, Euclid Avenue, Cleveland, for Wednesday evening, Oct. 5, as one of the entertainment features of the convention. In order to avoid confusion in obtaining tickets after delegates reach the convention, they are urged to purchase them in advance. They may be obtained from T. L. Kennedy, vice-president Ohio Public Service Company, Box 693, Cleveland, Ohio. The committee in charge of the theater party has obtained many special acts and a special de luxe performance is assured.

Metropolitan Section Breakfast at Cleveland

DEFINITE arrangements have been completed for a Metropolitan Section breakfast during the Cleveland convention. This will be held on Wednesday morning, Oct. 5, at 8 o'clock in Parlor D on the second floor of the Hotel Statler. The breakfast will be simply a get-together meeting and all members are earnestly urged to attend.

News of Other Associations

C.E.R.A. Master Mechanics Meet

SOME 75 representatives of the Central Electric Railway Master Mechanics' Association from several Midwestern states gathered in South Bend on Sept. 8 and 9 for a two-day program. Reports from the standardization committee and from the committee of uniform charges were read and other routine business conducted. George R. Green, general superintendent Chicago, South Bend & Northern Indiana Railway and president of the association, presided.

Following the first meeting, luncheon was served in the hotel and the afternoon of the first day was devoted to addresses by D. F. Smith of the General Electric Company, Schenectady, N. Y., who spoke on "Railway Motor Manufacture and Maintenance," and by L. F. Mullen of the Sherwin-Williams Paint Company, Cleveland, Ohio, who spoke on "Insulating Varnishes." Later in the day a tour of inspection of the South Shore shops at South Bend was made.

The program on the second day began early in the morning when the guests were transported on a special train over the South Shore lines to Chicago and return, with a stop at Michigan City for an inspection tour of the shops there.

Specifications for Track Materials

ON SEPT. 9 the twelfth meeting of the A.E.S.C. sectional committee on specifications for materials for use in special trackwork and the design of 7-in. plain girder rails was held at the headquarters of the American Electric Railway Association in New York. The American Electric Railway Association is the sponsor body for these projects.

Present at the meeting were R. C. Cram, vice-chairman; J. E. Davidson representing J. B. Strong, E. B. Entwisle, W. G. Hulbert, E. F. Kennedy, E. P. Roundey, E. M. T. Ryder, and H. H. George, secretary. R. E. Hess, representing the American Society for Testing Materials, and G. C. Hecker, special engineer of the A.E.R.A., also attended. Mr. Cram presided at the meeting.

The work of the committee covering design of 7-in. plain girder rails was completed late in 1925, and the designs were adopted as tentative American standards July 1, 1926. The specifications for special trackwork materials have now taken definite shape as the result of the work of a special committee on form consisting of Messrs. Ryder, Alden and Cram. This committee presented a tentative specification, which was approved at the meeting after thorough discussion. The specifications will be submitted to the entire membership of the committee for formal letter ballot and upon approval will go to the sponsor body for approval and submission to the A.E.S.C.

Work of the committee has been delayed through the deaths of its chairman, Victor Angerer, and of George L. Fowler. R. C. Cram was elected chairman to succeed Mr. Angerer and E. B. Entwisle was elected vice-chairman to succeed Mr. Cram.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Sept. 26-30 — **National Safety Council, annual congress, Hotel Stevens, Chicago, Ill.**

Oct. 3-7—**American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

Oct. 4—**American Automobile Association, Motor Bus Division, Cleveland, Ohio.**

Oct. 18-21—**National Association of Railroad and Utilities Commissioners, thirty-ninth annual meeting, Baker Hotel, Dallas, Tex.**

Oct. 26-27—**Public Utilities Association of West Virginia, annual convention, Parkersburg, W. Va.**

Oct. 26-27—**Society Automotive Engineers, Transportation Section meeting, Hotel Sherman, Chicago, Ill.**

British Fares Vary Greatly

ORDINARY fares on British municipal tramways vary per mile from 0.67 cents (in Glasgow) to more than 2 cents on some of the smaller lines, as in Cardiff and Dundee. The average fare varies from 1.86 cents (in Aberdeen) to 3.34 cents in Burnley. The average fare in Glasgow is 2.776 cents and in London 2.9 cents. Only three of the seventeen principal municipal systems sell season tickets. Glasgow, New Castle and Aberdeen are the only systems having adult fares less than 1d. (2 cents), though three others have such a rate for children only.

These figures are given in a paper on "Maximum and Minimum Fares," presented at a meeting of the Municipal Tramways and Transport Association at Cardiff, Sept. 7-9, by Lachlan MacKinnon, general manager of Glasgow Corporation Tramways. In speaking of the Glasgow system he said that the ½d. fare in that city was given up in 1920 but reintroduced July 1, 1927. A 2d. (4-cent) maximum fare is still in force in Glasgow and has helped increase the receipts and reduce bus competition. The speaker believes in the principle that the long-distance passenger should pay a lower rate per mile than the short-distance passenger.

This was the only paper scheduled for the meeting, though there were a number of conferences. The presiding officer was R. L. Horsfield, general manager Cardiff City Tramways, who referred to the changed name of the association, which is now Municipal Tramways and Transport Association, to recognize the bus service by members. He said that the number of buses so operated has increased from 326 in 1920 to 1910 in 1927. He thought the idea that tramways had become obsolete was disproved by the fact that last year the British tramways carried 4,668,812,206 passengers, an increase of more than 48,000,000 over the previous year.

Utilities Commissioners to Meet at Dallas

DALLAS, Tex., has been selected for the 39th annual convention of the National Association of Railroad and Utilities Commissioners. The meetings will be held at the Hotel Baker on Oct. 18-21.

According to the call for the convention issued by Secretary James B. Walker, one whole session will be devoted to the regulation of motor vehicle carriers. There will be reports from the committee on motor vehicle transportation, Hon. Amos A. Betts chairman, and the committee on motor vehicle legislation, Hon. John E. Benton chairman. There will also be an address by H. S. Ives on insurance.

There will be a round-table discussion of "Holding Companies." In addition the several committees of the association will present reports.

The address of welcome will be delivered by Governor Dan Moody of Texas. Hon. John J. Esch, chairman Interstate Commerce Commission, will deliver an address if possible. Other speakers will be United States Senators Pittman of Nevada and Mayfield of Texas, F. A. Farrar, president Investment Bankers Association; Chief Justice Cureton of the Texas Supreme Court; Senor Alexjandro P. Carillo, Mexican Consul-General at San Antonio; Albert L. Reed, member of the National Industrial Traffic League and Industrial Traffic League of Texas, and Prof. W. M. W. Splawn, president University of Texas.

William A. Prendergast, chairman Public Service Commission of New York, will speak on "Valuation." H. G. Taylor of Nebraska, now with the American Railway Association; Carl D. Jackson, Alexander Forward, M. H. Aylesworth and Hon. Sherman T. Handy also will speak.

Prominent executives of the railroad and public utility organizations on the program will include Gen. W. W. Atterbury, president Pennsylvania Railroad; Walter S. Gifford, president American Telephone & Telegraph Company; Oscar H. Fogg, next president of the American Gas Association; Lucius S. Storrs, managing director American Electric Railway Association; Paul S. Clapp, managing director National Electric Light Association; John S. Wise, Jr., president Pennsylvania Power & Light Company.

News of the Industry

Seattle Continues Discussion

Extension of payment of Municipal Railway purchase bonds before Council—New move in Von Herberg suit

A NEW attempt to secure an extension in the payment period for the $15,000,000 Seattle Municipal Street Railway purchase bonds has been launched in the City Council of Seattle, Wash., with an apparent intention of removing from the office of Mayor Bertha K. Landes to the Council chamber the seat of negotiations for such an extension.

In a resolution introduced by Councilman A. Lou Cohen, the president of the Council is authorized to appoint a special committee to negotiate with representatives of the Puget Sound Power & Light Company and other bondholders. At present Mayor Landes is negotiating with A. W. Leonard, president of the company, by a tacit understanding of Council members, with the idea that the negotiations would continue, and Council members could participate. Mr. Cohen pointed out that the extension plan, recognized as vital to the successful financing of the railway system, had been hanging fire for five years, but so far without tangible results.

Legal Difficulties Retard Settlement

The carrying on of the negotiations with the Puget Sound Company has been complicated by the various legal entanglements in which the municipal railway has been embroiled, including the Von Herberg suit, brought to prevent the railway setting aside any funds from its revenues to pay on the purchase bonds until all salaries and operating costs were paid. Mr. Leonard declared, when the suit was brought, that all negotiations, as far as the company was concerned, would be held in *status quo* pending settlement of the litigation.

Asking for dismissal of the action and assesment of costs against the plaintiffs, Thomas J. L. Kennedy, corporation counsel for Seattle, has filed a motion for leave to file an amended and supplemental answer in the suit of J. G. Von Herberg against the city in the railway litigation. At the same time, the city has set up an affirmative defense and filed a bill of interpleader. This is the first move taken in some time in the litigation which started last February, when Mr. Von Herberg purchased some of the "no-fund" warrants issued in payment of the December wages due the trainmen.

All phases of the cases involving the railway system will be argued before Circuit Judge Frank S. Dietrich when he arrives in Seattle within the next two weeks. Two separate suits are pending, that of Mr. Von Herberg's to halt payment of funds to the bondholders, and one brought by the Puget Sound Power & Light Company to halt this character of litigation involving the system.

The city charges that Mr. Von Herberg purchased the wage warrants merely to continue the "vexatious litigation against the city of Seattle."

Hearings Begun on Omaha Franchise

The City Council of Omaha, Neb., has begun hearings on the draft prepared by City Attorney Van Dusen of the proposed franchise for the Omaha & Council Bluffs Street Railway. Senator R. B. Howell presented his plan for forcing the company, as the price of getting a new franchise, to agree to sell its Missouri River bridge to the city. Spokesmen for the company say no consideration will be given the proposal. Counsel for the Guaranty Trust Company of New York, trustee for the bondholders, has received no instructions as to the clause contained in the city attorney's draft which makes it a condition of the grant that the trustee shall concede that the present franchise is not perpetual.

New York Plan Expected Soon—Mr. Dahl Ordered to Answer

Samuel Untermyer, special counsel for the New York Transit Commission, has nearly completed his report, which will contain his recommendations for transit readjustment for New York City. It is understood a feature of the plan will include recapture of the B.-M. T. subway system, recapture of the Interborough east side subway in event property of the Interborough and B.-M. T. companies cannot be acquired by purchase, and the combination of these lines with the new city subway system. The plan also will contain recommendation for referendum as to whether the fare shall be increased in case the combined system shows deficit of whether any deficit on 5-cent fare shall be paid by taxpayers. It is expected the plan will be ready before Oct. 1.

In the case of Chairman Dahl of the Brooklyn-Manhattan Transit Corporation, who must answer certain questions by Samuel Untermyer, special counsel to the Transit Commission, Justice Frankenthaler said:

> The court will require all questions to be answered which bear on the holdings of B.-M. T. stock in the I. R. T. both at date of refusal to testify and for a period of three months preceding. The price and time of purchase need not be given, but quantities of purchases and sales as well as holdings must be fully and frankly stated.

Emergency Rate Denied

Maryland commission is not satisfied that public interest requires higher temporary rates in Baltimore

THE Maryland Public Service Commission has refused to grant an emergency increase in fares to the United Railways & Electric Company, Baltimore, pending hearing on the company's application for a permanent fare of 10 cents. At the same time the commission dismissed the petition for an emergency increase it set Oct. 26 as the date to start hearing the petition for a permanent 10-cent fare. In denying the emergency increase it was stated that the United had failed to make it appear to the satisfaction of the commission that the public interest required the establishment of substantially increased fares or temporary emergency fares pending the establishment of permanent fares, or that establishment of such temporary emergency fares was necessary for the purpose of providing adequate and efficient service, or for the preservation of property.

The hearing had been conducted several days and was hurried through as soon as possible. Opposition to the temporary increase was led by Thomas J. Tingley, people's counsel, who was assisted by attorneys representing the city and various organizations opposed to the increase. Although the United had requested an increase as an emergency it left the amount of increase to the commission. Charles D. Emmons, president of the company, said on the stand, however, that the company thought it should receive a temporary increase to 10 cents pending the hearing to make the 10-cent fare permanent.

The application to be heard in October is for a flat rate of 10 cents, 5-cent or half fare for children between four and twelve years of age, school tickets at 5 cents each and special commutation rates. The present fare is 8 cents, with two tokens for 15 cents.

Bill Drawn to Continue Public Control of Eastern Massachusetts

Extension of the period of public control of the Eastern Massachusetts Street Railway, Boston, Mass., for ten years from the date of the termination of the present period of Jan. 15, 1929, is proposed in a bill drawn for introduction at the coming legislative session. Among the bodies that favor the plan is the Savings Bank Association of Massachusetts. The proposed act contains twelve sections substantially the same in their provisions as those contained in the present act. The whole act is based around the provision in Section 1 to the effect that:

> The company may, subject to the pro-

Digitized by Google

visions of this act, exercise all the powers and privileges of a street railway company organized under the general laws, so far as the same are applicable, and, subject to the approval of the department of public utilities, hereinafter referred to as "the department," any powers or privileges granted by any special acts applicable to the company, until the general court shall otherwise provide, and shall be subject to all the duties, restrictions and liabilities imposed upon street railway companies, except as otherwise provided herein.

Higher Fare in Lorain Expected

Rates of fare on cars of the Lorain Street Railroad, operating in Lorain, Ohio, are to be increased soon to 6 cents, with an extra cent for transfers. No definite date has been set for the new rate to go into effect.

Inability of the company to operate on its present income has forced the increase in rates, according to John W. Heim, superintendent.

On the Alert in Buffalo Against Accidents

Co-operating with a local newspaper in a campaign to reduce traffic accidents, Bernard J. Yungbluth, president of the International Railway and the International Bus Corporation, Buffalo, N. Y., has issued a general order to all trainmen and bus drivers to continue their efforts to reduce accidents and promote a greater degree of safety. In his general order President Yungbluth said that if there was any question as to the right-of-way, trainmen and bus drivers should play safe, observe scrupulously the commands of traffic signals, and be particularly careful when children are at play. He recommended a redoubling of efforts to reduce the appalling loss of life occurring through street accidents. "Let us constantly be on the alert," he said, "that the splendid record in safety you have set up may be continuingly improved."

The president of the traction and bus company said that in spite of the heavy increase in the registration and use of automobiles, the total number of accidents in which the company's cars and buses were concerned was 9.6 per cent less this year than last; 14.2 per cent less than in 1925 and 24.4 per cent less than in 1924.

Fares Increased in Michigan City

The Chicago, South Bend & Northern Indiana Railway has been authorized by the United States District Court at South Bend, Ind., through R. R. Smith, receiver, to increase the fare on local lines in Michigan City from 5 cents to 7 cents. The application for a higher rate of fare in Michigan City alleged that the company had incurred a deficit last year of $25,245 in operating its cars in that city, The company operates approximately 90 miles of interurban and city lines in north central Indiana.

Argument Started on Schenectady Fare

The first hearing on the petition of the Schenectady Railway seeking a reasonable rate of fare on the lines in Schenectady, Albany, Rensselaer and Saratoga Counties, N. Y., was held on Sept. 8. Authority is also sought to file schedules authorizing a 10-cent fare and 5-cent school token in Schenectady, with corresponding increase in the various fare zones on its divisions to Albany, Troy and Saratoga Springs. The company proposes to issue commutation tickets or 50 rides at commutation rates.

In answer to the query of Mayor Blessing of Schenectady, on the jurisdiction of the commission to fix fares in Schenectady, as such fares had heretofore been fixed by the Common Council, John E. MacLean, attorney representing the Schenectady Railway, said the question had been decided by the Appellate Division of the Supreme Court in the United Traction Company case that the commission had jurisdiction in such proceedings. Commissioner Pooley advised Corporation Counsel Poersch that the commission would reserve decision on the question raised and permit the railway to present such proof at this time as it were prepared to present.

Daniel Naylon, representing the Schenectady Railway, recited the history of the company and concluded with the statement that its present financial condition was such that a serious crisis confronted it inasmuch as its income was insufficient to go on and perform its duty as a public carrier. Adjournment was taken to permit the representatives of the city to examine the evidence and exhibits presented by the company and for the commission to determine the points raised by the city.

Delos Wilcox to Report for San Francisco

At a recent conference between the public utilities and the finance committees and City Attorney John J. O'Toole, at which Delos F. Wilcox was present, the need of expert advice and information was generally conceded and Mr. Wilcox was designated as the man most familiar with San Francisco's situation, sympathetic with the movement of municipalities in acquiring their own transportation and thoroughly competent to make a comprehensive study.

The survey that Mr. Wilcox will make for the city of San Francisco will deal with the expiration of franchises of the Market Street Railway, the best methods of acquiring the properties and the elimination of duplication of service. Major franchises begin to expire in 1929 and the public utilities and the finance committees are making their recommendation of a survey so that the city may be in a position to act when the franchises run out. Mr. Wilcox is reported to have said:

San Francisco is in a better position to solve her transportation problems than any other city in the United States that has already a system controlled by private ownership. This is due in part to the fact that the city has the nucleus of a city-wide system and in part because the franchise of the privately operated lines are nearing their end. I am convinced that a consolidation can be effected in a manner satisfactory to the public.

Mr. Wilcox estimated the survey would require about two months and set his price at $5,000 a month. He is prepared to undertake the work at once.

The recommendation to the Supervisors will be made by the City Attorney, whose office had for several weeks been investigating the legal phases of the franchise expiration and the city's rights relative to taking them over.

Want Overhead Wires in Columbus Removed

The City Council of Columbus, Ohio, has asked C. C. Slater, general manager of the Columbus Railway, Power & Light Company, to explain in writing the cause of delay in starting work of removing poles and overhead wires in North High Street between Fifth and Arcadia Avenues. The company has until April 1, 1928, to complete the work but was ordered to start the program several months ago. A 30-day extension, which expired six weeks ago, was later granted and so far no work has been done.

Economics at Boston

Under the caption "Every Day Economics" the Boston Elevated Railway, Boston, Mass., is running in *Co-operation*, its official publication, short chapters from the new book of J. E. Le Rossignol, called "First Economics." Special arrangements have been made with the publishers, the A. W. Shaw Company, for the reproduction of any or all of this book by the Boston Elevated Railway. In August *Co-operation*, there are excerpts on income, wealth and capital. Here are valuable lessons for the employees in the rudiments of economic management and finance.

Change in Rates on Reading Line

A reduction in the cost of monthly 30 round-trip tickets became effective on the lines of the Reading Transit Company, Reading, Pa., on Sept. 1. The new and old rates follow:

	New Reduced Rate	Old Rate	Saving
2 Zone Books.....	$6.25	$7.25	$1.00
3 Zone Books.....	7.50	9.50	2.00
4 Zone Books.....	8.65	11.35	2.70
5 Zone Books.....	9.65	12.65	3.00
6 Zone Books.....	11.75	15.75	4.00
7 Zone Books.....	12.75	17.50	4.75
8 Zone Books.....	13.80	18.55	4.75

On Sept. 1 the company also resumed the sale of its round-trip excursion tickets between Oley Valley towns and Reading. The round-trip fare to Friedensburg is 45 cents and to Boyertown 90 cents. Each ticket allows a six-day stop over privilege.

Fight in Columbia Gains Many Adherents

The transportation problem in Columbia, S. C., long discussed in the public prints and often in the courts, has come in for attention from three new angles recently — the executive board of the Richland County Federation of Women's Clubs has gone on record as favoring the restoration of railway service in Columbia and the school board of the city of Columbia and the board of trustees of Chicora College (a denominational school located in Columbia) have filed intervention petitions with the state Supreme Court with regard to the action instituted some time ago against the Broad River Power Company to bring about a restoration of railway service.

The club women urge the use of every effort to have the railway service reestablished as they are convinced that it is the safest and most reliable system of transportation.

In its intervention petition the Columbia city school board sets forth that an adequate railway system is for many reasons the most desirable form of transportation service for Columbia and its environs, and particularly for this petitioner's purpose for furnishing a safe and reliable means of transporting the school children; further, that the school problem in the city of Columbia is now tremendously increased and rendered more difficult by the lack of an adequate or satisfactory transportation system. The petition from the Chicora College trustees sets forth that the "students and faculty are largely dependent upon an adequate system of public transportation for its best service to the state and community."

This case will likely come up for hearing before the State Supreme Court in October. Several weeks ago the Attorney-General of the state instituted suit for a writ of mandamus requiring the Columbia Railway, Gas & Electric Company to resume the operation of street cars, discontinued last March. The matter has been before the courts for some time. At present, buses are in operation in Columbia and also 10-cent jitneys, which operate without restrictions at present. The jitney, it is generally believed, had much to do with cutting down the patronage of street cars as the jitney takes its passenger to his door. But the jitney has neither schedule nor route, often goes off the street in disagreeable weather and is a free lance in the transportation business.

Smoking Killed in Atlanta

By a vote of nearly four to one Atlanta, Ga., street-car riders have requested the continuance of the present rule forbidding smoking. Not only were hundreds of individual letters received, but many petitions as well, some signed by as many as 100 riders.

Some of the reasons given why smoking should not be permitted were as follows: The unpleasant and unhealthy atmosphere in smoke-filled cars during seasons when ventilation was not always possible, danger of fire and difficulty for railways to preserve their reputation for cleanliness. Finally, it was generally agreed that any normal man could refrain from smoking for the short period of time he was on a street car and that any gentleman would be glad to do this rather than cause discomfort to his fellow-passengers. The vote against allowing smoking in the cars was so definite that the rule prohibiting smoking will be kept in force.

Inquiry Started on Philadelphia Suburban Rates

Increased rates, effective July 20 on the lines of the Philadelphia & West Chester Traction Company, Upper Darby, Pa., were called for inquiry before James S. Benn, Public Service Commissioner, at a hearing in City Hall on Sept. 15. Protests had been filed by many organizations.

In a statement read by A. Merritt Taylor, president of the company, it was set forth that the investment was $5,466,725, with the company entitled to a return of 7 per cent. This, he said, in view of a decrease in return of 3.49 per cent in the year ended Aug. 26, compared with the previous year, necessitated an advance in fares to keep the company out of bankruptcy. The hearing was continued.

The schedule of fares, which was published in the ELECTRIC RAILWAY JOURNAL, issue of July 2, page 33, called for a flat 10-cent rate where formerly the zone rate was 8 cents.

State Department Overrules Boston Transit Commission

In a case involving the construction of a section of the Dorchester rapid transit system the Massachusetts State Department of Public Utilities has overruled the Boston Transit Commission. The Transit Commission opened bids last August for the construction of Section 4, but decided to reject all the bids on the ground that the time wanted to build the section seemed to the commission "unreasonable, excessive and impracticable because of reasons special and peculiar to the work." The lowest bidder wanted 300 days and the commission was of the opinion that it should be done in 200 days. Hence the commission requested the Public Utilities Department to authorize the rejection of all the bids. In its decision the Department of Public Utilities says:

At the hearing the chief engineer of the Transit Department testified that, in his opinion, the time reasonably required for the completion of Section 4 of the Dorchester Rapid Transit Extension was not more than 200 days, and it was contended that the necessities of the public for the improved transportation contemplated by the act required the completion of the work as soon as it was reasonably possible to do it, and that to take 300 days to complete the work of Section 4 was not in the interest of the public and that, consequently, there were reasons, special and peculiar, which made it impracticable to proceed under any of the proposals submitted, and thus a rejection of all the bids was justified, under the provisions of Section 15 of said Chapter 480, in order that arrangements might be made by which the work included in Section 4 would be completed within 200 days. The Transit Department did not include this 200-day limit in its proposals.

The statute obviously contemplates that where practicable proposals for contracts shall be advertised and open to competitive bidding and the contract made with the lowest responsible and eligible bidder. We feel that we ought not to authorize a departure from the general plan contemplated by the Legislature unless it is clear that the public will derive substantial benefits thereby. While we are satisfied that the Transit Department has acted in good faith, a majority of us are not convinced that such substantial benefits will be derived from the rejection of the bids as to warrant our authorizing such action.

Accordingly, it is ordered that the petition be and hereby is dismissed.

Commissioner Goldberg dissents.

More Dissension Over Holyoke Fares

A special committee of Aldermen has been appointed by the City of Chicopee, Mass., to investigate and hand down its finding on the proposed increase in rates by the Holyoke Street Railway, Holyoke, Mass., in so far as those increases affect patrons from Chicopee. The committee is anxious to seek a further postponement on hearings regarding these fare changes, which were scheduled to go into effect Oct. 1. The Holyoke Street Railway has stated that increased rates in Chicopee, were essential to the continuation of service on that line. Mayor Michael I. Shea is opposed to the rate increases. The main objection to the rate changes is based on alleged discriminations. According to reports the objection lies in the fact that citizens of Chicopee will be forced to pay a fare increase of 10 cents, whereas citizens in certain sections of Holyoke will pay less.

Another "Coming Out" of Guide Book

The third edition of Guide and Information, published by the Boston Elevated Railway, Boston, Mass., and distributed to tourists and others desiring information regarding the railway, has just come off the press 50,000 strong. The folder is being furnished to all employees.

Compared with the second edition, issued late in 1926 and comprising 100,000 copies, the third edition is designed to stimulate riding as well as to furnish specific information desired by users of the service. It has been made smaller than the second with the idea of bringing out future editions at more frequent intervals. On the large colored map, the central feature in the folder, revision on route changes have been included.

Special Sunday Trips Out of Reading

The Reading Transit Company, Reading, Pa., started on Sept. 18, and continuing each Sunday thereafter for a 30-day trial period, a one-day excursion trip from Reading to Lancaster and return for $1.25. The route from Reading to Lancaster passes through some picturesque sections of Berks and Lancaster counties. The first car for Lancaster leaves Reading at 4.30 a.m. and every hour thereafter. Returning, the last car for Reading leaves Lancaster at 10 p.m.

Tickets are for sale only at the cashier's office, 412 Washington Street. They cannot be purchased from the conductors.

West Penn Dedicates Lake to Public Uses

Before an assembly of notables, including Gov. Howard M. Gore of West Virginia and his staff, industrialists, bankers, power officials and engineers, the West Penn Electric Company, a subsidiary of the American Water Works & Electric Company, dedicated to the public use on Sept. 14 Lake Lynn, a recreational development. Railway subsidiaries of the American Water Works & Electric Company include the Monongahela West Penn Public Service Company, Fairmont, W. Va., and the West Penn Railways, Pittsburgh, Pa.

Lake Lynn was created by the Cheat Haven hydro-electric development of the West Penn System on the Cheat River in West Virginia, 80 miles south of Pittsburgh. It stretches 13 miles through the West Virginia hills. It was named in honor of the late Albert M. Lynn, former president of the West Penn properties, during whose administration the Cheat Haven project was developed and put into service. A memorial to Mr. Lynn was unveiled during the ceremonies.

Lake Lynn will perform a dual service for people in this region. It will not only furnish an ideal place for recreation, as there are no lakes of any considerable size in this territory, but also the 52,000-kw. power plant located there will provide additional energy to meet the demands of the expanding industries along the Monongahela and Cheat River Valleys.

Teaching "Safety" in Indiana

"Safety Always" was the slogan of a car of the Interstate Public Service Company which visited Scottsburg, Ind., on Sept. 21 and was viewed by many people. The car bore signs and posters urging safety at all times and was thoroughly equipped to convey lessons in safety to all who visited the exhibit. Instructions in the Schaefer prone pressure method of resuscitation were given during the exhibit by an employee of the Interstate in charge of the safety car.

Many school children at Scottsburg and other towns along the route visited the "exhibit" car. Stops were made at all cities and towns along the line.

Portland Theaters Pay Railway Fares

All inbound street cars and buses of the Portland Electric Power Company, Portland, Ore., were chartered between 6:30 and 7:30 on the night of Aug. 19 by the West Coast Theaters, Inc., in celebration of its fall season opening, known as the "Greater Movie Season." Five of the leading theaters in the city are included in the combine. Conductors on the street cars helped to spread the publicity by saying to each patron who entered the car: "This ride is through the courtesy of the West Coast Theaters, Inc. It is the night of their grand opening."

Price Put on Use of Houston Tracks

An agreement has been reached between the City Council of Houston, Tex., and the electric railway interests by which a franchise will be granted allowing the Houston North Shore Electric Railway, operating an interurban between Houston and Baytown, to pay the Houston Electric Company 18 cents per car-mile for the use of the latter's tracks inside the city limits. The cars of the Houston North Shore Electric Railway will use the tracks of the Houston Electric Company on a number of streets.

Higher Fare Sought in Beacon and Fishkill

The Fishkill Electric Railway filed a petition on Sept. 16 with the Public Service Commission for permission to increase fares on its lines in Beacon and Fishkill and in the surrounding territory to 10 cents with twelve tokens for $1. With the petition is filed a proposed rate schedule, establishing two zones. Strip tickets of twelve coupons each will be sold for $1. Commutation tickets good for 54 trips, for use during the calendar month indicated on the ticket, will be sold for $6. School tickets for those under seventeen years of age and attending school will be sold in strips of ten in Zone 1 and Beacon for 70 cents and in Zone 2 for 50 cents.

The petition alleges that its present fare is insufficient to yield a reasonable compensation for the service rendered, is unjust and unreasonably low, and does not allow a reasonable return on the value of its property used in the public service. It further alleges that the company is unable to meet its assessment of $40,000 as its proportionate share of the paving cost of Main Street from Beekman to Herbert Street in Beacon, which was authorized at a special election of the voters of Beacon in August, 1927. A public hearing will be held on this petition.

Certain Rate Reductions in Seattle

Reduced rates of fare on rides which involve transfers from one system to the other went into effect on Sept. 16 on the Seattle & Rainier Valley Railway Line and the Seattle Municipal Railway of Seattle, Wash. The Rainier company has formally notified the City Council that it accepted the provisions of a recent ordinance which provided for issuance of transfers on either line to the other on an 8⅓-cent token. At present transfers are given only on a 10-cent fare. In return for this concession, the City Council has provided by ordinance that the railway be credited with 1⅔ cents on its delinquent franchise tax for each transfer from its lines accepted by the municipal system. The company is in arrears a total of $77,135 in its franchise tax.

Plans of the Seattle Municipal Railway to extend its service in the Rainier Valley by operating the Empire Way buses over Renton Avenue from Henderson Street to Ryan Street brought a protest from the Rainier Valley Line, which informed the Council by letter of its intention to extend its Rainier Beach bus route on Renton Avenue.

$27,765 for Efficiency in Brooklyn

For efficient performance of their duties during the year ended July 31, 1927, 1,026 trainmen of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., shared in a bonus totaling $27,765. The awards were based upon the efficiency ratings of each conductor and trainman made at periodic inspections of their work. Individual bonuses ranged in amount from $50 to $12.50. Because there were in all more than 200 trainmen whose inspection records gave them 100 per cent efficiency ratings for the year, a total of 233 bonuses of $50 each were awarded instead of 100 such bonuses specified in the bulletin.

Massachusetts Property Enlarges Service

The Union Street Railway, New Bedford, Mass., has been authorized by the Public Utilities Department to take over some of the service that the New Bedford & Onset Street Railway will discontinue on Sept. 30. It will extend its tracks into Massapoisett and it is authorized to construct, maintain and operate a street railway in New Bedford, Fairhaven, Dartmouth and Westport.

Free Rides in Denver

Howard S. Robertson, president of the Denver Tramway, Denver, Col., permitted all boys and girls under eighteen years of age to ride the cars free, between the hours of 1 and 5 p.m., on Aug. 31, the day that Colonel Lindbergh visited Denver. He said he wanted every child in Denver to see the Colonel.

Recent Bus Developments

Southern Pacific Opens Bus Service

A bus service was to be started on Sept. 20 by the Southern Pacific Railroad in conjunction with its steam and electric lines. This announcement was made by T. B. Wilson, vice-president and general manager of the newly organized Southern Pacific Motor Transport Company, a California corporation, which was granted a permit to operate in Oregon two months ago.

The new service will extend from Portland to Salem, Eugene, Roseburg and Ashland, and from Portland to points in other directions, and will include an interurban run connecting Portland, Lake Oswego and other resorts. About 30 buses will be used at first, with probably 45 in use within a month.

It is stated that plans are complete for replacing railway service in the cities of Salem and Eugene with the new buses. The Southern Pacific Motor Transport Company has acquired the traction lines in these two places.

Detroit Coaches Start Passengers on Air Voyages

The Department of Street Railways, Detroit, Mich., is operating daily its Graham Brothers parlor coach from the Detroit hotels to the Ford Airport, 11½ miles away. At that point passengers board Stout air lines for aerial tours or trips to other cities. Regular two-hour coach service was instituted Sept. 1, with a fare of 25 cents each way.

Acquires Perth Amboy Bus Lines

The Public Service Transportation Company, subsidiary of the Public Service Railway, Newark, N. J., acquired three important bus lines in the vicinity of Perth Amboy. One runs from Perth Amboy to Carteret via Woodbridge, another is the Perth Amboy-Rahway line, and the third is the Fords-Woodbridge-Iselin line. Purchase was made from one corporation and several individuals. Twenty-two permits and 26 buses were involved in the transaction. The purchase price was withheld.

Extension of Bus Route in Rome May Mean Profits

The Public Service Commission recently granted the petition of the New York State Railways for the discontinuance of railway service on North James Street, Rome, from Thomas Street to Linden Street, for a period of one year only.

A bus line paralleling this route is operated by the Utica Railway Co-Ordinated Bus Line, Inc., which extends into territory not now served by street cars. The railroad company does not wish to abandon the line and remove the tracks until bus service has proved successful. The city of Rome has consented to discontinuance of street car service and the substitution of bus service for five years.

The evidence showed that the street car line in Rome has been operated at a loss, but the railway believes that by the extension of the bus route and other economies additional revenue will result and prove profitable. Repairs to existing street pavements will be made.

Bus Rehearings in New York State Denied

The New York Public Service Commission denied the petitions of the cities of Albany, Troy and Cohoes on Sept. 12 for a rehearing on the application of the Capitol District Transportation Company, Inc., for increased passenger fares on its bus lines in Cohoes, Troy, Albany, Rensselaer and the town of Guilderland. Insufficient reasons were shown why the rehearing should be held.

Express Bus Service Proposed in Washington

The Washington Rapid Transit Company, Washington, D. C., petitioned the Public Utilities Commission on Sept. 18 for permission to establish new routes for express or limited bus service, which would be in addition to the present local service. The routes over which the limited buses would run, however, are slightly different from the regular routes. The use of two streets is contemplated, the buses using less congested streets, returning from the main trip during rush hours to facilitate rapid movement. At the start approximately six buses will be scheduled in the limited service.

Citizen's Peace Threatens School Attendance in Evanston

Application for a permanent injunction filed on Sept. 11 before Circuit Judge Otto Kerner to restrain the Evanston Railway from operating buses over a certain portion of Grant Street in Evanston, Ill., is seriously threatening attendance at the Evanston Township High School, on the far west side of the city. The school reopened the morning the suit was called for hearing with a heavy enrollment. A majority of the students are dependent upon the railway bus service and Grant Street is the only thoroughfare which reaches the school. A citizen residing on Grant Street obtained a temporary injunction several weeks ago on the grounds that the passing buses destroy the peace and quiet of his home. Now he is seeking an order permanently to restrain their operation on this street.

Buses on Meriden-Middletown Route

The Connecticut Company has lately decided to change over to bus service on the Meriden-Middletown line, and has petitioned the Public Utilities Commission for such authority. The date for the public hearing has not been specified.

Morris County Planning Change Over

Otto G. Schultz, general manager of the Morris County Traction Company, is on a trip, during which he will meet with the bondholders' committee of the company at Pittsburgh to arrange for the substitution of buses for trolleys. He planned this trip following the favorable decision on Sept. 3 of the Public Utility Commission on the matter of the substitution.

It is expected that buses will be ready to operate within thirty days after the order is placed and this will mean shortly after Oct. 2. While Mr. Schultz desires to secure all new buses of the type now in use and giving satisfactory service on the Springfield-Elizabeth line, it may be that arrangements will be made with the Public Service Corporation for the use of some of its buses. The new buses would cost about $350,000.

The railway is in the hands of receivers. It is proposed to offer the assets under foreclosure sale in four lots. One will be the right to operate bus lines, another will include the right to operate railway lines and other rights under this franchise, the third lot will comprise the real estate and the fourth will include the personal property and equipment.

In its decision the Public Utility Commission reserved the right to issue an order at some future time concerning the removal of the poles and overhead lines and also the replacement of the pavement when the tracks are taken up. This, Mr. Schultz said, was due to the fact that the company did not ask to abandon these and will not do so until after the bus lines are in routine operation. Then the commission will be requested to grant permission for the removal of these rails. Both buses and cars will be run for a time until the bus routes are thoroughly worked out and the machines running satisfactorily. In the event that the travel by bus proves more popular than by trolley car, the company will be prepared to increase its service.

Just how the change will work out in relation to the direct line running into Newark has not yet been decided. Now the Morris County cars operate over tracks of the Public Service Railway through special arrangement. If

Digitized by Google

the bus route is substituted there, the buses will be run as an express line direct from the terminal of the Morris County line.

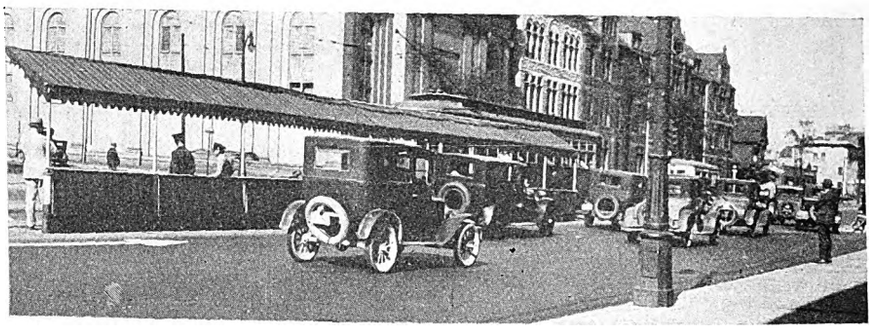
Express Service in Detroit

The plans for express service as worked out by the Department of Street Railways in Detroit and put in operation on Jefferson Avenue on Sunday, Sept. 18, have proved successful after the first few days of operation and, according to General Manager Del A. Smith of the Detroit Municipal Railways, the express system is a distinct improvement over the old system. The cars are run express. Between express stops local buses, known as transfer buses, pick up passengers and deposit them at the nearest express stop. These buses double back between express stops.

At a meeting of the Street Railway Commission after the Jefferson Avenue express service had been started it was announced that a number of other improvements were contemplated. These include the synchronization of traffic lights on Jefferson Avenue, which are now operated manually; facilitation of the movement of cars in the downtown loop, extension of the local bus service to the downtown district and the installation of windows in the loading stations. The commission also authorized the purchase of 50 instruments for buses to record the time of stops, the speed and mileage.

It is anticipated that express service will also be established on Grand River Avenue in the near future. Ultimately, it is planned to extend the service throughout the entire Jefferson line and to run a modified express service even through the downtown loop. The Jefferson line will probably be extended about 2½ miles beyond the city limit into the village of Grosse Pointe.

The Miller-Schorn system is applied experimentally to the Jefferson Avenue line. The total route is 6.8 miles. The express portion from Antoine to Lillibridge, 4.3 miles, is covered at an average speed of 18.4 miles. The maximum running speed is 27 miles. The stations are at intervals of 0.9 miles, located at Antoine, Chene, Grand Boulevard, Parker, Parkview, Lillibridge. Express zones are equipped with orange and black awnings and splash aprons. In the express section transfer buses pick up passengers at the curb and deliver them to the express zones. The present zones are being used temporarily. Loading stations to be located between tracks with sub-walks are being considered by the city.



Sheltered express stations are spaced at 1-mile intervals at Detroit

A three weeks publicity campaign with posters and newspaper co-operation educated the public for the change. There were three days of preliminary training for motormen, conductors and special guards for express stations. Police traffic officers were supplied for automobile control so as to approximate the condition expected when the cascaded traffic lights and the stations with sub-walks are installed between the tracks.

Traffic Director Gustave C. Schink is enthusiastic over the change. He says auto traffic has been speeded 40 to 60 per cent and the street capacity proportionately increased. Newspapers report the system has public approval.

Mr. Smith states many letters of approval have been received from patrons and only two criticisms from 60,000 daily passengers on the Jefferson line after four days operation. Improvement associations of other Detroit sections are requesting similar service. According to Mr. Smith the soundness of the plan has been definitely established, but it is too early to state the exact operating costs.

Contends Bus Routes in Brooklyn Not Needed

Objections to the granting of a certificate to the Equitable Coach Company by the Board of Estimate to operate buses in Manhattan, Brooklyn and Queens were filed with the Transit Commission on Sept. 21 by Clarence J. Shearn of counsel for the Brooklyn-Manhattan Transit Corporation and the Brooklyn City Railroad, Brooklyn, N. Y. A protest was also made by the New York Railways Corporation through William Wallace of the law firm of Chadbourne, Stanchfield & Levy as counsel. A hearing will be held on Sept. 26.

Mr. Shearn said the Equitable company in its application failed to say anything about its financial condition or how it proposed to finance the operation of its bus routes. He also questioned the necessity for the different bus routes which the board authorized. He added that the Brooklyn-Manhattan Transit Corporation was prepared to meet the contentions to disprove the necessity of the bus routes in Brooklyn.

Bus Replaces Rail Line in Gadsden

Bus service has replaced railway service on the North Fourth Street and Ewing Avenue line in Gadsden, Ala. The Alabama Power Company is operating as an experiment a 25-passenger bus on the short crosstown line.

Buses run local and cars express in new service on Jefferson Avenue, Detroit

Financial *and* Corporate

Brooklyn Case Appealed

Brooklyn-Manhattan Transit Corporation secures order to require commission to submit records of bond case for review

THE New York Rapid Transit Corporation, a subsidiary of the B.-M.T., obtained on Sept. 21 from Supreme Court Justice Phoenix Ingraham an order in certiorari proceedings requiring the Transit Commission to submit for judicial review all papers and records in connection with the company's application for permission to sell $20,000,000 in refunding mortgage 5 per cent bonds to pay for new cars and for other purposes. The New York Rapid Transit Corporation proposed to sell these bonds to the B.-M. T. at 80, or for $16,000,000. The commission on Aug. last denied the application on advice of Samuel Untermyer, its special counsel.

In its petition the New York Rapid Transit Corporation attacks statements made by Mr. Untermyer during the recent transit inquiry hearings and asserts that the commission in denying its application acted merely upon the advice of Mr. Untermyer without requiring proof of his assertions. The decision of the commission, the petition alleges, was erroneous because the commission denied consent to the issuance of the entire amount of the proposed issue of bonds, notwithstanding that Mr. Untermyer had consented to the issue of bonds at the price of 80 up to the amount of $3,467,000, the amount which the company desired to spend for purposes not covered by its contract with the city.

The commission, the petition charges, confused its functions as a regulatory body under the Public Service Commission act and its functions as an agent of the city under the contract between the city and the company. The commission, the petition continues, has assumed to use its powers as a regulatory body and to give consideration to the alleged effect on the amount the city would be required to pay the petitioner for debt discounts and expenses in case the petitioner should sell the bonds at 80 and the city should exercise its alleged right of recapture of the city-owned rapid transit lines operated by the petitioner.

The right of the city to recapture is questioned in the petition, which states that the city has not given the company the one year's notice required, as a condition precedent to the exercise of its alleged recapture right. The petition contends that the city is not now and will not be in a position to give such a notice or to exercise its alleged recapture rights until it constructs the Nassau Street subway, as provided in the contract.

The city has not indicated that it has any intention or desire to exercise its alleged right of recapture and to separate the city-owned and company-owned rapid transit lines of the B.-M. T. system and disrupt the service, the petition recites, unless statements of Mr. Untermyer, unsupported by any evidence or proof of his authority to make them, is accepted as an indication of city policy.

The commission erred, the petition recites, in giving consideration to Mr. Untermyer's statement that the petitioner is "a mere creature of the Brooklyn-Manhattan Transit Corporation, which proposes to take these bonds at 80 cents on the dollar." Exception also is taken to the statements attributed to Mr. Untermyer that "the parent company is both the seller and the buyer" and that "the parent company is selling the bonds to itself at a price and upon terms fixed by it."

Would Free Nashua Property from Tax Payments

The Public Service Commission has certified to the State Tax Commission that the Nashua Street Railway, Nashua, N. H., should be exempted from taxation for the year 1927, because the road failed to earn operating expenses through the year closing March 31.

Railway Property Not Included in Transfer

Commissioner Lunn held a hearing on Sept. 13 on the petition of the Eastern New York Utilities Corporation, Rensselaer, N. Y., and the Municipal Gas Company, Albany, for consent to transfer the gas and electric franchises, works and systems of the former to the latter. The petition alleges that this transfer is to be made on the basis of the net book value of the property transferred, plus or minus adjustments, the book value to be determined by the commission. The electric railroad property of the Eastern New York Utilities Corporation is not to be transferred.

Colorado Springs Rejects Railway Offer

After deliberating the matter for some time, the City Council of Colorado Springs, Col., on Sept. 13 answered that the city will not purchase the Colorado Springs & Interurban Railway. Buses have already supplanted some of the car lines in that city.

The railway made it plain to the city officials of Colorado Springs that it could not operate the street cars much longer unless there were more revenue; that regardless of the increased fare it was not making sufficient money to justify the continuance. It then offered the system to the city for $500,000, agreeing to accept half that amount in city bonds.

Day & Zimmermann Deal Approved

U.G.I. votes additional stock necessary to carry out plan first voted months ago

STOCKHOLDERS of the United Gas Improvement Company at a special meeting on Sept. 15 voted to increase the authorized capital stock of the company from 2,036,528 shares, par $50, to 2,130,088 shares; the additional shares to be used in the acquisition of the engineering and public utility firm of Day & Zimmermann, Inc., of Philadelphia, and stock of several gas companies operating in Connecticut.

Shareholders of the company also voted to increase the number of directors to twelve, including the president, who is an ex officio member of the board. Three new directors were elected as follows:

Thomas S. Gates, of Drexel & Company and J. P. Morgan & Company; Charles Day, of Day & Zimmermann, Inc., and Morris W. Stroud, president of the American Gas Company.

After approving the increase in capitalization, the stockholders authorized the board of directors to issue 53,082 shares in exchange and payment for 58,980 shares of the no-par common stock of Day & Zimmermann, Inc., 2,017 shares in exchange and payment for a like number of shares of the no-par preferred stock of Day & Zimmermann, payment for 3,656 shares of the com- Inc., and 38,461 shares in exchange and mon stock of the Hartford City Light Company and for 204,481 shares of the no-par common stock and 8,361 shares of the no-par preferred stock of the Connecticut Gas & Coke Securities Company.

Directors of the company convened immediately after adjournment of the stockholders' meeting and approved a resolution providing for the exchange of stock, as authorized by the shareholders.

Concerning the exchange of shares as arranged with the Day & Zimmermann concern, a statement issued by the management of the United Gas Improvement Company said:

The exchange of stock with Day & Zimmermann, Inc., will give the U.G.I. a controlling interest in that widely known public-utility company. Day & Zimmermann, Inc., is interested in and operates properties in fifteen States, serving 935 communities with a population of 2,369,000. Among the largest properties controlled and managed by Day & Zimmermann are the National Public Service Corporation, the General Public Utilities Company and the Southern Ohio Public Service Company.

Kansas Road Sold Under Foreclosure

The Kansas City, Kaw Valley & Western Railway, an interurban operating from Kansas City to Lawrence, Kans., was sold to the first mortgage bondholders for $300,000 at a recent special master's sale. The bid presented

Digitized by Google

by George W. York, Cleveland, chairman of the first mortgage bondholders' protective committee, included a cash payment of $50,000 specified in the sale order made by Judge John C. Pollack, in federal court. Mr. York was the only bidder. A valuation of $1,500,000 had been placed on the line.

The interurban has been in receivership since July, 1924, but continued to operate during that period.

Mr. York said that approval of the sale would be asked of Judge Pollack promptly and a general plan for the reorganization would be announced as soon as the approval was given. The line will continue to operate unchanged until that order has been approved and the reorganization completed.

Talk of Akron-Youngstown Merger

It is stated that a discussion that may lead to a consolidation of the Northern Ohio Power Company and the Penn-Ohio Power system has been resumed. Practical control of the Penn-Ohio system rests with the American Superpower Corporation, through holdings in the Penn-Ohio Securities Corporation. Interests friendly to American Superpower control Northern Ohio. Properties of the companies in the reported merger are adjacent. Northern Ohio serves Akron and vicinity in a radius of 30 miles. Penn-Ohio has headquarters at Youngstown, about 60 miles east of Akron, and sends electricity as far as Pennsylvania. Connections through other lines make a superpower system extending from Cleveland to Akron and Canton in Ohio, Windsor in West Virginia, Charleroi in Pennsylvania, and back to Youngstown and to Cleveland.

$900,000 Needed to Complete St. Louis Reorganization

The St. Louis Public Service Company will require at least another $900,000 in addition to the cash now available to complete the reorganiza- of the United Railways, St. Louis, Mo. This estimate was made by W. DeW. H. Bradley, secretary of the company, in a letter sent to the Missouri Public Service Commission, which has the reorganization plan under consideration.

The cash requirements of the new company include $2,000,000 to pay off Suburban bonds, $2,937,000 for cash settlement with holders of St. Louis Transit Company bonds, $440,550 for accrued interest and $1,130,745 for accruing preferred stock dividends, a grand total of $6,508,295. Cash available will be $1,040,187 from common stock sold to holders of transit company bonds, $1,041,720 from common stock sold holders of other securities of old company, $3,000,000 cash estimated to be sum receiver will turn over to new company and $276,280 from sundry items, a total of $5,662,937. The estimate of requirements did not include any of the actual expenses of reorganization. These expenses are expected to exceed $800,000, while in addition the reorganization committee advanced $409,754 to the St. Louis Bus Company for 35 buses.

Union Traction Lines Carry 11,800,810 Passengers

The revenue from railway operation for 1926 of the Union Traction Company of Indiana, Anderson, Ind., was $3,060,465, compared with $2,939,182 for 1925. Expenses of railway operation were $2,566,742, compared with $2,541,873. Gross income for 1926, being the income after operating expenses and taxes, but before charges for bond interest and other fixed charges, was $408,625, compared with $324,787. These facts were contained in the annual report of the company, submitted by the receiver to the Madison Circuit Court in Indiana.

In operating expenses for the year are included $571,623 for maintenance of way and structures and $351,560 for maintenance of equipment, making the total sum charged in these directions for maintenance of the property $923,223. This is equal to 30 per cent of the gross railway operating revenue for the year.

The 1926 account for additions and betterments shows debits of $139,627 and credits of $164,687, making the balance for the year a credit of $25,061. The credits arose principally out of the removal of three railway lines at Muncie and the sale to the Indianapolis Street Railway of part of the Broad Ripple line at Indianapolis. This amount is exclu-

INCOME ACCOUNT OF THE UNION TRACTION COMPANY FOR THE YEAR 1926

Revenue from transportation:	
Passenger	$2,046,994
Baggage	6,285
Parlor, chair and special car	10,003
Mail	5,565
Express	131,502
Milk	14,171
Freight and switching	696,466
Total	$2,910,990
Revenue from operation other than transportation:	
Station and car privileges	$15,153
Parcel room receipts	120
Car service and storage	544
Rent of tracks and terminals	2,826
Rent of equipment	9,589
Rent of buildings and other property	13,589
Power	107,302
Miscellaneous	348
Total	$149,475
Total operating revenue	$3,060,465
Operating expenses:	
Way and structures	571,623
Equipment	351,599
Power	512,676
Conducting transportation	737,559
Traffic	41,180
General and miscellaneous	352,071
Total operating expenses	$2,566,741
Net operating revenue	493,723
Taxes	110,000
Net operating revenue less taxes	$383,723
Other income	24,901
Gross income	$408,624

TRAFFIC STATISTICS OF THE UNION TRACTION COMPANY

(Year ended Dec. 31, 1926)

Passengers carried, interurban lines	4,174,308
Passengers carried, city lines	7,626,502
Total passengers carried	11,800,810
Freight handled, tons	268,644
Express handled, tons	10,976
Mileage of cars, interurban lines, miles	6,745,003
Mileage of cars, city lines, miles	1,770,914
Total mileage of cars, miles	8,515,917

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Total	$3,060,465	$2,566,741	$110,000	$24,901	$408,624

*Deficit.

sive of charges in 1926 for the purchase of buses and bus lines, amounting to $289,602 and also of charges of $26,029 for extensions of and betterments to the property of the Traction Light & Power Company, wholly owned by the Union Traction Company of Indiana. The principal debt item included in additions and betterments is $60,000, representing the purchase under a conditional sale contract of twenty freight box cars.

Buses were operated by the receiver during much of 1926 between Indianapolis and Peru, Indianapolis and Muncie, Indianapolis and Sheridan and Anderson and Marion, in the cities of Anderson and Muncie and at Fort Benjamin Harrison. Gross revenues for bus operation were $129,423 and operating expenses, taxes, interest and amortization charges were $268,288, making a deficit resulting from bus operation of $138,865, which includes $81,495 for depreciation and amortization.

The report mentions the record of the general safety board and department safety organizations in promoting safe and efficient operation, and to the cooperation shown and interest taken by employees generally in the endeavors made during the year to meet the difficult conditions confronting the company.

Operation of the Anderson-Middletown interurban line resulted in a deficit of $6,884 for the year. This deficit is greater by $2,628 than that of 1925, as shown in the receiver's report for that year. Operation of the Muncie-Union City line resulted in a deficit of $10,814, being $2,896 greater than that shown for 1925. Operation of the Marion-Wabash interurban line resulted in a deficit of $5,703, which is $962 less than that shown for 1925. Further consideration is being given to the question of the course which should be taken with respect to these three interurban lines and certain non-paying street railway lines.

Some facts are also given on the Traction Light & Power Company, the sales of the Broad Ripple lines, the Broad Ripple Traction Company's bonds and the Traction Land Company, a subsidiary of the Union Traction Company of Indiana.

The segregation of earnings and expenses of the respective lines subject to the liens of the principal mortgages and also of the lines leased to the Union Traction Company of Indiana was undertaken, and the earnings and expenses so segregated for the year are shown, tentatively and subject to revision.

ROUTE MILEAGE OF THE UNION TRACTION COMPANY

Indianapolis-New Castle-Muncie	62½
Muncie-Portland	32
	136½
Total	445½

Would Abandon Illinois Interurban

The Illinois Power & Light Corporation has filed a petition to abandon its interurban line between Danville and Catlin, Ill. With suspension of its operation traffic between the two terminals will be handled by the Allerton bus line, which up to this time has been forbidden to handle passenger traffic in the territory. The traction line has been a losing proposition for more than a year.

Local Interests Take Over Wichita Property

Passage of control of the transportation business in Wichita, Kan., from the Illinois Power & Light Company to a $3,000,000 Wichita concern is noted in the organization of a new company, details of which were completed on Sept. 14 at a meeting of the Wichita Transportation Company's directors and officers.

The meeting marked completion of negotiations and organization work through which ownership in the Wichita traction systems passes from the Illinois Power & Light Company to a group of Wichita capitalists.

Officers of the company are: H. V. Wheeler, banker, president; R. B. Campbell, president of the Arkansas Valley Interurban Company, vice-president; R. C. Clevenger, banker, secretary-treasurer, and Robert C. Foulston, former city attorney, counselor.

All stock of the new company, formed to operate the transportation facilities of the city, including both bus lines and car lines, is owned by local people in Wichita.

Seeks Receiver for Fitchburg Road

A bill in equity against the Fitchburg & Leominster Street Railway, Fitchburg, Mass., seeking appointment of a receiver was filed in the Suffolk County Superior Court on Sept. 21 by Charles S. Cummings of Boston, who asks to have the company ordered to pay interest on $5,000 in bonds he holds and also to have it restrained from payment on unsecured notes until the bonds are paid in full. E. W. Baker, president, looks upon the action as entirely unwarranted and characterizes Mr. Cummings' statements as not being in accordance with the facts of the case.

Auburn Abandonment Authorized

The Public Service Commission granted on Sept. 15 the petitions of the Auburn & Syracuse Electric Railroad for permission to abandon all of its car lines in the city of Auburn and two lines forming part of its system in the towns of Owasco and Fleming. The abandonment does not affect the interurban lines of the company and these are to be continued in operation. Hearings were held on these applications by Commissioner Lunn in Auburn on Aug. 2 and Aug. 20. In his memorandum accompanying the order he said that the representatives of the city practically conceded that local trolley service could no longer be carried on profitably in Auburn and the Common Council has gone to the extent of soliciting bids for bus service to supplant the trolleys. The order of the commission becomes effective on Oct. 15, 1927.

Binghamton Sale Ordered

The properties of the Binghamton Railway, Binghamton, N. Y., which include a $1,000,000 electric lighting plant at Endicott, will be sold under mortgage foreclosure to the highest bidder on Dec. 1 next, according to an order issued by Federal Judge Frank Cooper at Elmira.

Bidding must start at $2,300,000 "upset price," according to the court order. The properties were appraised some years ago at $3,000,000 and the debts aggregate that sum.

Market Street Railway Deal Rumored

Plans are said to be underway for an offer of exchange of Standard Gas & Electric Company stock for the shares of the Market Street Railway, San Francisco, Cal. It is known that the subject has been discussed more or less officially but it is stated the actual working out of the plan will take some time. The Byllesby organization obtained the privately owned railway in San Francisco when the United Railways Investment Company was acquired some time ago.

Personal Items

J. F. Egolf with Western United Company

John F. Egolf, former general manager of the Aurora, Elgin & Fox River Electric Company and lately general manager of the Chicago, North Shore & Milwaukee Railroad, has been appointed operating vice-president of the Western United Gas & Electric Company, effective on Nov. 1. At the same time officials of the Western United announced that the agreement between the Western United and the General Engineering & Management Company, under which the latter concern has been operating and managing the properties of the former, would be terminated on Nov. 1.

The General Engineering succeeded Stone & Webster as operator of the Western United property on March 1, 1926, shortly after controlling interest had been acquired by E. H. Rollin & Sons and A. E. Fitkin & Company. Later the Fitkin interests were acquired by the Rollins interests, which now own practically all of the class B common of the Western United Corporation, which in turn owns all the common stock of the Western United Gas & Electric.

B. P. Alschuler, vice-president of the Western United, announced that after Nov. 1 operation of all affairs of the company will be in the hands of its own executives. The change will affect very few men now engaged in the executive offices.

Mr. Egolf will succeed B. E. Waltz, who was elected when the General Engineering came into the property and who was elected through that corporation. Mr. Egolf is well known in the railway field. He began his railroad career as a conductor on the street railway at Columbus, Ohio, in 1902 and from that position rose to assistant superintendent of the Ohio Electric Railway. Later he became general manager of the Springfield & Xenia Railway. He was president of the Illinois Electric Railway Association in 1925.

E. E. Whiting, Trustee at Boston

Edward E. Whiting, who writes the Whiting column in the Boston *Herald*, has been appointed by Governor Fuller to the position of trustee of the Boston Elevated Railway, Boston, Mass., to succeed Andrew Marshall, resigned. Mr. Whiting was born in Springfield, Mass., in 1875. He studied three years at Harvard College. He became interested in journalism through his father, who was editor of the Springfield *Republican*. Edward E. Whiting has been connected with Boston newspapers since 1903. He was at one time editor of the defunct Boston *Evening Record*, and has been on the Boston *Herald* staff since 1921. In recent years he has written much on political matters. He succeeds Edward Marshall, who in turn succeeded James F. Jackson.

Ross Schram with Twin Coach Corporation

Ross Schram, whose name is indelibly written in the annals of transportation history in Detroit, Mich., is now vice-president in charge of sales of the Twin Coach Corporation, Kent, Ohio. He has also been elected a director of the corporation. The announcement of his appointment was made by Frank R. Fageol, president.

In 1925 Mr. Schram resigned from the

©O. M. Hayes & Co., Detroit, Mich.
Ross Schram

Detroit Municipal Railway after many years service. He, with Clarence E. Wilcox, former corporation counsel for the city of Detroit and later head of the claims department of the Department of Street Railways, became asociated with Senator Couzens in the Couzens Ice Machine Company. It was in 1924 that Ross Schram succeeded William B. Mayo as general manager of the Detroit Department of Street Railways. He was well known at the time, having served as secretary to Mayor-elect James Couzens in 1918. Later, when construction was started on the municipal railway system, Mr. Schram was made secretary of the Street Railway Commission. When on Dec. 23, 1921, he was made assistant general manager of the Detroit Municipal Railway he knew the problems confronting the railway management and was a valuable aid to the late Joseph S. Goodwin, then general manager. Upon the death of Mr. Goodwin, Mr. Mayo resigned his place on the Street Railway Commission to become general manager and Mr. Schram continued as assistant general manager. In reality he assumed full responsibility of a 400-mile municipal system whose early history had played a conspicuous part in the making of the present-day Detroit. Further details of Mr. Schram's rôle were given in the ELECTRIC RAILWAY JOURNAL, issue of July 12, 1924, page 71.

Mr. Schram was born in Battle Creek, Mich., in September, 1888. He was graduated from the Detroit University School. At one time he was connected with the Charles H. Fuller Company, the J. Walter Thompson Company and the Packard Motor Car Company.

A. W. Stace Directs Michigan Committee on Utility Information

Arthur W. Stace, Grand Rapids, has been appointed director of the Michigan Committee on Public Utility Information with offices in Ann Arbor, Mich. The committee was formed in 1920 to provide responsible information on utility operation and to promote public understanding. Through its bureau speakers are furnished for clubs and schools.

During the past four years Mr. Stace has been engaged in writing articles concerning Michigan, her resources and possibilities. For many years he was identified with the Grand Rapids *Press*, leaving the post of managing editor there to become special writer for the Booth newspapers, his particular field being constructive editorial research and studies looking to the solving of Michigan problems and the development of Michigan's natural resources.

Mr. Stace was the first president of the Michigan Associated Press Editorial association. He was graduated from Notre Dame University. In his new position he succeeds Alfred Fischer, who resigned on April 1, to become affiliated with the Semet-Solvay Engineering Corporation, New York.

J. R. Blackhall Made North Shore Manager

J. R. Blackhall, vice-president and general manager of the Chicago & Joliet Electric Railway, has been appointed general manager of the Chicago, North Shore & Milwaukee Railroad at Highwood, Ill., succeeding John F. Egolf, who has returned to the Western United Gas and Electric properties as manager. No successor to Mr. Blackhall has been named so that he will divide his time between Joliet and Chicago until the Chicago & Joliet appoints a manager. Mr. Blackhall was born on Nov. 16, 1869, in a little French community named Caraquet, in New Brunswick, Canada. He left home when he was fifteen years old, and after working in several different places in Canada, he went to Portland, Me., in 1889. In the spring of 1891 he entered railway work with the Woodbridge & Turner Engineering Company, New York, which had taken a sub-contract under the Thomson-Houston Company, then engaged in electrifying the Deering branch of the Portland Railroad. A few months after the Woodbridge & Turner Engineering Company com-

Digitized by Google

pleted its work at Portland the company employed Mr. Blackhall on the construction of the electric railway extending from Buffalo to Tonawanda along the Lake. He was finally promoted to the position of superintendent of the road.

Subsequently Mr. Blackhall served the Woodbridge & Turner Company in connection with the electrification of the horse car lines in Providence, R. I., the construction of the Westbrook branch of the Portland (Maine) Railway, the building of the Scranton-Moosic line, the electrification of the mule lines in Chester, Pa., the installation of an electric scenic line on Briganteen Island, N. Y., the electrification of the lines in Poughkeepsie, N. Y., and the construction of the independent telephone system at Mount Vernon, N. Y.

After leaving the Woodbridge & Turner Company, Mr. Blackhall constructed an overhead line connecting the new power plant with the old system in Wilkes-Barre, Pa. He next became connected with the Portland (Maine) Railroad in charge of its electrical work and remained in Portland until the spring of 1900. He then secured a position with the American Railways, Philadelphia, on work at Bridgeton, N. J. He was next sent to Joliet by the American Railways in the capacity of electrical superintendent on the rebuilding of the local lines there and the construction of the interurban line to Chicago. Upon the completion of that work he served the American Railways in other places, returning to Joliet in January, 1904, to become manager of the Chicago & Joliet Electric Railway.

George D. Powell at Terre Haute

The appointment of George D. Powell as division engineer at Terre Haute, Ind., of the Terre Haute, Indianapolis & Eastern Traction Company is seen in an official order sent out by G. O. Nicolai of the company. Mr. Powell will be engineer of maintenance of way with supervision of all tracks, buildings and grounds of the division. He was with the Union Traction Company of Indiana before going to Terre Haute in 1926 as assistant to the late W. F. Graves.

G. L. Lederer has been appointed local superintendent of the railway system of the Milwaukee Electric Railway & Light Company in Racine, Wis., succeeding the late A. W. Weyker.

W. J. Carr has been appointed a member of the California Railroad Commission to fill the vacancy caused by the death of Harley W. Brundige. Mr. Carr is a well-known local attorney and former State Senator from Los Angeles.

J. L. Billingsley is superintendent of the newly organized Southern Pacific Motor Transport Company, a California corporation with a permit to operate buses in Oregon. Mr. Billingsley has been superintendent of the Southern Pacific city railway lines in Salem and Eugene for the past fifteen years. His headquarters will be in Salem.

OBITUARY

Frank C. Wight

Frank C. Wight, editor of *Engineering News-Record,* one of the McGraw-Hill publications, died at his home in Summit, N. J., Sept. 18. He had been ill for only a week.

Mr. Wight was a man of brilliant attainments and remarkably broad understanding and sympathies. On these qualities and on his great administrative talents was based his success in his chosen vocation. He worked both rapidly and surely, and was incessantly active throughout his career. As an authority on reinforced concrete, Mr. Wight had contributed largely to the advancement of the art. Other subjects had also commanded his major attention during the past years, studies of the Mississippi River flood problem and traffic control among them. He was a member of Secretary Hoover's Committee on Street and Highway Safety when that body was first organized.

Frank C. Wight

Mr. Wight entered technical journalism in December, 1906, as associate editor of *Engineering News.* For six years his main assignments were in the fields of concrete, general construction and river and harbor work. In 1913 he was promoted to the managing editorship of *Engineering News,* a position which he held until *Engineering News* and *Engineering Record* were consolidated in 1917. Four years later he became managing editor of the consolidated journal, and on Jan. 1, 1924, was made editor of *Engineering News-Record.*

Mr. Wight was born in Washington, D. C., Feb. 26, 1882. He studied at Columbian (now George Washington) University and later at Cornell, where he received the degree of civil engineer in 1904. After graduation he spent three years in the office of the engineer of bridges of the District of Columbia, his previous summer vacations having been spent in the district surveyor's office.

He was a member of the American Society of Civil Engineers, the Cornell Society of Engineers, the American Concrete Institute and the Engineers Club. He had for years been active in the work of both the National Conference of Business Paper Editors and the New York Editorial Conference. Of the former organization he was president at the time of his death. He was a former chairman of the New York Editorial Conference.

A. E. Clifford

Arthur E. Clifford, business manager of *Automotive Industries,* published in Philadelphia, died suddenly at Cleveland, Ohio, on Sept. 20. For many years Mr. Clifford was connected with the McGraw Publishing Company and its successor, the McGraw-Hill Publishing Company, Inc., as business manager of the *American Electrician* and the *Electrical World.* In December, 1923, he resigned as assistant to President James H. McGraw to join the business staff of *Automotive Industries,* at that time published in New York.

In speaking of Mr. Clifford's death, Mr. McGraw said:

"Both capacity and courage were conspicuous characteristics of Arthur Clifford, whose earnest and devoted work will long be remembered by those for and with whom he labored. A large circle of friends in the McGraw-Hill Publishing Company and the United Publishers' Corporation, as well as in the other circles where he mingled, will miss him for his sterling personal and business qualities.

Mr. Clifford was born in New Hampshire 59 years ago.

Charles Barrett Attlesey, division superintendent at the Ninth Avenue depot of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., died recently. With this property he served in various capacities until in 1918 he was promoted to the position of acting division superintendent. This was made permanent on Feb. 1, 1919. His work in Brooklyn was interrupted by a short period of service with the Public Service Corporation of New Jersey. Mr. Attlesey was 58 years old.

Henry Doerr, director of the Twin City Rapid Transit Company, Minneapolis, Minn., for the term expiring 1930, died Aug. 11 at his country home in Minnetonka. He was president of the Minneapolis Drug Company, director of the Northwestern National Bank and had been affiliated with other banking institutions. He was 74 years old.

G. T. Wiswell, president of the Wiswell Improved Railroad Crossing Company, Chicago, Ill., died on Aug. 8. He was prominent in the construction end of railroad work for more than 40 years. He was the organizer of the Roadmasters Association in Massachusetts and its first secretary. For the past ten years he gave his entire attention to his invention, the Wiswell improved railroad crossing, a noiseless, jarless, grooved flangeway patent. This invention was described in the Electric Railway Journal more than a year ago. One such pattern was recently installed on the Great Northern and Illinois Central crossing at Sioux City, Iowa.

Manufactures and the Markets

Large Expenditures Planned by Virginia Company

Double-tracking of the Bay Shore Line to Ocean View on the Norfolk Division of the Virginia Electric & Power Company, for which $207,000 has been appropriated, is one of the many large rehabilitation and construction projects announced by officials for completion during the latter part of this year. Most of the right-of-way for the second track of the Bay Shore Line is clear and the company does not expect to have serious difficulty in completing it. With the construction of this second track, Ocean View, one of the most popular seaside resorts near the Virginia coast, will be furnished with a high-speed express service.

The company will spend in addition to the money appropriated for this work $36,000 for reinforcing and replacing in part the primary system of its 2,000-volt distributing lines. In Norfolk it will construct an underground conduit between Bank and Cove Streets to cost $5,300. Extensions of the power distribution system to Fentress and vicinity is estimated to cost $6,000. Plans include the double-tracking of portions of the Church Street line and laying of new track on Church Street between Eighteenth and 26th Streets, for which $60,000 has been allocated.

New business in Norfolk necessitates the extension of the power distribution system in various parts of the city, particularly in the suburbs. This project will cost about $150,000. Storage and garage facilities at Cove Street substation are being improved at a $30,000 expenditure. Sums of $52,000 and $53,000 respectively have been allocated to the construction of new transmission lines from the Reeves Avenue power station to Gilmerton and Newton Park. These lines will serve to strengthen the link between Norfolk and the high-tension line which runs from Gilmerton to Suffolk and permits interchange of power between Norfolk, Richmond, Petersburg and Roanoke Rapids (N. C.) generating stations. The rebuilding of an 11,000-volt transmission line will cost $20,000 and the installation of a transformer bank at the Reeves Avenue power station $15,000.

It is estimated that the company has spent in the territory of eastern Virginia and North Carolina $5,530,000 for extensions and improvements during the first six months of this year and that the program under way will cost $6,652,339. The largest project which the company has undertaken in Norfolk is the addition to the Reeves Avenue station, which has been under way for several months and which in order to put this generating plant in first class condition will absorb $2,500,000 of the construction funds during the last half of the year. The total cost of the Reeves Avenue additions is estimated at approximately $5,000,000. It is understood that plans for the North Carolina extension include the acquisition of property of the independent power companies in one or more of the smaller North Carolina communities. The local plants will be scrapped and their customers supplied by current brought in over the new transmission line. Construction last year of the transmission line through the Dismal Swamp to Edenton, Hartford and other North Carolina communities makes it possible for the company to branch out in that state at a relatively small expense, for the Dismal Swamp line is not used at its full capacity at present. At Richmond the company recently received a shipment of track steel to be used in completing the work on Main Street at Fourteenth, Eighteenth and 21st Streets.

Southern Utility Completes $100,000 Car Program

The last of seven cars built in the company owned plant of the Southern Public Utilities Company, Charlotte, N. C., has been completed. Seven cars were included in the construction program, estimated at $100,000, and all of the units have been placed in operation. Others, it is announced, will be built as needed. In the meantime the car building shop at the company's carhouse on East Boulevard will engage in construction of bodies for cars to be used in Charlotte and Winston-Salem. Each of the new cars recently turned out cost approximately $15,000. They are of the double-truck type, and are for one-man or two-man operation. The frames are of steel and the bodies are constructed of steel and wood. Each unit has a seating capacity of 40 passengers. Over-all length of each car is 38 ft. 3 in. and the width over all is 8 ft. 4 in. The height, from rail to top of car, is 11 ft. 6 in. All units are equipped with air brakes and numerous safety devices. Each car is provided with comfortably upholstered seats. W. B. Osborne, master mechanic, had charge of the building details.

Noiseless One-Man Cars for Minneapolis

The Minneapolis Street Railway, Minneapolis, Minn., contemplates putting one-man noiseless cars on its Bryn Mawr line to reduce the cost of operation as on this line at times only six to eight persons are carried on a trip. T. Julian McGill, vice-president, says under the circumstances there would seem to be no necessity for using two men. If the service proves satisfactory it may be extended to other lines where there is light operation. Similar service is being discussed for some of the St. Paul lines. One-man cars are utilized for local service on the Stillwater city division and some are utilized in Duluth. The 25 new cars are to be equipped with roller bearings, automobile type brakes and herringbone gears. They will cost about $25,000 each and will be turned out from the Snelling shops in St. Paul in three or four months.

R. H. Goodwillie Heads Electrical Manufacturers

R. H. Goodwillie, manager of the Otis Elevator Company, Yonkers, N. Y., was elected treasurer of the National Electrical Manufacturers Association by the executive committee at its meeting on Sept. 16, according to an announcement by Gerard Swope, president. Mr. Goodwillie succeeds J. W. Perry, formerly associated with the Johns-Manville Corporation, who has resigned from active business connections. I. A. Bennett of the National Metal Molding Company, Pittsburgh, Pa., will succeed Mr. Perry on the board of governors.

International G. E. Men Promoted

Loren Emery, merchandise sales manager of the International General Electric Company, has been appointed a member of the executive department and assigned to special duties in Mexico. He is succeeded as merchandise sales manager by R. A. Rowlands. George F. Mosher, assistant to treasurer of the General Electric Company, has been named auditor of disbursements, succeeding C. H. Stull, who becomes treasurer of the Ohio Contract Purchase Corporation, an associated company, with headquarters in Cleveland.

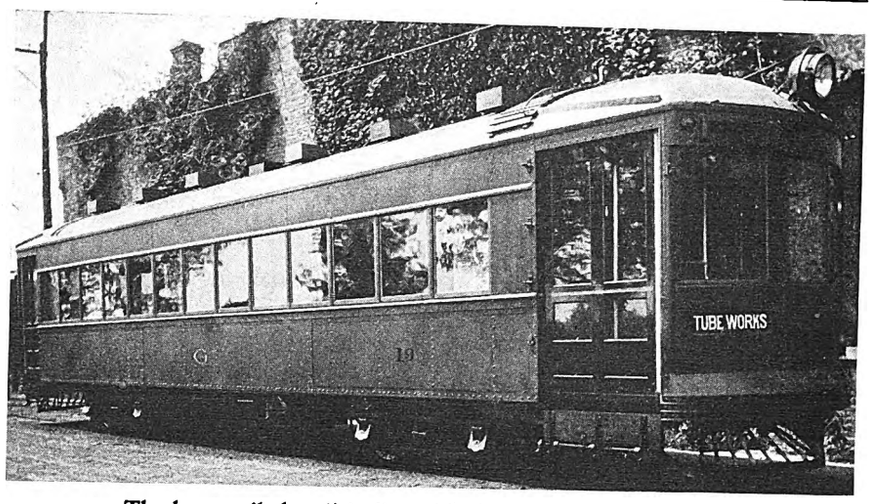
New Gary Cars Embody Utmost in Comfort and Safety

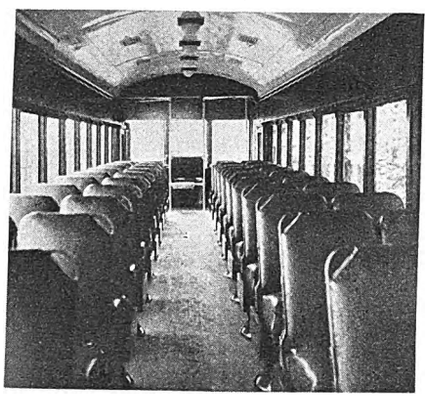
Marking another step in the progressive modernization and improvement of the system, ten new light-weight safety cars for one-man operation have recently been placed in service by the Gary Railways, Gary, Ind. The entire fleet of nine city-type cars and one interurban was built by the Cummings Car & Coach Company, Paris, Ill., and embodies the most modern principles of construction and design. Car dimensions recommended by the committee on "essential features of modern cars" were followed as far as possible, the builders using the same post centers, height, etc.

From the standpoint of comfort and attractiveness to riders the new equipment is unsurpassed by but few, if any, street cars manufactured. The low dash, a feature developed by Gary Railways engineers, gives a becoming streamline appearance to the new cars which is suggestive of speed and smoothness in riding. Equipped with four 40-hp. motors each and automatic safety and control apparatus of every description, the cars are capable of unusually rapid acceleration and retardation, features which are of great importance in operating through the congested streets.

With 52 semi-individual, leather-upholstered seats and ample aisles and vestibules the new city-type cars are designed to handle heavy loads during rush hours with comfort and dispatch. Delays in loading and unloading passengers are minimized by automatic rear door treadle exits, sliding doors and a passenger signal system which not only indicates the proper door to use on boarding or leaving the car but which also warns trailing motorists of an imminent stop. Provision against sudden incapacitation of the operator is made in the "dead man's control." With the inauguration of service with the nine safety cars on the Broadway-45th Avenue line in Gary, the company increased the headway from ten to fifteen minutes.



The low vestibule rail in line with the side belt rail carries out the streamline appearance

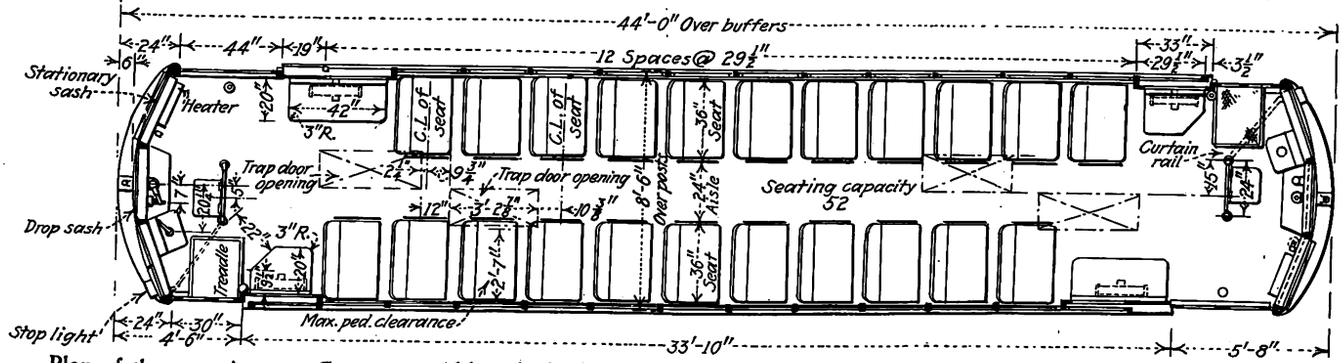


Comfort is the keynote of the interior design, the cars being equipped with semi-individual, leather-upholstered seats and having ample aisle and vestibule

Other specifications of the city-type cars are shown below.

The new interurban car differs from the city-type equipment only in the wider spacing and plush upholstery of its seats. Like the other units for local operation in Gary, this car, which is now being used on the Gary-Indiana Harbor interurban line, is finished on the interior in cherry with an ivory-toned ceiling. The cars are illuminated by standard Pullman fixtures and carpeted with handsome gray linoleum. Windows are properly spaced for clear and easy vision and are framed in brass sash.

The car is of the same type as the seven interurban cars received during January of this year and described in the Jan. 29 issue of ELECTRIC RAILWAY JOURNAL.



Plan of the new city type Gary cars. Although the length is only 44 ft., the cars have a seating capacity of 52 passengers

SPECIFICATIONS FOR GARY CITY UNITS

Type of unit	One-man, motor, passenger, city, double end, double truck
Number of seats	52
Date of order	Jan. 20, 1927
Date of delivery	June 9, 1927
Total weight	37,000 lb.
Bolster centers	21 ft. 6 in.
Length over all	44 ft. 0 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 8 in.
Height, rail to trolley base	11 ft. 0½ in.
Window post spacing	29½ in.
Body	All steel
Roof	Arch
Air brakes	General Electric
Axles	A.E.R.A. standard
Car signal system	Faraday high-voltage
Control	General Electric K-75
Curtain fixtures	National Lock Washer Co.
Curtain material	Black Pantasote
Destination signs	Hunter illuminated
Door mechanism	National Pneumatic Co.
Energy-saving device	Economy meters
Finish	Sherwin-Williams lacquer
Gears and pinions	General Electric
Glass	D.S.A.A. plate
Hand brakes	Pittsburgh No. 35
Heaters	Railway Utility Co. (thermostatic control)
Headlights	Golden Glow H.D.B.
Headlining	⅛-in. Agasote
Journal boxes	Cummings Car & Coach Co.
Lamp fixtures	Dayton Mfg., Co., Pullman type
Motors	Four GE-265, inside hung
Painting scheme	Orange and maroon
Registers	Ohmer
Roof material	Haskelite
Safety car devices	Safety Car Devices Co.
Sash fixtures	Edwards, brass
Seats	Hale-Kilburn 392 No. A semi-individual
Seat spacing	29½-in.
Step treads	Kass
Trolley retrievers	Ohio Brass Co.
Trolley base	U.S.-20
Trolley wheels	Holland 6 in.
Trucks	Cummings Car & Coach Co., MC. No. 62
Ventilators	Railway Utility Co., Honeycomb type
Wheels, type	26-in. Davis, steel
Wheelguards	Gary Railways standard

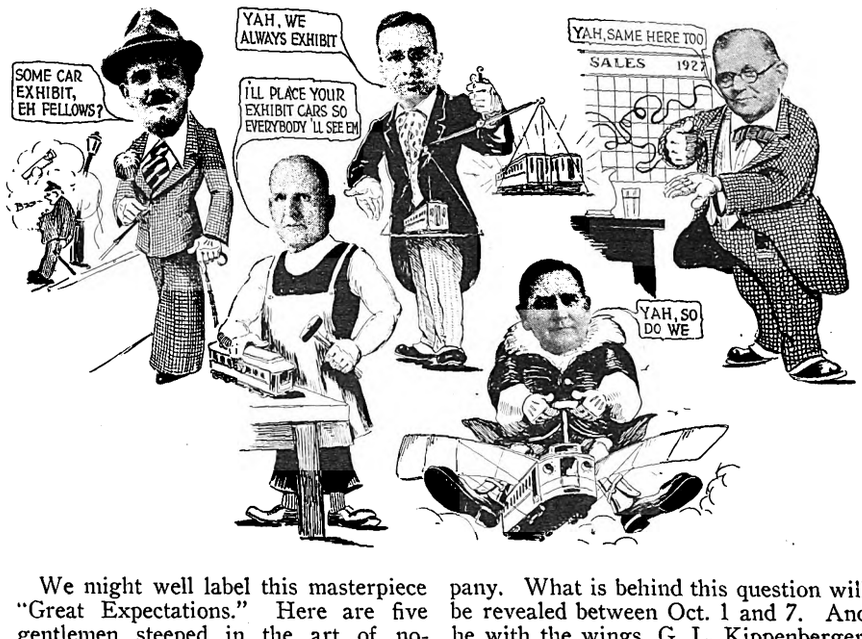
EXHIBITOGRAPHS—No. 5



We might well label this masterpiece "Great Expectations." Here are five gentlemen steeped in the art of no-pushee-no-pullee locomotion. Begin at the left, skyward, A. M. Robinson, P.M. of the Brill-American-Kuhlman-Wason aggregation, known as "Robbie," the A.M. signifying the time of day that he is going to show the buyers some real stuff. To his right is A. P. Jenks, V.-P. of the Cummings Car & Coach Company. Behind his dignified expression lurks a knockout in the matter of the light-weight material. Will the referee raise his hand at the Cleveland bout? "Were you ever in Zinzinnati?" questions the gentleman at the extreme right, A. L. Kasemeir, V.-P. Cincinnati Car Company. What is behind this question will be revealed between Oct. 1 and 7. And he with the wings, G. L. Kippenberger, "the Spirit of St. Louis," has he another world surprise in transportation like unto Lindbergh, which he will bring from the shops of the St. Louis Car Company? Another V.-P. with a royal flush?

But who is the husky Vulcan with the hammer, standing a little to the left of center? Little Charlie Clark, who when not engaged in maintaining a way for the Cleveland Railway, is chairman of the sub-committee on car exhibits. He knows all that the four others know, but won't tell, because at present he's as busy as two bees in a tar bucket.

Copper Market Active

A much larger business in copper, with all sellers participating at 13¼ cents delivered in the East, has been the feature in the non-ferrous metal markets in the week ending Sept. 20. Lead has also sold in improved volume, and the St. Louis price has advanced to 6.075 cents. Zinc and tin, however, have been quiet and slightly lower.

The large producers, who have been holding their copper at 13¼ cents delivered Connecticut, for over a month, finally brought buyers to their way of thinking, and the sales have been the largest for any week since June 1. In the East, 13¼ cents was generally realized, with a fair amount of business in the Middle West at 13⅜ cents. Foreign sales are now about normal for this time in the month, the export association's price continuing at 13½ cents, c.i.f.

The week has witnessed better business in lead, leading to an improved tone in the St. Louis market toward the end of the week. This had the effect of bringing the St. Louis price up to 6.075 cents. The New York sales have also improved, but the market price has not risen to correspond with the St. Louis quotation. In many quarters not only is no rise in price expected, but uncertainty is expressed as to whether 6.25 cents New York is rock bottom.

Galvanizers have shown but little interest in zinc this week. Until Sept. 19 6½ cents, St. Louis, was generally realized, with an occasional carload at slightly higher prices.

Tin has been declining steadily, and even at the present low prices sales are not being made in any quantity.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Sept. 20, 1927
Copper, electrolytic, cents per lb	12.95
Copper wire, cents per lb	15.25
Lead, cents per lb	6.075
Zinc, cents per lb	6.225
Tin, Straits, cents per lb	61.50
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.275
Somerset mine run, Boston, net tons	1.80
Pittsburgh mine run, Pittsburgh, net tons	1.95

Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.3
White lead in oil (100-lb. keg), N. Y., cents per lb	13.75
Turpentine (bbl. lots), N. Y., per gal	$61.0

ROLLING STOCK

SEABOARD AIR LINE RAILWAY, Portsmouth, Va., has placed an order with the J. G. Brill Company, Philadelphia, for ten combination gas-electric passenger cars and nine trailers. The equipment will be used by the railroad in local interurban service. In addition to this four gas-electric cars will be built by the Electromotive Company, East Cleveland, Ohio, according to an announcement recently made by the Timken Roller Bearing Company, Canton, Ohio, which will equip the cars with its bearings.

CLEVELAND RAILWAY, Cleveland, Ohio, has ordered twenty White six-cylinder buses, which brings the company's quota to 100 vehicles, including trucks.

GREAT NORTHERN RAILWAY, St. Paul, Minn., has placed an order with the Westinghouse Electric & Manufacturing Company for six additional locomotives to be used on the Cascade Mountain electrification project. This is part of the $15,000,000 program of improvement which includes line revisions and an 8-mile tunnel through the Cascade Mountain.

TRADE NOTES

ATLAS CONVEYOR COMPANY, Philadelphia, announces the opening of offices at 20 South Fifteenth Street, Philadelphia, and the appointment of Percival K. Reed, L. G. Weygandt and E. A. Thumlert as chief engineer, Eastern sales manager and general manager, respectively.

UNITED STATES RUBBER COMPANY, New York, has announced to the trade an important addition to its line, the Usco Junior.

DELTA-STAR ELECTRIC COMPANY, Chicago, Ill., announces the purchase of the Electric Connector Company, Minneapolis, Minn., manufacturer of compression connectors. The connectors will be made now in the Chicago factory.

MALCOLM S. SIMPSON, Suite 1401 Starks Building, Louisville, Ky., has been appointed as direct sales representative for the Morton Manufacturing Company (railroad division) in the territory surrounding Louisville and including those electric railway systems located in that territory.

GENERAL WHEELBARROW COMPANY, Cleveland, Ohio, announces that the name of the Akron Barrow Company, Cleveland, has been changed to that of General Wheelbarrow Company. The announcement states that the old name is geographically wrong for a Cleveland company; also, that need was felt for a name which would be broader, more inclusive and indicative of the scope of its business. The renamed company will remain under the same management.

New York Gets Another Transit Report

NEW YORK has another transit report. This time it is Mr. Untermyer, special attorney for the Transit Commission, who presents to that body an elaborate plan which purports to outline a method for unscrambling the transportation mess in the country's metropolis. Of course that is no simple job. It is comparatively easy to stand back and criticise almost any scheme which is suggested for straightening out the tangle of politics, prejudice, physical difficulties, finances, personalities, self-interest and public ignorance involved in the New York transportation problem.

There is no intention here to analyze Mr. Untermyer's report in detail. The electric railway industry generally is little interested in the complicated legal, physical and financial scheme which is proposed. Suffice it to say that the report does not seem to put foremost the most important need, i.e., for more transit and better riding conditions for the millions of people who daily depend on its inadequate and distorted jumble of transportation lines. The word "jumble" is used in preference to "system," for by no stretch of the imagination could the latter term be made descriptive of the conditions which exist.

What the report seems to try to do is to find a way of utilizing the new subway lines to the construction of which the city is committed, and at the same time avoid the necessity of charging a rate of fare that will make these lines self-supporting, in accordance with the provisions of the law authorizing the city to undertake the construction of an independent subway. As a political expedient, this seems to be an astute move. First, the city was committed by its officials to the construction of this subway. They succeeded in inducing the Legislature to authorize it only by writing into the law the provision that the system must charge a rate of fare sufficient to make it self-supporting. If that program were permitted to go into effect, there would be presented to the intelligence of the voters the anomalous situation of privately operated subways required to charge 5 cents, while a city subway charged 8 or 10 cents for a ride. Obviously Tammany can ill afford to permit such a situation to develop. Now that the city system is well under construction, therefore, and before the people shall fully realize the blundering of its officials, Mr. Untermyer starts out to rescramble the situation, so that by dissecting the present transportation systems and taking from them the cream of their routes, the city may obtain a group of lines which will show some possibility of being operated on a 5-cent fare. What is to happen to the remnants of the private companies thus dismembered seems to be of small concern to Mr. Untermyer. In fact, one is led to believe from the report that if he had his way fully their fate would be terrible.

The retention of a 5-cent fare remains the alpha and the omega of New York's transit policy, according to this report. Everything else seems to be secondary; financial stability, efficient operation, increased convenience. Comfort and even decency for passengers do not seem to get so much as a serious thought. An elaborate and complicated plan, with many financial and legal contingencies, is set up, and the report then proceeds with meticulous care to argue that the scheme proposed would make possible the retention of a 5-cent fare. That seems to be the extent of its accomplishment. The slightest consideration does not seem to be given to showing just when the people of that city may expect to be treated less like sardines and more like human beings when they endeavor to ride on its rapid transit system.

Savings Banks Want Public Control to Continue

LEGISLATION has been drawn for introduction in Massachusetts to extend the period of public control of the Eastern Massachusetts Street Railway. This is an act that appears to be well considered. It is favored more particularly by the representatives of the savings banks of that state, who point out that under public control an insolvent railway in the hands of a receiver for a long time and in bad operating condition has been rehabilitated. The savings banks have, of course, in mind the conservation of the more than $5,000,000 of bonds of the system held as part of the assets of their 2,800,000 depositors.

The present special act went into effect in 1919. It pledged the credit of the Commonwealth for the payment of principal of not exceeding $4,000,000 of the road's serial bonds. The proposed new act in no way asks financial aid or credit from the Commonwealth. This is, perhaps, the most important distinction between the existing act and the one which the Savings Banks Association has indorsed. Under the terms of the proposed new act the Eastern Massachusetts property would continue to be operated by a board of five trustees appointed by the governor. They would have the same power as at present to regulate fares and to determine the character and extent of service. One section provides that they shall fix such fares as in their judgment will produce income sufficient to meet all operating and fixed charges, preferred dividends and 6 per cent on the common stock. Another section gives the company the right to sell electricity for light or power to the extent that it shall not be required for the proper operation of the railway, but the department of public utilities must first determine that public necessity and convenience require such sale.

The fact that the savings banks have a self-interest in seeing the present arrangement renewed detracts not a whit from the excellent record made by the railway management. Among the most noteworthy of the commendable things done was the division of the property into operating units, each made to stand on its own basis on the general theory of paying in fares to the extent

Digitized by Google

that the service was used. This plan has worked well. So was the provision well made that the cities served might contract within limits definitely fixed to making up any deficit from operation. Fortunately rehabilitation has progressed without the need for assessing any of the cost on the municipalities, but the provision is a wise one. Despite the trials and tribulations with which it has been beset the company has maintained a constant level of net earnings in the face of steadily diminishing gross income during six years. In this achievement the one-man car played a large part. It has, indeed, been hard sledding, but the courage of the management never faltered. After its house had been placed in order the railway went in for an intensive merchandising plan. The officers resorted to every expedient, not indiscriminately but wisely and well. It is none too soon to bring the matter of the renewal of the present arrangement to public attention. The good work should be permitted to go on.

Success in Rapid Transit Involves Co-ordination

PERHAPS no better demonstration of the necessity for co-ordination of transportation facilities to obtain best results has ever been made than that given in the Beeler report on rapid transit for Cincinnati, abstracted in two articles appearing in last week's issue and in this one. Several years ago the city of Cincinnati appropriated a considerable sum for the construction of a rapid transit subway line. The line was built in the rough, but has not yet been carried to completion. Meanwhile conditions have changed so that the need for the line for its original purpose, of furnishing an entrance for a number of interurban lines to a downtown terminal, does not exist. The problem was to find a use for the investment already made, totaling some $6,100,000, so that it would bring some return to the city instead of lying idle.

Many estimates were made by the engineers to determine the best course of procedure. Naturally the simplest and the cheapest plan would be to complete the subway and run it as a separate unit. Used in this way, it was estimated that it would carry only 6,060,000 revenue passengers the first year. But by co-ordinating all the local facilities, and using surface cars, interurbans and bus lines to feed into the rapid transit line, it will carry 37,400,000 passengers the first year. Moreover, it will be possible to reduce the surface transportation mileage where it would duplicate the rapid transit, and so make a saving so great that not only will the combined system pay operating expenses, but from the start there will be almost enough revenue to meet fixed charges on the $10,600,000 additional investment needed to complete the system.

A word of caution is not amiss for those who, for various selfish reasons, desire to modify any plan proposed so as to gain preference for some particular locality. It is shown conclusively that the addition of only three stations to those recommended would destroy the usefulness of the rapid transit line in the outer sections, would involve a serious loss of patronage, and would result in a deficit instead of a profit.

Every city administration that is faced with a need for rapid transit will do well to ponder this report, for it contains the essentials of success or failure for such an enterprise, set forth in no uncertain terms.

Prospects for Federal Income Tax Reduction

CORPORATIONS, as a whole, have been very patient with the federal government for leaving them out when favors in the form of tax reductions were to be handed out. Indeed, they accepted increases with comparative complacence when others were enjoying reductions. And probably little would be done about it now, even though the corporation rate was increased from 13 to 13½ per cent and is now more than 2½ times the maximum normal rate for individuals and partnerships, had not the Treasury piled up an unprecedented surplus of $636,000,000.

Is there anything inherent in the corporation form of business ownership and operation that would justify such high taxation as compared to that of individuals and partnerships? Its main characteristic is that of limitation of liability, but the present rate of taxation imposes a very high rate of premium for this kind of negative insurance. If this unusually high rate of tax is to be continued we may expect to find more and more corporate businesses changing to another and cheaper form, or, where this cannot be done, we may expect profits to decrease and the salaries of those in control to increase. An investigation of the income tax returns of one of our Middle Western states disclosed an alarmingly large number of corporations which were prosperous but were paying no dividends. The paradox of a lower rate of tax bringing in greater returns may be seen if the federal government reduces its rates.

A great part of the Treasury surplus above mentioned has already been paid out in debt retirement, but a huge sum is still available for return to the taxpayers. Whose turn is it to benefit? Under the act of 1926 the number of persons paying income tax to the government was reduced by almost one-half. While 7,369,788 persons made returns in 1925, only 4,171,051 did so in 1926. There are many who feel that the individual exemptions are already low enough and that too many people escape federal taxation. At any rate, there is little argument for further favors to this group while the corporation tax remains so high. For the holders of the shares of corporations represent an enormous group of people—rich, middle class and poor—and either they must pay a high rate of tax for the privilege of investing in this form of business enterprise or pass the tax along—if they can! It is not often they can pass it along and they usually have to pay it.

There are some who feel that the demands for flood relief and control will make tax reduction impossible just now. Secretary Hoover, who may be expected to have clear ideas on this subject, says that reasonable demands for such purposes should not interfere with substantial reduction of the income tax, and that annual appropriations will suffice. If a tax reduction is to be made at this time, corporations should certainly benefit by it. Reductions for them are long overdue. The sentiment in the ways and means committee and among members of both houses of Congress is more favorable to the cause than ever before. This splendid opportunity should be used so that the case may be kept prominently before them. Every corporation executive in every state should bring this matter to the attention of his representative in Congress and the Senate in the interests of his stockholders and in those of the buyers of his goods or services.

The Special Library a Valuable Adjunct

WITHIN the last few years a new form of activity has been added to the work of the utility corporation. It is that of maintaining a special library for the purpose of keeping on file within ready reach all information available about the subjects in which the various departments are interested. In this way it differs radically from the general library, which is content with the usual catalog, but largely leaves to the reader the work of locating and classifying articles on a particular subject.

Several electric railways have for a number of years devoted considerable effort to the development of libraries of this type. The work they have done has been noteworthy. For this reason the article on the conduct of the library of the Philadelphia Rapid Transit Company, published in this issue, is of particular value. While this library is organized along the same lines as others which were established earlier, in a relatively short time an invaluable set of references have been built up. Then, too, through a co-operative association the information that has been collected by the several libraries of this class is made available to all, and a vast fund of information has been assembled on practically any subject in the field of the industry.

Wood Preservation Progressing

LATEST statistics show that there are in the United States approximately 400,000 miles of steam railroads and about 47,000 miles of electric railways. The total number of ties in steam railroad tracks is approximately 1,100,000,000, of which about 730,000,000 or 66 per cent are treated. At the present time the steam roads are installing about 100,000,000 ties annually, of which approximately 65,000,000 are treated.

There are in electric railway tracks about 124,000,000 ties. According to the records of the United States Department of Commerce and the Department of Agriculture, the electric railways purchased approximately 5,000,000 untreated and 1,120,000 treated ties in 1925. No records are available to show the number of untreated ties which were subsequently given some form of treatment by the purchaser, but it is quite probable that it would not materially affect the comparison.

From the above, it is evident that while the steam railroads are replacing slightly less than 10 per cent of the total number of their ties per year, 65 per cent of new ties have been treated. On the other hand, the electric railways are apparently replacing slightly less than 5 per cent of their total ties per year and treat less than 20 per cent of their new ties. The difference in the proportion of renewals is, of course, partly because the electric railways do not have the same proportion of renewals on account of mechanical wear as do the steam roads, and partly because of the more extensive use by the former of substitutes. No data as to the extent of the use of the latter are available, but they would undoubtedly show up favorably to the electric railways. The situation, however, is one which from the electric railway standpoint leaves considerable room for improvement.

At least two electric railway properties, Boston and Atlanta, own and operate their own treating plants and treat all ties and most of their other timber. One of these companies reports a cost of only 8.7 cents per treated tie per year as compared with 13.3 cents per untreated tie per annum. Pressure treated creosoted ties have been known to give 30 years life in paved electric railway tracks. An extensive test installation on one steam railroad showed over 80 per cent of creosoted tie installations still sound after 17 years of service, and of the remaining 20 per cent more than half were removed for reasons other than decay. In this test it was proved that the average life of untreated ties ranged from 3.1 years for cottonwood to 8.5 years for white oak. The creosote treatment was full cell 10-12 lb. per cubic foot. In European tracks, life of treated ties as high as 40 years has been reported.

Big Returns from a Small Investment

PRESERVATIVE treatment is not limited to ties. The advantage for other timber is well known. Data recently published on a yellow pine pole line on the Bell telephone system between Hurricane, Ala., and New Orleans, La., which was installed in 1899, showed that in 1925 only 13.5 per cent out of a total of 7,644 treated poles in the line had been replaced because of decay. According to these data, the Bell system is now using between 600,000 and 700,000 poles annually, of which 90 per cent are treated. Government statistics show that the total number of poles being used per year is about 3,250,000. It is estimated that the telephone, telegraph, railroad and power companies are now treating about 2,500,000 poles annually, or 80 per cent of the total requirements. This is 6½ times the number treated in 1909.

About 10,000,000 cross arms are now being used per year, of which about 1,000,000 are treated. While this is only 10 per cent of the total, it represents an increase of 1,500 per cent over the number treated in 1909.

While reasonably accurate data are not available for posts, car timbers and mines, it is reasonable to assume that there is at least an equal opportunity for improvement in these fields. The records show that there are now being treated approximately 400,000,000 ft. b.m. of construction timber and miscellaneous material per year, but this represents only about 1 per cent of the total annual production of such timber, and while it represents a gain of 38 per cent over the amount treated in 1909, there is still much left to be desired.

The economies to be effected from preservative treatment of timber are so obvious as hardly to require argument. It is not a matter of first cost, but rather one of average annual cost during the useful life of the material. The experimental stage has been passed, the anticipated life of treated timber upon which installations were originally justified has been exceeded, and the element of uncertainty has been removed. There would appear to be no good reason for hesitation in the matter of choosing between treated and untreated timber. Every dollar spent on treated timber is the same as putting money away in the bank, where it will earn a substantial return to the investor.

The wood preservation committee of the American Electric Railway Engineering Association has been doing excellent work for several years along the lines of educating the electric railway industry as to the benefits to be derived from wood preservation, but "reading the directions on the bottle will never cure the ill." The directions must be followed and the dose taken as prescribed.

Part of the P.R.T. library staff, which furnishes technical information for the 12,000 employees

12,000 Employees Can Use This Library

P.R.T. librarians are called upon by all departments for information on transportation, economics and related subjects—The 6,000 books and 150 periodicals kept on hand are of vital importance in employee training—Library exhibit to be seen at A.E.R.A. Cleveland convention

IT MAY readily be understood that the important function of a special business library is to correlate and provide information on subjects of pertinent interest to the organization which it serves. Such a library must be more than an imposing row of well-filled bookcases, more than an amply filled periodical rack, more, even, than an efficient filing and clipping bureau. The company library must serve as an effective digestive apparatus, consuming vast quantities of printed words and skimming from that material the trace of nutritive information for which the company's executives and the rank and file of its employees may be seeking.

What the public library, serving persons of every type and interest, cannot do, the special library is created for the explicit purpose of doing. Its chief librarian and assistants are specialists in securing from material already on hand, or from outside sources, the information requested, almost always in a rush, by the personnel of the company and, so far as possible, in anticipating and meeting those requests in advance.

In so far as the company's librarians are able to shoulder a portion of the load of the executives and to carry on at least the preliminary steps of a research along lines desired by the various departments, the special library proves itself as one of the most important functions of the company. Hardly less important is the cooperative part which it may play with the employee training activities, now being carried on by so many of the larger and even the smaller companies in every type of industry.

The Philadelphia Rapid Transit Company perhaps has more diversified fields of activity than any other urban transportation system at the present time. Not only does it embrace every type of public transportation in Philadelphia, high-speed lines, street cars, city and intercity bus service and taxicabs, but its employees and management also embarked some time ago upon the high seas of finance, with the establishment of the Mitten Bank under Mitten auspices.

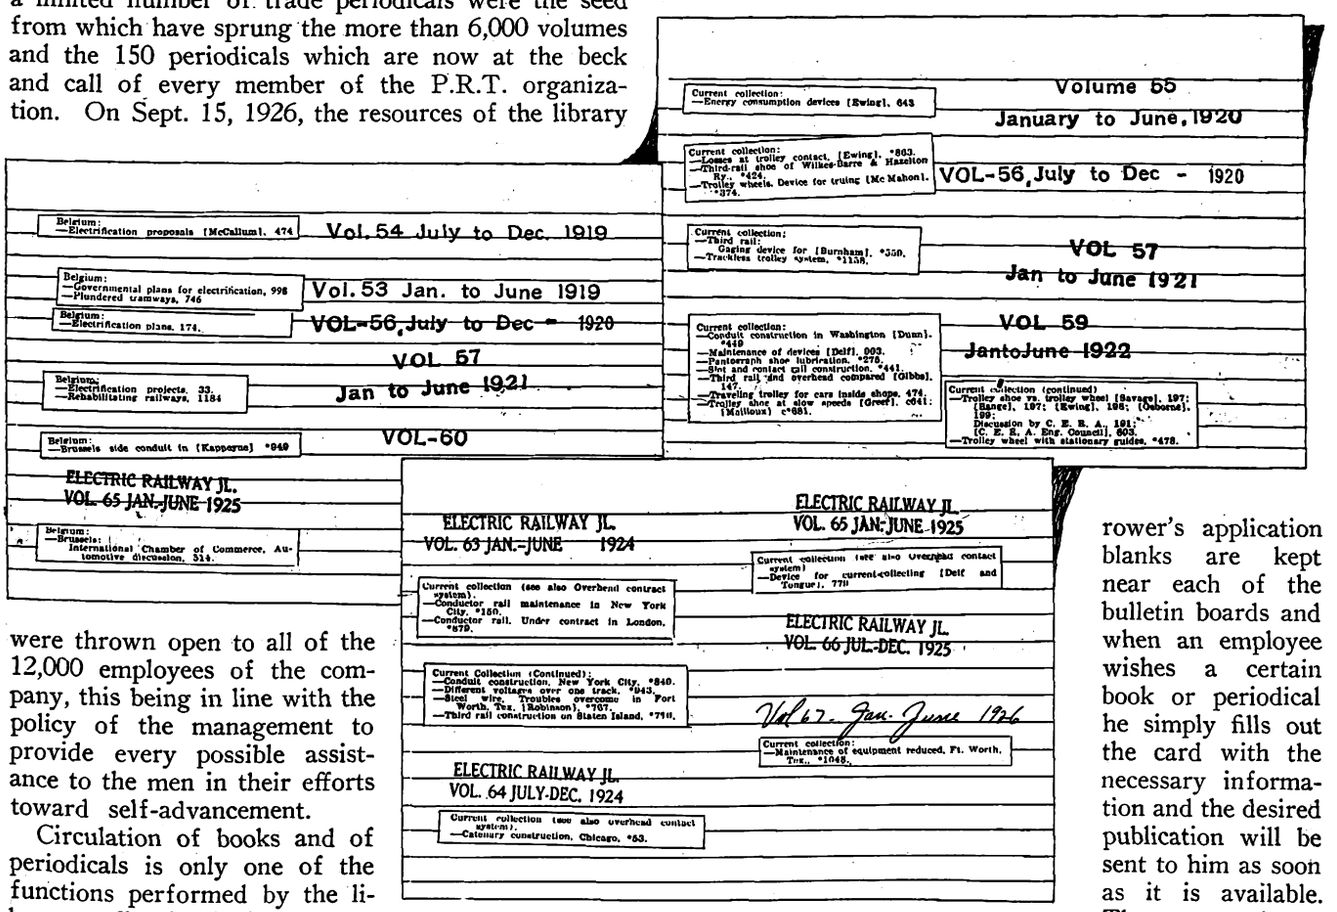
In a rapidly expanding organization such as this there are, of course, constant calls for specific information on innumerable subjects. The executives and the employees wish to be kept constantly in touch with new developments in the street railway, motor bus and taxicab industries,

Digitized by Google

and such related subjects as co-ordinated transportation, accounting practice, customer and public ownership, employee and public relations, benefited property assessments, cost of living, accident prevention, traffic problems, indeterminate permits, employee representation in management, foreman training, fares, wages, investment practice and countleses other matters.

One of the features of the P.R.T. library is to bring these subjects to the attention of the persons directly interested in the various problems—in abstracted form when possible and always so as to reduce the amount of unproductive "digging" which must be done by the individual seeking information.

The library was first established as a central bureau in 1919. Its beginnings were small. One bookcase and a limited number of trade periodicals were the seed from which have sprung the more than 6,000 volumes and the 150 periodicals which are now at the beck and call of every member of the P.R.T. organization. On Sept. 15, 1926, the resources of the library were thrown open to all of the 12,000 employees of the company, this being in line with the policy of the management to provide every possible assistance to the men in their efforts toward self-advancement.



Information on certain subjects is prepared and sent to a list of officials on Lefax cards

Circulation of books and of periodicals is only one of the functions performed by the library staff. A clipping department is maintained which combs the newspapers of Philadelphia and of cities in many other sections of the country, searching out relevant news notes which are pasted into daily clipping books and circulated among the company's officials. To increase the effectiveness of this work a number of outside clipping services are also utilized.

Since the central filing department is a natural corollary of the library, it too comes under the jurisdiction of the librarian. This work includes the classification and filing of all company mail, interoffice communications, reports and other material which must always be at hand for ready reference.

Book Reviews and Library Bulletins

So that the employees may constantly know what new material the library has available for them, considerable use is made of the 100 company bulletin boards, which are located in the carhouses, garages, shops, general offices and other departmental locations. Some form of library publicity is posted at all times, including lists of new books received during the month, with very brief reviews of each; lists of short abstracts of magazine articles, etc. All of these library bulletins are, of course, sent to the various officials.

All of the 150 periodicals subscribed for are carefully reviewed and articles of particular interest are abstracted. These short abstracts are typed on a routing sheet and pasted on the outside of the magazine in which they appear. The magazine is then routed to a regular list of readers and to such individuals as may be interested in special features which appear therein. Pads of borrower's application blanks are kept near each of the bulletin boards and when an employee wishes a certain book or periodical he simply fills out the card with the necessary information and the desired publication will be sent to him as soon as it is available. The company interoffice mail is utilized for this service. No charge is made to the employees for any of the library service, but they, of course, are held responsible for books and periodicals loaned and are expected to return them within a reasonable period.

To determine how extensively the employees are making use of the library and also to ascertain the type of material which is most in demand careful records have been kept of all publications loaned and the locations to which they are sent. It was found, as might be expected, that shop employees were particularly interested in mechanical works and in maintenance articles published in Electric Railway Journal and elsewhere, while trainmen centered their attention on subjects lying more nearly in their field of activity, such as traffic studies, co-ordinated transportation, etc. All employees, however, have in common a very real interest in personal

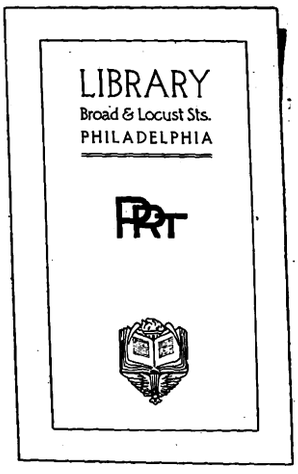
Some of the index cards which make easy the finding of information on special subjects of interest to the library's users

analysis, investment practice, public and employee relations and similar more general subjects. "How to Get Ahead Financially," by William A. Schnedler, and "Financial Independence, How to Win It," by Harvey A. Blodgett, are two of the most popular volumes on the library shelves.

Working with the Training and Educational Division

The company is constantly expanding its educational work among the employees and the facilities of the library are thus being subjected to a corresponding increase in demand. Three correspondence courses, "The Electric Railway Industry," "Handling Men" and "Public Relations," are now being offered to the men and evening classes in public speaking, mathematics, English, blueprint reading and similar subjects will be offered during the fall and winter months. With all of these the library must co-operate by preparing reading lists and suggesting texts which will provide valuable supplementary information for those participating in the courses.

Extra copies of books and magazines which are subjected to the greatest demand are purchased, so that long delays in getting a desired publication may be avoided. An attempt is made to obtain copies of all surveys made in Philadelphia and in other cities on problems which affect coordinated transportation. When a particularly illuminating survey is made extra copies are secured and distributed to employees who request them.



The bookplate by which the volumes owned by the P.R.T. library are identified

The annual reports of the company are exchanged with about 100 other transportation companies and this collection of reports is of great assistance in the compilation of comparative statistics. The company publications, *Service Talks* and *P.R.T. Co-operator,* are also exchanged with a large number of other companies and publications received in return are routed to interested officials and are then filed.

A fare and wage history of street railway and motor bus companies of comparable size has been compiled. A book of fares and wages in effect is made up on $3\frac{3}{4}$x$6\frac{7}{8}$-in. Lefax sheets. Copies of this book are in the hands of the various department heads. As fare and wage changes occur revised sheets are distributed.

Bound volumes of Electric Railway Journal and its predecessors from 1894 to date are maintained by the library. A cumulative index for this publication, from 1916 to date, is prepared to facilitate ready reference. This indexing has been accomplished by clipping and pasting all index references to articles on one subject on one or more cards. The volume number appears above the clipping, as is shown in an accompanying illustration.

Service Talks and *P.R.T. Co-operator* are bound with a carefully prepared index. A frequent query with the library is "Where did we publish this?" and it is thus essential that all company publications be thoroughly indexed.

The A.E.R.A. compilations, which are found to be of great assistance and value, are filed in vertical steel cabinets using the same subject headings which the association publishes in its annual report.

A large collection of legal books is maintained for the benefit of the company's legal staff. This collection includes the various Reporters, Pennsylvania Superior and Supreme Court Reports, U. S. Superior Court Reports, the American Law Reports, U. S. Supreme Court Reports and Pennsylvania Court Reports. An index to all legal opinions emanating from the company's legal staff is prepared.

Other sources of information which are filed over a period of years are: Decisions and reports of the New York Public Service Commission, the New York Transit Commission, Pennsylvania Public Service Commission decisions, Philadelphia ordinances, Mayor's messages, city transit department reports (Board of Supervising Engineers of Chicago Traction report), the *Commercial*

ROUTING SHEET

ARTICLES OF SPECIAL INTEREST IN ELECTRIC RAILWAY JOURNAL

Date May 14, 1927

SUBJECT	Page
BOSTON ELEVATED RAILWAY	
Legislation for Boston "L" fails - valuation ordered.	879
BROOKLYN CITY RAILROAD	
Dividend policy explained. Circumstances connected with passing of Brooklyn City dividend reviewed - $11 000 000 for improvements.	882
BROOKLYN - MANHATTAN TRANSIT CORPORATION	
Approval of $20 000 000 Brooklyn refunding issue sought.	882
BUFFALO MOTOR BUSES	
Duplication not the answer in Buffalo. Application has been denied the Buffalo Motor Coach Co. to operate	
Mitten Bank has merged with Brotherhood of Locomotive Engineers Title and Trust Co.	878
MONORAIL	
Monorail proposal for Detroit under advisement.	879

Your attention is called to special articles contained herein. When you finish reading, kindly initial and date, and forward to next succeeding name. If you do not contemplate prompt use of magazine please forward, and after routing has been completed it can be secured from library or photostatic copies of desired articles obtained.

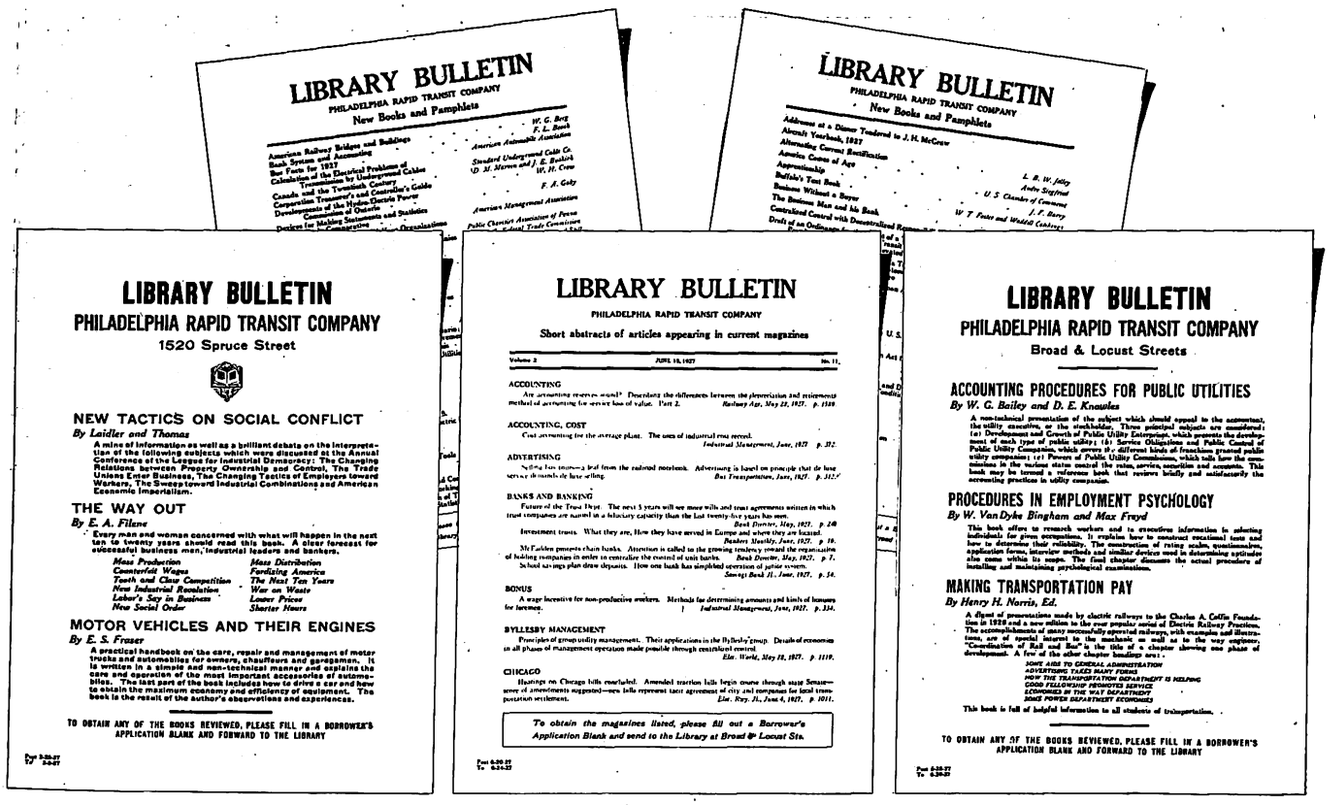
Librarian, 1520 Spruce Street.

Messrs: W. K. Myers
C. E. Ebert
W. M. Campbell
H. B. Hutchinson
W. W. Logan

JUN 3 1927

Items of special interest in the leading periodicals are listed by the librarian on the routing sheet which is sent with the magazine

Digitized by Google



Weekly bulletins issued by the library call attention to the most important books and magazine articles. They are posted on the company bulletin boards

& Financial Chronicle (from 1920 to date), *Aera* (from 1912 to date), A.E.R.A. *Proceedings* (from 1905 to date), *Moody's* and *Poor's Manuals* (from 1911 to date), *Public Utilities Reports,* and reports of the Boston Transit Commission.

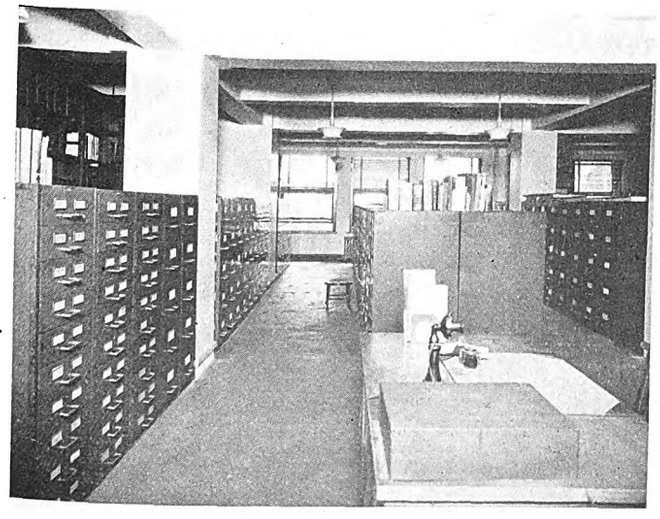
Such services as the *Industrial Arts Index, Reader's Guide, Public Affairs Information Services* and *Commerce Clearing House* are found to be of considerable value. The publications of the American Management Association are used quite extensively and are bound in Strapflex binders by series.

The library uses a slightly modified Dewey decimal classification system and Library of Congress subject headings are followed with variations. Library of Congress cards are used whenever possible.

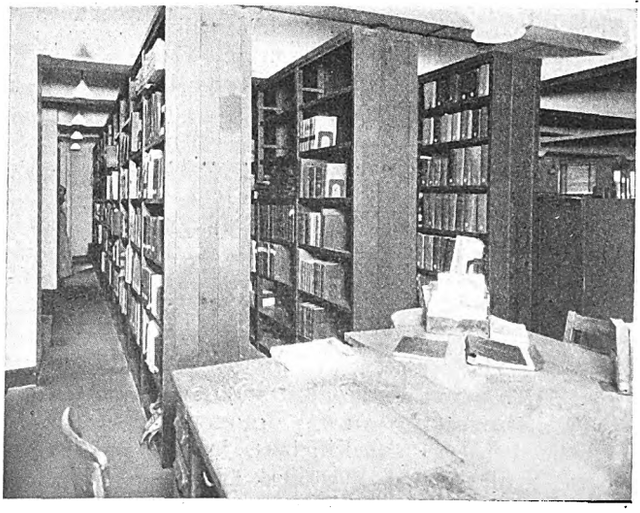
The P.R.T. library is a member of the Special Libraries Association and of the Special Libraries Council. It has established contacts with information sources both locally and nationally and these are of tremendous value when material is desired which is not available in the library's own files.

To Participate in Exhibit at Cleveland Convention

A library exhibit at the Cleveland convention of the A.E.R.A. has been arranged for by the Special Libraries Association. The exhibit will be in charge of Miss Alma C. Mitchill, librarian of the Public Service Corporation of New Jersey, who is chairman of the committee; Mrs. C. S. Faltermayer, librarian of the



The central files of the company are under the librarian's direction



There are more than 6,000 volumes in this library of the Philadelphia Rapid Transit Company

MAKING TRANSPORTATION PAY, *(edited) by Henry H. Norris*

PRACTICAL RAILWAY MAINTENANCE, *by Charles W. Weiss*

ELECTRIC POWER STATIONS, *by L. W. W. Morrow*

Philadelphia Rapid Transit Company, and Lewis A. Armistead, librarian of the Boston Elevated Railway.

Copies of a specially prepared booklet entitled "The Value of a Company Library" have been prepared by this committee and have been sent to various transportation companies. Copies will be available at the Cleveland convention or may be obtained from any of the committee members.

The purpose of the library exhibit will be to point out the type of service which a company library should be equipped to render and to demonstrate the relative ease with which such a department may be established and built up to be one of the most useful adjuncts of the organization. The point will be made that a small company has quite as much need for a library of its own as have the larger organizations, although, of course, it will not need to be as extensive as those of the metropolitan companies.

Bus Speed on Fifth Avenue

IN THE caption of the illustration appearing on page 486 of ELECTRIC RAILWAY JOURNAL for Sept. 17, it was stated that the speed of buses in the congested section of Fifth Avenue, New York City, in the rush hour was "about 5 m.p.h." The figure should have been "3 m.p.h."

Car Building and Shop Statistics

STATISTICS of the car manufacturing industry are issued by the United States Census Department every two years. Included in them are statistics of electric cars built and electric railway repair shops.

Table I shows the electric railway cars built in 1925, according to figures in the latest census. The data are divided into freight and passenger cars. The table includes not only those manufactured in car building plants but also in railway shops. The value of the 1,798 passenger cars built is given in the report as $19,604,813, and that of the 89 freight and other cars built as $453,479.

Table II gives statistics of the electric railway repair shops in the country for the three years mentioned in the table. These figures, however, do not include data for establishments with products under $5,000 in value. The average number of wage earners during 1925 employed in the shops included in the table was 32,521; during 1923, 34,925, and during 1921, 33,279. The wages paid in these shops during 1925 were $48,357,386.

Table III gives detailed statistics of the work performed in the shops listed in Table II.

TABLE I—ELECTRIC RAILWAY CARS BY CLASSES AND TYPES OF CONSTRUCTION, BUILT IN THE UNITED STATES IN 1925

	Passenger	Freight and Otner	Total
All wood	11	5	16
Steel under-frame	424	43	467
Steel body with wood interior	955		955
All steel	408	41	449
Total	1,798	89	1,887

TABLE II—OUTPUT OF ELECTRIC RAILWAY REPAIR SHOPS IN THE UNITED STATES, 1925, 1923 AND 1921

	1925	1923	1921
Number of estabiishments	521	547	560
Wage earners (average number)	32,521	34,925	33,279
Wages paid	$48,357,386	$49,225,583	$47,775,235
Paid for contract work	$121,883	$110,949	$105,862
Cost of materials*	$29,738,148	$31,981,650	$33,560,133
Value of products	$83,812,220	$86,412,645	$87,312,426
Value added by manufacture†	$54,074,072	$54,430,995	$53,752,293
Horsepower	70,479	62,370	‡

*Includes also cost of fuel, electric power and shop supplies.
†Value of products less cost of material.

Hamburg has an excellent elevated and subway system with suburban extensions. This is a standard six-car train

Rapid Transit

Car Design and Noise Reduction *in Europe*

European rapid transit cars are developing along American lines. Considerable progress has been made in London in the direction of reducing the noise from car operation. European surface cars are noticeably more quiet in movement than those in the United States

By Henry W. Blake
Senior Editor *Electric Railway Journal*

CARS on the rapid transit lines in Paris, Berlin, Hamburg and London bear a closer resemblance to those used in America than do the street cars. The bodies generally are of steel throughout, with multiple side doors, and the arrangement of seats gives large standing capacity. Sometimes these seats are entirely longitudinal, sometimes there are two or more pairs of cross seats on each side of the aisle.

All of the lines mentioned use sliding doors that are closed while the train is in motion, but otherwise the door arrangements differ greatly. The latest cars in London, those for the Hampstead Tube, have an arrangement similar to the Interborough system of door control. The Hampstead Tube is running two trains, one of six cars and one of seven cars, with only one guard per train and electro-pneumatic door control with bell signal interlocked with the doors. The guard is near the rear end of the train and can communicate with the motorman by a telephone with a loud speaker in the latter's cab. This line will introduce automatic doors as rapidly as possible because of the saving in labor, and it is expected that they will be on all tube cars within three years.

On the rapid transit lines in Paris, Berlin and Hamburg the general practice is for the passengers to open the doors at stations, but for a member of the train crew to close them, usually by electrically controlled air engines. The Berlin elevated and underground railway, however, is putting on three sample trains, each with multiple-unit door control of different types. One will be of the Paris type, one a modified National Pneumatic type, and one the Kunz-Knorr type. In the National Pneumatic type one door engine operates both halves of each door, the power being transmitted to each half independently so that the work is equally distributed on both sides of the engine crosshead. If the door is obstructed while being closed the engine automatically adjusts its pressures so that the door will not slam when the obstruction is removed. The engine also has an automatic cushioning feature which eliminates the possibility of the door slamming at any time. Although

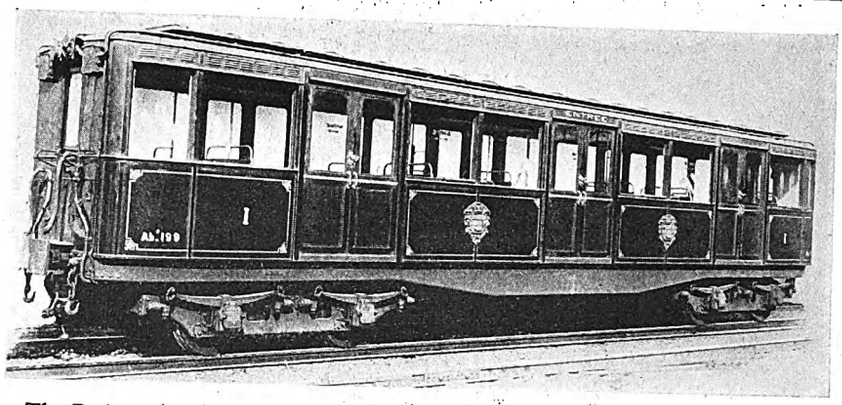
passengers are provided with handles inside and outside for opening the doors, they can do so only when the train guard has set his control switch to the door-unlocked position. This he does in normal operation only when the train has entered a station. Once the doors are open they remain so until closed by the guard.

The operation of these inside and outside door handles are independent of each other because passengers at a crowded station were accustomed to hold the doors closed to prevent passengers on the platform from entering the car. While the handles are at the usual height, the latch is at the top of the door and is connected to the handles by levers. The purpose of this arrangement is to remove from the side of the door any sharp projection which might tear the clothing of passengers during entrance or exit.



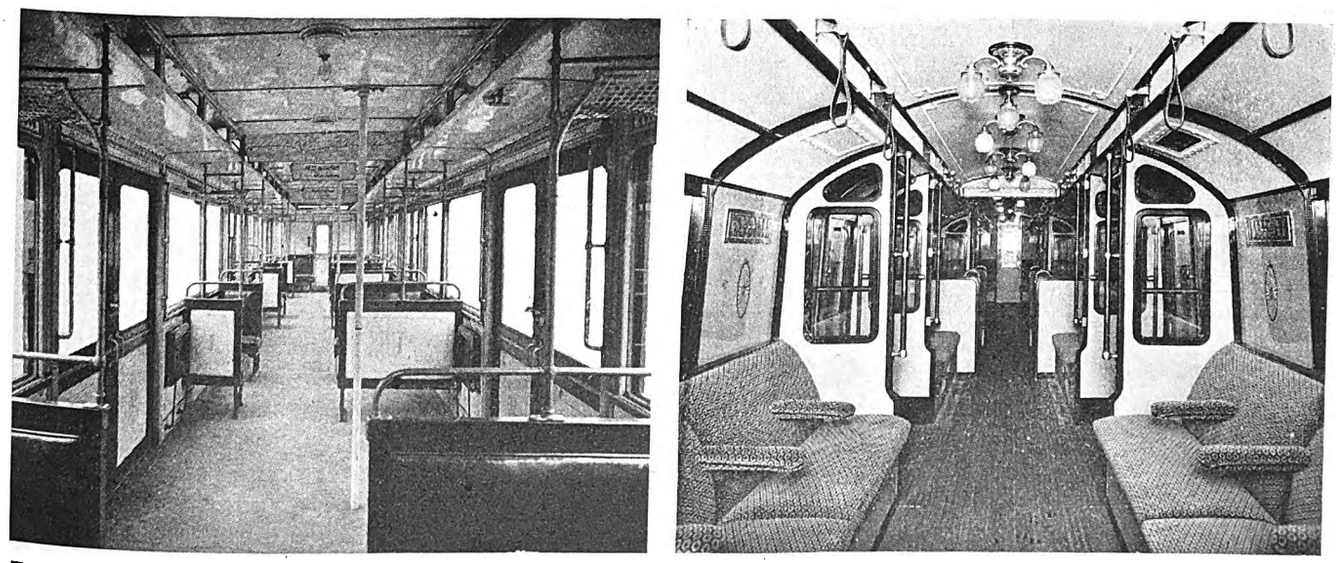
The Paris subway cars have three side doors and passengers are expected to enter by the center door. This is a first-class trailer. The class is indicated by the color (red) and also the numeral "I" on the side

In the Paris type, the doors are opened by the passengers but are closed by the motorman after a train leaves the station, through electrically controlled air cylinders. The doors are equipped with an ordinary latch, and when they come together with considerable force, under the action of this air cylinder, the latch drops into place through impact. On some of the new cars the doors are interlocked with the control so that the train will not start until all the doors are closed. On the older cars there is no interlock and passengers can open the doors from the inside or outside without any warning to the motorman.

Two-Fare Cars in London and Paris

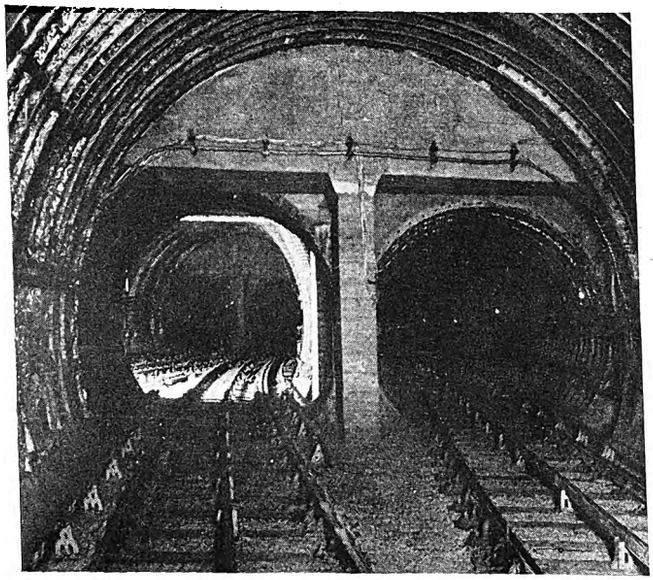
The tube or deep underground railways in London operate only one class of car, but on the shallow London underground lines, the Metropolitan and Metropolitan District, there are two classes. They are marked respectively first and third. The retention of these names is in line with the practice on most of the steam railroads in England, which originally operated three classes of cars, first, second and third, with different rates of fare. The second class was abolished on most of the steam railroads years ago, and the Metropolitan and Metropolitan District Railways, being old steam roads, have adhered to the "first" and "third" arrangement. The seats in the first-class cars are upholstered somewhat more luxuriously than those in the third class, and the outside is painted a different color so that the first-class cars can be recognized readily as they enter a station. On a six-car train on these two London lines the standard arrangement is to run two first-class and four third-class cars, the first-class cars being the second and fifth in the train, counting from either end. In a seven-car train there are three first-class cars, and they are placed in the second, fourth and sixth positions, counting from either end. The policy of the London company is to use moquette upholstery for all cars.

In Paris two classes of cars, first and second, are operated in all trains. They are of different exterior coloring so passengers can readily distinguish them when they arrive at a station and they are always in the same positions in the trains. The number of passengers paying first-class fares in Paris last year were 11.19 per cent of the total, though they contributed 16.29 per cent of the receipts. The standard trail car on the Paris Metropolitan line weighs 43,120 lb. and has a rated carrying capacity of 38 seated and 69 standing when used as first class and 38 seated and 72 standing when used as second class. An interior view of one of these cars is published. The motor car has slightly fewer seats because of the space occupied by the motorman's compartment. The



European rapid transit cars provide plenty of standing space. At left, Paris Metropolitan car; at right, latest type of London tube car

Digitized by Google



The London tubes are tubes in fact as well as in name. Larger diameters are used at junction and stations

proportion of higher-fare cars in a Paris train is always less than 50 and may be only 25.

In Hamburg and Berlin the rapid transit lines have only one class of fare. In Berlin it was the practice until recently to operate two classes of cars, but now those which formerly were the higher fare cars are used for smoking while the former lower fare cars are for non-smokers. Interior fittings are alike and all seats are being upholstered in imitation leather. Further particulars of these cars were given in last week's issue.

Noise Reduction Experiments in London

Of all the rapid transit lines abroad a greater study of the causes of noise reduction has been made by the London Underground Electric Railways than by any other. These studies were begun five or six years ago. Special attention was given to the conditions on the company's tube railways as, owing to their constricted section, only slightly larger than the car, it was thought the noise in them was somewhat greater than in the larger tunnels of the company, like the Metropolitan District Railway. The results of these early tests were published in this paper during 1924, particularly in the issues of Jan. 26, March 29 and Sept. 20.

Since the conclusions then reached were made public the company has had an experience of more than three years with various remedial measures. As some of the arrangements have been materially altered a review of the situation will be given, together with some particulars of the latest type of tube car, and comments on the relative amount of noise in operation of European surface cars as compared with those in the United States.

It is believed by the management of the London Underground Electric Railways that the principal noise produced by its trains comes from the motors, gears and wheels. The company's first efforts were to reduce the volume of noise. Later efforts, which have been directed to keeping the noise out of the cars, may be divided into two parts, namely (1) to retain the noise in the place where it is generated and (2) to keep it from entering the car.

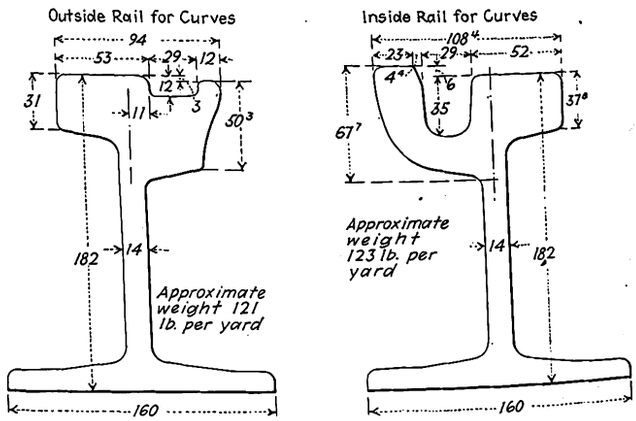
To gain the first mentioned object, i.e., to retain the noise at the point where it is generated, a sort of skirt was built around the truck. This skirt consisted of a screen made of ferrodo or composition board, carried as near the live rail as possible. While this gave fair results, it was looked upon as being somewhat of a fire risk. It was also inconvenient when an examination had to be made of the equipment. Moreover, it was found that much of the noise from beneath the car could be eliminated by better truck design. Hence, special attention has been given in the later types of trucks to see that they have fewer parts and better springs. The decision in regard to springs was reached after a moving picture had been taken of a truck while it was running at high speed. This picture showed that the truck proceeded by leaps and bounds. The more resilient springs in the present trucks are designed to reduce the length of these leaps and the reduction in parts to reduce the number of them which would rattle. It was found that even in the open a truck would be noisy if the springs were stiff.

A great deal of noise in trucks was found to come also from the gears, and some from the motor brushes. The remedy here, in the opinion of the engineers of the company, is better design and maintenance, particularly better maintenance.

The efforts made to reduce noise in car bodies were similar to those made with trucks, namely (1) to reduce the noise, (2) to keep it where it was generated and (3) to prevent it from entering the inside of the car.

In damping the noises on the car frame use was first made of air-cell or sheet asbestos. This was installed to a thickness of $\frac{3}{8}$ to $\frac{1}{2}$ in. between the inside and the outside car panels. Some of it was also put under the floor and some in the roof. In the form in which it was used, however, it was found to be hydroscopic, i.e., it absorbed moisture and tended to rust the metal parts against which it was placed.

An effort was then made to cover these parts, particularly the inside of the outer panel, with a film of lead to prevent rusting, but finally the use of sheet asbestos was abandoned for open mesh cotton scrim. It is believed that the use of this material, well cemented on the noise-producing or reflecting parts like the sash, panels, floor and ceiling, will stop their tendency to drum. This material also helps to hold the paint. It is attached with marine glue. In the flooring the scrim is placed under the wooden flooring and the wood is treated for fireproofing. In the latest cars the ceilings are non-metallic, so that it is not considered necessary to use this material there.



The Paris surface lines use a shallow groove for the outside rail of all curves up to 90-ft. radius. It reduces friction and noise from cars passing around curves

Digitized by Google

All cars built since 1923 up to last June, 444 in number, have been constructed in this way. The same protective measures have also been adopted for 100 cars of the District Railway, owned by the same company. In these cars the scrim is attached to the side sheathing. The company has also tried strips of asbestos fabric boiled in oil, so as not to be frictional, and attached to the foundation and hand brake rigging and a few other places where there might be a chatter.

Cutting off Entrance of Noise into Car

So much for noise reduction. The other recourse in the company's policy is to prevent the noise generated from getting into the car. If the passengers could be sealed within a car they would probably hear very little noise. This is impracticable. The next best plan is to reduce the amount of noise that gets in at the windows and elsewhere.

Originally the windows were arranged to drop, but it was found that passengers would keep them open unnecessarily. Now the sash is fixed, but above the main sash is a narrow sash, the width of the lower window, and hinged so as to swing inward. This sash is normally kept open and is found sufficient to give air as well as to keep out the rain when the car is outside the tunnel, but it is not large enough to admit as much noise as if the entire window was open. Another step to keep out the noise has been to make the window areas smaller and the glass in them thicker. A change was also made in the ventilators by arranging their passageways to be tortuous.

The company has constructed instruments for measuring noise, but while these instruments determine the volume of the noise produced, they cannot measure the irritating effect of the noise on the passengers, the degree of which, it is believed, depends not only on the volume, but to a considerable extent on the musical pitch of the noise. Thus, a note which compels persons to raise their voices while talking with others is tiresome, whereas a noise which does not require this would probably be less irksome to most persons. It has been found that in small tunnels there is more vibration and consequently more noise than in larger tunnels, like the District tunnel.

Little Noise from Surface Car Operation

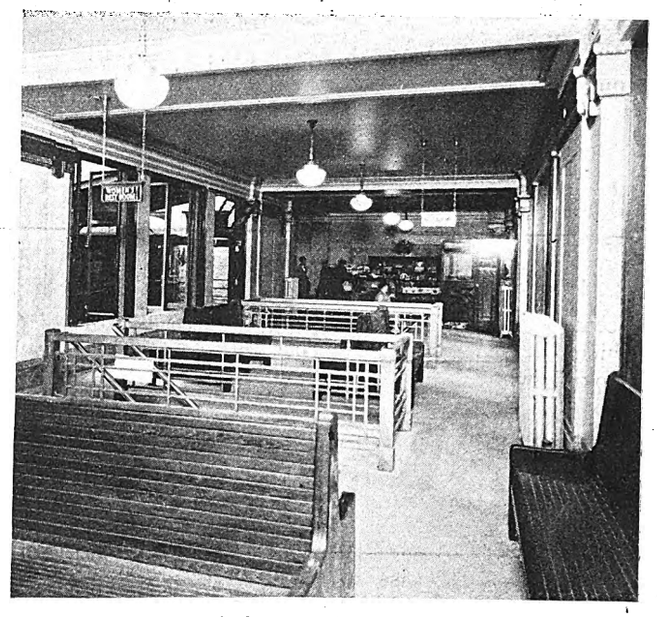
Outside of these experiments in London the European electric railways do not seem to have given any special attention to noise reduction. Nevertheless, the surface cars in Europe are noticeably less noisy in operation than those in the United States. This fact was noticed and commented on by the 1924 Committee on Foreign Operation of the American Electric Railway Association, whose report was published in the Electric Railway Journal for Sept. 20, 1924.

Among the reasons given by that committee for this condition are better maintenance of cars and track, slower speed of cars, use of wood in car construction, extended employment of fixed window sash and lower weight of cars. To these might be added the more common use in Europe of manganese flange-bearing special work, and in some cities the use of manganese flange-bearing rails for outsides of all curves up to 90 ft. This is the practice in Paris. Where such rails are not used a great deal of attention is usually given to greasing the sides of the rails in curves to prevent squealing and friction. This is the practice in Berlin.

Chicago's Wells Street Terminal Opened

WORK on the new $250,000 Wells Street terminal of the Chicago Rapid Transit Company was completed in time so that the station was officially opened on Aug. 1. It is now serving the thousands of west side and west suburban residents who daily enter and leave the Chicago Loop at that point. The new structure also provides a modern and spacious Loop terminal for the Chicago, Aurora & Elgin Railroad, serving the Fox River valley and other points west of Chicago.

On the first floor of the terminal is the main lobby, containing the Chicago, Aurora & Elgin Railroad ticket offices and baggage checking room, twenty telephone booths, rest rooms, a restaurant and a soda fountain concession. The second and third floors are "L" shaped, being constructed around the Chicago Rapid Transit Lines elevated structure. The north wing of the second floor includes a trainmen's room, with connection to the platform. Half of the east wing provides offices for the Chicago, Aurora & Elgin Railroad, while the other half contains a women's rest room and men's smoking room. On the third floor, which is reached either by elevator or stairway from the first floor, is a large waiting room. This room, located at platform level, gives access to all trains. Direct connections with the Rapid Transit Lines are made at the Quincy and Wells station of the Loop, which is reached by a glass-inclosed bridge extending over the sidewalk.



Entrance to station platforms and trains is from the third floor waiting room in the new Wells Street terminal of the Chicago Rapid Transit Company

Walls and columns of the new station are of pink Tennessee art marble, with bronze capitals and old ivory cornices and ceiling. The floors are of terrazzo. Ticket booths are finished in bronze. A feature of the station is a system of electric amplifiers through which trains are announced throughout all parts of the building. The front of the building is designed in terra cotta and the rear of the structure adjacent to the tracks and platforms is of old English mission brick. Architect A. U. Gerber designed the new terminal.

Cincinnati's business district as it is today

Co-ordination Essential for Rapid Transit in Cincinnati

ARTICLE II

This, the second and concluding article on the Beeler report to the city of Cincinnati, shows the traffic that can be developed by the rapid transit line with various plans for operation. Only if the line is co-ordinated with the existing transportation can a profit be obtained

LAST week's article on the report of the Beeler Organization on rapid transit facilities for Cincinnati showed that the unfinished line should be completed with minor modifications, but that it should be extended to Fountain Square on the downtown end and to Oakley on the outer end. Following this discussion the report continues to show how the traffic was estimated and the financial results calculated. The following article, largely an abstract of the report, completes the presentation of the plan recommended.

A number of interesting methods were used to determine the probable rapid transit traffic and the loading at the various stations. Based on the riding on the street railway and the local bus lines, 5,045,379 rides would be made annually directly on the rapid transit line, 18,868,442 with one transfer and 11,532,230 with two transfers, making a total of 35,446,051 annual riders. The daily loading is shown in the traffic charts.

Standard gage track, laid with 100-lb. rail on treated ties in ballast, was recommended, with a third rail at 600 volts d.c. for power supply. A complete signal system was considered essential, including interlocking switches and signal towers

The car recommended is 49 ft. 11 in. long and 10 ft. wide. The locations of the doors are such as to facilitate rapid interchange of passengers. The car should weigh about 26 tons. It will seat 50 or 52 passengers, have a comfortable loading capacity of 162 and a maximum capacity of 200. Each car will be equipped with two 100-hp. motors. The manufacturers state that

Recommendations for Cincinnati Transit Summarized

1. Merge all street railway and bus lines with rapid transit system.
2. Extend existing subway to Fountain Square.
3. Extend outer end to Oakley.
4. Construct street car line between Madisonville, Mariemont and Oakley station.
4. Relocate Ludlow station in vicinity of Knowlton's Corner.
6. Construct and operate nine stations only on rapid transit line, as designated.
7. Provide prepayment areas for transfer between surface and rapid transit at five stations designated.
8. Adhere to recommendations in report as to schedules, running time and headways to secure fast, frequent and regular service.
9. Secure C., H. & D. Railway as tenant to serve College Hill territory.
10. Follow the changes recommended for street car and bus lines to co-ordinate with rapid transit and obtain minimum fare.

Digitized by Google

this motor capacity is capable of hauling a maximum load of 40 tons at a maximum speed of 45 m.p.h. with an accelerating rate of 1½ m.p.h.p.s. under the conditions pertaining to this line.

The choice of car for Cincinnati lies between the single car with automatic couplers and the two-car articulated unit, since the density of traffic does not justify employing units of more than two-car capacity. The advantage of the articulated unit is chiefly that a given carrying capacity can be secured at lower first cost and the cost of operation is about 9 per cent less than that of equal capacity provided by single units. Its disadvantage is that the articulated unit, having twice the capacity of a single car unit, cannot be adjusted to fit traffic demands so closely as the single car. Because of the greater flexibility and the comparatively low requirements it was recommended that single cars operated in trains be used, although further developments and greater experience with the articulated unit between now and the time the cars will be needed in Cincinnati may justify its adoption at that time.

Eastern water level entrance to the Basin, the central district of Cincinnati

Determining Service Characteristics

Considerable attention was given to determining probable schedules. Intermediate running times were calculated between stations, with sufficient allowance for stops and for coasting to insure efficient operation. For the entire distance of 11.86 miles between Fountain Square and Oakley the total time estimated is 28 minutes. This includes 20-second stops at all stations except Fountain Square, giving an average speed between terminals of 25.4 m.p.h. A 30-second stop is allowed at Fountain Square and a layover of 6½ minutes at Oakley to take care of any unforeseen delays, afford time for changing ends, etc. On this basis each train will complete a round trip in 63 minutes.

A three-minute headway was decided on as meeting the demands for frequency of service. This headway would be maintained all day, except between midnight and 1 a.m. and between 5 and 6 a.m. No service is provided between 1 a.m. and 5 a.m., although it might later be found desirable to keep one train operating on a 60-minute headway during the owl hours. Saturday service is assumed to be the same as that for the other weekdays but it necessarily would have to be distributed somewhat differently.

The same number of trips will be operated on Sundays as on weekdays, but it is assumed that single cars will be operated until noon and two-car trains for the remainder of the day. With the proposed schedule it was found that a total of 7,445,684 car-miles will be operated annually, of which 6.3 per cent will be operated with one car, 56.9 per cent with two-car trains, 13.2 per cent with three-car trains and 23.6 per cent with four-car trains. The total car-hours corresponding to this would be 330,886 annually, allowing for pull-outs and pull-ins.

The number of train-hours shows that 390 hours 9 minutes would be operated on weekdays and 388 hours 9 minutes on Sundays and holidays, making a total of 142,286 train-hours annually. This figure represents the number of hours that a motorman and a conductor will actually be on duty on a train. Adding time for reporting and for pull-outs and pull-ins made by the regular

crews brings this up to 148,686 hours. This is practically the pay hours for motormen and conductors required to operate the system because with no extra trainmen required for rush-hour trips, this service being cared for by operating more cars in a train without added men, there should be little time to be paid for which does not represent active duty.

The maximum car requirements occur in the evening rush hours, when 21 four-car trains, or 84 cars, will be in service. As cars will be out of service at certain periods for repairing and general overhauling purposes it has been estimated that 90 single-car units should be purchased.

Time Saving Essential

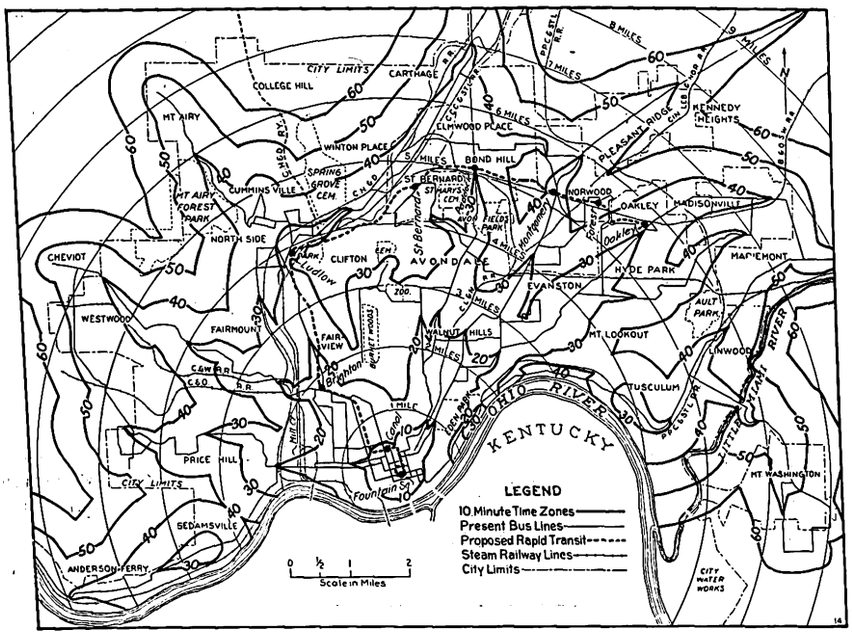
Since time saving is one of the essential benefits of rapid transit, three time maps were prepared to show the time from Fountain Square to all other parts of the city. Similar information is given in Table II. A very appreciable saving will be made in the time to reach all rapid transit stations as compared with existing facilities. Where a transfer to surface transportation lines must be made, the saving varies. The time for a trip by street car or bus now is little different until a point between the 20 and 30-minute zones is reached. Beyond the 30-minute zone the bus shows an appreciable saving if topographical conditions are favorable, although it should be remembered that the buses accomplish most of their time saving by running express and not accommodating local business.

The value of the time saved to riders who may use the rapid transit line is perhaps intangible. On an average each rider will save approximately 11.7 minutes each trip. This means that the rapid transit will save its patrons about 7,400,000 hours annually which they may use for work, rest or play. If time is worth 50 cents an hour the saving would mean some $3,700,000 per year to the citizens of Cincinnati.

Operation of the rapid transit system will be possible only provided all local transportation facilities are unified into one comprehensive system, and if there is a retention by the unified system of all riders now using cars and buses. Practically all lines, both street car and bus, will be affected. On some lines it will mean a slight change in load only, brought about by transfer of riders to the new high-speed line. In territory served directly by the rapid transit line 26 out of 40 car lines will be affected. Six of the nine company bus lines and twelve of the sixteen independent bus lines are likewise affected.

An analysis of the present service was made to determine the demand for transportation under the changed conditions. Three-fourths of the independent bus lines are now operating in what will be rapid transit territory. With the advent of rapid transit the field for these bus lines will be filled by it, as patrons will find it quicker than other means. An analysis of the business shows that 49.1 per cent are potential riders on the new line. The losses sustained by the bus lines will vary from 31 per cent to 100 per cent. With half of the bus business going to the rapid transit, operation of independent bus lines will no longer be justified or sufficiently remunerative to be continued. Some of the routes could be shortened and in that way continue to compete with the railway lines for the short-haul business. This would result either in wasteful duplication of service or drastic curtailment, either of which would be undesirable. Even if the independents could continue to operate, most of them would be of little value to the community served because they could not give their patrons the privilege of transferring to the rapid transit line, for at the outer ends of the lines their present traffic would find quicker service by the rapid transit line, while patrons along the inner sections of these lines would find little or no saving in time over street cars.

The present lines that will be affected by rapid transit and the pro-



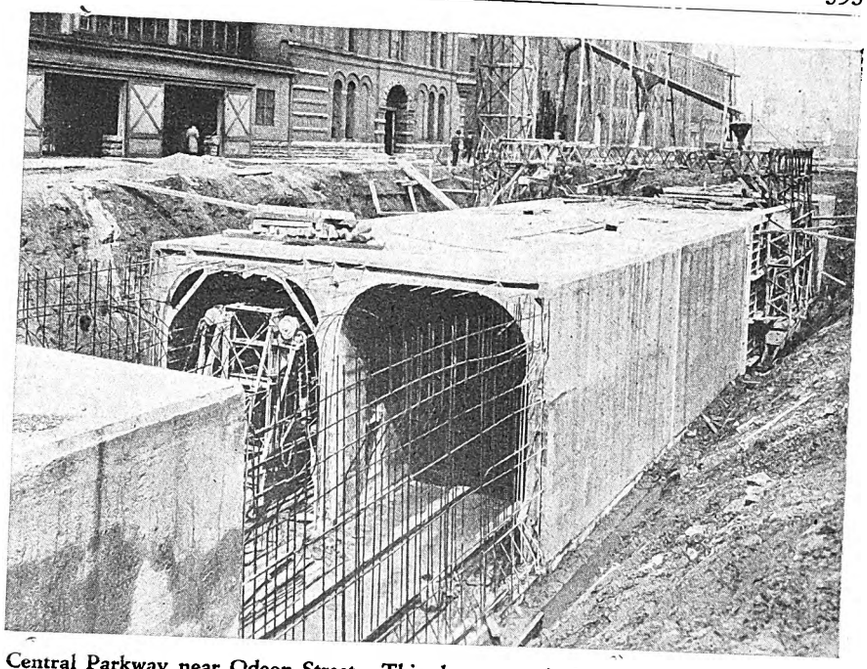
Time zones from Fountain Square using present bus lines

Digitized by Google

posed rearrangement are shown in two maps on page 596. Three car routes should be discontinued and two new ones added. Seven present car routes should be revised to fit in with the new conditions. Three railway bus routes should be discontinued. Two independent bus routes should be continued but modified, and five new bus routes should be established to feed into the rapid transit stations. Two other bus routes should be revised. Eleven independent bus routes should be discontinued entirely and the passengers cared for by new lines feeding into the rapid transit stations and by the present street railway lines. Two suburban bus lines should be shortened, their city terminals to be at rapid transit stations. The report devotes considerable space to the details of the various routes, and indicates the exact changes that should be made in each. A summary of the cars and buses required under the present and proposed arrangements is shown in Table I. There will be a maximum reduction of 32 street cars and 97 buses, while the rapid transit system will require a maximum of 84 cars, none of which will be on the street surface or in any way interfere with or be interfered with by street traffic. The result of this should be a marked improvement in street traffic conditions in which the balance of street railway system, its patrons and the public generally will participate. The saving in car and bus-miles, and the additional rapid transit car-miles, will be considerable. There will be a direct saving of 1,300,000 street car-miles and nearly 6,000,000 bus-miles with the addition of approximately 7,500,000 rapid transit miles. Some 300 fewer round trips by street cars into and out of the Basin, as well as some 1,300 fewer motor coach trips, will be made daily.

Under the rearrangement, operation will be discontinued over 11.37 miles of surface track. The cost of rehabilitation of this track would be from a minimum of about $166,000 to possibly twice that amount, which would have to be expended immediately. The value of the track must no doubt be amortized during the life of the franchise. It is estimated that the amortization charge would be approximately $14,000 annually.

Approximately 3.19 miles of new track must be built at a cost of $200,000. Assuming a 20-year life the annual amount required for renewal and retirement would be $10,000.



Central Parkway near Odeon Street. This shows a typical section of the subway line as constructed in the canal bed

TABLE II—COMPARATIVE RUNNING TIME AND DISTANCES VIA STREET CAR, MOTOR BUS AND RAPID TRANSIT LINE

Station	Running Time, Via: Street Car Min.	Motor Coach Min.	Rapid Transit Min.	Rapid Transit Sec.	Distance, Miles: Street Car	Motor Coach	Rapid Transit
Brighton	15	15	6	00	2.15	2.44	2.22

Present street car and bus lines affected by rapid transit line

Analyses of the savings to the street railway alone in surface operation according to the proposed plan show the summarized annual figures as given in Table III.

The net annual saving is applicable toward the payment of the operating expenses of the rapid transit line.

TABLE IV—ANNUAL OPERATING COST OF RAPID TRANSIT LINE ALONE

Maintenance of way and structures	$83,500
Maintenance of equipment	162,000
Power	247,500
Trainmen's wages	200,714
Other transportation	123,000
Injuries and damages	55,843
General and miscellaneous	40,000
Depreciation reserve	149,945
Total	$1,062,504

With the unified system and a discontinuance of excess competitive service 5,311,433 less miles would be operated annually by the independent buses, and this would be an additional economic saving to the community under the service-at-cost plan.

With the characteristics of the proposed rapid transit line determined, the estimate of the cost of operation given in Table IV was made.

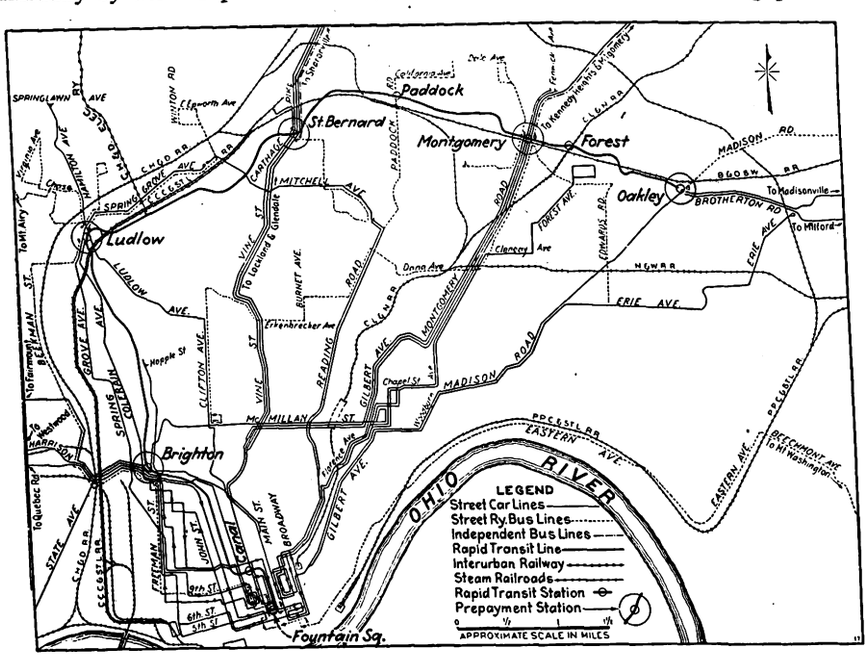
This estimate includes operating the rapid transit line, including train, station and signal service and a sufficient allowance to cover depreciation on all depreciable property. Taxes and fixed charges are not included.

The total estimated cost of completing the rapid transit line, including the extension to Fountain Square, the equipment, real estate and construction for prepayment stations, necessary track changes in connection with the prepayment areas, construction of surface feeder track, together with interest, insurance and contingencies during the construction period, is $10,606,960. Details are given in Table V on page 597.

Under any feasible plan of operation a rapid transit line cannot be made to pay from the start; neither can the true value of such an enterprise be determined solely from the financial results. To operate the rapid transit line independently would scarcely pay its operating expenses, to say nothing of interest and sinking fund charges. The number of passengers to be carried under present conditions would be but about 6,060,000 annually. The plan for unification of all the local facilities, street cars and buses, into one comprehensive system is the only practicable solution. Were this plan effective now some 38,000,000 riders would use the rapid transit line to advantage as they would save time in making at least a portion of the trip via the rapid transit line. These results can be expected only by adopting the unification plan in full. The service must be fast, frequent and regular.

Strong pressure will undoubtedly be brought to bear for the operation of the rapid transit stations which it is specified should be eliminated. Requests for other stations undoubtedly will be made. To make stops at the four stations eliminated would mean an increase of 4½ minutes in the running time from Fountain Square to Oakley, reducing the schedule speed between terminals from 25.4 to 21.9 m.p.h. Three extra trains would be added, the extra equipment alone costing $270,000. The time lost would destroy the usefulness of the line beyond Norwood and make the extension to Oakley impracticable. In addition there would be a loss of about 4,500,000 passengers annually who would not be attracted to the line.

Were it possible to make the rapid transit plan effective immediately, but with the independent buses continuing in operation, the operation of the unified system would result in a deficit of $845,723 annually, if financed

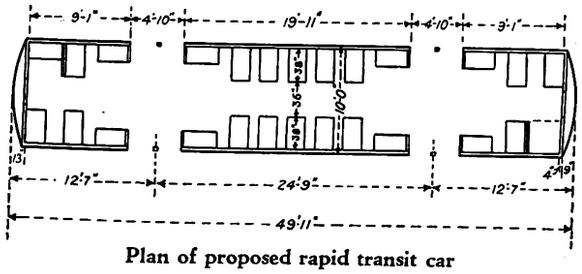


Proposed routing of street car and bus lines in conjunction with rapid transit line

Digitized by Google

by 50-year serial bonds. On the other hand, could the independent bus lines be merged with the unified system immediately $839,800 additional net revenue would accrue, exclusive of charges on the old rapid transit bonds. If it were possible to secure the new capital requirement under 50-year sinking fund bonds instead of 50-year serial bonds, the deficit of $5,923 would be transformed into a balance of $12,361.

The rapid transit line, however, cannot be put in service before 1930. In the meanwhile, the most important question to be answered is what will result from discontinunig independent bus operation. There is a large investment in the 84 buses of the several independent lines affected by rapid transit, which must be paid for by somebody, and instead of loading up the subway and surface systems with the cost of buying them it might be sounder economics to allow them to be operated for a reasonable time with a definite understanding between the city and the operators that the old equipment must not be replaced when it is worn out. On the basis of completely merging them in 1932, the estimate of Table VI on page 598 was prepared. It will be noted that while the revnue in 1930 is greater than now, operating expenses, taxes and fixed charges will have increased, the latter from $2,171,184 to $2,527,935, this change being due to the increase in the capital charges in the new financing of the street railway and restoring on

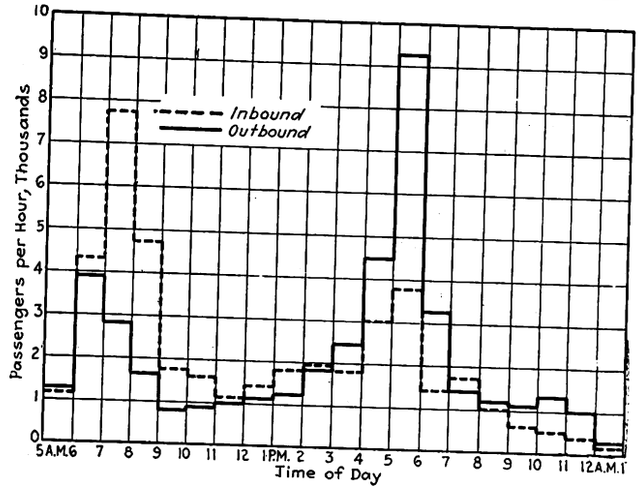


Plan of proposed rapid transit car

Nov. 1, 1928, the dividend rate on the capital stock which for three years was reduced from 6 to 5 per cent under the terms of the ordinance. Because of these factors and on account of the independent buses being yet in

TABLE V—COST OF COMPLETING RAPID TRANSIT PLAN

1.	Construction work, including station, of downtown extension from Central Parkway and Walnut to Fountain Square	$2,600,000
2.	Completing construction work excluesive of track and equipment between Central Parkway and Walnut and Oakley. This includes constructing stations at St. Bernard, Paddock Road, Montgomery Road, Forest Avenue and Madison Road, and completing and finishing stations excluesive of equipment at Race Street, Brighton and Ludlow	720,000
3.	Lighting system for stations and tunnels	125,000
4.	Complete equipment of all stations including heating system	275,000
5.	Complete fire protection for tunnels and stations	90,000
6.	Ventilating system for tunnels and stations	50,000
7.	Fencing right-of-way	10,000
8.	Construction of track with 100-lb. rail, creosoted ties and the necessary special work including cross-overs, yard and shop tracks	600,000
9.	Construction of third rail and bonding of track and third rail	330,000
10.	Complete signal system including interlock track switches, signal towers and automatic block signals	300,000
11.	Distribution systems	285,000
12.	Expense necessary to provide for car storage, yards, shop facilities, etc., on property of the Cincinnati Street Railway at Mitchell Avenue	100,000
13.	Passenger car equipment	2,025,000
14.	Service and work car equipment	100,000
15.	Real estate for prepayment stations	750,000
16.	Construction of prepayment stations including fixtures and track changes	500,000
17.	Relocating line at Knowlton's Corner including construction of roadway and station, right-of-way and damages	716,000
18.	Construction of surface line connection between Madisonville and Oakley	125,000
19.	Construction of surface track additions and changes recommended at Ivorydale and on Freeman Avenue	75,000
	Total	$9,776,000
20.	Interest, insurance and contingencies during construction at 8½ per cent	830,960
	Grand total	$10,606,960



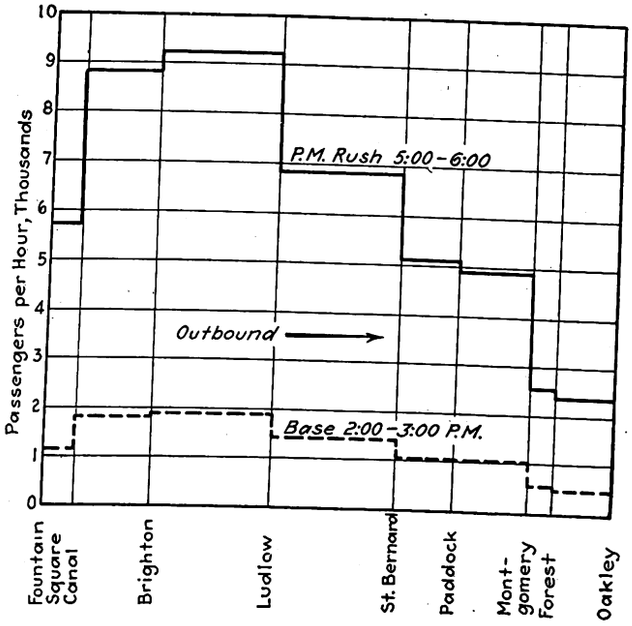
Hourly load demand at point of maximum traffic, rapid transit line

partial operation, a net deficit of $246,111 will result for the year 1930. In the future, as traffic expands more will be added to plant and equipment account, which will still further increase these charges.

As operations continue, more and more business will gravitate to the rapid transit line. The year 1932 at least should witness a complete cessation of independent bus operations. In that year there should be a balance of $136,704 from operation, which would be applicable to payment on the principal of the rapid transit debt. During 1933 a balance of $243,824 is shown, and this increases at the rate of approximately $120,000 per annum.

Alternate Plans Considered

Several alternative plans were considered. These include the operation of the rapid transit line independently and also with its own system of bus feeders, but without any connection with the street railways. Operation of the present subway without the extensions proposed was figured for each of the test combinations. In all six plans were prepared. The comparative results for 1930 are given in Table VII, page 598. Plan No. 1



Maximum load demands in afternoon rush outbound, rapid transit line. The inbound morning loads are quite similar

TABLE VI—ESTIMATED RESULTS OF FUTURE OPERATIONS UNIFIED SYSTEM SURFACE AND RAPID TRANSIT

	1930 (*b*)	1931 (*c*)	1932	1933	1934	1935
Revenue						
Combined surface and rapid transit	$9,544,185	$10,297,425	$10,844,000	$11,178,000	$11,511,000	$11,845,000
Operating expenses	6,666,000	7,160,000	7,480,000	7,666,000	7,827,000	7,995,000
Taxes	808,500	826,600	843,100	856,100	870,100	884,100
Net after taxes	2,069,685	2,310,825	2,520,900	2,661,900	2,813,900	2,965,900
Fixed charges						
Street railway	1,865,000	1,897,000	1,929,000	1,961,000	1,993,000	2,025,000
Net for rapid transit	204,685	413,825	591,900	700,900	820,900	940,900
Fixed charges						
Rapid transit (*a*)	662,935	670,858	678,003	685,202	692,186	698,932
Net after all charges (*a*)	(*d*)458,250	( )257,033	( )86,103	15,683	128,714	241,968
Deduct payment on principal of rapid transit bonds	212,139	217,473	222,807	228,141	233,475	238,809
Net after all charges exclusive of money applied to purchase of rapid transit system (*a*)	(*d*)246,111	( )39,560	136,704	243,824	362,189	480,777

(*a*) Includes interest and payment on principal under 50-year serial bonds to cover new capital necessary to complete rapid transit plan, but does not include fixed charges on old rapid transit investment of $6,100,000. (*b*) Assumed that independent buses will carry 7,500,000 passengers during year. (*c*) Assumed that independent buses will carry 2,500,000 passengers during year. (*d*) Deficit.

is the one adopted, and which has been discussed in detail in the report.

While requiring the greatest amount to complete, Plan No. 1, the one recommended, is in reality the cheapest. Its net deficit is less and it furnishes the most comprehensive and economical solution of the city's transit problem. Plan No. 2, without the extensions, but with unified operation, would show nearly twice the net deficit. If considering only the amount of money to complete the rapid transit line, Plan 3, which calls for independent operation without the extensions, requires only $4,386,330 additional capital. The cheapness is only apparent, as its operating expenses alone would exceed the revenue by 27 per cent. The net deficit would be even greater than that of Plan No. 1, which would carry ten times as many riders.

The deficits under plans No. 4 and No. 6 indicate clearly that if the rapid transit were to be operated as an independent line it would not support its own system of feeder lines to bring patrons to it under the present rate of car fare. A comparison of plans No. 1 and No. 2 with the others shows that the construction of the rapid transit extension to Fountain Square is well justified from a purely financial standpoint. It should also be remembered that the plan carrying most passengers will tend to improve its earning ability faster. The plan recommended, No. 1, will serve 66 per cent more people than any of the remaining five plans.

Since the Cincinnati Street Railway is operating under a service-at-cost franchise the people of the community have a direct interest in any matter influencing the business. For this reason the estimated results of operation of the various plans were carried out to determine the effect of each on the operations of the street railway. Any of the plans for independent operation of the subway would throw additional burdens on the street railway.

Some attention is given in the report to methods of financing the rapid transit project other than the issue by the city of bonds under its present financing arrangement. It is pointed out that property values in uptown Manhattan increased more than 100 per cent in seven years, due largely to the installation of a rapid transit line. More recent lines have caused even greater increases. For this reason attention is called to the plan recommended in Pittsburgh and approved at a referendum by the voters of Detroit.

Briefly, the plan approved in Detroit divides the cost for financing the project into (a) the cost of what is termed permanent way, which in general includes construction cost, and (b) the cost of equipping the systems, which, as the name implied, includes the cost of all equipment necessary to operate the system. The cost of the latter is the car rider's proportion of the total cost, and is collected by charging a fare that will pay the cost of operating the service and of fixed charges on the equipment. The cost of the former, i.e., construction cost, is apportioned between the benefited property owners and the general taxpayer, the former paying 75 per cent and the latter 25 per cent. As worked out in Detroit, the benefited property owners pay 51 per cent of the total cost, the car riders 32 per cent and the general taxpayer 17 per cent. Since in Cincinnati charges on the old rapid transit bonds are all being paid for by the general taxpayer, it is believed to be only fair and just to all concerned that at least a part of the new capital requirements be secured by a direct assessment on the benefited property owners, and it is suggested that careful consideration be given this method as a means of partially financing the rapid transit line.

Springfield and Worcester Companies

Introduce Latest Light-Weight City-Type Car

MARKED by special ceremonies in which civic and business organizations participated, an official demonstration trip was made in Springfield, Mass., Sept. 16, on two of the new one-man, two-man, double-end, light-weight, double-truck city-type cars which were part of the order of 50 cars placed by the Springfield Street Railway with the Wason Manufacturing Company last spring, as announced in the JOURNAL for March 26. A similar demonstration for the first of the 50 units ordered at the same time for service on the Worcester Consolidated Street Railway, at Worcester, Mass., was made on Aug. 9. As previously noted in the JOURNAL, the Osgood-Bradley Car Company furnished these units.

In Springfield C. V. Wood, president; W. L. Harwood, engineer of power and equipment; H. M. Flanders, general manager, and other officers of the company had as their guests the Mayor of Springfield and other city authorities, presidents of business clubs and representatives of business organizations. They boarded the cars at the starting point, Vernon and Broadway, shortly after 10 a.m. A trip was made on some of the railway lines, including a portion of the system where an extensive piece of track reconstruction work rapidly nearing com-

Digitized by Google

pletion. President Wood and some of the members of the party made a brief inspection of the work. From this point the cars returned to the center of the city, where the picture reproduced in this article was taken. The trip occupied approximately an hour and a half. There was every indication of the enjoyment and appreciation of the party of this progressive addition to Springfield transportation facilities. An hour after the trip one of the new cars was in operation on one of the principal streets in Springfield.

Twelve of the new cars had been delivered by Sept. 16. It is understood eighteen will have been turned over by the car builders by the end of last week and that the rate of delivery will be five a week until completion of the order. The car company is up to its schedule on delivery.

Worcester Also Staged Celebration

Prior to putting the first cars into service in Worcester the company took 30 invited guests, representing heads of city departments, the Mayor and Councilmen and business men of the city, for an hour's ride over the several routes. After the trip every one was enthusiastic and commented favorably on the riding qualities of the new car and the attention that the company and car builders had given to the minute details to make the units indicative of the attitude hoped for from the riding public. It is hoped that before the early part of October the entire order of 50 will have been completed. This, together with plans for rehabilitation of 100 of the latest type cars of the present fleet, will give Worcester nearly enough cars in good up-to-date condition to fill all wants, including rush-hour needs.

With the exception of certain details of equipment, which may be seen from the accompanying specification, the units for Worcester and Springfield are alike. The outward appearance of the cars is strikingly attractive. They are constructed along graceful and serviceable lines, and afford the public high visibility, a decidedly favorable feature brought out by the color scheme. Truck and platform supports are black, the body is light yellow, the belt rail red. Above the belt and body posts is cream, over windows and vestibule light yellow, and the roof is red. The cars are of the low-level type, easy to board, and have rear treadle-door exits. They have commodious aisles and comfortable upholstered leather seats.

At first glance of the interior, from the standpoint of the public, an impression is given of roominess, abundant light, both artificial and daylight, and good ventilating equipment. There are four Druid glass 94-watt dome lights placed along the center line of the arch roof. Metal sash windows that can be raised so as not to obstruct the passenger's vision are one of the notable features. Ventilators are arranged on each side of the center of the roof, and the flooring is of linoleum. The units have 44 seats each, including sixteen longitudinal, four on each side at the front and back of the car. The motorman's seat in the rear can be reversed to give an additional place for a patron in the rush hour. The electric heaters under car seats are thermostatically controlled, and the interior trim of the units is African mahogany. There are no handles on seat backs, nor are there curtains on the car body windows. Rico retrieving hand straps are installed over the longitudinal seats at the ends of the car for standees. All piping for door engines and switch boxes is concealed.

New Features in Door Control

Both units are equipped with treadle control doors and stationary steps; windows in front of the motorman are arranged to open out, and the top of the equipment cabinet on the motorman's platform is of aluminum. The four doors are of the two-panel folding type. Those at the right-hand front and left-hand rear corners are pneumatically controlled by engineer's valves operating light-weight door engines. Door engines are in flush-type panel boxes mounted over the top of the door. The

Seating plan and general dimensions of the Springfield, Mass., fifty units

The 50 units for Worcester are similar with the exception of a few major differences, among which are truck wheelbase, 5 ft. 6 in.; width over all, 8 ft. 5 1/4 in.; height of rail to trolley base, 11 ft. 2 in.

Official party on Springfield demonstration trip with two of the new light-weight city-type cars in the background. These cars are part of a 50-car order placed with the Wason Manufacturing Company

other two doors, although under the direct supervision of the motorman, are treadle-operated by means of an electro-pneumatic controlling and interlocking arrangement. In operation it is as follows: When used as a one-man car the right-hand rear door is hooked up so it can be treadle-operated after the brakes have been applied and the car operator has pressed the button on the top of the equipment cabinet. This is a new and unique feature of the treadle-operated doors. Pressing the button accomplishes two things—it draws the attention of the car operator to the rear door and it closes a circuit that interlocks the brakes with the rear door so that car cannot be moved until after the doors are closed. The seating of the brake interlocks in turn causes pneumatic switches to operate and to energize the treadle mechanism and hold the circuit on the brake interlock magnet. This circuit is not broken until the doors are closed, when the brakes can be released by means of the engineer's valve.

When the car becomes a two-man car, there is a separate switch or door control handle that permits the conductor to open the treadle door from the rear platform. Likewise, by the insertion of a key from the street, the door can be opened from outside and the rear entrance used for loading purposes by a street fare collector. The same thing can be done when operating pay-leave on outbound trips.

The company has issued an illustrated leaflet for distribution to the public in which the operation is described in a simple manner. The method of display followed for destination signs is worthy of mention. At the car end a side sign is cut into the letterboard over the window and the 10-in. route number sign displayed in the right-hand vestibule window presents

DETAIL SPECIFICATIONS OF THE SPRINGFIELD AND WORCESTER CARS

	Worcester	Springfield
Type of unit	One-man, two-man, city, double-end, double truck	Same
Number of seats	44	Same
Builder of car body	Osgood-Bradley Car Co.	Wason Mfg. Co.
Date of order	April, 1927	Same
Date of delivery	August, 1927	Same
Weight car body	35,300 lb.	36,000 lb.
Bolster centers	20 ft. 6 in.	Same

some interesting design refinements. Kranz safety device switches are included in the cabinet in the top of the motorman's platform.

On the Springfield cars the main motor resistance in the power circuit for operating the motors is the new type of ribbon wound on edge, cutting down the weight about three-quarters and space for locating it about one-half. Safety switches for the auxiliary control circuits, as lighting, heating, compressor control and buzzer circuits, have been installed, and are an innovation in Springfield cars. It is believed this is the first time a switch of this type has ever been put on any street car. It was made especially for these cars and is a development of a switch used on the experimental car that was conceived by President Wood and designed by W. L. Harwood, as stated in the JOURNAL of March 26.

Some of the major differences between the Springfield and the Worcester cars are that the former are equipped with Westinghouse motors, control, and air brakes, whereas the Worcester units have General Electric; trucks for Springfield are Brill and for Worcester Osgood-Bradley. For the purpose of comparison and to show the difference between the two units, the specifications released by the Osgood-Bradley company and the Wason company respectively are tabulated herewith.

The Readers' Forum

Experience with One-Man Cars Satisfactory

GENERAL ENGINEERING & MANAGEMENT CORPORATION

NEW YORK CITY, Sept. 22, 1927.

To the Editor:

We note on page 445 of your Sept. 10 issue an article reciting the objections that the Los Angeles Railway has to operating its system with one-man cars. This article is of particular interest to us in view of a story sent you recently reciting the experience of the Scranton Railway.

The interest charges mentioned in the Los Angeles story probably include interest on the conversion of the entire equipment, plus charges for installation of signals, etc., and is considered reasonable.

However, several points mentioned in objection to the proposed operation are of interest to the entire street railway industry, as they may, if not rebutted, work a hardship on many companies who may be confronted with them by commissions or governing bodies before which they appear in an effort to reduce their operating expenses by one-man operation.

It is not our intention to criticise any street railway company, as we know there are often peculiarities of operation of which the outsider has no knowledge, but we wish to go on record from our experience, as follows:

Cost of breaking in men has been negligible with us. We have usually figured an average of five days.

If only 5 per cent of the present force cannot qualify as one-man operators it still leaves a tremendous balance in favor of one-man operation.

The additional supervisory force may be needed in a large railway, but this has not been the case in any of the companies under our management.

The difficulty of the operator being obliged to stop and pull switches and plug them and then remove the plugs is not an operating condition with which we are familiar. Electric switches at important points relieve the operator of such an adventure, and in outlying sections spring switches can usually be relied upon.

The additional hazard at railroad crossings is one which we emphatically deny. The hazard is not so great as that encountered by the operator of a bus.

The delays in case of accidents are present owing to time lost getting names of witnesses, but blockades can be more expeditiously handled with one man in control.

The increased possibility of hold-ups may be serious in some sections of the country, but the probability of a hold-up man assaulting a conductor has not been one of our major problems.

The city ordinances in regard to fenders is probably a serious handicap. We have found, however, that most city officials are glad to co-operate with us and permit the use of an improved type of life guard, and about 450 railway companies are now using them.

The speed of operation, in our experience, has not been influenced by the number of men on the car. Traffic conditions have everywhere affected speeds where cars must travel through the heavily congested parts of a town, and there often is a decrease in speed when the one-man car is in no wise to blame. The Wisconsin Railroad Commission, after extended observation in the Milwaukee Electric Railway & Light Company case, states:

> We are convinced that the difference in actual running time between one-man cars and two-man cars is negligible and that the substitution of one-man cars for two-man cars will have no appreciable effect upon street traffic.
>
> We are satisfied that the one-man cars can be operated as safely as two-man cars. We have discussed this feature many times in other decisions and will not enlarge upon it here.

Similar decisions have been rendered by various other commissions.

C. G. KEEN,
Railway Engineer.

A Correction on Paris Wages

CORRECTION should be made in the table of wages paid motormen and conductors on the Paris Surface Lines, as published on page 354 of the issue of this paper for Aug. 27. The correct figures follow:

Period	Monthly Wages in Francs	American Equivalent—Monthly	American Equivalent—Yearly
First year	757	$30.28	$363.36
Next 1½ years	787	31.48	377.76
Next three years	807	32.28	387.36
Next three years	827	33.08	396.96
Next three years	857	34.28	411.36
Next three years	887	35.48	425.76

Note—Basis of exchange 1 franc = 4 cents.

Indiana Freight Business Expanding

THAT freight service on electric lines in Indiana is increasing is shown in the business being done by the Indiana Service Corporation at Fort Wayne. The depot is handling nearly 15,000 shipments a month. One month recently 997 cars were handled, 202 of which were through-bound cars. This depot is operated 24 hours a day except Sunday, with 32 men employed. The new station is located on High Street and was constructed at an approximate cost of $400,000.

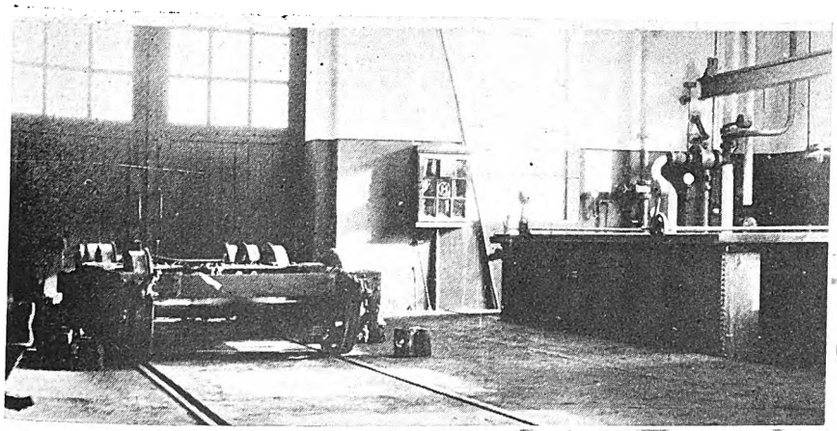
Maintenance Methods and Devices

Protecting Field Coil Leads from Iron Dust

CONSIDERABLE trouble was experienced at one time with short circuits in the field coils of the ventilated motors on some of the lines of the London Underground Electric Railway. The trouble occurred because iron dust from the brake shoes, rails and wheels would be drawn into the motors by the ventilating fans and would collect on the coils, where it was naturally very destructive to their insulation, particularly of the leads. Shellac was tried to overcome the difficulty, but did not prove very satisfactory as it would crack and flake, then the dust would get in. Short circuits of the kind described did not occur on the lines operating in the open or with the non-ventilated motors in tunnel service, but with the subway ventilated motors it presented a real problem.



Some of these pickling tanks are large enough to accommodate a complete side frame

Finally, the method was devised of protecting the exposed parts, like the field leads, with a paste made up of two parts of asbestos powder and one part of mica powder, which are mixed to the consistency of a paste by the use of gray enamel Megalac. This enamel is the material used in the Underground shops for coating the armatures. The paste is mixed with these three ingredients until it has about the consistency and appearance of putty. It is then held in by Empire cloth. Then tape is wound around the joint. This practice is not necessary with unventilated motors, where Empire cloth alone is enough protection.

The advantage of this insulating paste or putty is that it can go into service in a plastic condition.

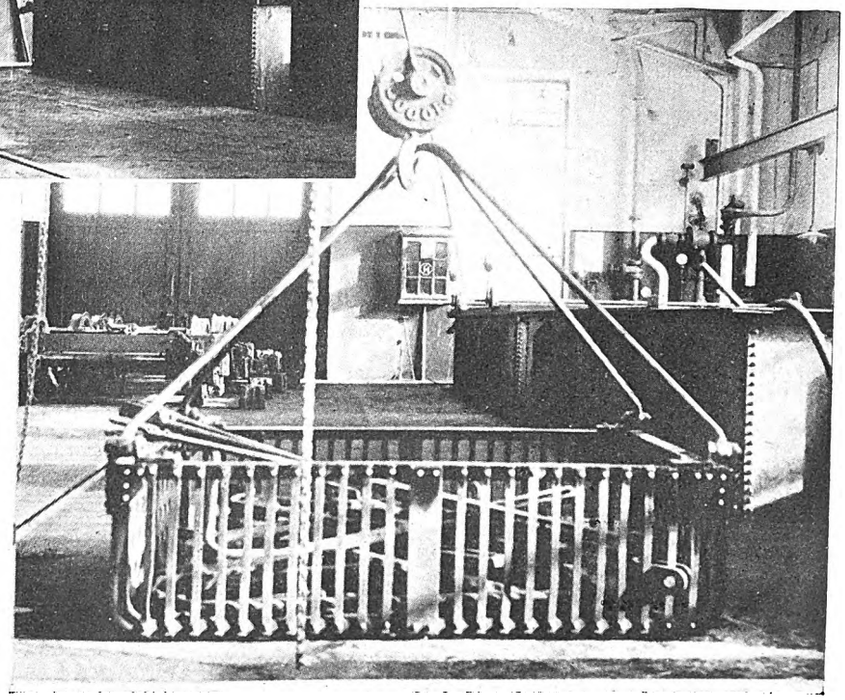
Cleansing Is Thorough in European Repair Shops

VERY thorough cleansing which truck and other parts receive when a car goes through overhauling at one of the repair shops is a feature of the repair shop practice of most of the European electric railways. It is not uncommon in this cleaning process to let these parts "pickle" in vats of soda or other chemical solutions or to be steamed to remove all paint, grease and other dirt before the car is put into service again.

Two of the accompanying illustrations show the tanks used for this purpose in the shops of the Hamburg Elevated Railway, Hamburg, Germany. The illustration at the left shows one of these tanks and the end of another. Each tank is large enough to take in an entire truck frame. These tanks are filled with a solution, kept warm by means of steam pipes, of which soda is the principal ingredient. In the lower part of this tank is a grating on which the truck frame rests, while the cleaning process is going on. This grating is given a rocking motion to agitate the liquid and so free the truck from grease and dirt more easily. The truck frames are left in this tank for a sufficient length of time so that they come out quite clean.

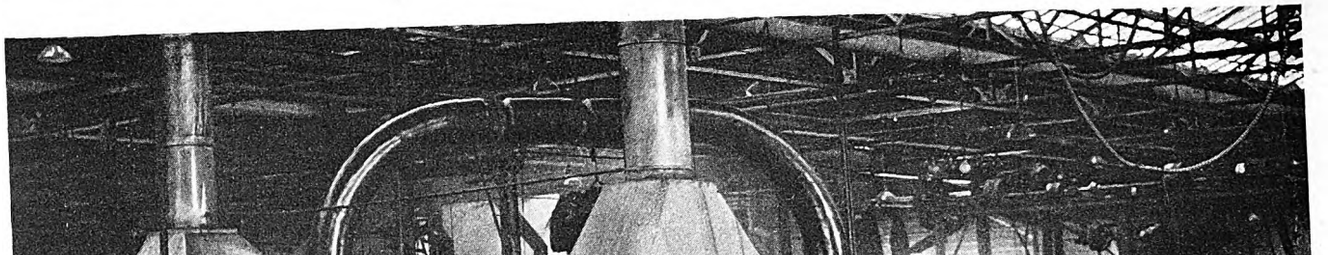
Small parts are put in the metal basket shown in the second illustration and are cleansed in the same way. Similar practice is followed in Berlin and other cities, and various cleansing fluids for this purpose are sold by dealers in chemicals. In Dortmund, Germany, where such a chemical cleaning tank is used, a pipe connection has been fitted near the bottom of the tank by which compressed air can be admitted to agitate the liquid.

In the repair shops of the London General Omnibus Company, prefer-



All metal parts of trucks receive a soda bath during overhauling at Hamburg

Digitized by Google



In London steaming is used for cleaning many of the large car and bus parts in the overhaul shop

ence is given to steaming. The third illustration shows the system used. The steam chamber shown is large enough to hold a pair of bus side frames. In this particular view a workman is welding the side frame before it enters its Turkish bath. Incidentally this process, like most others in the Chiswick repair shops of the London General Omnibus Company, is carried out on a moving belt conveyor. The motion is a continuous though a slow motion, and while the part, in this instance a bus frame, is on this conveyor the various necessary repairs are made by the workmen, who remain in the same place. The welding and steaming, shown in this particular illustration, are but two of the processes which this bus frame undergoes while it is on this moving platform.

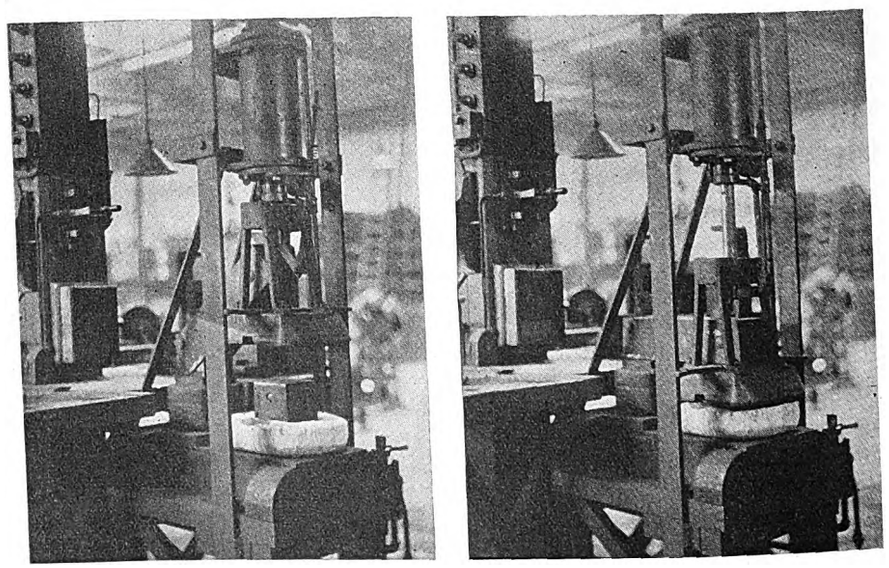
A bolt in the axle caps of the motor is worth two in the bushes along the roadbed.

Field Coils Tested Under Pressure

USE is made in the shops of the Portland Electric Power Company of an apparatus to test field coils for short and open circuits while they are subjected to a pressure similar to that which exists when the coil is bolted in position in the shell. An air cylinder and shoe compress the field coil while it is being subjected to the customary alternating current electrical test in an open transformer. The simplicity with which the apparatus operates is the outstanding feature.

The frame which carries the air cylinder is built up from the ground and supports, in addition to the air cylinder, the base and laminated section of the transformer. The top of the transformer core is hinged so that it may be raised by air pressure to permit the coil under test being slipped over the vertical leg. Also, connected to the piston of the cylinder is the ram, cut away to slip over the core of the transformer and exert pressure on the coil that is under test.

In operation, the coil is slipped over the exposed leg of the transformer core. Then air is admitted to the cylinder, lowering the head to the coil and at the same time bringing the top portion of the core in contact with the leg. This closes the magnetic circuit. With the coil under a pressure of approximately 2,000 lb., the primary coil of the transformer is connected to the a.c. circuit. The current is indicated on an ammeter. Shorts or open circuits in the coil under test result in abnormal or subnormal rating on the ammeter.



Testing field coils under pressure in Portland, Ore.

Apparatus used in Portland, Ore., to test field coils under service conditions. The air cylinder applies a pressure of approximately 2,000 lb. to the coil while it is in the magnetic field of an alternating current transformer. Variation in the current flowing through the primary coil of the transformer indicates shorts or open circuit in the coil under test. At left, open position. At right, closed position.

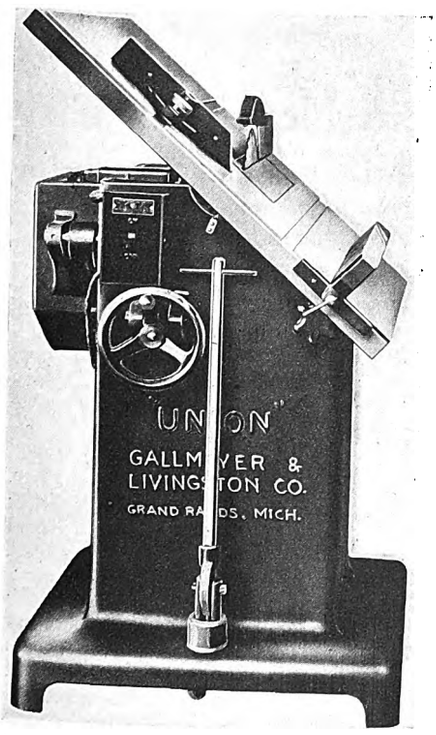
New Equipment Available

Electrically Driven Arbor Saw

GEARS and belts are eliminated in a new type direct-driven arbor saw placed on the market by the Gallmeyer & Livingstone Company, Grand Rapids, Mich. The machine has a 30-in.x3-in. table, machined and fitted with a removable throat plate to allow for the use of a dado head, grooving saws, etc. The table tilts up to 45 deg. and may be locked at any desired setting.

A dial with graduations and a pointer indicates the position of the table. A stop facilitates a quick and accurate return to the horizontal position. A cross-cut gage can be used on either side of the saw, two slots in



Portable direct-driven arbor saw

the table being arranged for this purpose. The gage can be set at any angle and clamped rigidly. Holes are provided for mounting an auxiliary wood face piece when such action is desirable.

The ripping gage is machined on both sides and can also be used on either side of the saw. Tightening of the lever head screw locks the ripping gage in position and lines it up automatically with the saw. A guard to protect the operator is placed over the saw and can be set for any thickness of stock. A splitter guard also keeps the stock from pinching the saw. The saw may be raised and lowered from flush with the table to high enough to cut 2½-in. stock.

The pedestal is a heavy one-piece casting fitted with two rollers at the back and two stationary feet at the front to give a firm foundation when in operation. When the handle is pulled forward in a position for moving the machine a cam lifts the feet from the floor automatically and brings the weight of the front of the machine on to a third roller, which is carried on a swivel bearing moving with the handle. This makes the machine portable.

Correct pressure on a brush holder spring hammer will avoid many a flashy and costly repair.

Extension for Spray Painting

FOR painting cars, ceilings and high, inaccessible places an extension for a spray painting gun has been developed by the Alexander Milburn Company, Baltimore, Md. It grips the standard Milburn gun, which while in use can be swiveled to any desired angle. The section is 8 ft. long and with the operator's reach will spray the paint to an approximate height of 14 ft. Other lengths of extensions will be furnished if desired.

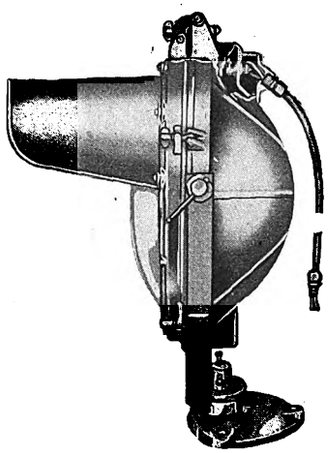
For painting within arms' length the gun is immediately detachable and can be used. A slight pull on the operating handle of the extension operates both the air and the levers on the spray gun simultaneously. The paint under pressure flows to the atomizing chamber, is expanded and driven into the pores of the surface to be covered.

Extension arm applied to paint spraying gun

The extension unit consists of the extension and standard type gun, pressure feed tank with the regulators, etc., 25 ft. of air hose, 25 ft. of paint hose and hose with connections to the compressor or pressure container. The extension is constructed ruggedly of strong tubing and has the gun and angle control close to the bottom for easy manipulation. It is light in weight, well balanced and can be handled easily.

Increased Efficiency in Floodlight Projector

BY IMPROVED design greater efficiency is obtained in a parabolic shaped reflector of 24 in. diameter just announced by the Crouse-Hines Company, Syracuse, N. Y. The reflector intercepts and redirects into the beam a greater portion of the lamp rays than has here-



Type LCE-24 floodlight projector with hood recommended for railway yard lighting

tofore been obtained. The case is made of special cast aluminum alloy to resist corrosive gases. It is practically airtight, the large radiating surface making the usual ventilators unnecessary. This feature prevents dust and dirt from getting into the case and collecting on the reflector. The door and the case are ground to fit so that no gasket is necessary.

By means of two simple adjustable stops the projecting case can be released from its position, tipped completely over or turned around for cleaning and lamp renewal and then returned to its original position. This makes it unnecessary to refocus the projector every time a lamp is renewed or the lens cleaned. This is especially convenient when the projectors are mounted on the edge of a tower, ledge or roof.

When used for railway yard lighting, the floodlight projector can be supplied with a 15-in. hood to throw the stray light beneath the tower. This also prevents soot from falling on the lens.

News of the Industry

Union Men Advertise Service at Their Own Expense

An appeal from the trainmen of the Tide Water Power Company at Wilmington, N. C., addressed to the general public in behalf of their employer's business, appeared recently in the Wilmington *Star* in the form of a large advertisement which accentuates the peaceful revolution taking place in the relation of employer and employee in the industry. The advertisement was written and paid for by the members of the Amalgamated Association, and occupied a space three columns wide by eight inches deep. It was as follows:

REQUEST

An Appeal from the City Lodge No. 708

The Members of the Amalgamated Association of Street and Electric Railway Employees of America, Division No. 708, of Wilmington, N. C., employed on the city and suburban cars of the Tide Water Power Company, is paying out to its employees in Wilmington

Every month more than $36,000. Every twelve months more than $432,000.

This money is largely spent in Wilmington as a big factor in keeping Wilmington going.

OUR APPEAL

Is to ride the cars which we are operating so as to enable the company to maintain schedules and operate more cars, thereby giving more men work and making a larger payroll for Wilmington.

We, the members of the Amalgamated Association, earnestly solicit your patronage as passengers on the cars which we operate and shipment of freight and express over our line. We are endeavoring to carry you safely and on schedule to and from your work or to your destination. We have an interest in our work and in serving you and we trust that you will help us and help Wilmington by riding the cars which we operate. This will increase the number of employees, therefore making the payroll in Wilmington larger by patronizing the transportation system of the Tide Water Power Company.

This advertisement is written and paid for by the members of the Amalgamated Association of Street and Electric Railway Employees of America, Division No. 708.

Safety-Conscious School Children in Atlanta

At the request of the superintendent of the Atlanta, Ga., public schools, the Georgia Power Company will this year detail several men to visit every school in the city and tell the children about safety methods.

Last year an official of the company conceived the idea of reducing accidents, particularly among children, by having two trainmen visit the different city schools and talk for a few minutes on safety. After a considerable argument the Board of Education was finally sold on the proposition and two trainmen, themselves the fathers of several children, were taken from their cars and detailed to the work of talking to the children in the city schools.

The two men visited the different schools and were given a few minutes at chapel exercises. So good an impression did these men make and so important did the school board consider the work that the superintendent wrote President Arkwright asking that he detail speakers to talk to the children every year.

In addition to lowering the number of accidents to children, which was the main object of the speaking campaign, the plan accomplished other and scarcely less important things. It showed the children and their parents that the street car company was something more than a "soul-less corporation" as had been pictured. It demonstrated that the company really had the safety of the children at heart. It got the attention of the children themselves and built up a kindly feeling for the company. And it taught them valuable safety habits for every-day use in riding on the street cars and crossing the streets of the city.

Officials of the company consider the expense of taking the speakers from the cars and filling their places with substitutes negligible compared with the splendid results obtained.

Recapture Advocated in New York City

Unification of transit lines with non-political control advocated by special counsel for Transit Commission—Cost put at $196,000,000—Surface lines ignored—Not all rapid transit lines involved

SAMUEL UNTERMYER, special counsel for the Transit Commission in its investigation of the New York transit situation, has rendered a report to that body in which a summary of the recent hearings is given and recommendations are made for a plan of transit unification. Many interesting exhibits are included to support the text and recommendations. The summary was made public on Sept. 26. It is not expected that the plan in detail, a book of several hundred pages, will be ready for distribution for another week or ten days.

Mr. Untermyer recommends the recapture of the lines of the New York Rapid Transit Company, subsidiary of the Brooklyn-Manhattan Transit Corporation, and the termination of the lease under Contract 4 between the city and the New York Rapid Transit Company on Dec. 31, 1928, and that notice should be served on the company by the city to that effect.

A similar notice of recapture and the termination of the lease between the Interborough Rapid Transit Company and the city and the termination of Contract 3 between that company and the city is recommended. But simultaneously with such notice to the Interborough Rapid Transit it is recommended that an offer be made to buy the Interborough Rapid Transit and its leased Manhattan Elevated property by the exchange of New York City bonds, aggregating $245,594,000, for the securities of the companies. The exchange of securities recommended is on the following basis:

$148,762,000	3½ per cent city bonds for I.R.T. outstanding 5 per cent mortgage bonds.
33,832,000	3¾ per cent city bonds for I.R.T. outstanding 7 per cent notes.
10,500,000	3 per cent bonds for I.R.T. outstanding 6 per cent notes.
10,500,000	3¾ per cent city bonds for I.R.T. stock at $30 a share (350,000).
42,000,000	3 per cent city bonds for Manhattan Railway Company's stock at $70 a share (600,000).

The city bonds would have a sinking fund attached which would retire them at maturity. In event such an exchange of securities materializes, it is recommended that at least that portion of the city bonds exchanged for company bonds and notes be exempted from the debt limit by securing an order of the Appellate Division of the Supreme Court of New York.

Legislation should be sought, according to Mr. Untermyer, granting to the commission and the city the right through the courts to condemn by the power of eminent domain such company property as may be required by the city to carry out a unification plan. Presumably this power might be used in connection with condemning the Sea Beach and Brighton lines of the Brooklyn-Manhattan Transit in case the city could not secure trackage rights over those lines.

In event the New York Rapid Transit Company does not notify the city 30

Digitized by Google

days after notice of recapture that it is willing to accept the terms of such recapture, it is recommended that the city begin a suit for a declaratory judgment to determine the right of the city to terminate Contract 4 and the amount payable by it to the company.

If the Interborough Rapid Transit does not accept the offer of purchase made by the city within two months after it has been authorized by the city, the latter should then continue its proceedings for the recapture of the recapturable portions of that property.

Board of Transit Control

Formation of a corporation with authority to lease from the city such transit lines as it may own or acquire is recommended. The corporation would have a nominal share capital, if any, and the right to issue bonds and other obligations. The board of directors would consist of nine members. The chairman of the Board of Transportation would be chairman of the board and a director. The comptroller of New York City would be a director and a third would be named by the mayor. The Real Estate Board of New York, Merchants Association of New York, Brooklyn Chamber of Commerce, Queensboro Chamber of Commerce and the Bronx Board of Trade and Bronx Chamber of Commerce, acting together, would each submit a nominee to the Transit Commission, which would in turn name such nominees as directors. The Borough of Richmond will have a representative on the board when the subways are extended there. The terms of directors will be from four to six years. Eight directors selected as above shall elect the ninth member. The mayor will be an ex officio member of the board without voting power. The ninth director elected as above described will be president of the corporation and must be an operating man of not less than ten years' experience. Directors will serve without compensation, excepting that $450 will be apportioned among them at each meeting of the board to the exclusion of the chairman, president and comptroller. Salaried officials will include the president, one or more vice-presidents and other minor officials.

This plan of control does not look toward municipal operation, says Mr. Untermyer. He recommends that the lease from the city of its constructed or acquired subways to the new corporation be for 25 years and that such subways be operated on a 5-cent fare "until and unless otherwise required by law."

Referendum Proposed

Mr. Untermyer suggests that the following proposal be submitted to a referendum vote:

Do you favor the repeal of the existing law so as to assure the continued maintenance of a 5-cent fare on the city-owned and operated transit lines as between the car riders, the taxpayers and the owners of the properties benefited, after all private interests in the properties have been eliminated, if it should hereafter appear that the maintenance of such fare yields and may continue to yield less than the cost of service, and that it will or may involve annual deficits that must be met by taxation.

The law referred to in the above-proposed referendum is that of 1924, which requires that the fare be readjusted upward if during the third year of municipal operation of a road the gross revenues are not sufficient to cover operating expenses, fixed charges and amortization costs.

Mr. Untermyer's report contains various exhibits tending to show that the new city system now being constructed when joined with the recapturable portions of the existing privately operated properties will make a self-supporting system on a 5-cent fare within a comparatively short time. He says:

If the new city subways are compelled to increase the fare to, say, 7 cents, will the existing rapid transit lines be likewise permitted to increase their fare and thus penalize 79 per cent of the car riders and incidentally add the huge sum of $44,000,000 a year to the revenues of the present privately owned companies? If not, how can the new city subways hope to get their share of the traffic or to relieve the existing congestion? . . . I do not for a moment admit that the new city subways when joined with the recapturable properties will not make a self-supporting system on a 5-cent fare within a comparatively few years. The proofs are to the contrary.

Surface Lines Would Not Be Included

Mr. Untermyer would exclude surface lines from the proposed unification of rapid transit lines because, among other reasons, they are losing money and "it would involve the impossible task of separate negotiations with each of the 43 companies included in the seventeen separate operating systems."

Representatives of the Brooklyn-Manhattan Transit Corporation are expected to contend in court that the city cannot recapture until ten years after the completion of the Nassau Street subway, construction of which has not yet been started, on the ground that its contract with the city gives it trackage rights which the city cannot furnish until the Nassau Street subway is built.

The B.-M. T. also will oppose condemnation of its Sea Beach and Brighton elevated lines, on the ground that such condemnation would be unconstitutional. It also will oppose legislation for condemnation, which Mr Untermyer has suggested.

The officials of the company also intend to appeal to popular sentiment, particularly in Brooklyn, against recapture of the B.-M. T. subway system, which they assert would result in a disruption of the present Brooklyn rapid transit service and leave many sections without transportation to midtown or uptown Manhattan without payment of an additional fare. Another argument which spokesmen of the B.-M. T. intend to use in an appeal for popular support against the plan is that the city cannot find the $196,600,000 needed for the recapture plan.

James L. Quackenbush, general counsel of the Interborough, said he did not care to discuss Mr. Untermyer's report.

John H. Delaney, chairman of the Board of Transportation, who is Mayor Walker's chief adviser on transit matters, approved the Untermyer report in principle, but said that there undoubtedly would be changes in minor details, as the plan suggested by Mr. Untermyer in his report was only tentative. In the presence of Daniel L. Ryan and Frank X. Sullivan, the other members of the board, who gave general acquiescence to his views, Mr. Delaney said:

There are three big points about the plan. It preserves the 5-cent fare, it assures public control and it eliminates stock speculation. The entire Board of Transportation is heartily in accord with the report in principle.

The city has not money enough within its debt limit right now to pay $196,000,000 for recapture, but it will take a year to work out the proposals and before they can be put into effect.

If the city decides to put the money into recapture of the lines, this will affect the debt limit only temporarily. The entire investment which private capital now has in the lines which it is sought to recapture is self-supporting. The returns which the railroads are securing are sufficient to carry the investments by the companies. We would be changing the form merely and it would throw no additional burden on the city.

We know that the B.-M.T. subway system is showing a profit to the company. So far as the Interborough is concerned, the earnings of its East Side and West Side subway lines are all thrown into one pot at present. If we decide to recapture the Interborough East Side subway, it would take a year to allocate the earnings of that system before we could go to the court to have the city's investment in that line exempted from the debt limit and demonstrate what its earnings were.

I am pretty well satisfied with the whole idea of the plan. I suggested this idea of a quasi-public service corporation a year ago in an address before the Municipal Club of Brooklyn. It is very gratifying to find that Mr. Untermyer has found a way out and has reached a solution without municipal operation.

We are not so much concerned with municipal operation as we are with getting away from private exploitation.

Chairman Recommends Careful Study of Report

Dwight W. Morrow, chairman of the committee formed to represent the bondholders at the time the financial structure of the Interborough Rapid Transit Company was readjusted, issued this statement on Sept. 28:

An informal meeting of the committee of Interborough bondholders was held today and there was discussed the report and recommendations of Mr. Untermyer, the special counsel to the Transit Commission, on the proposed plan of readjustment. It recognized that this report is preliminary in character, but the committee is of the opinion that the plan should be given careful consideration and that everything should be done by the representatives of the bondholders to aid the Transit Commission and its counsel in its efforts to work out the complicated task imposed upon the commission by the Legislature.

Mr. Morrow's statement was issued late in the day at the offices of J. P. Morgan & Company. J. P. Morgan is

Digitized by Google

the nominal head of the committee, but Mr. Morrow has acted as its chairman since the readjustment in the Interborough's affairs on May 1, 1922. The committee was formed to further the interests of owners of first and refunding 5 per cent bonds, of which $150,000,000 are outstanding, and of three-year secured convertible 7 per cent notes.

Meanwhile the Citizens Union has opened an attack on the proposed constitutional amendment, to be voted on in November, by which $300,000,000 of city bonds would be released from debt limit consideration and the money used for subway construction. The union utilized Mr. Untermyer's report as a basis for its attack. In part the statement read:

> The report of Mr. Samuel Untermyer to the Transit Commission throws a flood of light upon the real purpose of the constitutional amendment to increase the city's borrowing capacity, which is to be voted upon at the coming election.

The statement then quoted Mr. Untermyer's fifteenth recommendation, which was to the effect that everything possible should be done in order that public approval of the proposed amendment could be obtained.

Thrift Conspicuous in St. Louis

After the stockholders of the United Railways Savings & Loan Association, controlled by employees of the United Railways, St. Louis, Mo., had voted to increase the capital stock from $11,000,000 to $12,000,000 the board of directors declared a six months dividend of $114,000.

The association, formed twelve years ago with 126 members to encourage thrift and home owning, was authorized at the outset to issue capital stock for a gross value of $1,000,000. Today the association has 6,000 members and assets of $4,500,000. In August, 1927, the receipts of the association were $200,000 and loans $165,000.

Railway Exhibit in Rochester Includes Instructive Scenario

A film which features the New York State Railways exhibit at the annual Rochester, N. Y., Exposition shows how the present electric railway lines in the city follow the old Indian trails. This scenario was written by Leon R. Brown, editor of the *Transportation News*, house organ of the Rochester lines of the railways. The picture is part of the industrial course for public school pupils.

The railway's exhibit also graphically shows the toll in street accidents through carelessness of motorists and pedestrians by means of a film, in a trolley car, which is entitled "What the Motorman Sees." This depicts the many close calls the man at the controller experiences during the course of the day's work.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Oct. 3-7*—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

***Oct. 4* — American Automobile Association, Motor Bus Division, Cleveland, Ohio.**

***Oct. 18-21*—National Association of Railroad and Utilities Commissioners, thirty-ninth annual meeting, Baker Hotel, Dallas, Tex.**

***Oct. 26-27*—Public Utilities Association of West Virginia, annual convention, Parkersburg, W. Va.**

***Oct. 26-27*—Society Automotive Engineers, Transportation Section meeting, Hotel Sherman, Chicago, Ill.**

Ohio Safety Councils Will Hold Monster Meeting

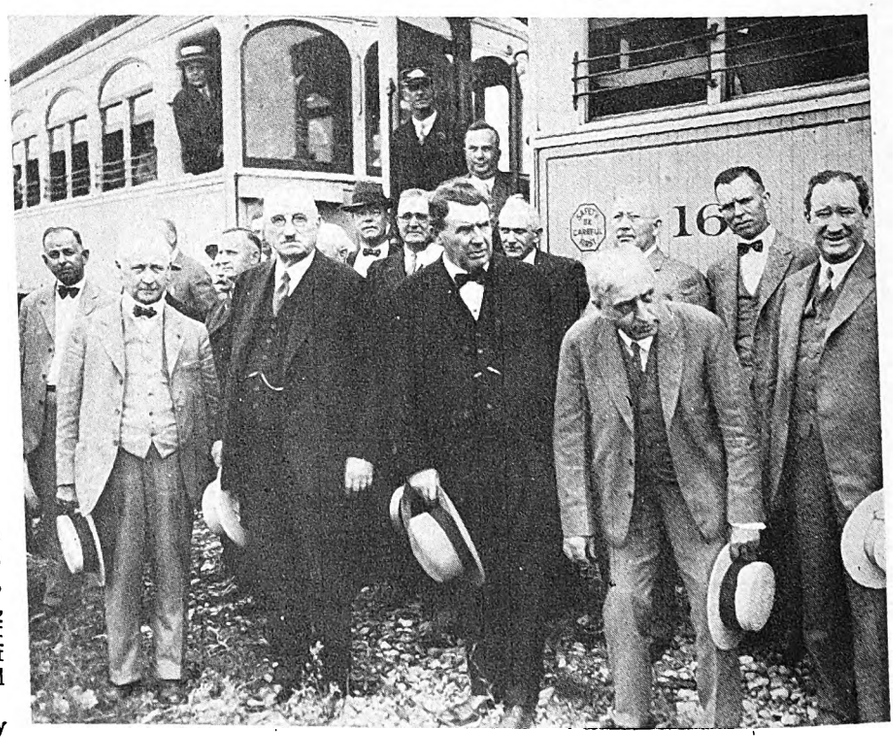
Representatives of utility companies, industrial plants and safety councils from all over Ohio will hold a two-day safety congress and exhibition in Columbus on Nov. 10 and 11.

There are about 200 plants and other companies in Ohio now doing safety work, with the result of a reduced rate to employers for claims amounting to $1,250,000. The congress and exhibition will show how this great saving was accomplished and the methods used in prevention of accidents.

Sick Employees of Pacific Electric to Have Added Comforts

The New California Lutheran Hospital of Los Angeles, Cal., is to be the official headquarters for afflicted employees of the Pacific Electric Railway. This new hospital to care for the sick and injured will have many improvements over the previous hospital facilities. Through negotiations concluded by Dr. Weber, chief surgeon of the medical department, and approved by Vice-President and General Manager Pontius, the $1,500,000 edifice will become available to all of those whose names appear on the official payrolls. It was announced that dependent family members of employees are to be granted a special rate in the two and four-bed wards at the low rate of $3.75 per day for hospitalization.

Dr. Weber's staff has been augmented in many ways so that at the present time practically every disease or injury can be cared for in an efficient and thorough manner. The scope of the medical department has been extended not only to the very numerous disorders and injuries to which human flesh is heir, but also to dental service.



Officials of New York State Railways and city of Rochester on inspection trip over new subway railroad in bed of abandoned Erie Canal. The cars were the first operated by electricity over the new line

Front row, left to right: Charles E. Ogden, secretary to the Mayor; Charles R. Barnes, City Commissioner of Railways; Mayor Martin B. O'Neil, John P. Morse, chairman of the Citizens' Committee on Subway Operation, and James F. Hamilton, president of the New York State Railways.

New Orleans Has 100 Per Cent Safety Day

For the first time in its history the New Orleans Public Service, Inc., New Orleans, La., established a 100 per cent transportation safety record on Sept. 20. During the 24 hours ending at midnight not a single accident was reported. In that period 399 cars were operated over 38,966 miles of tracks, 22 buses over a mileage of 2,866 and approximately 395,000 passengers were carried. New Orleans has a population of 425,000.

The nearest approach to the perfect record was made on several occasions when only two accidents were reported during an entire day. The term "accident" does not necessarily mean bodily injury, but covers all forms of complaints, where a report is required to the company.

New Services Planned in Maine Sections

The York Utilities Company, Sanford, Me., operating between Biddeford and Sanford via Kennebunk, discontinued service on Sept. 15. Service in Sanford over York tracks will be confined to a 5-mile route between Sanford and Springvale. The bus line from Sanford to Biddeford via Alfred will continue to operate, and also the Sanford-Springvale bus line. The company is also seeking approval of a petition to operate buses between Biddeford and Kennebunkport. Citizens of Sanford wish to have the electric railway operate between Sanford Square and Lion Hill for the benefit of mill employees. The Biddeford & Saco Street Railway is planning to use York Utilities rails in Biddeford between City Square and Proctor Road. It is the intention of the Biddeford & Saco company to lease the route from month to month. If the line proves profitable, a long-time lease will probably be negotiated.

Safety Work Expanding in West Virginia

The Monongahela West Penn Public Service Company, Fairmount, W. Va., which is extending its safety work throughout its territory, will hereafter devote at least one page of *Courtesy and Service*, its magazine, to news of the safety and accident prevention work. President Alexander and others are giving valuable suggestions and assistance to the safety director in co-ordinating the safety program with other activities of the company. At various places on the properties, such as carhouses, garages, power plants, substations, linemen's rooms, trainmen's rooms and shops, safety suggestion boxes have been installed. With these boxes will be provided pads for safety suggestions. This is an invitation to all employees of every department to submit suggestions which, in their opinion, will make for greater safety or eliminate hazardous conditions or practices now existing. Employees are urged to submit suggestions, every one of which, according to the statement of the company, will receive attention and, if worthy, will be put into effect. If it cannot be carried out the reasons why will be given to the one making the suggestion.

Hearings Begun on North Shore Rate Increase

Hearing of evidence on the application of the Chicago, North Shore & Milwaukee Railroad to the Interstate Commerce Commission for permission to increase rates for intrastate travel in Illinois and Wisconsin on a par with its interstate rates began in Chicago Sept. 21 before Examiner Hoy. L. E. Butler, assistant to the vice-president, testified that interstate rates on the North Shore line were recently increased to 3.6 cents a mile, while intrastate fares in Illinois and Wisconsin still remained at the 3-cent level. The proposed increase in rates, he explained, would not affect commutation tickets and was made necessary by the strong competition under which the road operated with steam lines.

Baltimore Riders Read About Iron Horse

In the Sept. 22 issue of *Trolley News*, the car pamphlet of the United Railways & Electric Company, Baltimore, Md., an interesting story is told entitled "The Fair of the Iron Horse," the pageant and exhibition of the Baltimore & Ohio Railroad, in commemoration of its hundredth birthday. When spread out the folder on one side is a map showing the car and bus line connections to the Fair Grounds.

Utility Subjects to Be Discussed Before Florida Students

Lecture courses in all of Florida's higher institutions of learning will be conducted this fall by speakers to be furnished by the Florida Public Utilities Information Bureau. The lectures delivered at the University of Florida were made following special invitations sent to the experts by the executives of the school. Lectures as planned by the committee, it was stated will be of much assistance to the students.

Col. Peter O. Knight, Tampa attorney, and John P. Ingle, manager of the Jacksonville Traction Company, recently lectured at the University of Florida. Robert J. Holly of Sanford is director of the bureau, Mr. Ingle is chairman of the executive committee.

For the past several years many lectures have been delivered by public utility experts in Florida before classes at the University of Florida, at Gainesville, and with the announcement of the committee's lecturing program, invitations for the speakers are expected to come from all the state institutions.

Further Efforts to Make Safety a Reality

White lines indicating how far the rear end of a street car will swing while making a curve are being painted on all downtown street intersections in Atlanta, Ga., by the Georgia Power Company. Motorists and pedestrians who stay clear of the line are out of the danger zone. Safety experts say that the lines will prevent a number of yearly street car accidents as well as speed up the cars, often delayed by traffic in turning corners.

New Franchise for Omaha to Be Submitted

Preliminary conferences between the members of the City Council of Omaha, Neb., and representatives of the bondholders and stockholders of the Omaha & Council Bluffs Street Railway have resulted in an agreement to submit a new franchise at a special election to be held on Jan. 10, 1928. As tentatively agreed upon the franchise will have a life of 30 years; it shall not be exclusive, but will give the Council the right to license buses and other forms of city transportation; it shall be subject to the exercise by the city of all future powers conferred upon it. It provides that the right to the use of the streets shall cease whenever the franchise terminates, and that city firemen and policemen and mail carriers in uniform and on duty be carried free. A proposal to retire half the bonds in twenty years was voted down.

Freight Service in Utah Authorized

The Bamberger Electric Railroad has been authorized by the Public Utilities Commission of Utah to operate a pickup and delivery freight service in less than carload lots at its terminals, Salt Lake City and Ogden. The application was protested by the Salt Lake-Ogden Transportation Company, an auto truck line, but the commission held that there was no good reason why such permission should not be granted if shippers desired this service.

Lower Fare Sought on Atlanta Line

A petition of patrons of the Oglethorpe University car line asking for a unit fare of 7 cents between Oglethorpe and Atlanta, Ga., instead of the present two-unit fare of 13 cents is being considered by the Georgia Public Service Commission. Attorney Charles M. Hutchinson, representing the petitioners, stated that the present fare of 7 cents from Atlanta to Buckhead and of 6 cents from Buckhead to Oglethorpe was exorbitant, discriminatory and out of line with prices charged on other systems. Preston S. Arkwright, president of the Georgia Power Company, appeared in opposition to the petition.

Recent Bus Developments

Rules in Favor of Indiana Buses

Interurban buses in Terre Haute, Ind., now may take on and discharge passengers on any street traversed by a railway despite the city ordinance against the practice. The judge in Superior Court recently granted a restraining order to that effect on application of Joseph H. Gregg and Andrew Carl, owners of the Blue & Gray Bus Line and the Hoosier Transportation Company. The Mayor and chief of police are especially directed not to enforce the city ordinance. This will, until further order of the court, stop arrests of bus drivers for picking up and discharging passengers along railway lines. Legality of the ordinance has been questioned in a petition filed with the Indiana Public Service Commission.

In this instance, both the car lines and the buses are being operated under certificates of convenience and necessity issued by the Indiana Public Service Commission. The avenues by which the buses reach the heart of the business district in Terre Haute and which are the nearest routes to this point are traversed by car lines. A similar situation prevails in several other Indiana cities. The order issued by the court is a temporary one, but will hold good until a final order on the petition for permanent injunction is issued. The court named no date for a further hearing of the case.

Line in Missouri Continued

The United Railways, St. Louis, Mo., has been granted a certificate of convenience and necessity for the continued operation of its bus line between Wellston and St. Charles, Mo., via Federal Highway No. 40. A permit was issued by the Missouri Public Service Commission, which now has jurisdiction over Missouri bus lines.

Roberto's Bus License Revoked in Boston

The bus license of Alphonso Roberto, owner of a bus line which operates between Revere and East Boston, has been revoked by the Massachusetts Department of Public Utilities because of violation of the terms. The commission finds that on Nov. 18, 1926, and on May 23 to 28 inclusive of this year Roberto on 49 instances took on a total of 210 passengers for hire at points where, under the terms of his license, he was not authorized to stop for that purpose. The commission also finds that he discharged passengers in violation of terms of his certificate.

This is the case which attracted considerable attention when it was given a public hearing, Roberto contending that despite the state rules and regulations a person has a constitutional right to get on and off a public bus wherever he pleases, and especially that he cannot be held prisoner in a bus when he desires to get out.

The restrictions had been placed in the certificate in conformity with the policy of protecting the electric railway, in this case the Boston Elevated, against unfair competition. This is the first time that the Public Utilities Department has revoked a bus license.

Buses on Old Jersey Car Route

The City Commission of Millville, N. J., has granted permission to the successor of the Millville Traction Company, Millville, N. J., to substitute buses for trolley cars on the Millville-Vineland route. The permit to operate buses extends to Dec. 31, 1930.

Bus Expansion in Lakewood

A hearing was held before the Public Service Commission on Sept. 22 on the petition of the Jamestown Street Railway, Jamestown, N. Y., to abandon its Lakewood railway line for buses operated by the Jamestown Motor Bus Transportation Company, its subsidiary. No opposition to the change was expressed, and it is expected that the commission will authorize the change.

The city's attorney, Ernest Cawcroft, declared that there was no objection on the part of the city provided there was assurance that the new service would be adequate to handle the traffic now handled by the railway. George L. Maltby, general manager, testified that an expenditude of $8,000 to $10,000 would be necessary to put the railway in good shape.

Buses on Utah Line

The Utah Light & Traction Company has been authorized by the Public Utilities Commission of Utah to discontinue service on its Murray-Midvale-Sandy line from the intersection in Murray of Second Avenue with State Street and to tear up its tracks on the line south of that intersection. As a substitute for street-car service on this line the company is to operate buses with the same frequency and at the same rates offered by its present railway service. Approximately 6 miles of street car track will be abandoned and superseded by bus service. This is the southern section of a line of about 14 miles which runs from Salt Lake City south to Murray, a community about 7 miles south of Salt Lake City, and thence south to the communities of Midvale and Sandy.

At the hearing the railway introduced evidence to the effect that the section of line which it seeks to abandon has been operated at a loss for several years.

Review of New Jersey Fares Refused

Chief Justice Gummere of New Jersey has denied an application by three municipalities and individuals in those municipalities for a writ of certiorari to review the decision of the Board of Public Utilities Commissioners readjusting bus and railway fare zones on the lines of the Public Service Transportation Company and the Public Service Railway.

However, the Chief Justice announced that, because of the importance of the case, he would permit the applicants to renew their plea before the Supreme Court *en banc* in Trenton in October if they wished.

The municipalities joining in the effort to have the decision reviewed were Irvington, Roselle Park, and Kenilworth.

At the offset, Chief Justice Gummere indicated that he could not see what standing the municipalities, as such, had in the case, holding that municipalities were created as governing bodies and that the case at point was not a governmental function. In the cases of the individuals joining in the application for the writ, he considered their interest small. He said:

> Nothing has been shown to me, the Chief Justice said, in ruling upon conclusion of argument by counsel for the municipalities, that the Public Utilities Commission, by its act, has authorized the Public Service to charge excessive rates. It hasn't been suggested that the rates are excessive.

In arguing for the writ, Mr. Stewart said the application for the review was based upon the fact that no evidence of valuation of the property used and useful in the service by the buses had been submitted to the board or found by it.

Coach Application Opposed by New York Companies

The Equitable Coach Company, to which the Board of Estimate recently awarded a bus franchise for Manhattan, Brooklyn and Queens, has been directed by Transit Commissioner Leon G. Godley to amend its application for a certificate of convenience and necessity by filing a plan for financing. The contention that the petition on which the hearing was held was defective because it did not contain such a plan had been made by Clarence J. Shearn, counsel for the Brooklyn-Manhattan Transit Corporation and subsidiary surface line companies. Godfrey Goldmark, counsel for the Equitable company, immediately filed an amended petition, which he had held in reserve.

The amended petition proposed as a method of financing the issuance of $4,000,000 of 6 per cent first mortgage bonds, $6,500,000 of 5½ per cent equipment trust certificate notes, 75,000 shares of preferred stock without par value but entitled to a dividend of $7 a share and 225,000 shares of common stock of no-par value. All of these securities are to be issued when designated by the commission, and the

Digitized by Google

entire financial plan is contingent on the commission's granting a certificate for all the routes specified in the franchise.

Mr. Shearn declared that millions of Brooklyn passengers yearly would be inconvenienced, because the Brooklyn surface lines would be affected severely if the application were granted and the Equitable company permitted to operate buses.

Mr. Shearn said that the Brooklyn surface lines carried 530,000,000 passengers each year. William Wallack, representing the New York Railways, declared that it was the duty of the commission to protect the surface lines as existing transit facilities, not through favoritism, but in the public interest.

The Union Bus Corporation objected to the granting of the certificates on two grounds. The first of these was that no statutory public hearing, as required by law, was held by the Board of Estimate before granting the Equitable company a franchise. The second was that the city had sustained a loss of $100,000 by awarding the franchise to the Equitable company, as the Union Bus Corporation offered the city a guaranteed minimum return of $500,000, as compared with $400,000 offered by the Equitable company.

Legal Point Raised Over Brockton Fair Bus Permit

A temporary bus line service to the Brockton Fair is being arranged by the Eastern Massachusetts Street Railway, Boston, Mass., under a license from the Brockton city authorities. An interesting point of law has arisen in this connection. Licenses issued by the city authorities are not revokable by the city, under Massachusetts law, and some opposition to confirmation is developing before the Public Utilities Department on the ground that it might mean that the railway could operate this line to the Brockton Fair grounds every year. The question has been assigned for a public hearing.

"Busmen, Don't Be Road Hogs"

In a letter to all officers, inspectors, chauffeurs and other employees of the County Transportation Company, the bulk of the stock of which is owned by the New York & Stamford Railway, and which operates a network of bus lines in Connecticut and the Long Island Sound section of Westchester, Leverett S. Miller, president, has laid down a code of courtesy.

In this code or pronouncement there is no place for "road hogs." Mr. Miller suggests practicing the rule of judgment tempered by recognition of the rights of others. He says that by encouraging the practice of common courtesy among drivers, public and private, the number of highway casualties in Westchester will be lessened and the lamentable condition existing in that section as elsewhere will be improved.

Financial *and* Corporate

Gary Railways to Issue $363,000 Common Stock

Authority to issue a total of $363,000, par value, of common stock was granted on Sept. 19 to the Gary Railways in an Indiana Public Service Commission order. The purpose of the new issue, as alleged in the company's petition, is to reimburse the treasury for money used in purchasing the common stock of the Shore Line Motor Coach Company, a supplementary motor coach system jointly controlled by the Gary Railways and the Chicago, South Shore & South Bend Railroad.

Massachusetts Railway in Plight

The Shelburne Falls & Colrain Street Railway, operating between Shelburne Falls and Colrain, in Massachusetts, the revenues of which have been greatly enhanced by freight transportation from the Griswoldville Manufacturing Company, has been notified by the latter that it will transport all its freight by means of motor trucks after Nov. 1. It is thought unlikely that the road will be able to continue after the loss of this substantial revenue. This line is 7 miles long. It was built 31 years ago and gives the industries in that section their only connection with railroad facilities by means of a cement bridge across the Deerfield River to connect with the Boston & Maine line.

Montreal Company Given Time Extension on Property Disposal

The City Council of Montreal, Canada, has adopted the report of the city executives favoring the extension of time to the Montreal Tramways to sell certain properties it possesses in several city wards. Delay in disposing of them was due to the state of the real estate market which has necessitated this further extension of two years to January, 1930. The contract with the city provided for disposal of land in various wards within five years.

Preferred Stock Offering in Richmond

An issue of $1,965,600 of 6 per cent cumulative preferred stock of the Virginia Electric & Power Company, Richmond, Va., was offered Sept. 19 at $97.50 a share and a yield of 6.15 per cent. The par value of the stock is $100 a share. The stock was issued to provide for extensions and improvements of equipment throughout the area served by the company in Virginia and North Carolinia.

Employees of the Virginia Electric & Power Company were given an opportunity to purchase the stock before it was placed on general sale. On the partial payment plan an initial payment of $7.50 was made on each share and the balance in nine months at $10 each. In Richmond, 2,000 more employees bought 400 more shares of the latest issue than they purchased of the issue of $1,500,000 brought out in December of last year.

Decrease in Boston Traffic in July

The cost of service of the Boston Elevated Railway, Boston, Mass., exceeded the revenue in July, 1927, by $353,208, against $393,028 in July, 1926. The number of revenue passengers carried was 26,167,466, compared with 27,160,300 for July, 1926. Total miles operated numbered 4,491,667, against 4,809,609 in July, 1926. These figures included bus-miles of 465,875 in July 1927 and 417,165 in July 1926.

President Baker Defends Fitchburg & Leominster Road

Charles S. Cummings, Boston, has filed a bill in equity in the Superior Court in Boston asking that a receiver be appointed for the Fitchburg & Leominster Street Railway or that the Boston Safe Deposit & Trust Company, trustee under the mortgage indenture, be ordered to take possession of the road for the bondholders. Mr. Cummings, as the owner of $5,000 of bonds of the company, declares the company has defaulted on interest payments and that it owes various banks $710,800 in unsecured notes. He wants the road enjoined from paying any more interest on the unsecured notes until the bondholders are paid in full.

Mr. Cummings alleges that the $300,000 of bonds, due on Feb. 1, 1921, were extended for five years at 7 per cent; that up to 1926 on this five-year extension the railway paid interest on the bonds and also paid $25,700 on secured debts and $231,686 on unsecured debts, a grand total of $315,886, or a sum more than sufficient to pay the bonds in full.

In 1926 the plan was adopted through action of a bondholders' and note holders' committee to extend these bonds another five years at a lower rate of interest. A new plan was made for handling the unsecured notes by which the noteholders would have their notes maturing each year. Under this plan no provision was made to establish a fund to pay off the bonds, it was claimed. Mr. Cummings charges that in the last eighteen months, holders of unsecured notes have received $14,216 in interest and that bondholders of the Leominster, Shirley & Ayer Street Railway have received $6,000 in interest. He complains that the note holders will have received $106,620 and that the holders

Digitized by Google

of the bonds of the Leominster, Shirley & Ayer Street Railway will have received $20,000 in interest to the damage of the Fitchburg & Leominster bondholders.

President Defends Action

When he was informed about the bill in equity Emerson W. Baker, president of the railway, said that the company's property is perfectly protected by the so-called "after acquired" clauses in the trust mortgage. He said:

All that Mr. Cummings wants, apparently, is to get paid par value for his bonds right now and to let the hest wait until the end of the reorganization period. Our hope and endeavor is to improve the property and so improve the condition of the bonds. It is now far better than when we took hold of it on Oct. 21, 1926.

Mr. Cummings is in error when he alleges the property is no better off than it was before. The rolling stock and other equipment are far better than ever before. The amusement park has been rebuilt, much work has been done on tracks and three rotary converters have been installed. Take, for instance, the bus terminal. It has been repaired and a heating plant put in.

As a matter of fact, the bonds are hard to get. Those who hold them now seem to be well satisfied with the progress made and are very reluctant to part with them.

The remark by Mr. Cummings about interest is misleading. All he would have to do to get the interest on his bonds would be to present them at the Boston Safe Deposit & Trust Company. It has awaited since 1926 at 5 per cent. This is one-half per cent more than the rate originally issued. His declaration of 7 per cent I cannot understand, inasmuch as that rate operated from 1921 to 1926 and ended then.

Mr. Cummings' prayer relating to payment of sums to unsecured creditors I would answer by saying we have not paid out anything since Feb. 1, 1927, and are not planning to pay anything now. I do not see how anything would be gained by a trustee or receivership. We are operating at a profit so far as revenue and expenses are concerned. For the six months ended July, 1926, there was a loss of $20,000, but for the six months ended July, 1927, we made $26,000, a change of about $46,000 for the better.

This does not mean that the company is prosperous. It merely means we are operating at a profit and expect to pay out of our current income for all new equipment over a period of years. We do not expect ever to pay more than a small percentage by way of compromise with the noteholders and very old unsecured creditors. In other words, the capital structure ultimately will have to be greatly reduced, but this has no present effect on the quality of service rendered.

Court Disallows Contention

The Charles S. Cummings bill, heard in equity session recently at Boston, Mass., was denied by Judge Marcus Morton on the grounds that there was no dispute as to facts in the case and that whatever question in law might be raised it would not justify the court in issuing an injunction to prevent payment of interest. Such a move would it was brought out, prevent the proper and successful negotiation of plans for the betterments of the company to the general advantage of the public.

Deficit in Indianapolis in 1926

The net earnings of the Indianapolis Street Railway, Indianapolis, Ind., for the year ended Dec. 31, 1926, less taxes, were $880,575, against $1,116,924 for the year previous. After all deductions there was a deficit of $203,514. This compares with a balance in 1925, after all deductions, of $41,175.

An extensive improvement program was carried out by the company. This included track and paving work, the installation of temporary cross-overs, replacements, renewals and the relocations of loop track. Five new substations are now well under way. Power is to be supplied by the Indiana Electric Corporation, at a material reduction, and the operation of cars greatly improved.

The company is at present operating 33 buses, fifteen of which are used on nine feeder lines. The service, while greatly accommodating the public and protecting the company from further inroads of competing bus lines, has lacked patronage and resulted in a net loss from operation, including depreciation, of $203,507 for the year 1926. In addition to the general news on the company's bus activities the report refers to the proposed merger of the Peoples Motor Coach Company and the Indianapolis Street Railway.

During the past year the company purchased 370 Johnson registering fare boxes and 1,000,000 tokens at an expense of $31,105. The token system was started on Jan. 1, 1927. By this the company hopes to eliminate the expense of printing tickets and other expenses in the counting room. Beside 59 one-man cars are now in operation in Indianapolis, resulting in a saving in operating cost. More cars are to be converted into the one-man operating type during the year 1927.

The board of directors was unable, according to the report, to declare dividends on the Indianapolis Street Railway preferred stock during the year 1926 on account of decreased earnings, due principally to the constantly increasing use of privately owned automobiles and to serious loss from bus competition.

During the year 1926 there was paid to employees and beneficiaries of the Pension Fund and Benefit Association $29,000, of which sum the company contributed $5,000. These two associations since their organization have disbursed nearly $200,000 as subsidies for the sick and surviving members of families of deceased members.

INCOME ACCOUNT OF THE INDIANAPOLIS STREET RAILWAY

For Year Ended Dec. 31, 1926

Gross Earnings:	
Passenger receipts—city lines	$4,425,529
Transfer receipts—city lines	310,866
Track rentals interurban passenger cars	105,994
Track rentals interurban freight cars	53,238
Chartered cars	736
Advertising	30,600
Dog permits	1,151
Rent of land and buildings miscellaneous	27,417
Rent of terminal building and stations	247,467
Sale of power	6,126
Rent of equipment	1,315
Miscellaneous income	2
Receipts, Broad Ripple Line	86,689
Bus receipts	214,703
Interest, discount	6,954
Total	$5,518,794
Operating Expenses:	
Maintenance of way and structures	$610,914
Maintenance of equipment	502,982
Special maintenance per order of Public Service Commission of Indiana	
Operation of power plant	756,813
Operation of cars and buses	2,028,500
General expenses	444,135
Total	$4,343,346
Net earnings	$1,175,447
Less taxes	294,872
Total net earnings, less taxes	$880,575
Deductions:—Bond Interest	
Interest on $4,000,000 Citizens Street Railroad 5's	$200,000
Interest on $4,547,000 Indianapolis Street Railway 4's	183,484
Interest on $3,570,000 Indianapolis Traction & Terminal Company's 5's	178,663
Interest on $285,000 Broad Ripple Traction Company's 5's	12,361
Interest on trust equipment notes	2,684
Interest on Indianapolis car equipment company preferred stock	4,250
Interest on notes	49,497
Total deductions	$630,939
Surplus (exclusive of accrued depreciation)	$249,635
Deductions from surplus:	
Indianapolis Street Railway sinking fund	$80,000
Indianapolis Traction & Terminal Company sinking fund	73,150
Dividends unpaid on $5,000,000 preferred stock 1926	300,000
Total deductions	$453,150
Balance (deficit)	$203,514

COMPARATIVE OPERATING STATEMENT OF THE INDIANAPOLIS STREET RAILWAY

	1926	1925
Earnings:		
Passenger receipts—City lines	$4,425,529	$4,754,227
Transfer receipts—City lines	310,866	176,492
Miscellaneous earnings — Track rentals	782,398	605,649
Gross earnings	$5,518,794	$5,536,369
Maintenance of way and structures	$610,914	$631,678
Maintenance of equipment	502,982	517,988
Special maintenance expended from revenue from increased fares by order of Public Service Commission		20,708
Total maintenance	$1,113,896	$1,170,375
Operation of power plant	$756,813	$734,466
Operation of cars	2,028,500	1,682,517
General expenses	444,135	445,462
Total operation expenses	$4,343,346	$4,032,821
Net earnings	$1,175,447	$1,503,548
Less taxes	294,872	386,624
Net earnings, less taxes	$880,575	$1,116,924

Railway Net of Northern States Power Shows Improvement

The gross earnings of the street railway department of the Northern States Power Company for the year ended Dec. 31, 1926, were $268,704, representing 0.95 per cent of the total gross. In 1925 the gross earnings were $277,578. Net earnings in 1926 showed a loss of $30,654 against a loss of $61,858 for the year previous. This company, controlled by the Northern States Power Company of Delaware, a Byllesby property, operates 16 miles of line connecting Fargo, N. D., and Moorhead and Dilworth, Minn.

Digitized by Google

Evanston Railway Asks Authority for Refunding Issue

Application for authority to issue $15,000, par value, of general mortgage bonds was made to the Illinois Commerce Commission on Sept. 14 by the Evanston Railway, Evanston, Ill. The company's petition states that the new bonds are to be issued in lieu of first mortgage bonds in the amount of $15,000 recently paid and canceled.

Fight Over Goshen, Ind., Discontinuance

A recent ruling by Judge Thomas Slick in the federal court at South Bend, Ind., granted permission to R. R. Smith, receiver of the Chicago, South Bend & Northern Indiana Railway, to discontinue service in Goshen. The receiver cited the constant decrease in revenue in Goshen for several years as the reason for the discontinuance. The City Council, however, will oppose the court ruling because of a finding clause in the franchise. The legality of the franchise likely will come before the courts.

Partial Discontinuance in Syracuse Allowed

The Public Service Commission granted on Sept. 23 the petition of The New York State Railways for permission to discontinue service on its Green Street line in Syracuse. It was established at the hearing that the line was operated at a loss and that there were other means of public transportation available to the patrons. Commissioner Brewster in his memorandum accompanying the order said that the loss to the petitioner through this operation exceeded its income therefrom by more than 50 per cent and further that no real public necessity demanded the continuance of service.

A. G. & E. Properties Under New Owners

The American Electric Power Corporation, of Delaware, which now owns all the voting stock of the Pennsylvania Gas & Electric Corporation, has purchased the American Gas & Electric Company's controlling interest in the stock of American Electric Power Company, which owns control of utility properties in and near Wilmington, Del., and Springfield and Dayton, Ohio. The purchase of this holding company stock in no way anticipates any change in the local management of the subsidiary properties except that they will come under the general management and supervision of Stevens & Wood, Inc., New York, a corporation that for many years has operated extensive public utility properties in Ohio, Pennsylvania, New York, Virginia, District of Columbia and North and South Carolina.

Transportation service will be furnished to and about Wilmington, Del., and Media and Chester, Pa., and to Springfield and Dayton, Ohio, by the Peoples Railway of Dayton, Ohio, the Wilmington & Philadelphia Traction Company, Wilmington, Del., and the Springfield Railway, Springfield, Ohio.

Eight Months Net of Eastern Massachusetts $546,377

Net income of the Eastern Massachusetts Street Railway, Boston, Mass., after all charges for the month of August, was $42,409, compared with $38,433 a year ago. Gross operating revenues for the month were $744,925, against $757,134, and income after taxes was $223,167, compared with $222,656. For the eight months period ended August, 1927, the net income after all charges was $546,377, compared with $530,067. Gross operating revenues for this period were $6,326,620, against $6,373,659, and income after taxes was $2,309,846, compared with $2,316,886.

Balance Higher in Reading

For the year ended July 31, 1927, the operating revenue of the Reading Transit Company and subsidiary companies, Reading, Pa., was $2,935,181, against $2,981,253 for the period ended July 31, 1926. Operating expenses and taxes, excluding depreciation and maintenance, decreased from $1,715,145 to $1,619,880 for the 1927 period. Total deductions from income left a net income of $210,073 in 1927 and $159,560 in 1926. After the provision for dividend on preferred stock the balance of net income was $90,928 against $40,415 for the year ended July 31, 1926.

Kaw Valley Sale Confirmed

The sale of the Kansas City, Kaw Valley, & Western Railway, Kansas City, Mo., was confirmed on Sept. 14 by Judge John C. Pollock of the federal court in Denver. The sale was made to a group headed by Jo Zach Miller, Jr., 1001 Commerce Building, Kansas City, and George W. York, Cleveland. The sale price was $300,000. Mr. Miller is president and Mr. York vice-president of the new company. The line has been in receivership several years. It operates between Kansas City and Lawrence, Kan.

Second Avenue Railroad, New York, Sold

On behalf of the preferred certificate holders' committee Arthur W. Hutchins has bought for $500,000 all the tangible assets of the Second Avenue Railroad, New York. The sale was made at public auction conducted by Joseph P. Day, who announced that the sale was subject to the confirmation of the Supreme Court. The assets comprise the real estate, franchises, trackage, agreements and contracts. The real estate included the entire block on First and Second Avenues between 96th and 97th Streets.

An action started on behalf of George E. Warren and others against the Second Avenue Railroad brought about the sale, which was directed by a judgment of the Supreme Court of New York County and under the direction of John C. Clarke, referee.

The assets were purchased provisionally and subject to the confirmation of the Transit Commission's acceptance of the reorganization plan adopted by the certificate holders' committee.

Improvement in Revenue from Omaha Property

The report of the Omaha & Council Bluffs Street Railway, Omaha, Neb., for the month of August, filed with the Nebraska Railway Commission, continues to show a steady decrease in traffic exceeding 3 per cent, compared with the month of August, 1926, but the financial results of operation are better. Revenue for the month was $216,093, a decrease of $9,000 over August, 1926, but operating costs were cut $14,000, to $166,173. The net after payment of taxes was $26,744, and as interest charges are $37,479 a month, the deficit was $11,412, compared with $20,611 for August a year ago.

Attractive Railway Securities Await the Knowing Investor

The fact that progressiveness is permeating most of the electric railway industry and that in view of this condition opportunities abound among its securities was emphasized by Clarence V. Price, of Price and Company, in an article in a recent issue of the *Financial World*. As proof of this spirit of progress he cites arguments such as trained men, light-weight and one-man cars, weekly tickets, bargain rides and many other features of modern merchandising methods whereby service is really sold to prospective riders. In addition he refers to the changed attitude on the part of the railway managements who now take the public into their confidence, seeking their opinions and reactions as well as catering to their conveniences and comforts. Such conditions convince Mr. Price that many investors are overlooking some unusual bargains in the electric railway security field. He says that these have a real promise for the future. "Too many investors, perhaps," he says, "still are looking on the local transportation industry with 1915 eyes. The best advice that I could give them is to familiarize themselves with current conditions."

Discontinuance Sought in Hillsboro

John H. Mitchell, manager of the Illinois Power & Light Corporation, has applied to the Illinois Commerce Commission for authority to discontinue the two railway routes operating in Hillsboro, Ill.

Digitized by Google

Legal Notes

FEDERAL CIRCUIT COURT — *Law prohibiting competing buses on certain streets is valid.*

An Oklahoma statute and a city ordinance which prohibited the operation of buses on streets occupied by street railway lines or on the first two streets on either side of a street so occupied and parallel to it, was held not to be discriminatory and invalid because they excluded from such prohibition motor buses operated by the street railway company as part of its transportation system. The court said that competition, like monopoly, may be restrained for the public welfare; the test in each instance is the public good. [People's Transit Co. vs. Henshow, S.L. 20 Fed. (2D), 87.]

FEDERAL DISTRICT COURT — *Rulings on Valuation of Public Utility Property.*

In an extended decision, the District Court for the District of Idaho, ruled on methods of valuing real estate used in public utility service and on allowances for overhead, contingencies, contractors fees, good will, working capital, depreciation, reasonable return and other features in connection with valuation and rate making. [Idaho Power Co. vs. Thompson et al., 19 Fed. (2d), 547.]

KENTUCKY—*Street Railways May Sue to Restrain Operation of Illegal Bus Lines.*

A street railway company, as a taxpayer, can maintain a suit to restrain the operation of a competing bus line over city streets, where the competing line has no franchise. The fact that the railway company itself may be operating bus lines on some streets without a specific franchise does not prevent it from bringing suit to enjoin the operation of a competing bus line. [People's Transit Co. vs. Louisville Railway, 295 S. W., 1055.]

MASSACHUSETTS.—*Only Duty of Railway on Reservation Is to Refrain from Wanton or Reckless Conduct.*

A railway company had laid tracks on a reservation in the center of a street, and a person intending to become a passenger, while crossing the reservation diagonally at a place where there was no cross walk was struck by a car. It was held that the railway owed him no duty except to refrain from wanton or reckless conduct. [Fernald vs. Boston E.R., 156 N. E., 692.]

MASSACHUSETTS—*Failure to Register Makes an Auto Trespasser.*

In an action for damage to an auto resulting from a collision with a street car of the defendant, under circumstances warranting a finding of due care on the part of the plaintiff and negligence on the part of the defendant, it appeared on the day before the accident the plaintiff removed from his auto the motor, listed on his certificate of registration and installed a new motor therein, but obtained no new registration since the installation. It was held that the plaintiff was a trespasser on the highway and could not recover for damages to his auto through the negligence of another. [Wallace vs. No. Bedford & Onset St. Ry., 155 N. E., 660.]

MASSACHUSETTS.—*Passenger on Truck Is Guilty of Contributory Negligence.*

An experienced truck driver who was riding in another truck as a guest was injured while the truck was running on the wrong side of the road and was struck by an electric car. Both the driver of the truck and his guest were held to be guilty of contributory negligence. [Thorpe vs. Boston E.R., 156 N. E., 748.]

MASSACHUSETTS—*Driver Trying to Start Stalled Car on Track Without Looking for Approaching Street Car Held Negligent.*

An automobile became stalled on a straight railway track and the driver started to crank it without looking to see whether any cars were coming. The railway was not responsible when he was struck. [Loyle vs. Boston Elevated Railway, 157 N. E., 356.]

MISSOURI—*Refusal of instructions on sounding gong upheld.*

An action was brought under the humanitarian doctrine for personal injury when a street car hit an automobile which was being driven on the left side of the street and in a rut in the car tracks. The plaintiff claimed that if the car gong had been sounded the driver would have had warning, but the request of the company that the court instruct the jury there was no evidence that such failure to use the gong was the approximate cause of the collision was refused. This refusal was upheld by the Supreme Court. [Perry vs. Fleming et al., 296 S. W., 167.]

MISSOURI—*Wording of Ordinance for Punishing Transfer Abuse Is Important.*

An ordinance passed by the City, making it unlawful for any person not connected with the railway company to sell, barter, or exchange for any consideration a street railway transfer, or give it away for the purpose of enabling another person to use it for passage, or any person so to use it, or to alter the transfer so that it could be used for a round trip, to be guilty of a misdemeanor. The Court held that the wording of this ordinance attempted to regulate the rates and practices of the company which the city had no power to do. The Court pointed out, however, that an ordinance prohibiting the use or issue of transfers in violation of the rules and regulations of the street car company, would be valid, as these rules presumably would have the sanction of the State Public Service Commission. [Ex Parte Packman, 296 S.W., 366.]

MONTANA — *For Taxation, Electric Railway Track and Poles May Be Considered Personal Property.*

For the purpose of taxation, the State of Montana classified property into seven groups of which one includes real estate and improvements and one personal property. The rates were different on these two. By an amendment of the act, a street railway track was placed in the "personal property" group. The present case was upon the proper grouping of the overhead construction and poles which, for reasons given in the decision, were also placed in the "personal property" group. [Butte Electric Railway vs. Brett, 257 P., 478.]

NEW JERSEY—*License Required by Bus Hauling Employees of Single Industrial Plants.*

A bus hauled only employees of a single industrial plant to and from it and made no stops to receive or discharge passengers in a town where it had no municipal license. This was held to be a violation of a statute which requires motor buses to receive municipal licenses from the municipalities through which they operate and have such licenses approved by the Board of Public Utility Commissioners. [Doskovich vs. Board of Public Utility Commissioners, et al., 138 At., 110.]

OHIO—*Judicial Notice Will Be Taken of Differences Between Buses.*

A bus company operated some 16-passenger buses under authority of the Public Utilities Commission, but the State Supreme Court issued an order at the request of a railway company that the bus company must use 7-passenger buses instead of those employed. The bus company then removed 9 seats in each of the 16-passenger buses, but the Court held that this was not in compliance with its order. [Scioto Valley R. T. Co. vs. Public Utilities Commission, 157 N. E., 475.]

WASHINGTON — *Passenger Alighting in Dangerous Place Must Exercise Special Care.*

At a point where an accident occurred there was a single track in the middle of a street and only on one side of this track the street was paved. On this paved side, traffic moved in both directions. A passenger was injured after alighting from a car by being hit by an automobile travelling in the opposite direction from the car. The passenger had an unobstructed view and as good an opportunity to see possible danger as the car operator. The decision of the jury in favor of the railway was upheld. [Jones vs. City of Seattle, et al., 157 P., 393.]

Personal Items

Cincinnati Men in New Posts

Added Responsibility for Engineers Under New Power Arrangement —Careers of Men Involved, Messrs. Venning, Clark, Swift, Noertker and Genrick, Are Reviewed

FURTHER details available about the promotions in the personnel of the Cincinnati Street Railway, Cincinnati, Ohio, and the assignment of additional duties to officers of the operating department of the railway indicate more minutely than a previous item the significance of the changes. To provide for the new power distribution plans under which the railway will get all its power from the Union Gas & Electric Company through a system of eighteen automatic substations, the responsibilities of Messrs. Venning, Clark, Swift, Noertker and Genrich are increased.

F. J. Venning

H. L. Swift

W. P. Clark

F. J. Venning will continue as superintendent of power and will have jurisdiction over the Pendleton power house and all operations incident to the production of power. He will have charge of the transmission lines to the point where current is delivered to the switches in the substations and all feeder lines from the time they leave the substations, as well as the overhead trolley lines. He will also supervise the maintenance and operation of the Mount Adams Incline. Mr. Venning began as oiler for the Westinghouse Electric Company in 1889. He entered the street railway field in 1893 as barn foreman for the Citizens Traction Company of Pittsburgh, where he later became superintendent of maintenance of way and overhead lines. He remained in Pittsburgh until January, 1910, when he was appointed superintendent of construction for the Cincinnati Traction Company. He was made superintendent of overhead lines for this company in June, 1918, and in 1920 was given additional jurisdiction over shops and equipment. In February, 1926, he was made superintendent of power for the new operating company in Cincinnati, the Cincinnati Street Railway.

W. P. Clark was appointed assistant superintendent of track and roadway. He will assist the superintendent in handling the large program of track reconstruction work which is being carried on by the company. Mr. Clark had also served the traction company prior to the reorganiation in 1925. After his graduation from Tri-State College at Angola, Ind., as civil engineer in 1921, he went to the company as material man. In 1924 he was made paving engineer.

Harley L. Swift was appointed superintendent of substations and will have jurisdiction over the maintenance of all present substations and the construction of the new substations, including the installation of the equipment. He went to the Cincinnati Street Railway in January, 1927, as assistant superintendent of maintenance of way, leaving his position as superintendent of factory No. 14 of the American Window Glass Company at Monongahela, Pa. He is a graduate of Penn State College, where he received his degree in 1914 as mechanical engineer.

J. A. Noertker was appointed electrical engineer and will look after the details of the new substation installation. He entered the company's employ in 1921 as draftsman after his graduation from the University of Cincinnati as electrical engineer.

H. C. Genrich was appointed electrician and will continue to handle the inspection and maintenance of the present substation and to assist in constructing the new stations. He has been with the company since 1895 and has served as chief electrician since 1898.

L. S. Ready Takes Up Commissioner's Duties

Lester S. Ready, vice-chairman of the board of directors of the Key System Transit Company, Oakland, Cal., and formerly president of that company, has completely severed his connection with that utility. The California Railroad Commission, of which he was formerly chief engineer, has announced that arrangements have been concluded with Mr. Ready to take charge of the preparation and presentation of the commission's testimony and evidence in the pending Pacific Telephone & Telegraph rate case.

Mr. Ready is a graduate of the University of California, College of Electrical and Mechanical Engineering, class of 1912. For four years he was chief engineer of the commission and was connected with the engineering department of the commission for thirteen years. He has had charge of the various engineering investigations in connection with all the varied rate proceedings before the commission in recent years.

Daniel Durie Made General Manager of West Penn Lines

H. L. Mitchell, president of the West Penn Railways, Pittsburgh, Pa., on Sept. 27 announced changes in the operating organization of the company. Two operating divisions have been created and a general manager has been named for each of the two sections of the system. Daniel Durie, Connellsville, Pa., who has been general superintendent of what is known as Territory "A," is promoted to the general managership of the Pennsylvania Division. The West Virginia and Ohio Division is under the direction of A. C. Spurr, Wheeling, W. Va.

Three co-operating departments are included in the railway's organization, all located at Pittsburgh. J. L. Fritsch, chief engineer of the company since its beginning, has charge of engineering and construction standards. James McFall, general claim agent of the West Penn Railways and the West Penn Power Company, is in charge of the claims department. H. K. Breckenridge, Pittsburgh, development engineer, is in charge of bus developments and standards.

H. S. Metcalfe, who has been in charge of public relations, has been appointed assistant to Walter S. Finlay, Jr., president of the West Penn Electric Company, in the publicity and public relations field, but he will continue to serve the railways department as his services are needed.

J. O. Horton, who has been in the Pittsburgh office, is transferred to Connellsville and appointed assistant to Daniel Durie, general manager. Ernest R. Kooser, Connellsville, assistant superintendent of Territory "A," becomes superintendent of transportaiton in that division, and Joseph Black, located at New Kensington, is named superintendent of transportation in Territory "B."

Manufactures *and the* Markets

100 Articulated and One-Man Units for Cleveland

Shortly after the Cleveland convention an order will be placed by the Cleveland Railway for 100 street cars part of which are to be the duplex articulated type and the rest for one-man, two-man, front-entrance, center-exit operation. Samples of each type are under construction and will be exhibited at the convention. Authorization for the purchase was made about two months ago by the City Council of Cleveland, according to Joseph H. Alexander, president of the traction company. The order is in addition to the 36 single-deck buses, ten de luxe single-deck buses and six double-deck units which were purchased from the White Motor Company, Yellow Coach Company, and Six-Wheel Company respectively.

Rolling Stock Order Placed by German State Railways

In connection with the electrification of the railways in Silesia and Saxony, the German State Railway Company has lately placed orders for more than 80 electric locomotives and other rolling stock to an estimated value of $850,000,000. Brown, Boveri & Company, Mannheim, in conjunction with the Krauss Locomotive Works, Munich, are to supply seven 2,200-hp. express locomotives and the A.E.G. and the Siemens-Schuckert Company, Berlin, in conjunction with the Borsig Company of Tegel, 33 2,600-hp. engines. The A.E.G. and the Siemens-Schuckert concerns are also to supply twelve heavy goods engines and eight shunting locomotives, while the Bergman Electric Company and the Schartzkopf Company, Berlin, are to supply five light express locomotives and 23 goods engines.

Fire Destroys 25 Trolley Cars in Canada

Fire last Sunday night destroyed a wing of the Ottawa Electric Street Railway carhouse in the Rockcliffe district and 25 trolley cars, with an estimated loss of $200,000. An early investigation points to the blaze having originated from defective wiring. Breaking out near the front door of the building, the conflagration soon assumed uncontrollable proportions and swept through the entire wing, rapidly reducing it to ashes. Besides the 25 emergency trolley cars lost, a track bonding car and a track grinder car were destroyed. The entire loss is covered by insurance.

Two other wings of the main carhouse were saved. The structure is within a stone's throw of Rideau Hall, official residence of the Governor-General, and but for an opposite wind these buildings would have been endangered by myriads of sparks thrown up by the blaze. Firemen had a strenuous task in keeping the flames from catching the thick bush, which stretches for miles at the rear of the carhouse and forms Rockcliffe Park, a scenic beauty spot of the capital.

Subway Approach Planned by I.T.S. for St. Louis

Illinois Traction System, Springfield, Ill., has engineers at work to devise plans for a co-ordinated subway and elevated railway system to connect its downtown terminal and station at Twelfth and Lucas Avenue, St. Louis, Mo., with a proposed new approach to the McKinley Bridge which spans the Mississippi River at Salisbury Street.

The new system would give the railway approved access to the downtown section for its freight and passenger business and eliminate many grade crossings in north St. Louis. Three tentative plans are under consideration, but the preliminary studies have not advanced sufficiently to warrant any announcement at this time. It probably will be January before anything definite will be decided.

Worcester's $75,000 Bus Purchases Approved by Commission

The Worcester Consolidated Street Railway, Worcester, Mass., has entered into a conditional sales agreement with the Yellow Manufacturing Sales Corporation, Chicago, for the purchase of seven motor coaches, which has been approved by the Massachusetts Department of Public Utilities as being "reasonable and proper and for a lawful purpose."

The coaches are to have special bodies, manufactured by the Lang Body Company. The conditional sale calls for the payment of a sum not exceeding $75,410, with 6 per cent interest, in installments on specified dates.

Twin Coach May Appear in New York

Contingent upon the outcome of franchise hearings before the New York Transit Commission and legal proceedings by other transportation companies concerned, the Equitable Coach Company, New York, N. Y., will operate Fageol Twin Coaches on crosstown lines in Manhattan and ordinary street-car type city buses in Brooklyn.

Should the necessary permission be secured, the company will place in service 163 Twin Coaches in Manhattan, establishing a crosstown service with a two-minute rush-hour headway. An indeterminable number of the street-car type buses will be purchased for use in Brooklyn.

Electric Locomotive Sought for South Africa

The South African Railway Administration is inviting tenders for an electric freight locomotive. The authorities desire to find an electric unit that will be a big improvement on those in use at present, and it is their intention to test this single unit against the three units now being employed. Should the experiment prove successful, it is understood that this contract for a single locomotive will be followed by one of the largest contracts in the history of the South African railways.

Delivery of Detroit Cars Will Begin in October

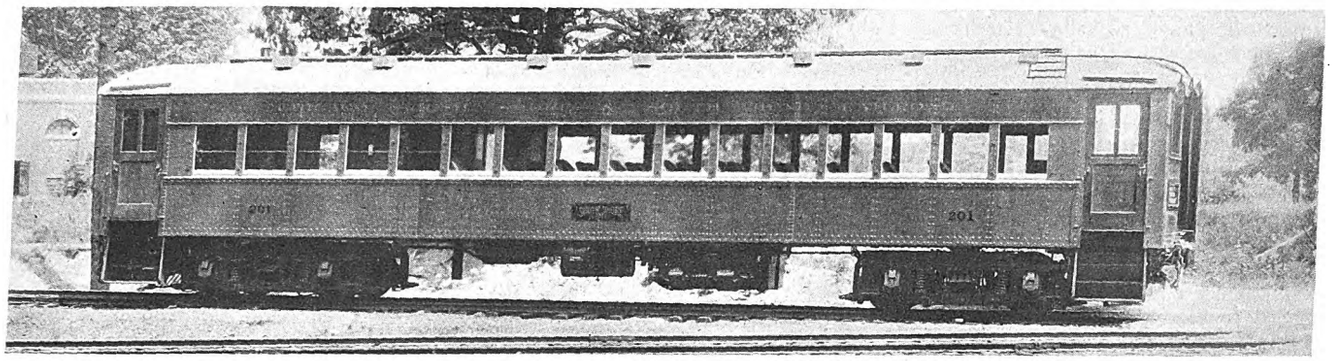
Delivery of the 125 Peter Witt type cars ordered on July 30 by the Department of Street Railways of the City of Detroit from the Cummings Car & Coach Company, Chicago, will begin in October. Following the first delivery eight cars will be completed each week. Payment for the cars, as outlined in the July 23 issue of ELECTRIC RAILWAY JOURNAL, is being made by an initial installment of $250,000 and $18,000 per month over a ten-year period from Aug. 1, 1927, to July 1, 1937, inclusive. The units are of the single-end type and are designed for two-man operation.

Specifications for the units follow:

Number of cars ordered	125
Type of unit	Peter Witt two-man, motor, passenger, city, single end, double truck
Seating capacity	52
Builder of car body	Cummings Car & Coach Company, Chicago
Weight, total	36,000 lb.
Bolster centers, length	23 ft. 9 in.
Length over all	48 ft. 5 in.
Truck wheelbase	5 ft. 6 in.
Width over all	8 ft. 4 in.
Window post spacing	29½ in.
Body	Steel
Roof	Arch
Doors	Peter Witt
Air brakes	Westinghouse DH-16
Armature bearings	Plain
Car signal system	Faraday
Compressors	DH-16
Conduit	Flexible
Control	K-35 HH
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	Front folding, center slide
Energy-saving device	Cleveland
Fare boxes	Cleveland
Finish	Lacquer
Floor covering	Wood
Gears and pinions	Grade M. & B. P.
Glass	D. S. A.
Hand brakes	Peacock
Hand straps	Rico No. 7
Heaters	Gold
Headlights	Golden Rod
Headlining	Three-Star Agasote
Interior trim	Cherry
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	Electric Service Supplies Company
Motors	Four General Electric 265, four Westinghouse 510, inside hung
Roof material	Wood
Sash fixtures	Edwards
Seats	Rattan
Seat spacing	29½ in.
Seating material	Rattan
Steps	Stationary
Step treads	Kass
Trolley	Ohio Brass
Trolley base	Ohio Brass
Trolley wheels	Detroit Street Railway, standard
Trucks	Standard
Ventilators	Railway Utility Company
Wheels	26-in., steel
Wheelguards	H. B.

Digitized by Google

Twenty New Steel Motors and Trailers for the South Shore Line



Ten motors and ten trailers of this type for the South Shore Line

Delivery of the first of twenty new all-steel motor cars and trailers built by the Pullman Car & Manufacturing Company was made recently to the Chicago, South Shore & South Bend Railroad, Michigan City, Ind. The initial consignment of new equipment, which was ordered in January, consisted of five trail cars. They were received July 30. Five additional trailers were expected to arrive by Aug. 8, while the ten motor cars were scheduled to be in service shortly after. Reference to delivery appeared in the JOURNAL of July 30.

Features which distinguish the latest group of passenger cars from the 25 units put in service by the South Shore Line a few years ago, coincident with the re-electrification of the road, are their greater length and the bucket type of seat used. The new cars are 61 ft. long, 1 ft. longer than the old ones, and are equipped with rotating bucket seats upholstered in gray Byzantine plush, whereas green plush reversible cross seats were installed in the earlier equipment. Another interesting arrangement in the new cars is the Pullman type smoking compartment, which has been made standard for both motors and trailers. The smoking compartments are furnished with facing leather-covered seats for eight passengers. An aisle passes around this compartment, making it unnecessary for passengers entering the cars to pass through the smoke-filled room.

Control apparatus in each car permits multiple-unit operation with either a motor or trail car at the head end of the train. The cars are also equipped with steel and canvas diaphragms, making possible the operation of solid vestibule trains. Steel pilots are at both ends of the cars.

The interior finish of the cars is mahogany with cream-colored ceilings, while the exterior is done in the railroad's standard orange and maroon lacquer. A 32-volt multiple lightng system is used, with a 225-amp.-hr. storage battery automatically charged from a motor-generator set.

The motor car specifications are as follows:

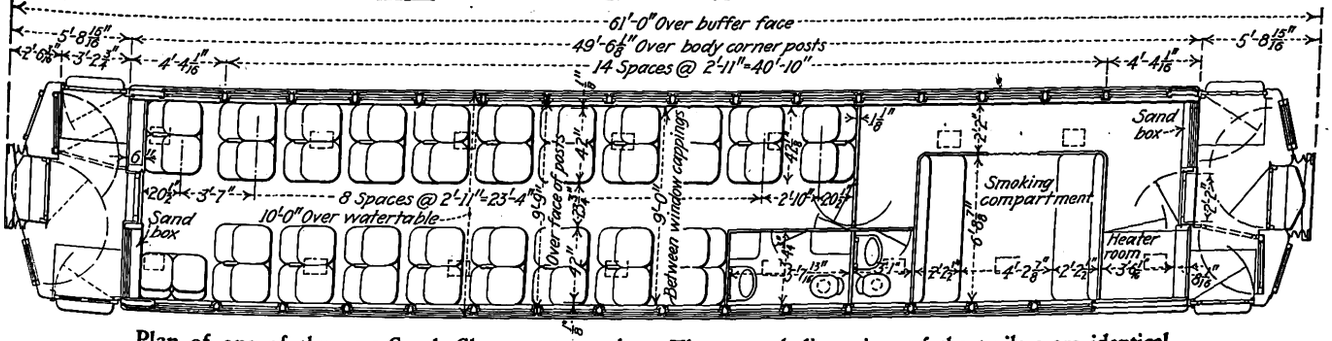
Number of units	10
Type of unit	Two-man, motor, passenger, interurban, double end, double truck
Number of seats	48
Builder of car body	Pullman Car & Mfg. Company, Chicago, Ill.
Weights:	
Car body	63,700 lb.
Trucks	33,200 lb.
Equipment	33,700 lb.
Total	129,600 lb.
Bolster centers	38 ft. 0 in.
Length over all	61 ft. 0 in.
Length over body posts	49 ft. 6⅛ in.
Truck wheelbase	7 ft. 0 in.
Width over all	10 ft. 1⅛ in.
Height, rail to trolley base	13 ft. 1 in.
Date of order	Trucks, Dec. 18, 1926; body, April 18, 1927
Date of delivery	Aug. 8, 1927
Window post spacing	35 in.
Body	All steel
Roof	Arch

Interior of one of the units showing the rotating, bucket type seats

Doors	End, swinging
Air brakes	Westinghouse AMU
Armature bearings	Plain
Axles	5½x10 in.
Car signal system	Faraday 32-volt, single stroke bell
Compressors	Westinghouse D3F, 1,500-volt
Conduit	Metal
Control	Westinghouse HBF, 1,500-volt
Couplers	Ohio Brass Company
Curtain fixtures	Railway Curtain Company
Curtain material	Pantasote
Destination signs	Hunter
Energy-saving device	Economy meters
Finish	Duco
Floor covering	¼-in. battleship linoleum
Gears and pinions	Westinghouse BP
Glass	Plate
Hand brakes	Peacock staffless
Heat-insulating material	Balsam Wool
Heaters	Peter Smith, OC2
Headlights	Electric Service Supplies Company 32-volt, 250-watt
Headlining	Steel
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	Pullman dome type
Motors	Four Westinghouse No. 567, inside hung
Painting scheme	Orange and maroon
Pantograph	No. 515C Westinghouse
Roof material	Poplar wood and canvas
Safety car devices	"Deadman" feature and controller
Sash fixtures	Adams & Westlake
Seats	Hale & Kilburn No. 900 rotating
Seat spacing	35 in.
Seating material	L. C. Chase Co., Byzantine plush, gray and brown
Slack adjusters	Westinghouse type J
Steps	Stationary
Step treads	Stanwood self-clearing
Trucks	Baldwin Locomotive Works, equalizer type
Ventilators	Railway Utility Company
Wheels	Rolled steel, 36 in. diameter

The ten trailers are identical in design and dimensions with the motor cars. They are fitted with control including full safety equipment the same as on the motor cars. The air brakes are Westinghouse ATU, trailer type. The trailers seat 50 passengers as compared with 48 for the motor cars on account of a slight rearrangement of the toilet. Weights are as follows:

Number of seats	50
Date of delivery	July 26, 1927
Weights:	
Car body	60,000 lb.
Trucks	33,200 lb.
Equipment	3,000 lb.
Total	96,200 lb.



Plan of one of the new South Shore motor units. The general dimensions of the trailers are identical

$300,000 Railway Order for Japan

Contracts have recently been let by the Tobu Railway of Japan for 28 motor-coach equipments, sixteen trailer-coach equipments and two completely automatic rotary converter substations to supply 1,500 volts direct current for the electrification of the 50-mile stretch of railway from Sugito, on the Asakusa-Kuzuu line, to Nikko. This order, which was awarded to the English Electric Company of London, is valued at approximately $300,000. It is the fourth placed by the Tobu Railway with the same company and is additional to contracts for the supply of twenty motor-coach and fourteen trailer-coach equipments previously awarded by it to this concern.

Metal Markets Dull

Producers of the non-ferrous metals can find little ground for optimism in the market report for the week ended Sept. 27. Sales of all metals have been meager and the prices for all the more important ones are lower.

The excellent buying of last week has been followed by a wave of lassitude, and the tonnage disposed of during the week ended Sept. 27 was one of the smallest of the year. Most sellers feel confident that the present lack of interest is only a passing phase, and have merely quoted 13.25 cents. Certain sellers who pursue the policy of always disposing of their output irrespective of market conditions have made large concessions from this price, and in consequence have practically monopolized the market. To obtain a price of even 13 cents, however, they have been compelled to make a wide canvass of the consumers.

The most that can be said for the lead market is that the American Smelting & Refining Company is holding firm at its contract price of 6.25 cents in spite of a quiet domestic demand and continued reductions abroad, which have brought the London spot price today to £20½, the lowest level reached since March, 1922. The leading producer in the Middle West has gone back to 6 cents St. Louis, which seems to be the deadline for the time being, so far as this seller is concerned.

Less zinc was sold in the week ended Sept. 27 than in any other week since February. On Sept. 28 zinc sold as low as 6.075 cents, though forward deliveries were higher.

Tin has broken through the 60-cent level, and is down to about 58⅝ cents for prompt Straits, forward being about half a cent less.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Sept. 27, 1927
Copper, electrolytic, cents per lb.	12.80
Copper wire, cents per lb.	15.25
Lead, cents per lb.	6.25
Zinc, cents per lb.	6.15
Tin, Straits, cents per lb.	58.75
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.175
Somerset mine run, Boston, net tons	1.80
Pittsburgh mine run, Pittsburgh, net tons	1.95
Franklin, Ill., screenings, Chicago, net tons	†
Central, Ill., screenings, Chicago, net tons.	†
Kansas screenings, Kansas City, net tons	2.70
†Quotations withdrawn because of strike.	
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.55
Weatherproof wire base, N.Y., cents per lb.	5.20-5.70
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.2
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.75
Turpentine (bbl. lots), N. Y., per gal.	$59.0

Twenty Car Sets Sold Sao Paulo Company by Canadian Car & Foundry

The Canadian Car & Foundry Company, Ltd., Montreal, Canada, recently furnished twenty sets of car parts for the twenty new units built by the São Paulo Tramway, Light & Power Company, Ltd., of Brazil. The new units were placed in service on May 5. Their interior finish is of fine quality national wood, highly varnished, which, combined with a creamy white ceiling and a diffusion of illumination with opal reflectors, at all times gives a restful and pleasing atmosphere. The outside color scheme is composed of Tuscan red paneling surmounted by framing finished with cadmium yellow. This gives the cars a bright and attractive appearance.

The units are of the one-man, two-man type and they are adaptable to the pay-enter or pay-leave method of operation. The company built an experimental car before decision was made to construct the twenty units. In outside appearance the cars are very much after the order of the usual type of American units. The seating arrangement is a departure from American practice, however, in that there are two longitudinal seats at either end of the car and facing four crosswise rattan slat seats in each case.

Noiseless Trolley Experiments

Noiseless trolley service is being sought by the Eastern Massachusetts Street Railway. Experiments with noiseless trucks are being conducted on the system by a representative of the J. G. Brill Company of Philadelphia, under an understanding that if satisfactory results are obtained the Eastern Massachusetts will have its cars equipped with new Brill trucks.

ROLLING STOCK

HOLYOKE STREET RAILWAY, Holyoke, Mass., received one Mack city-type bus, gas-electric drive, 196-in. wheelbase, with four-cylinder motor and 25-passenger capacity.

SOUTHERN PACIFIC MOTOR TRANSPORTATION COMPANY, bus-operating subsidiary of the Southern Pacific Railroad, San Francisco, Cal., has accepted delivery on two Mack buses, 230-in. wheelbase, with four-cylinder motors. The buses will operate between Santa Cruz and Boulder Creek, a route 16 miles long, at a 50-cent fare.

BINGHAMTON RAILWAY BUS LINE, INC., subsidiary of the Binghamton Railway, Binghamton, N. Y., has received three 25-passenger Mack city type buses, AB model, 196-in. wheelbase.

SHORE LINE MOTOR COACH COMPANY, subsidiary of the Gary Railways, Gary, Ind., announces the acquisition of a 42-passenger parlor-type twin coach. The unit is a six-cylinder type. It was built by the Frank R. Fageol Company, Oakland, Cal., and will be used in main line service between Chicago and Muskegon, Mich.

TRACK AND LINE

COLUMBUS RAILWAY, POWER & LIGHT COMPANY, Columbus, Ohio, has completed the laying of new track on High Street, between Arcadia and Oakland Park Avenues, a distance of about ¼ mile.

CONNECTICUT COMPANY, Bridgeport, Conn., has been granted permission by the Public Utilities Commission to make changes in its line west of Ash Creek to Library Corner in the town of Fairfield. The company will abandon the present trolley line and give service over the new highway to be known as the Fairfield cut-off. The new route will be considerably shorter, and the company proposes to lay a double track line. The old route was a single-track affair with numerous switches to cause service delays. Public approval has been voiced on the change.

ST. JOSEPH RAILWAY, LIGHT, HEAT & POWER COMPANY, St. Joseph, Mo., has completed a track job on Alabama Avenue. As soon as this was finished work was started on laying new tracks, steel ties and new concrete between Eighth and Eleventh Streets. Later on the company will rehabilitate its line on Alabama Avenue from Lake Avenue west to the railroad tracks.

READING TRANSIT COMPANY, Reading, Pa., has been busy with a program of track rehabilitation during the spring and summer months which has included relocation and reconstruction of the double track on Aulenbach Cemetery Hill. Another important piece of work under way is the complete rebuilding of the track on North Eleventh Street between Marion and Amity, a distance of about three blocks. The track area is being paved with asphalt on a concrete base, finished off with granite liners. Work on North Eleventh Street will cost about $18,000. In addition the company has done considerable repair work, special work switches, etc., at Sixth and Washington Streets and Third and Chestnut Streets and at Fourth and Centre Avenues. Track joints have been raised along the entire route of the Eleventh Street line, except in the section of new track on Schuylkill Avenue, and on Penn Street.

The Significance of the Cleveland Convention

FROM the moment the exhibits were thrown open in Cleveland, last Saturday at noon, until the final meeting, conference and luncheon was over yesterday, the 46th annual convention of the American Electric Railway Association was permeated with an intangible something that the industry has not experienced in many years. One finds difficulty in naming it. Nevertheless every one in Cleveland was conscious of its presence. Maybe "an air of confidence" would be the proper term to apply. Perhaps "conviction" would be a better word; confidence in the industry's stability and conviction as to the opportunity which lies at hand. Every man who seriously attended the Cleveland convention came away with a better outlook on the industry and on his job.

Cleveland crystallized the thinking which has been developing in the industry for several years. Cleveland furnished concrete evidence of the progress that has been made. Cleveland threw a brilliant spotlight on the future and literally dazzled that vast multitude of transportation men, who came not only from every corner of America but from foreign lands as well, with the vision it revealed of the opportunities that lie ahead. The convention proved that progress is being made, because it showed concrete advance in the exhibits, talked progress in the meetings and testified to progress in the conferences. It opened up a vista of new opportunities of which the industry has for many years scarcely dared to dream. Every one seemed at last definitely to have grasped the idea that the local transportation industry is moving forward and that opportunity lies just ahead for every man who is willing to grasp it. That, in a nutshell, is the significance of Cleveland.

An Exhibit in Superlatives

ANY attempt to characterize and interpret the exhibits at the Cleveland convention leads to the use of superlatives. It was the largest exhibit in terms of the square feet of space sold and the greatest exhibit in the extent of the developments shown. Many delegates declared that it was as much beyond the 1926 Cleveland exhibit as was that great show an advance over the previous year in Atlantic City. In cars and in buses, in track and in overhead line, in electrical equipment and in shop facilities; in fact, in every department of the transportation business new ideas and improved facilities were liberally offered.

Five distinct radical departures from conventional construction of street car trucks were shown by as many different manufacturers. For the first time in more than twenty years there was this direct effort, by fundamental changes from conventional practice in street car trucks, to meet the insistent demand for decreased noise, easier riding and reduced weight. Car bodies showed a similar metamorphosis. The ugly duckling showed great promise of developing into a swan.

The bus gave no indications of standing still. The models shown reflected a better understanding of the automotive vehicle's sphere of operation and of the conditions under which such service can be successfully rendered. There was evidence in the designs offered of a broader understanding of the economic and merchandising aspects of this comparatively new transportation tool. There was evidence of less reliance by the bus designer on the overworked "rubber urge" as the basis for the application of his vehicle. The idea that the bus depends for its future on the decadence and replacement of railways seems to be giving way in favor of the view that the bus has an even greater future through its development as a distinctive transportation agency in its own right.

And so one could go on indefinitely. The track manufacturers are grasping the idea of applying construction production methods to the laying and maintenance of railway track. Overhead line equipment shows progress in the direction of increasing reliability and life and decreasing ultimate rather than first cost. Shop equipment and accessory manufacturers have taken new interest in the development and application of their products to the needs of the local transportation industry. Every manufacturer seems to have grasped with renewed energy his opportunity for helping to sell more and better public transportation miles. With this spirit and this point of view almost anything seems possible.

American Program Reflects Trends of the Industry

PROMINENT among the many innovations of the American Association program at the convention just ended was a series of five-minute talks by executives on a wide range of topics, the underlying theme of which was the explanation of some progressive accomplishment. Subjects all the way from rehabilitating a broken-down electric railway property to prevention of trolley wire breaks were covered. It is only a pity that the time available prevented more talks of this sort, as they carried the conviction of men who have fought their battles and won.

Another feature was the entire absence of formal committee reports. The position was taken by the program committee that these reports have been printed in advance and are available for the entire membership. Usually the time allotted for discussion on the floor of the convention is so short that only an incomplete evaluation of the work of the committee can be made.

The time saved by elimination of committee reports was used to good advantage for the presentation of a number of notable addresses by speakers from outside the industry. It is significant that all of these speakers

Digitized by Google

took an optimistic view with respect to the industry and the forward steps it is making along many lines.

It is quite significant that the arguments of a few years ago regarding the place of the bus in the transportation scheme were absent. The bus has been accepted and the affiliated associations are now discussing the exact uses to which it is best adapted, as well as the detail of how best to provide facilities for it and the technique of handling it.

Don't Wait for Costly Money

FINANCE as a subject occupied a large part in the program at Cleveland. It was dealt with by several speakers and was the topic at one of the round-table conferences. There was very little mincing of words about the matter. It is pretty well known where President Stevens stands on the importance of revamping the structures of railway companies. Some of the speakers as well, particularly Mr. Frazer and Mr. Sisson, pointed out specifically what could best be done under certain circumstances to approach the improvement which the committee on finance had in mind when it made its report two years ago.

Advantage has not been taken of the suggestions made by that very able committee after several months of study. This is particularly regrettable because the ensuing period has been one of easy money which may or may not continue. Of course, it is well known that a voluntary readjustment of financial structures is a process not easy of accomplishment. But it is far easier during a period of low money cost than it will be if action is postponed until money rates become higher. The only alternative which any company carrying a topheavy and cumbersome financial structure may hope for is a gradual improvement of its condition through the process of plowing back surplus earnings. That, at best, is a slow method. If earnings are not sufficient to keep the property abreast of developments, then it is best both for security holders and car riders to make a change in structure that will make the company's securities more salable to the public. In view of the present money situation, it seems unwise for many companies to delay changes that ultimately may prove inevitable.

After all, the basis of credit is character. Character in an electric railway means progressiveness of personnel. As Mr. Sisson said, despite the soundness of the railway business from the standpoint of its economic necessity, many properties are hard pressed for credit because of unsatisfactory franchise or contractual relationships and topheavy indebtedness, with its accompanying overload of fixed charges. The relief from improper franchises lies in proper public relations. During the past few years there have been many examples of a complete reversal of franchise conditions through the medium of giving the public a better understanding of the situation as it affects its own interest. Similarly, then, the road to financial improvement lies in the direction of better investor relations. This can be brought about only by a management which adequately appreciates the importance of the financial problem, and undertakes seriously to convince its security holders of the need for readjustment. To come back physically often means to come back first financially. It is impossible to do that unless the railway securities which are offered to the banker, and through him to the public, will stand the closest scrutiny in comparison with those of other industries.

Luncheon Conferences an Innovation

NO CHANGE made in the convention program during recent years has aroused so much enthusiasm as the series of luncheon conferences. Fourteen topics were discussed on three different days and the range of subjects was so wide that there was something of interest for every delegate. In addition to these luncheons sponsored by the American Association, several other groups met similarly to discuss common problems. Such groups were organized by leaders among the affiliated associations and provided the opportunity to consider topics on which information was desired.

Because of the smallness of the groups and the informal nature of the discussion, many members took part who never have been heard on the convention floor. Modest though they were, they all had something to contribute to the discussion. It was quite noticeable that no attempt was made by the speakers to use the time in idle talk, but each one who took part had a real story to tell. In large measure the experiences of the speakers was the subject dwelt on. Often a series of rapid-fire questions brought out details that were needed to amplify the original story until the listeners understood fully the points made. By concentrating on a single subject it was possible to cover it more thoroughly than is usual on the convention floor.

Subjects considered at the meeting were well chosen by the committee in charge. All were well attended, though some were so popular that many were unable to gain admission. The interest, however, was in no way measured by the attendance, as some of the most enthusiastic discussion was evidenced in the smaller groups. In fact, these small groups on account of their size were the least formal, and on that account lent themselves to the most open statements of opinion.

Men Who Reveal the Facts

LIKE the Rosetta Stone which became the key to the long lost tongue of Egypt, so does the accountant, interpreter of countless masses of figures, unlock the secrets that lie buried deep in the intricacies of business routine. That he takes his duties seriously in the railway business was apparent during the meetings of the Accountants' Association at the Cleveland convention. There ran throughout the sessions an underlying note of earnestness, studying and thought given to the problems which arise in the accounting departments.

Even a casual visitor to the sessions of this body would have become quickly aware that these men are not limited in vision by the rules on the stationery they use. Their effort is being spent in reaching out for improved methods of gathering, presenting and standardizing accounts in a way that will facilitate analysis of operating efficiency. They are trying to improve their own performance as real interpreters of the industry.

"Dry as dust" is now a misnomer for figures. Under the skillful hand of the accountant they become deeply interesting and vitally significant. On chart and page, they are made to live, and they tell a vivid story that may be either one of inspiration or of tragedy. The Accountants' Association is making real progress in improving the work of its members. They are coming to be appreciated in a new way throughout the industry—these men of facts.

Digitized by Google

The Claims Association Is Making History

"HOW can a claim agent best fit himself for his job, keep his mind fresh and alert; keep up with the times?"

So was the question asked by President Proctor in his annual address. It was answered satisfactorily through the three days of meetings at Cleveland, at the Wednesday Claims lunch and in many groups of claims men—old friends meeting again and joining in helpful discussion of new problems and situations. Traffic regulation, for example, so needed as a means of accident and claim reduction, came in for both formal and informal conferences. It occupied much of the opening day's program and was taken up again to be considered from a different viewpoint at the joint meeting of the Claims and the Transportation and Traffic Associations.

It was felt unanimously that the chaos of conflicting traffic rules in cities and states constitutes a potent breeder of automobile collisions with each other, with pedestrians and with street cars, and from this thought and discussion came definite action—i.e., arrangements for the appointment of a committee to convey to the parent association the feeling of the Claims Association that the Hoover code should be fostered and stimulated so that its traffic control provisions may be incorporated into the laws of every state.

No claims man can fail to be interested in the proceedings of the closing day, with its symposium on claims subjects. It included an account of what happened in Milwaukee, where three Circuit judges sat for many weeks on an inquisition into ambulance chasing by personal injury lawyers and how the city was purged of their pernicious activities; also the last word on special conditions in Montreal, Cincinnati, Pittsburgh and other cities.

There were new faces, and younger men as well as practically all of the "regulars," at the meetings this year. No executive can afford not to have at least one of his claims men at next year's convention.

Engineering Committee Activities Bring Tangible Results

REPORTS presented this year by the various committees of the Engineering Association were notable for the number of definite recommendations contained. In most instances these committees investigated specific subjects and accomplished tangible results. They dug out the facts, examined them carefully, and stated without equivocation the logical conclusions deduced therefrom.

A good example of this method of working is furnished by the report of the committee on light-section rail. Comprehensive data were secured on the use of 7-in. grooved girder rails of various weights. From the figures obtained, it appeared that there was a considerable demand for a 7-in. rail lighter than the A.E.R.A. standard. The committee therefore recommended the adoption of a new standard, and submitted a design for a 7-in. grooved girder rail weighing 103 lb. per yard. The work of this committee was performed with the neatness of a mathematical exercise which begins with a hypothesis and proceeds through the demonstration to a definite conclusion.

Obviously, it is not possible to handle every subject in just this way. In the main, however, the reports made by the engineering committees were presented with commendable brevity and clarity. No one could read them without getting a very clear idea of the problems and the committees' ideas of what to do about them.

Unfortunately, the same cannot be said for the reports of all the other associations. Granting that their problems are not all susceptible of the precise treatment given by the engineers to their problems, there remains, nevertheless, much opportunity for improvement. This can best be accomplished by narrowing the scope of activity of the individual committees and studying specific subjects more intensively.

Increased Speed Is a Vital Necessity

AGREEMENT among members of the Transportation and Traffic Association present at the convention was practically unanimous that increasing the speed of car operation is one of the most important problems before the industry today. Opinions differed, however, as to how this desirable result could best be obtained.

In the discussion revolving around the subject of bus operation, it was pointed out that a combination of buses to handle the local traffic and cars operated on a high-speed express schedule with infrequent stops is a possible solution of the problem. Another method of attaining a somewhat similar result is by the operation of the buses in high-speed de luxe service, while the cars carry the local riding. In Detroit the first mentioned of these plans was said to be working well, while the second has met with marked success in Pittsburgh and elsewhere.

That traffic regulation has an important bearing on the speed of car operation was emphasized at another meeting. It was the general opinion that electric railway managements should take the lead in having transportation surveys made in the cities where they operate. Only after this has been done can effective traffic regulations be formulated. Regulations based on guesswork or simply borrowed from some other city are likely to do more harm than good. It was clearly brought out that the foundation of all effective traffic regulation is exact knowledge concerning traffic flow.

Speed was considered the first and most important element in service betterment by the committee studying this subject. The necessity of improving the character of electric railway rolling stock was by no means overlooked by the members of this committee or the delegates participating in the discussion, but it was felt strongly that faster service is of even more importance than better cars. Several transportation men mentioned the desirability of using street loading platforms. This results in speeding up not only the car service but also the movement of other vehicles. The need for quicker acceleration and braking was brought out, although it was emphasized that this should not be done in such a way as to cause discomfort to passengers.

It was admitted that the average street car today is far behind the times in the matter of speed. On the other hand, it was pointed out by one of the engineers present during this discussion that there is no physical reason why the street car should not be the fastest accelerating and braking vehicle on the streets. Judging by the keen interest displayed in this matter of speed by all members of the T. & T. Association present, the electric car of tomorrow will be a faster as well as a better vehicle than the car of today.

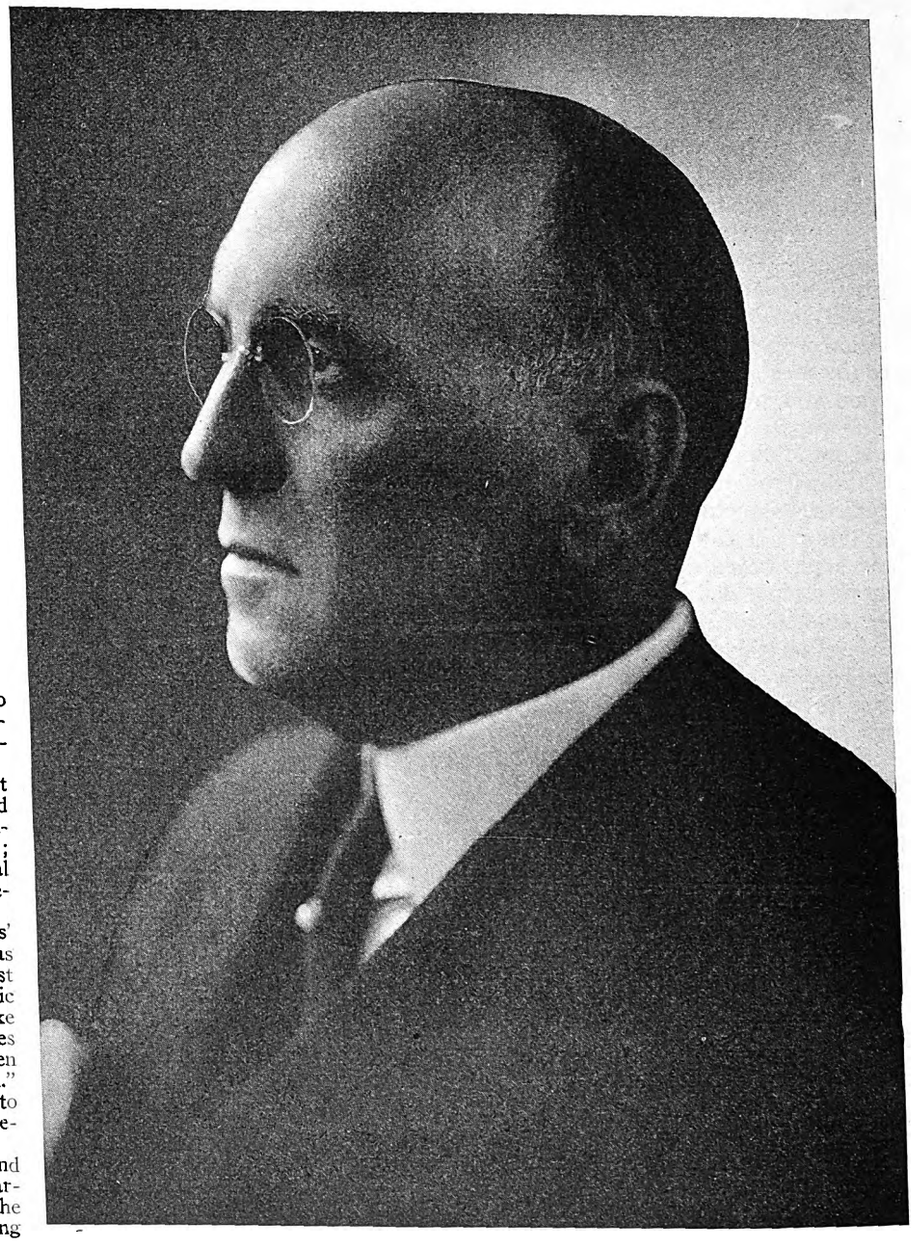
R. P. Stevens

Newly Elected President of A.E.R.A



R. P. STEVENS, president Penn-Ohio Edison Company, was elected president of the American Electric Railway Association Oct. 4.

In Mr. Stevens the industry has a fit leader for its present-day problems and opportunities. The field of his past activities extends from Maine to Washington; the range of his abilities from practical house-wiring to broad-scale interstate development.

As recently as 1926 Mr. Stevens' Pennsylvania-Ohio Electric Company was honored with the Coffin award for most distinguished achievements in the electric railway and motor coach field. De luxe interurban cars and de luxe express coaches have ceased to be a novelty, but when R. P. Stevens put the final financial "O.K." on orders for such equipment some five to six years ago he knew he was taking something more than a sporting chance.

Here was a property of small towns and short interurbans shot to pieces from wartime hangovers and competition, with the management faced by an overwhelming propaganda to tear up the tracks and run on rubber only. But there was no weakening. Instead, there was developed the first real co-ordination of rail and coach. Side by side, the company modernized its railways and installed a higher-rate, special-stop motor coach service. When 1926 rolled around, it had completed the full depreciation on its automotive equipment and could prove that its scheme of unification had made good.

With such pioneering by its own president, the American Electric Railway Association can look forward with confidence to the coming year, with its ever-speeding trend toward finer equipment with higher standards of service for an auto-accustomed public. Having made good on his own property, anything that he has to say before fellow-workers or the general public will be greeted with redoubled respect.

On looking back over the past years, one finds that responsibilities came early to Ray P. Stevens. Born in Eastport, Maine, in 1877, his boyhood and youth knew the training of New England effort and frugality. As he made his way through high school and the University of Maine, he built up a house and hotel wiring business to earn the wherewithal. Even his later work at the Massachusetts Institute of Technology went in tandem with jobs from the Bell Telephone Company and the General Electric Company.

After he built some lighting plants in the South for the General Electric Company, Mr. Stevens found himself at Everett, Wash., at the beginning of the century, where he practically built an entirely new system from power house and track through to cars and general organization. Returning East, he held a number of operating positions until 1907, when he achieved the presidency of the important Lehigh Valley Transit Company at the age of 30. In short order, a deficit was turned into a surplus.

Following six years successful work on what became known as the "Liberty Bell Route" through Mr. Stevens' pioneer work in ride salesmanship, he was called in October, 1913, to the presidency of the Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, a corporation which has since expanded into a great interstate group of power and transportation interests. With the expansion of these interests, Mr. Stevens found it necessary to make his headquarters in New York. There he also founded the engineering firm of Stevens & Wood.

Throughout the greater part of his career Mr. Stevens has gladly given his time and knowledge to association activities. While in Pennsylvania he was twice elected president of the Pennsylvania Street Railway Association. He is a past-president of the American Electric Railway Transportation and Traffic Association and now he has attained the highest personal honor within the gift of the industry, the presidency of the American Electric Railway Association.

Those who know R. P. Stevens appreciate his genial character as well as his broad views. If a man's character is best displayed among employees rather than equals, that of Mr. Stevens can well stand inspection. Throughout fourteen years on the Youngstown properties, labor relations, particularly in the difficult field of transportation, have been exceptionally harmonious.

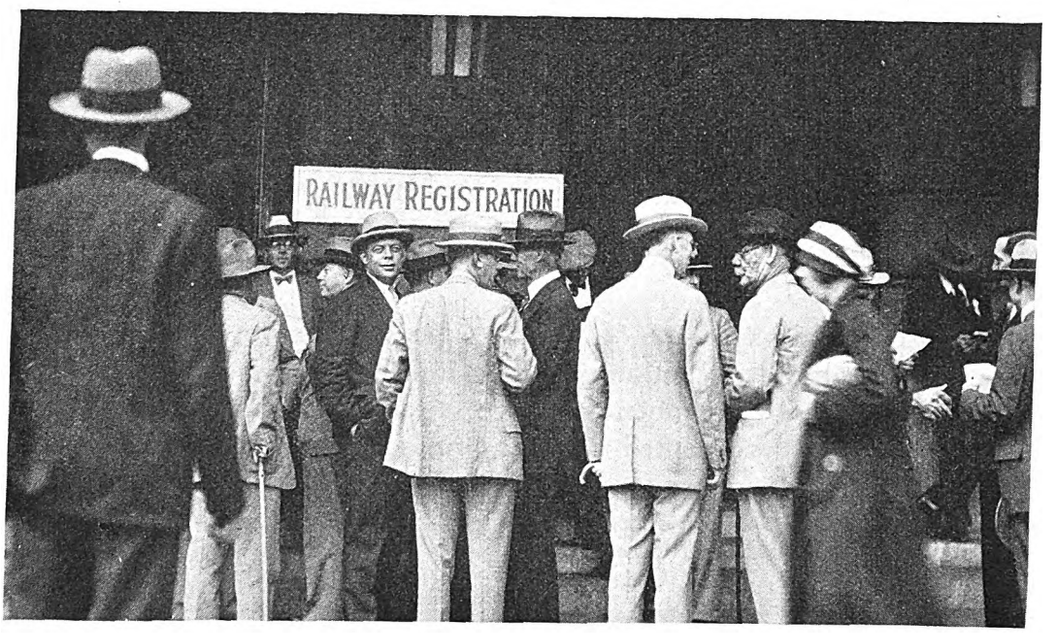
Second Cleveland Convention Eclipses Last Year's

More and better exhibits, improved arrangements, and an augmented program all contribute to the most successful convention in the history of the association



Rush hour at the registration desk

FOR the second time in two years a convention of the American Electric Railway Association has been held at Cleveland, Ohio. This year, the 46th in which a convention of the association has taken place, another record has been made. More railway men registered than last year. Figures for total registration are not available, so it is not possible at this time to say whether the record in this respect will be broken. More exhibit space was used than ever before, and the exhibits were more carefully chosen.

Changes from last year's program were numerous. Committee reports were conspicuous by their absence. None but the essential routine reports were made in the American Association. The Engineering Association, which handles the greatest share of the standardization work, naturally must consider many reports of its technical committees. Even here only one afternoon was devoted to this phase of the work, the meeting being split into parallel sessions that were attended by those who were most vitally interested. The other afternoons were taken up with addresses by men from within or without the industry, who are experts on the subjects they discussed.

For the first time in the history of the association the exhibits were all in place and the doors thrown open Saturday noon, Oct. 1. The registration on Saturday and Sunday showed that many persons took the opportunity of gaining time to inspect the exhibits beforehand rather than waiting until exhibit day, as in past years. Some rearrangements in the booths made access easier, so that there was not the congestion around some of the booths as in past years. Except for a shower on Saturday afternoon the weather was fair throughout the convention, so that many more persons inspected the outdoor car exhibits than saw those on display last year.

An earnest desire on the part of all the officers of the association to hold meetings on time was noticeable throughout. Discussion was limited, so that unless the speaker really had something to say he made way for the next one without waste of time. By this means the sessions were put through on schedule and closed earlier than has been customary.

The formal opening of the convention took place on Monday morning in the Auditorium. The Cleveland Railway Male Chorus and the Pittsburgh Railways Band alternated in providing an excellent musical program. At the appointed time President Willits H. Sawyer introduced City Manager W. R. Hopkins of Cleveland, who welcomed the delegates. Headed by the band, the assemblage marched to the West Wing, where Mr. Hopkins made the formal address of welcome.

President Sawyer talked earnestly to the delegates in his annual address, stressing the opportunity to give service. Following Mr. Sawyer came a succession of

Digitized by Google

excellent addresses by men prominent in the business and political worlds. Each left an impression on his hearers.

On Tuesday, Wednesday and Thursday a series of fourteen luncheon round-table conferences was held. The subjects on Tuesday were traffic regulation, taxes, the motor bus, the trend in franchises, developing the sales instinct in platform employees and advertising. On Wednesday, cars, financing, public relations, bringing city service up to date, valuation, fares, and employee relations were the topics. On Thursday there was a single luncheon, devoted to the subject of opportunities and prospects for the interurban.

No program of the association would be complete without an address by E. F. Wickwire. This year his talk sparkled just as much as ever, and he, as in former years, made as many points that drove home.

With all its serious topics the convention was not without its moments in lighter vein. Golf was confined to Sunday. Monday evening the president's reception was held. Tuesday evening's session, sponsored by the Advisory Council, had as its entertainment feature a number of solos by Miss Anna Case, prima donna of the Metropolitan Opera Company. On Wednesday evening one of the local theaters was completely reserved for the delegates and a special show was put on with features for the members. Thursday evening the grand ball was held in the Auditorium.

The Pittsburgh Railways Band gave concerts each afternoon during the convention, and the Cleveland Railway Male Chorus also gave a series of concerts for the delegates. These features added greatly to the success of the convention.

Regulation and Traffic Control Discussed

At Monday's session of the American Association street traffic control and regulation of public utilities were the subjects of addresses by prominent speakers. Revisions of the constitution and by-laws adopted broaden the scope of the association

BRIEF exercises in the Auditorium opened the 46th convention of the American Electric Railway Association at Cleveland on Monday, Oct. 3. A concert was given by the Cleveland Railway Male Chorus and the Pittsburgh Railways Band. President W. H. Sawyer introduced City Manager W. R. Hopkins of Cleveland, who formally opened the sessions. Headed by the band the audience then marched to the meeting room in the West Wing, and the business of the day began.

In his address of welcome Mr. Hopkins paid tribute to John Stanley, late president of the Cleveland Railway, who passed away at the opening of the convention last year. He said that the work of leading and modernizing the Cleveland Railway so ably begun has been carried on successfully by Col. J. H. Alexander. The virility of the transportation industry is shown, he said, by the way it is attacking the problems of the day with energy and intelligence.

The excellent state of the finances of the association was indicated in a brief report by the treasurer, Barron Collier.

The morning was devoted to two addresses. The first by Dr. Miller McClintock, director of the Erskine Bureau for Street Traffic Research of Harvard University, and the second by Hon. W. W. Potter, Attorney-General of Michigan.

Dr. McClintock spoke on street traffic control and electric railway operation, calling attention to a number of the vital points that are essential to betterment of present conditions. It is not possible in the ordinary narrow streets, he said, to give an exclusive right-of-way to street cars. It is, however, within the limits of reason to require vehicles to leave the tracks on the approach of a car so that it can proceed.

Loading zones are essential to safety and dispatch in the handling of street car traffic, he believes, and raised platforms should be installed. Parking should not be eliminated, but it should be controlled. Double-line parking should be prohibited.

The only reason for the use of signals for traffic control, Dr. McClintock believes, is to reduce delays. At least 50 per cent of the automatic signals in use today are worse than useless. The electric railway men should see to it that the installations are made only where they can do some good.

Progressive signaling, where the lights are so changed that vehicles can progress from one end of the control zone to the other without the necessity for a stop, is the best method that has yet been devised. This reduces the unnecessary standing time and speeds all movements.

A telegram of congratulation from President Coolidge was read by the president. This appears elsewhere.

Mr. Potter, speaking on the regulation of public utilities, traced the change from unbridled competition to regulated monopoly, showing the excellent results obtained. The demands of the public have changed, but the railways have not met them, he said. The methods must be modernized accordingly and the rates needed to support them will come, as the public in the long run is appreciative. Payment for paving in the railway area is archaic, he holds. It is unfair, as the community in general is using an investment made by the railway as a result of legislation dating back to the horse car days. The general taxes of the railway are the same as those for other corporations, but the proceeds are often used to provide a right-of-way for a competitor who is attempting to take business away from the railway.

Digitized by Google

Important changes in the constitution and by-laws of the association were adopted. In brief, these will broaden the statement of the objects of the association, and will make it possible for the executive committee to admit to membership, with proper restrictions, companies operating any form of urban or interurban transportation. Other changes will provide a class of membership for the various state and sectional associations to form an effective tie with their work, and to provide for plural voting in recognition of the difference in size of the various electric railways. This is particularly important in voting on standards. The schedule of dues was revised so that the finances of the Advisory Council would be consolidated with those of the main association.

American Association Elects Officers

Ray P. Stevens is chosen as president. Association listens on Tuesday to budgets. Conditions in the industry and how the public may be pleased

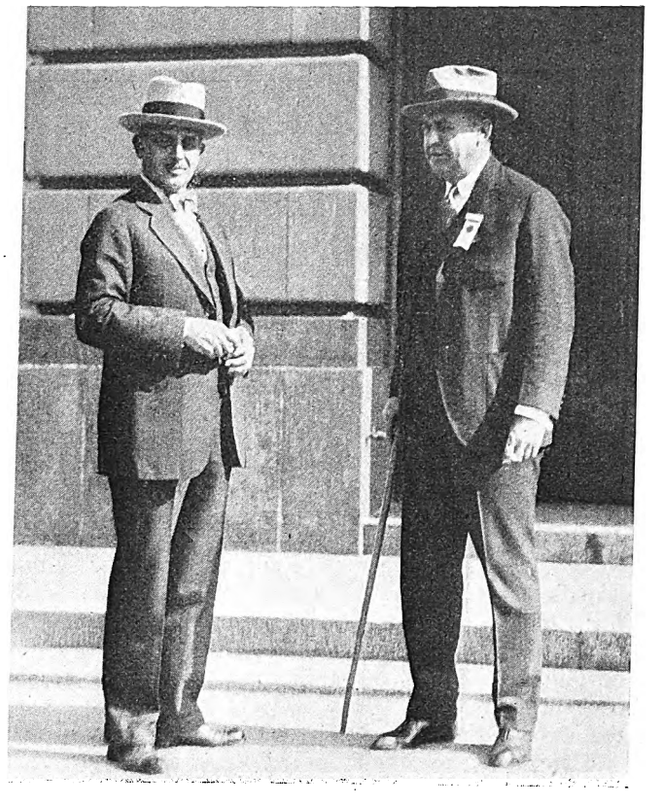
FOUR outstanding addresses featured Tuesday morning's session of the American Association. The subjects were budgeting for the future, improved conditions in the industry, the changing demands of American business, and methods by which the railways may please the public.

Before the first address, Past-President J. N. Shannahan presented the report of the nominating committee. The entire ticket, headed by Ray P. Stevens for president, was elected unanimously.

George E. Fraser of the firm of Fraser & Torbet, certified public accountants, spoke on the ten-year budget. An abstract is published on another page of this issue.

M. H. Aylesworth, president National Broadcasting Company, chose as his subject "Smile and the World Smiles with You—Weep and You Weep Alone." He said that he had originally decided to use as his title "Don't Imitate the Undertaker — He Serves Only the Dead," but that after a survey of the situation he had decided the former title would be more appropriate. He paid tribute to the way the electric railway industry has weathered the storm of the past few years and has profited greatly by the experience. A spirit of optimism and confidence, he said, is necessary if the transportation industry is to convince others it is a public service essential in character.

W. E. Wood



C. R. Ellicott and E. D. Kilburn

Merle Thorpe, editor of the *Nation's Business,* forcefully told the audience of the present orgy of lawmaking, which is in large measure aimed at American business. Some 92,000 bills were introduced in the last session of Congress, but practically none of the old laws was repealed. The administration of these many laws is burdensome and unduly expensive. One family out of every eleven now is employed in the administration of the laws. It is Mr. Thorpe's opinion that no government can operate a business as efficiently as can a private individual. Business is not a lower type of activity than the professions, said the speaker; it is in itself a profession with just as high standards and ideals. The industrial system of America has created three times the wealth that existed previously.

We still suffer from an old-fashioned idea of a secular order as distinguished from religion, held the Rev. Dr. A. W. Wishart, pastor of the First Baptist Church of Grand Rapids. It is not possible to separate the two, for a civilization or a business or a government cannot be built on falsehood. Men who make products such as those featured in the exhibits shown at this convention cannot do it without having character. He called attention to the beauty of the modern designs, holding that utilities may be pleasing as well as useful. This is a new era. The old era of corruption, political chicanery and trickery is fundamentally wrong and is immoral. Fortunately it is passing. The old way of doing business was secretive, he continued. Now when a good piece of work has been done, instead of keeping it to himself the author can scarcely wait until the next convention to tell about it and so make it useful to others in the industry.

On motion of Mr. Shannahan a vote was passed thanking the speakers for their addresses and the program committee for having secured them.

Grand Rapids Railway Wins Coffin Award

Small property in city of 160,000 awarded 1927 prize at Advisory Council meeting. B. C. Cobb, chairman, points out industry's pressing needs. Hon. George B. Cortelyou discusses the relation between utilities and government

IN RECOGNITION of accomplishments which have had a widespread influence on the entire industry and have done much to awaken the present almost universal interest in the improvement of electric railway service, the Grand Rapids Railroad Company, Grand Rapids, Mich., was awarded the Charles A. Coffin Medal for 1927. President W. H. Sawyer, chairman of the Coffin Award Committee, who made the presentation during the Advisory Council meeting at the Cleveland convention, read the report of the committee setting forth the accomplishments of this property.

The report itself epitomized these accomplishments. With limited facilities, on its initiative and largely with its own resources, this comparatively small railway property, which was scarcely known outside of its own city a few years ago, undertook to demonstrate to the world the process of popularizing electric railways by the improvement of equipment and service. So radical were its methods, the report points out, that when it filed a brief in the competition two years ago, there was considerable doubt as to the outcome of its experiment. The present awakened interest in the improvement of cars, which has permeated to all the manufacturers and to almost every operating property in the country, received a strong impetus by the pioneering of this comparatively small company.

Its accomplishments were not all in the direction of spectacular innovations and showmanship. Combined with this there was a consistent program of increasing operating efficiency and reducing costs. With no change in the rate of fare, revenues in 1926 showed an increase of 1.04 per cent over 1925, and in 1927, when the average figures for properties of its size showed a heavy decrease, it held its revenue slightly above what it had been in 1926, despite a reduction in the activity of the basic industry in its city. For the year ended May 31, 1927, there was a reduction of 9.88 per cent in operating expenses and an increase of 20.83 per cent in net revenue in comparison with the year 1926. After charging off depreciation amounting to approximately 10 per cent of its gross, there was available after taxes a balance equal to 6.4 per cent of its rate base of $6,000,000. This was an increase for the year ended May 31, 1927, of 41.68 per cent over the corresponding period of 1926. There had likewise been an increase in this figure for 1926 over 1925 of 15.63 per cent.

Twelve Contestants in 1927 Competition

There were twelve contestants for the 1927 award. The committee reported grave difficulty in making a selection because of the excellence of the presentations and felt that each of the briefs was entitled to recognition by the industry because of the accomplishments shown by these twelve properties—namely, Birmingham Electric Company; Chicago, South Shore & South Bend Railroad; Chicago Surface Lines; Durham Public Service Company; El Paso Electric Company; Georgia Power Company; Grand Rapids Railroad Company; Little Rock Street Railway; Northern Texas Traction Company; Southern Colorado Power Company; United Railways of St. Louis, and Virginia Electric & Power Company. Of these contestants the Northern Texas Traction Company won the award in 1924 and has continued to be a contender each year, having submitted this year its fifth consecutive brief. Two other of the above companies submitted briefs in previous years, Grand Rapids in 1925 and El Paso in 1923, 1925 and 1926.

B. C. Cobb

Several of the contestants showed evidence of major accomplishments which were considered by the committee to be ample basis for granting them the award had not the prize been so closely contested by the presentation of impressive accomplishments on the part of a number of other properties.

Gross and net revenues were increased by the Birmingham Electric Company, which also effected substantial operating economies and increased riding on its cars by rerouting, new cars and frank publicity.

The Chicago, South Shore & South Bend Railroad doubled its earnings in a period of two years by a program of complete rehabilitation and by the provision of comfortable and luxurious cars designed to win the patronage of former automobile drivers. By arranging to operate its cars over the electrified tracks of the Illinois Central Railroad, an entrance to the heart of downtown Chicago was obtained, thus increasing the usefulness of the road to the territory which it serves.

Despite increased ownership of automobiles in Chicago, the Chicago Surface Lines increased its rides per capita by the improvement of service. Gross earnings were increased and greater operating efficiency was obtained by a determined program of improvement undertaken in the shadow of a receivership and in the face of an expiring franchise. Participation by the railway management in the program of reducing traffic congestion

Officers and key men on prize-winning property

in the downtown district, combined with demonstrated public interest and leadership, won for it the co-operation of its community in bringing about traffic improvement. A major rerouting plan was put into effect without a serious hitch, and resulted in material speeding up of service with important operating economies. A record for efficiency was made during the Christmas holidays, by the operation of 100 per cent of all its equipment.

Continuation of a major program of rehabilitation and improvement over a number of years in the face of losses in revenue and despite those losses finally brought an upturn in the revenue curve for the Georgia Power Company. This improvement program was maintained in the face of a discouraging showing in pursuance of a policy of winning public recognition and support by the sheer weight of performance and demonstrated good faith. This property also succeeded in putting 100 per cent of its equipment in service during the holiday period.

The Little Rock Street Railway equipped its property with new and attractive cars and buses. It showed a reduction in the number and cost of accidents accompanying a change to one-man operation. One hundred per cent of the company's employees are owners of its stock.

Both gross and net revenue were increased by the Northern Texas Traction Company through the modernization of car equipment and the adoption of a scientific fare schedule.

Scientific co-ordination of street-car and bus service by the Durham Public Service Company resulted in a steady and large increase in gross and net revenue. The property shows a remarkably low record of accident costs.

The El Paso Electric Company shows increased average speeds and increased earnings with a steady betterment in its accident record.

The Southern Colorado Power Company rehabilitated its cars, increased operating speed, improved its operating and maintenance methods and succeeded in selling its securities to a large number of local stockholders.

Accomplishments by the United Railways of St. Louis, a company in receivership, include an increase in the number of passengers and in gross earnings, together with a decrease in the deficit after depreciation, taxes and interest charges. Speed was increased and improvement in power and distribution efficiency was shown by the use of a large proportion of automatic and portable substations. Accidents also showed a large decrease.

In the period of only slightly more than a year the Virginia Electric & Power Company completely reversed the opinion and attitude toward the company of the public in the communities it serves. New franchises were obtained, bus and car service was co-ordinated, large increases were made in gross and net revenue and the railway department was put on a self-supporting basis. A heavy program of rehabilitation was undertaken, exten-

Digitized by Google

sive rerouting was carried out and new fare schedules put into effect.

One of the features of the evening meeting of the Advisory Council was the annual report by B. C. Cobb, its chairman, which is abstracted elsewhere in this issue. He expressed conservative optimism regarding the outlook for the industry, pointing out that there has been no appreciable change in the number of passengers carried by electric railways and their allied motor bus lines during the past three years. The figure has remained almost stationary at sixteen billion passengers despite rapid increases in the number of automobiles owned.

Still another outstanding feature of the Advisory Council program was an address by George B. Cortelyou, chairman of the Joint Committee of National Utility Associations. Mr. Cortelyou's address is also abstracted elsewhere in this issue. Representing as it does the gas, electric and local transportation industries of the country, this committee speaks as the representative of an investment of capital approximating seventeen billion five hundred million dollars. To illustrate further the extent of the utility enterprises in this country and the widespread public interest which they represent, the speaker pointed out that the savings of approximately 5,000,000 people are represented by the investment in the utilities. He voiced the creed of this vast industry in the words, "We do not consider our job measurably complete until the public is well satisfied because well served."

An Experience Meeting of Operators Held

In five-minute talks prominent electric railway men tell how they are solving their problems. Addresses are presented on finance and progressive methods

FOLLOWING out the general plan of devoting the meetings to formal papers, the greater portion of Thursday morning's session was taken up with addresses by E. F. Wickwire, vice-president Ohio Brass Company, and F. H. Sisson, vice-president Guaranty Trust Company. Mr. Wickwire gave one of his inimitable talks.

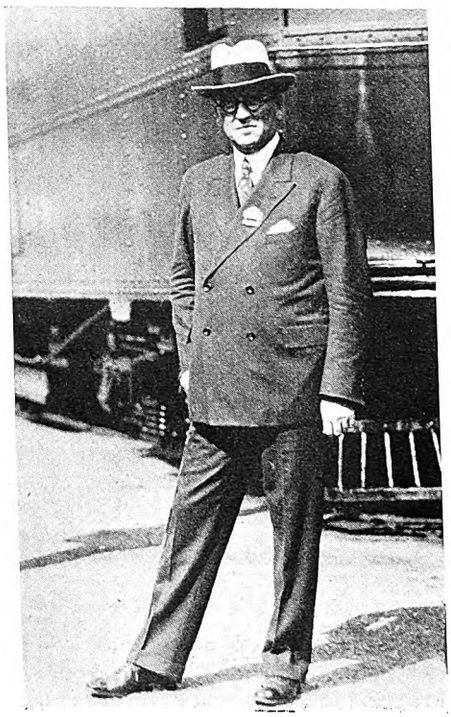
Mr. Sisson spoke on the financial situation. The present situation is more reassuring, he said. The public education campaigns are admirable and are producing results and the industry is becoming stabilized.

A feature of the session was a series of five-minute talks on operating problems. The first was by J. L. Alexander, Galveston-Houston Electric Company, who told of the methods used to inspire his men to greater efficiency and loyalty. In order to get the ideas over, the employees have been organized into classes.

R. H. Pinkley, Milwaukee Electric Railway & Light Company, said the methods used to meet the transportation requirements in Milwaukee include improvements in service, higher schedule speeds, and keeping the cars on schedule. Buses are used for special service, and are co-ordinated with the cars.

C. H. Jones, Chicago, South Shore & South Bend Railroad, gave some of the details of how he has developed a 300 per cent increase in business. The property was run down and about ready for the undertaker when it was taken over. The new owners had faith in the electric railway business and so were willing to incur the expense necessary for rehabilitation. Several things in particular have been done that have improved conditions: (1) An adequate entrance into the heart of Chicago was obtained; (2) at first the company furnished service far in excess of the requirements; (3) the best possible use was made of a parallel motor coach line; (4) a campaign for freight business was begun, both carload and less-than-carload shipments being solicited; (5) a new business department was formed to solicit passenger traffic; (6) a recreation bureau learns of the attractions of the territory served and sells the idea to the general public. There is only a small amount of attention paid to solicitation of passengers, as it is felt that if the territory is built up the riders will come to the line naturally.

There has been an increase in passenger revenue during the first part of this year of 175 per cent over 1926, while the maximum increase in one month was 200 per cent. The freight business is running at the rate of 150 per cent over 1926, while the maximum month shows a 175 per cent gain. This is a testimonial, he said, that the public wants good transportation service.



R. P. Stevens

Col. H. W. Alden, Timken-Detroit Axle Company, spoke of the policy of his company regarding experimental work in connection with street car drives. The type of drive that was chosen, he said, was one that had shown itself to have the longest life.

D. W. Pontius, Pacific Electric Railway, mentioned the loss of passenger traffic due to automobile competition. Though there has been a considerable increase in population in the territory served by his lines, there has been little growth in the passenger business. The freight business is growing at a rapid pace, he said, and the Pacific Electric Railway is now the third largest freight carrier in California, being exceeded only by two steam railroads.

The electric railways in his territory are modernizing and going after business, he said. He outlined the improvements being made in Los Angeles. Lines are being double tracked where needed, and other means are being used to increase the capacity.

A. F. Townsend, Northern Texas Traction Company, Fort Worth, attributed the success in his city largely to the substitution of light-weight Birney cars operated by one man, for heavy two-man cars. Schedule speeds also were increased. In 1914 the operating costs were 15 cents per car-mile, and by 1920 they had jumped to 25

Digitized by Google

cents. Introduction of the new cars caused a recession to 16 cents per car-mile in 1926, though the trainmen's wages are increased 180 per cent over what they were in 1914.

H. T. Connelly, Washington, Baltimore & Annapolis Electric Railroad, told of automobile and bus competition along the 40-mile route between the terminal cities. To meet this the old two car trains have been replaced by modern articulated cars, saving 44,000 lb. in weight, and one man out of the three formerly needed. While the cars have not been in service long enough to get comparable figures, there has been a gain in traffic since their introduction.

Adrian Hughes, Jr., United Railways & Electric Company, Baltimore, said that there has been a reduction in trolley wire breaks from more than 100 per month to one in 50 days. This has been accomplished with a reduction in cost of the line department from $100,000 a year to $60,000 a year. The change in method was introduced in December, 1920. Previously the line crew waited until a failure occurred; now by careful inspection failures are anticipated. There also has been an improvement in material used, it being appreciated that the best is the cheapest in the long run.

The *Electric Traction* speed trophy, awarded to the Chicago, North Shore & Milwaukee Railroad, was accepted by General Manager Harley A. Johnson, who told of the methods adopted for increasing the schedule speed without raising the maximum speed.

Installation of the new officers was the closing formality of the convention, following the report of the resolutions committee.

Discussions at the Lunch Table

Specific topics considered at fourteen round-table conferences prove of interest to many of the delegates

A SERIES of round-table luncheons was a feature of the Cleveland convention. Fourteen were held under the auspices of the American Association in addition to the several luncheons conducted at the noon hour by the several affiliated associations. Of the American Association luncheons, six were held on Tuesday, seven on Wednesday, one on Thursday and one on Friday. A brief account of those held on the first three days follows:

No. 1 was devoted to traffic regulation.

It was brought out that there is a marked tendency to install traffic control lights without regard for the conditions under which they are to operate. The bad results of this practice in various cities were mentionad by a number of speakers. Others emphasized the importance of railways assuming leadership in solving traffic problems.

Taxes were considered at luncheon No. 2. Most of the information developed at the meeting related to the taxing practice of different states on public utility properties, particularly electric railways. While no attempt was made to obtain any general consensus of opinion, the thought was expressed by several of the speakers that a gross or gross-net tax was simpler to determine and had the advantage usually of requiring a smaller number of tax boards.

Luncheon No. 3 was on the motor bus and was largely an experience meeting in which representatives from Louisville, Youngstown, Los Angeles and other cities gave their experiences.

The subject discussed at luncheon No. 4 was trend in franchises. One company said its difficulties on a new franchise were solved when it induced a group of representative citizens to investigate its situation and make recommendations.

At luncheon No. 5, on developing sales instinct in platform employees, the possibilities in this direction were brought out by the experience of several companies.

Luncheon No. 6, on advertising, was attended by more than 100 delegates and there was an exchange of ideas on the best means of selling car and bus rides.

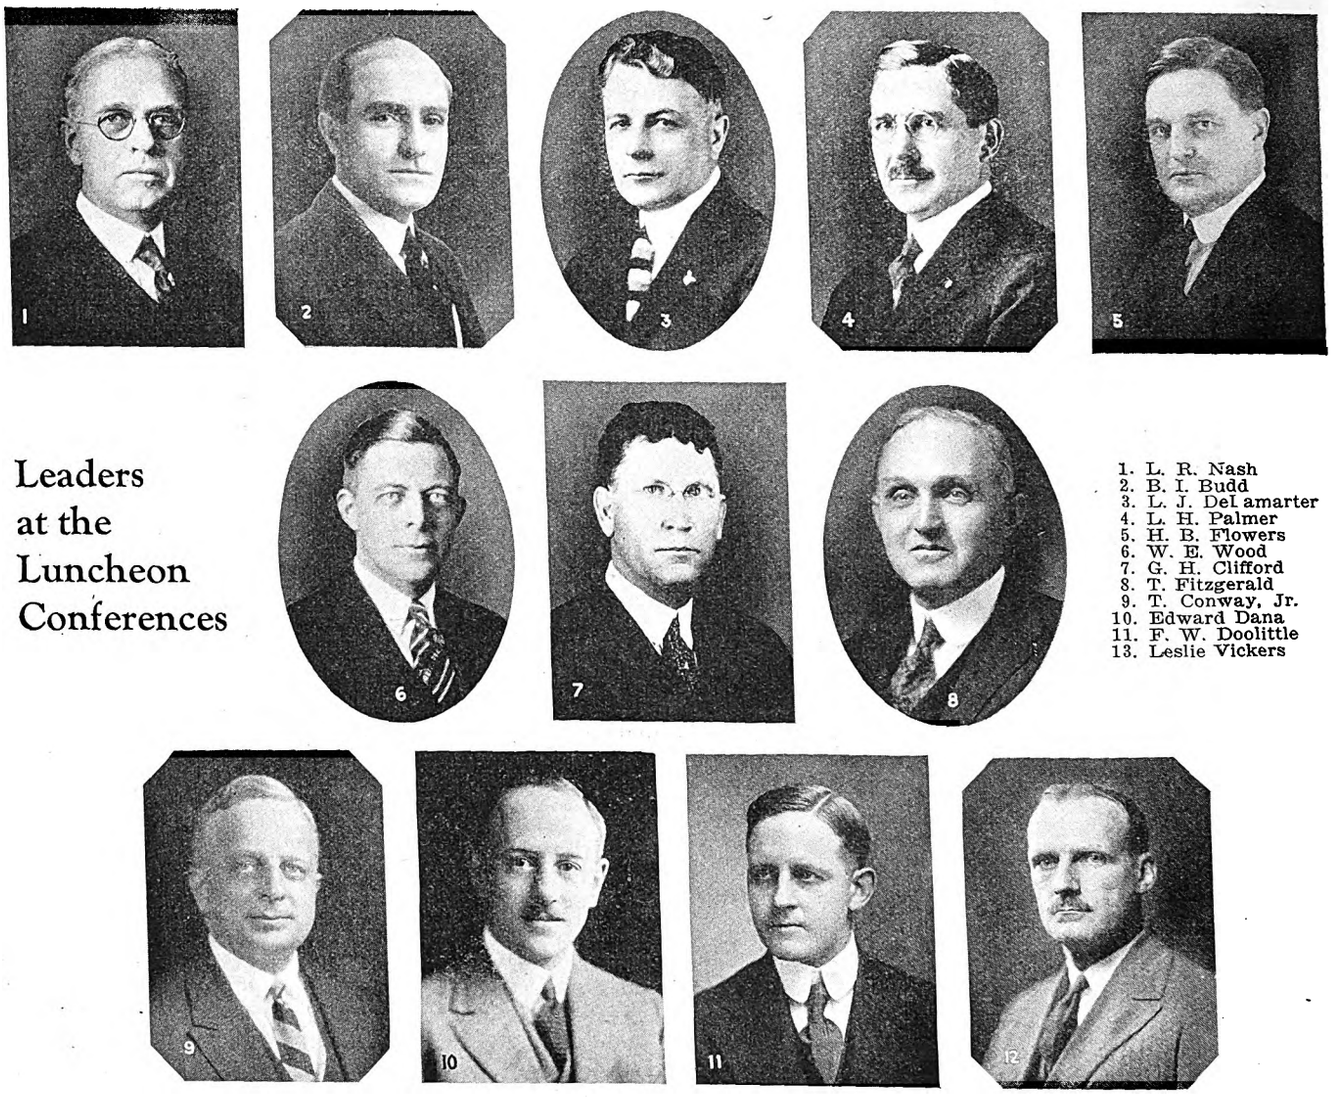
The popularity of the round-table luncheons at the Cleveland convention assures their retention as a feature next year. On Wednesday the American Association held six more of these informal meetings at which delegates were able to exchange experiences without loss of time. So many registrations were received for some of these luncheons that two rooms instead of one had to be engaged. When the discussion took place, however, all of the diners came together in one room.

This was the case with lunchean No. 7, on the subject of cars. In it the actual experience testimony of men who have carried out car improvement programs piled up convincing evidence of the growing acceptance by the industry of the importance of improved cars as the key stone of the entire service improvement program for electric railways. Several examples were cited of properties which had first started on a small scale with the remodeling of older equipment and had gradually expanded its program to the purchase of new cars of the most modern types available. Representatives of several large properties at the luncheon said that they were only awaiting demonstration of the proper types of equipment to be used before entering upon extensive replacement programs. There seemed to be no question in any one's mind but that the present car exhibit had demonstrated in no uncertain way the possibilities in developing cars that can compete successfully with the private automobile under modern traffic conditions.

Methods of new financing and refinancing of electric railway properties was the subject of luncheon No. 8. It was presided over by President-Elect Stevens. He opened the meeting by calling attention to the report of the advisory committee on electric railway finance, presented to the association in 1925. In this report it was recommended that where necessary to revise the financial structure, arrangements should be made to do it voluntarily without the necessity for a receivership. There are some properties, he explained, that cannot be made successful. The sooner this is admitted and they are eliminated, the better the general railway situation will be. L. S. Storrs pointed out that the better the earnings the lower the interest rate that can be obtained. Some question was raised as to why the senior security holders should be made to suffer rather than the junior. It was brought out that the junior holders will suffer in any event where a reorganization of the capital structure is necessary.

"Get your house in order," "sell your employees before you try to sell your public"—such were the rallying cries of the public relations luncheon (No. 9). Thomas Fitzgerald of Pittsburgh in opening this discussion mentioned briefly the policy of his company not to punish employees and not to allow any hint of compulsion to

Digitized by Google



enter the company's dealings with the public. Careful employee education and a fair attitude toward the city and the riding public are held by him to be more effective policies than would be heavy-handed methods. R. B. Stearns of Boston outlined briefly the "home rule committee" plan which the Eastern Massachusetts street railway evolved for improving public relations in the various communities which it serves. Fred Cummings of the same company expressed the belief that every company should have a good newspaper man in charge of its public relations, a man with courage enough to stand up to the railway executives and tell them when he believes their attitude to be wrong, even at the risk of sacrificing his own head. John Davies of Philadelphia spoke of the comprehensive plan of employee-employer co-operation which has been worked out in Philadelphia, resulting in a company sales force numbering 12,000 enthusiastic individuals. Adrian Hughes, Jr., of Baltimore mentioned the fact that his company has one employee for every 200 citizens in Baltimore, the obvious inference being that when each employee takes upon himself a responsibility for the company's public relations splendid city-wide coverage results. Other speakers told of good results in Houston and Fort Worth, Tex. The problem of interurban public relations was discussed by Mr. Allenson. He described the experience of his own company with the interurban line between Fort Worth and Dallas and pointed out that first-class equipment and service will do more for good public relations than anything else within the power of the company to accomplish.

More than 100 attended luncheon No. 10, on city service, many telling how the replacement of old cars with new or modernized cars, increased speed and additional comforts had resulted in increased patronage and greater friendship for the utility on the part of the public. In Chicago improved service has been obtained in speeding up street cars by co-operation with municipal authorities and other affected interests through a successful plan for street traffic control. This has enabled the speed of the street cars in Chicago to be increased to an average of 11.02 m.p.h. Other experiences along somewhat similar lines from Atlanta, Detroit, Kansas City and St. Louis were cited.

At the valuation luncheon, No. 11, the discussion centered particularly on the fundamental difference between historical value and cost of reproduction value. One of the intangibles that seemed to bother all representatives present was going value. Courts have ruled that some allowance must be made for this, but no rules for arriving at it have been given. The problems of each utility seemed to require separate solution so that a method used on one property is not applicable to another.

Digitized by Google

At luncheon No. 12 it was declared that the trend of fares was still upward despite the difficulty in securing increases, the dangers of making fares too high and the effect of changing fare rates on public opinion. Many interesting facts on various types of fare were mentioned, and means of attracting off-peak traffic at reduced rates and educating the public as to the need of higher fares with better service received considerable attention.

Luncheon No. 13 was devoted to employee relations, and accounts were given of the practice in discipline, pensions, benefit associations, etc. It developed that the benefit association in Milwaukee, composed of more than 6,000 employees, handles its own life, health and accident insurance, operates a building, savings and loan association and handles matters of safety, service and every other feature affecting its membership. The association also has more than $500,000 invested in good securities, and its members have more than $9,000,000 invested in their own building and loan stock. Through this association 3,500 employees have been able to purchase or build their own homes.

Under the sponsorship of Dr. Thomas Conway, Jr., president of the Cincinnati, Hamilton & Dayton Railway, the luncheon meeting on Thursday, devoted to the general subject of interurban railways, provoked a spirited discussion of many phases of the intercity problem. B. J. Fallon, speaking for the group of Insull owned high-speed electric lines radiating out of Chicago, declared that the large increase in the travel habit between cities offers interurbans a greater prospect for business, provided that the proper kind of service and selling initiative can be developed. As an example he cited the experience of the Chicago, South Shore & South Bend Railroad, which has shown an increase of 150 per cent in its business following an extensive program of rehabilitation and intensive merchandising.

D. W. Pontius said that the Pacific Electric Railway is about to spend more than $1,000,000 for improved seats and better facilities for its passengers in the effort to compete more successfully with the privately owned automobile. W. H. Burke testified to the effectiveness of higher speeds and remodeled cars by citing the experience of the Galveston-Houston Electric Company in successfully competing for business.

Freight revenue was held by many of the executives present to afford opportunity for the development of additional business. Freight earnings by the Interstate Public Service Company, according to L. M. Brown, have more than offset the decrease experienced in passenger business. H. A. Nicholl expressed the opinion, based on the experience of the Union Traction Company of Indiana, that interurbans must ultimately go to pick up and delivery of freight in one form or another to meet truck competition. J. M. Bamberger announced that the Bamberger Electric Railway had just started a pick up and delivery service at each end of its line, at regular trucking rates in that territory. He considered delivery of even more importance than pick up in the eyes of shippers.

A discussion of the proper type and size of passenger equipment for interurban service led to differences of opinion which occupied attention during the balance of the meeting. This discussion revolved around the relative advantages and safety of heavy and light equipment in high speed service. Dr. Conway summarized the situation by suggesting that interurban equipment divides itself into various classes depending upon the nature and characteristics of the line and service.

In addition to these luncheons, similar gatherings were held by the Accountants, Claims and Engineering Associations on Wednesday. References to them will be found on other pages of this issue.

Maintenance in the Limelight at Cleveland

Journal prizes awarded at dinner during convention. Prominent executives emphasize importance of maintenance men's part in popularizing electric railway service

W. T. Rossell
Who spoke at the Maintenance Dinner in Cleveland on Oct. 2

"SPEED, convenience, comfort, safety, economy—these are what the times demand. No inconsiderable part in the achievement of these things rests upon the maintenance man. He finds himself always between two opposing forces, improvement and economy. One without the other is easy; together, they test him. The balance that creates the greatest use is the end sought."

With these words, W. T. Rossell, general manager Pittsburgh Railways, characterized the problem of the maintenance man at a dinner held at the Hollenden Hotel on the evening of Oct. 2, when the four annual prizes awarded in the ELECTRIC RAILWAY JOURNAL'S maintenance contest were presented to the winners.

Three of these winners were able to be present. They were James A. Duffy, superintendent of equipment Monongahela West Penn Public Service Company, who received the first prize of $200; Joseph Mercier, general foreman track service division, Montreal Tramways, who received the second prize of $100, and E. M. Miley, estimating engineer Chicago Surface Lines, who received the fourth prize of $25. The winner of the third prize, $50, Charles Hermes, general foreman San Diego Electric Railway, was not able to be present, but the prize and a certificate of award were handed later to representatives of his company who were at the convention, for transmission to Mr. Hermes.

100 MEN INTERESTED IN MAINTENANCE PRESENT

Besides the prize winners and judges in the contest, those in attendance at the dinner included about 100 other representative delegates to the convention who are especially interested in maintenance problems. Those at the head table, besides Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL, who acted as the chairman, were President W. H. Sawyer and Managing Director L. S. Storrs of the American Electric Railway Association; Daniel Durie and R. H. Dalgleish, the retiring president and the incoming president of the Engineering Association; W. H. McAloney, president Association of Equipment Men, Southern Properties; P. V. C. See, past-president Central Electric Railway Master Me-

Digitized by Google

A Message to the Association

THE WHITE HOUSE
WASHINGTON, D. C., SEPT. 30, 1927

WILLITS H. SAWYER,
American Electric Railway Association,
Cleveland, Ohio.

I hope your convention will be most successful in furthering the cause of transportation so vital to the welfare of our people. Any progress in solving the real problems presented by modern conditions is a service to all. Please present my greetings and best wishes to your members and your guests.

Calvin Coolidge.

chanics Association; W. T. Rossell, general manager Pittsburgh Railways; A. T. Clark, superintendent of rolling stock and shops United Railways & Electric Company, Baltimore, and chairman of the committee of judges in the contest. The other members of the committee of judges, F. McVittie, electrical engineer New York State Railways; Howard H. George, assistant to chief engineer Public Service Production Company, and G. C. Hecker, special engineer American Electric Railway Association, were present as were also prominent railway and manufacturing executives.

The prizes were presented individually by Mr. Clark, chairman of the committee of judges, who declared that the purpose of the contest was to bring about a greater interchange of ideas between maintenance men and thus to raise the level of maintenance practice in the industry. In referring to these contests, he said:

"Since the men who are responsible for keeping cars, tracks and lines in efficient operating condition are inclined to be overmodest and reticent in taking the initiative toward publishing the improvements which they have found effective in saving labor or cost, this plan of posting prizes for such items was a very desirable and helpful one. The unusual publicity given to those items which were awarded prizes should also tend to break down the tendency on the part of maintenance men not to utilize in their own work an idea developed by the fellow on another property. In at least one instance a maintenance idea which was awarded one of the monthly prizes was quickly adopted by a large truck manufacturer and made a part of his standard equipment."

Mr. Clark explained that the members of the committee of Judges had been appointed by President Durie of the Engineering Association to represent different departments of maintenance work. He also explained the care used by the judges in naming the prize winners. In conclusion, he said:

"The board of judges desires to commend the action of the ELECTRIC RAILWAY JOURNAL for establishing these interesting contests. It is their belief that excellent benefit to the electric railway industry will result from the broadcasting through the railways of these various items and will stimulate those who would ordinarily give little thought to publishing their wrinkles to produce items of even greater benefit and more use to the many interested in electric railway companies."

Mr. Gordon, acting as chairman, pointed out that while the purpose of the meeting primarily was to award the prizes, the JOURNAL hoped thereby also to inspire in the maintenance men of the industry a broader vision of the part they play in popularizing electric railway service, to stimulate more interest in maintenance on the part of the railway executives and to encourage further developments of equipment and machinery through the introduction of these new devices to the manufacturers.

PROMINENT EXECUTIVES SPEAK

The railway executives who spoke at the dinner included Messrs. Sawyers, Storrs, Rossell, McAloney and See. All emphasized, though from different angles, the important part played by the maintenance man in popularizing electric railway service. Mr. McAloney said: "The street car is the show window of the industry, and unless the car is well maintained, clean, attractively painted and mechanically capable of operating with a minimum of failures, all the other efforts to popularize the service will fail."

Mr. Rossell, in addition to the remarks contained in the first paragraph of this article, said, in part:

"To me the significance of this maintenance contest is not the mere improvement in method in connection with a few operations. It is far deeper than that. It shows the alertness of mind, the enthusiasm and adaptability of the individuals. Formerly an attitude of mind seemed to exist based on the axiom, 'Never explain anything, your friends don't need it and your enemies won't believe it.' This attitude is breaking down. Everywhere men are traveling about to find out what others are doing. Everywhere men are explaining and showing their most cherished plans and methods. There is no property on which the visitor cannot learn something worth while. The harvest is waiting for the sickle."

Clarence W. Squier of the ELECTRIC RAILWAY JOURNAL staff, also spoke and showed slides of the apparatus which won the prizes. He explained the purpose and advantage of these devices. He also showed slides of other equipment entered in the annual and monthly maintenance contests.

Educational Conference Held Friday

THE final event on the program of the Cleveland convention was the educational luncheon and conference, held Friday at the Hollenden Hotel. Edward Dana, Boston, chairman of the American committee on education, was sponsor for the conference, and it was held under the leadership of Arthur J. Rowland, Milwaukee.

The principal subject discussed was systems for training platform men and bus operators. Experience quoted at the meeting was that following an extended course of this kind on one road, there had been a 70 per cent reduction in accidents, 10 per cent in labor turnover and 20 per cent in claims cases. The course is divided into three general divisions, i.e.: (1) The school training, (2) road training and (3) instruction in equipment details.

It was found that all the roads represented at the conference give special attention to the instruction of one-man operators, and they considered that freight operation adds many problems to the operating course.

The difficulty of modernizing the ideas of some of the older employees was mentioned as a considerable problem by some of those present. Many excellent methods used to select members of the supervisory force were also brought out at the meeting.

Digitized by Google

Improved Methods and Equipment Needed, Say Engineers

Ways of producing economical maintenance discussed. Power economies result from use of automatic substations. Motor coach design an added problem. Commercial aviation a new field. Committee reports show progress made

ECONOMY was the general subject of papers and discussions at the first day's session of the Engineering Association. That these problems are receiving much attention was evident. The general impression given was that improved methods and better equipment provide the surest road to ultimate maintenance economies and that although costs at the start may appear high, the ultimate results are the important ones to be considered. Improvements to railway cars, trucks, overhead and power supply are entirely up to the engineers and maintenance forces. That these problems are receiving much attention was evident.

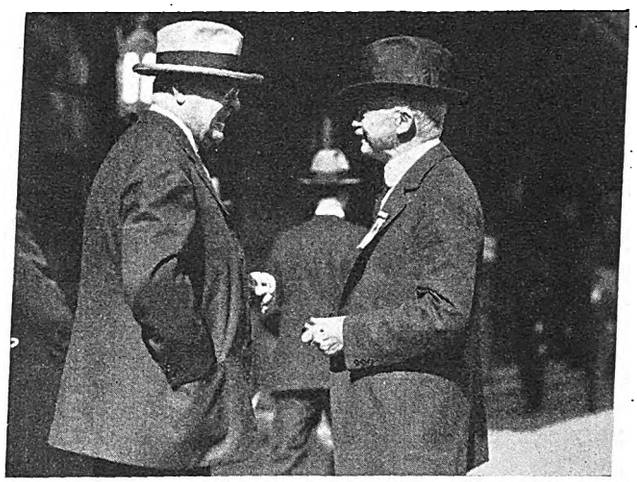
In his address as retiring president of the Engineering Association, Daniel Durie stated that many changes have taken place in our industry during the past decade. Car design, weight reduction, one-man operation, higher accelerating and braking rates, higher speeds, reduction of noise, improved appearance of car bodies, scientific lighting and increased comforts and conveniences for passengers are among the important developments.

In the power field, the automatic substation is a development which has influenced greatly the design and operation of substations. Now comes the mercury arc rectifier, which may have a marked influence on present practices in power conversion and distribution.

All of you are familiar with the developments that have taken place in the construction and maintenance of tracks. The use of labor-saving machinery and modern methods of track construction and maintenance, together with the application of welding to rail joints, has wrought great changes in this branch of our work.

The motor bus brings an entirely new set of engineering problems to be solved, and aërial transportation is being talked of. Perhaps our next set of problems will come in connection with the design, operation and maintenance of airplanes. The significant aspect of all these developments is the changed status of the electric railway business. The obligation to furnish any and all kinds of public transportation in our communities falls squarely upon the shoulders of the established transportation industry. This was held to broaden the field of activity for the electric railway engineer, and to open up greater opportunities ahead for those who can measure up to the job.

The association has been active through its committees and its staff at headquarters in gathering and disseminating information, in establishing good practices and in developing standards for use by the industry. Research work in several fields has been carried on under committee supervision to develop data for the advance of the art and to effect economies. The association is the agency through which the industry expresses its views and safeguards its interests in national standardization and in joint studies and investigations with other national groups.



J. G. Barry and W. B. Potter

The activities of the association have been expanding due to changed conditions and to the impetus given to national standardization and simplification through the work of the American Engineering Standards Committee and the Division of Simplified Practice of the Department of Commerce. This has necessitated a complete change of the association's committee structure in order that more men might be enlisted in the study of the ever-increasing engineering problems and in the development of improved practices and better standards. The new committee system will be completed during the next year. It appears to possess many advantages over the old system, but the executive committee is not yet entirely satisfied with the results and is striving constantly to improve the plan.

In recent years there has been too little time for the presentation and discussion of committee reports and there has been no time at all for papers and discussions of general interest. A new plan is being tried this year which the officers believe will greatly enhance the value of the meetings. This plan provides for group meetings to be held simultaneously, one for the rolling stock division, one for the way and structures division, one for the power division and one for the purchases and stores division. All committee reports will be presented and discussed at those group meetings and all necessary committee business transacted.

Another matter to which the executive committee has given considerable thought is that of promoting wider

Digitized by Google

use of the association's standards and recommendations. Obviously the maximum benefits and economies of standardization can be realized only when such standards become generally accepted. Some of our present standards are quite widely accepted today. Others, however, are not used very extensively and the executive committee is seeking the reason for this in the hope that our entire program of standardization can be made of greater value to the industry. Committee members can help in this problem by using our standards and recommendations and by urging others to use them.

Track, Cars and Power

A paper on each of these subjects was presented at the Monday afternoon session

IN A paper on track construction and maintenance economies, F. B. Walker, chief engineer Eastern Massachusetts Street Railway, showed charts to indicate the amounts of track reconstructed, progress by years, derailments and costs in a rehabilitation program of his company. He also described a base plate joint construction used on his system. This paper is published in abstract elsewhere in this issue.

W. H. Sawyer, president of the American Association, spoke briefly and emphasized the need for recognizing the human element in all engineering work, instead of insisting that things be mechanically perfect. He said that the convention speaks for itself; it is the biggest and best ever held, but what are we going to do about it? Everyone is sure to go home with a thrill and with new pride in the work that they are doing and with the fact that they are electric railway men. Mr. Sawyer emphasized, however, that the job is just beginning. Engineers must work out the foundation on which to build for a better future.

"Economies Obtained with Modern Cars" was the title of a paper presented by W. R. McRae, superintendent rolling stocks and shops Toronto Transportation Commission. This paper brought out the thought that attractive cars are not sufficient. Maintenance methods must be improved and as a result costs will decrease. Mr. McRae described the modernization program as carried out by his company and spoke of maintenance improvements, cars, shops, track, line, record systems and new tools used. Results showed that this elaborate program has paid far beyond expectations and that modernization, if properly carried out, will convert a deficit into a surplus. A more extended abstract will be found on another page of this issue.

Discussion of this paper brought out that increased attention to the modernization of all maintenance departments eventually results in economies and also a reduced attention to service and creates a better feeling toward the railway by its patronage. Two of the speakers indicated that managements of some railways appear to be forcing maintenance departments to give too great attention to the reduction of costs instead of insisting on improved maintenance methods and use of better and more modern equipment for the work. If railways are to continue to exist, this attitude must change.

The concluding paper of the first session was on "Automatic Substation Economies," by W. E. Bryan, superintendent of power United Railways of St. Louis. This described how automatic substations are constructed in St. Louis and showed that a large saving has resulted over operation with manual stations. This paper is also abstracted elsewhere in this issue.

Committee Reports Presented

Way and Structures, Rolling Stock, and Power Divisions Hold Separate Meetings

THE second day's meetings of the Engineering Association were devoted to committee reports. To facilitate presentation of these three simultaneous sessions were held. The first was devoted to reports of the way and structures division, the second to the rolling stock committee reports and the third to power reports.

Way and Structures Division

Evidence of the extent to which track and roadway officials are studying the problems of their department of electric railway service was given in the quality and variety of reports presented at the meeting of the way and structures division of the A.E.R.E.A. on Tuesday. H. H. George, chairman of the committee and assistant to the chief engineer Public Service Production Company, Newark, N. J., presided and presented the report of the main committee. W. W. Wysor, chief engineer of the United Railways & Electric Company of Baltimore, was sponsor of the meeting. The interest of the members in the work of the division was shown by an attendance of 150 engineers and construction men.

In addition to the technical reports and discussions, a brief talk was made by Lucius S. Storrs, managing director of the A.E.R.A., in which he pointed out the important part good track construction and maintenance plays in good transportation.

"The best and cheapest investment a railway can make is good track. Smooth tracks are a necessity in this day, when the automobile with its pneumatic tires has taught the public to demand comfortable, easy-riding transportation," Mr. Storrs said.

In addition to the report of the committee on way and structures by Chairman George, two other regular committees reported. C. A. Smith, superintendent of roadway, Georgia Power Company, Atlanta, as chairman of the committee on road preservation filed the committee's report recommending several changes in the manual. He stated that the committee considered the major part of its work had been completed and recommended that it be discontinued as an independent committee, the industry to be kept advised of new developments in the future by a special committee of the division. A more extended abstract of this report will be found elsewhere in this issue. E. M. T. Ryder, way engineer Third Avenue Railway System, New York City, made a brief verbal report telling of the studies being made under the direction of the committee on welded rail joints.

Reports also were filed by a number of special committees. The report of the committee on rail corrugation was made by D. D. Ewing, professor of electric railway engineering, Purdue University. The variety of problems involved in this subject was indicated when Professor Ewing stated that "everything between the trolley wire and 10 ft. under the track" might be a contributing factor in this mysterious cause of damage to rail. Further particulars of this report appear on another page.

Digitized by Google

Left, A. T. Clark and W. W. Wysor; right, Terence Scullen

An interesting paper on corrugation was presented by E. O. Ackerman, maintenance of way engineer Columbus (Ohio) Railway, Power & Light Company. Mr. Ackerman told of his studies over a period of years and advanced the theory that corrugation was caused by synchronization of pulsating flow of power with tort vibration of axle and wheels, these vibrations becoming cumulative at certain speeds of the vehicle and causing corrugation.

W. R. Dunham, Jr., executive engineer Department of Street Railways, Detroit, made the report of the special committee on review of Manual. He suggested that in the section of the Manual W. 108-23 Rivets there should be a revision of paragraph 503 to read as follows:

"Rivets shall be of full diameter called for on plans, and rivet holes shall not be more than $\frac{1}{16}$ in. greater in diameter. When not otherwise called for by plans or specifications, rivets shall have standard button or cone heads of uniform size for the same size rivet. Countersunk rivets shall be flush with the surface and fill the countersink except that the rivets through base and tie plates may have a crown of not more than $\frac{1}{8}$ in. below the surface of the plate."

E. M. T. Ryder, Third Avenue Railway, read the report of the committee on special track work. It referred particularly to switch tongues and hard centers and is given in abstract elsewhere in this issue.

Arc-welding processes and welding rod specifications were reported on by C. F. Gailor, of New York, chairman of this special committee. This report was based on a very thorough study, and the committee says it believes the report represents the most reliable and up-to-date information possible to secure at the present time. It contained a set of rules to be observed in arc welding, a set of welding rule specifications, both contained in appendices which the committee recommended should be published for general distribution. The committee also recommended that further study be made of the subject, particularly of the cost of welding rods, comparison of welding rods and use of special alloy rods.

A. T. Spencer, general superintendent of construction and maintenance Montreal Tramways Company, gave the report on alloy steels other than manganese for special trackwork, and light section girder rails were reported on by C. A. Alden, chief engineer of the frog and switch division of the Bethlehem Steel Company. Further discussion of rails was contained in the report of the special committee on relative advantages of 7- and 9-in. girder rails, which was given by H. F. Merker, chief engineer way and structures Brooklyn City Railroad.

A. E. Harvey, superintendent construction department Kansas City Public Service Company, reported on the effect of modern vehicular traffic on paving in the track area, giving special attention to the effect of increasing loads carried by rubber-tired vehicles in breaking down paving subgrade.

Other track matters were discussed in the report on track ballast and drainage delivered by S. C. Baker, engineer maintenance of way East St. Louis Railway Company, and on track construction specifications by C. L. Hawkins, engineer maintenance of way United Railways of St. Louis. C. H. Clark, engineer maintenance of way Cleveland Railway Company, offered in lieu of a written report on track checking gage two gages designed for this purpose by his committee.

J. R. McKay, chief engineer Indiana Public Service Corporation, Fort Wayne, gave the report on bus garage design and told of work that has been done in co-operation with the National Fire Protection Association in an effort to arrive at acceptable construction specifications.

H. E. Bachman, of Newark, chairman of the special committee on car house and shop construction and wiring regulations, was unable to attend the meeting and no formal report was made. Chairman George stated that the committee on joint railway and bus terminals had been inactive during the year and announced the appointment of E. D. Eckroad, engineer maintenance of way northern Ohio Power & Light Company, Akron, as chairman for the coming year.

Rolling Stock Division

Assuming that the amount of discussion is an indication of relative interest, it appears that modern cars, car lighting and noise reduction are the live subjects in the rolling stock division. Thirteen special reports and three general reports were presented at the session, abstracts of which appear elsewhere in this issue. In the progress report on suction strainers for air compressors J. C. McCune, chairman, urged that greater attention be given to suction strainer maintenance. The report contained descriptions of some late type designs.

The committee on sidewear of motor brushes reported progress and recommended a continuation of its study. The special committee on gearing reported that no conclusions could be arrived at regarding relative merits of helical and spur gears.

The committee on overhead current collecting devices presented two sets of graphs, one plotted from information secured by previous committees and the other from data obtained from this year's committee. These graphs showed companies arranged in order of their wheel life, and the outside diameter of the wheel used and trolley pole tension were plotted for these companies. The graphs were very similar in wheel life, but the 1927 data show a wide variation in trolley wheel pressure against the wire. They also show a more uniform diameter for wheels used.

Power Division

At the meeting of the power division of the Engineering Association held Tuesday, Oct. 4, two important commitee reports were read and discussed.

The first, on power transmission and distribution, was read by Chairman F. McVittie, electrical engineer New York State Railways, Rochester, N. Y. The particular subjects covered in this report were specifications for catenary construction and materials, trolley wire wear, improving specifications for bronze trolley wire, radio

Digitized by Google

interference, inductive co-ordination and design of distribution layout for automatic substations. The advisability of establishing a standard for comparing methods of operating and maintaining overhead lines and the standardization of trolley wire reels were also treated. A design of suspension for contact car and a specification for standard bronze trolley wire were reported as having been adopted by the standards committee. Further details of this report are published on another page.

The committee on power generation and conversion, W. E. Bryan, superintendent of power, the United Railways of St. Louis, chairman, had three specific subjects to report on: The ventilation of automatic substations, mercury arc rectifiers and economical trolley potential for congested districts of urban systems. The ventilation report included the results of an intensive three-year study on this subject. Other valuable information was given by W. E. Peters, C. A. Butcher and Pierre Blommers. The mercury arc rectifier report stated that no method of rating had as yet been agreed upon. Data on some rectifier installations were given by O. K. Marti. Results of tests on trolley potentials for congested districts were given. The economies effected by the use of certain voltages under various conditions were included in the report, of which further details are given on another page.

General Meeting Thursday

Motor coach engineering, overhead line maintenance, and aviation discussed

MOTOR coach design, overhead line maintenance and commercial aviation formed a varied program for the third and concluding session of the Engineering Association. The paper by H. D. Church, director of engineering White Motor Company, on trends in motor coach engineering brought out discussion as to developments that will provide greater accessibility of parts so that maintenance operations can be carried out cheaper and with less trouble. Light-weight construction through the use of aluminum or other light-weight materials appears as one development that will be watched closely. In answer to a question "Why Use Four Speed Gearing?" discussion showed that the speed steps of gearing for buses is determined usually by the worst conditions encountered.

New developments were referred to by Carl Stocks, editor of *Bus Transportation*. "An interesting feature," he said, "is the tendency toward automotive street cars on rubber tires. In the early days the automobile note was predominant in bus service. Engine location, lines of body, position of driver, all had to copy the private automobile as far as could be done with the much larger vehicle, or, at least, so it was thought. Now comes a new movement worthy of close study. Is the public concerned merely with getting somewhere as soon as possible regardless of the appearance of the vehicle, or has past favoring of the automobile type of vehicle had anything to do with the popularity of the bus?"

Maintenance of a large overhead system was discussed in a paper by M. W. Cook, superintendent of power and inclines Pittsburgh Railways, in which stress was laid on the great value of efficient overhead maintenance. Discussion brought out that proper organization to reduce detentions is most vital. Various speakers described things they are doing along this line.

The latest form of transportation, that by airplanes, was discussed in a paper, "General Aspects of Commercial Aviation," by R. H. Horton, former vice-president Philadelphia Rapid Transit Air Service. Mr. Horton traced the development of commercial air services since the war. Much of the progress has been in the mail service. He pointed out the dependability of this, and suggested that a method of payment be adopted that will more equitably compensate the carriers for the service rendered. Passenger air transport he holds to be one of the most important fields for development, although it has been sadly neglected.

The closing business of the session included the installation of newly-elected officers and the presentation of a past-president's badge to Daniel Durie, retiring president.

Conference on Welded Rail Joints

EXTENSIVE investigations by scientists and practical engineers conducted during the past year under the direction of the committee on welded rail joints of the Engineering Association were described at a meeting of the committee on the lower floor of the Auditorium Wednesday morning.

E. M. T. Ryder, way engineer Third Avenue Railway System, New York City, and vice-chairman of the committee, presided. Mr. Ryder stated that the committee, which is a joint committee of the A.E.R.A. and of the American Bureau of Welding, a research department of the American Welding Society, had outlined a series of investigations to determine the best type, size, shape and seam of welded joints, the effects of preheating and post-heating, the comparative advantages of use and non-use of base plates and the advantages of contact or compression of the joint. One hundred and fifty joints will be made up for these tests, and Mr. Ryder stated that approximately one-fourth of this number had been made up during the past year and turned over to scientific investigators.

Prof. H. L. Whittemore, chief of the division of mechanics, U. S. Bureau of Standards, Washington, described and presented charts showing the results of telemeter investigations into the effects of impact loads and static loads. O. S. Peters, also of the Bureau of Standards and an associate of Professor Whittemore in these studies, was scheduled also to speak but was unable to be present.

"Strain gage" investigations to determine the strains on seam-welded rails resulting only from the process of welding were described by Prof. L. H. Crook, of the department of mechanics, Catholic University, Washington. Studies along a similar line have been made during the year by Prof. Thomas R. Lawson, of Rensselaer Polytechnic Institute, Troy, N. Y., who told the committee about them.

W. W. Wysor, chief engineer United Railways & Electric Company of Baltimore, was in charge of a third series of experiments on the effect of "Impact on Joints Without Fishing Contact," and these were described by R. B. Fehr, of the Una Welding & Bonding Company, Cleveland, under whose direction the tests were conducted.

J. Wolfe, assistant superintendent of track and roadway Chicago Surface Lines, was elected a member of the executive committee, succeeding E. J. McIlraith, staff engineer of the same company, resigned.

Standard Tongue Switch Indorsed

AT THE Engineering round-table luncheon on Wednesday emphatic approval of the new proposed standard solid manganese steel tongue switch was voiced by way engineers from all sections of the country. Drawings of the suggested design were distributed by E. M. T. Ryder, who sponsored the meeting and called for expressions of opinion. It was generally agreed that many advantages can be had by standardization of switches and that the proposed design meets the needs of the situation. Some doubt was expressed as to whether a 6-in. riser was sufficiently long. This matter will receive further consideration by the committee.

Representatives of special trackwork manufacturers stated that the standard switch could be supplied at the same cost as designs now used. Practically every engineer who was present agreed to install one or more of the new switches during the next year for experimental purposes.

Better Buying and Storekeeping May Help Industry's Finances

PURCHASING agents and storekeepers who attended the meeting of the purchasing and stores division on the afternoon of Tuesday, Oct. 4, were not left in any doubt concerning their rôle in the present-day transportation drama. They were told in no uncertain terms by President W. H. Sawyer, Lucius Storrs and B. J. Yungbluth, president of the International Railway Company, Buffalo, N. Y., that they were the "watch-dogs of the money drawer"; that the financial stability of the electric railway industry depends, in large measure, upon their unceasing efforts to wipe out waste expenditures.

Should Widen Their Scope

Time after time the thought was advanced by the various speakers that purchasing agents and storekeepers, far from being mere routine cogs in an organization, should ever be widening their scope and becoming familiar with the activities of all departments in their respective companies. In this way these men become competent to assume a large share of the responsibility for coordinating more completely the work of their departments with that of the remainder of the organization. By reducing the investment in materials on hand, more money is released in the "cash drawer" of the industry.

Greeted cordially by Daniel Durie, president of the American Electric Railway Engineering Association, and presided over by J. Fleming, assistant secretary and purchasing agent of the Capital Traction Company, Washington, D. C., and chairman of the committee on purchases and stores, those in attendance were unanimous in their feeling that the afternoon was a most profitable one.

J. G. Barry, vice-president of the General Electric Company, discussed the possibilities of further standardization of equipment and urged that operating companies improve their own financial condition by adopting, as far as is consistently possible, the standards that have been established by manufacturers and by the American Electric Railway Engineering Association. This would make quantity production possible to a much greater degree than is now the case and would benefit materially both operating companies and manufacturers.

Mr. Barry also suggested that a real source of saving would be found in a reduction of the number of separate orders sent to manufacturers by railway purchasing departments. A number of small orders consolidated on one sheet will cut down amazingly the amount of "paper work" by both buyer and seller. This reduction will mean savings, not of hundreds but of thousands of dollars a year to the railways, in the opinion of Mr. Barry.

Mr. Yungbluth, in emphasizing his point that the investment in materials on hand be kept as low as possible, cited the "horrible example" of one large company about two years ago which had more than $100,000 worth of special work on hand which had never been used and for which there was no immediate likelihood of a demand. At the time, the financial condition of this company was very dubious and it could ill afford this needless tying up of capital.

"Some Phases of Stores Practice" was the title of a talk by W. E. Scott, superintendent of supplies for the Philadelphia Rapid Transit Company. Mr. Scott has been active in the work of the committee on purchases and stores since its establishment in 1923, and he outlined in interesting fashion some of the accomplishments of this group since that time, mentioning particularly the effectiveness of the stock-book plan, adopted in the year 1923.

Mr. Fleming Reads Report

The report of the committee on purchases and stores for 1927 was read by Mr. Fleming and was adopted in its entirety by the members of the division. An abstract appears elsewhere in this issue. Particular attention was called to the simplified invoice form mentioned on page 12 of the report, and the division voted favorably on the committee's recommendation that this simplified invoice form be indorsed by the American Electric Railway Association.

An added note of interest in the meeting was given by the unexpected attendance of both Mr. Sawyer and Mr. Storrs. These men spoke from their own experience as operating executives in stressing the importance of purchasing agents and storekeepers in the progressive forward movement of the transportation industry. In other words, these jobs are as big as the men that fill them.

T.&T. Plans for Increased Speed

Need for faster service emphasized at all meetings. Economies of bus operation and adoption of a uniform classification of accidents also discussed. Edward Dana becomes new president

METHODS of increasing the speed of car operation constituted the theme of greatest interest at the meetings of the Transportation and Traffic Association. The first session was devoted to a discussion of bus operation and it was brought out that buses can often be used to advantage in conjunction with cars to provide more rapid service. Much of the work done by the committee on traffic and safety, whose report was considered at the second meeting, was in the direction of speeding up service. Again at the third meeting the same thought was emphasized in the discussion of service betterment.

Careful study of the recommendations of the various committees was urged by J. V. Sullivan, retiring president of the Transportation and Traffic Association, at the opening session. He said that the statement in the report of the committee on bus operation that 80 per cent of the railways studied feel that bus operation is justified, even though a much smaller percentage were able to report revenue sufficient to pay a return on their investment, is evidence of real courage and a determination to carry out what these operators feel is an obligation to serve their communities. An outstanding feature of the report of the committee on traffic and safety to which he called particular attention is a suggested outline of subjects to be studied in making a traffic survey. Latest developments in traffic signal control are also ably presented, he said. The only way to sell our product, according to Mr. Sullivan, is through service betterment which involves comfort, convenience and speed of transportation. It involves also making transportation vehicles more attractive in design as well as in color.

In conclusion, he urged men of the operating departments to engage more actively in association work. By engaging seriously and studiously in committee work a man gets a more intimate knowledge of its important problems.

Views on Bus Operation

Report of committee provokes discussion as to whether buses can be run at a profit

WHETHER or not bus operation is profitable was the subject of lively discussion at the Monday afternoon session. R. N. Graham, chairman, briefly summarized the report of the committee on bus operation. Commenting on the report, L. V. Tighe urged that study be made to discover means of operating buses more cheaply so as to furnish mass transportation at lower cost. A. J. Brosseau said he had never heard of a profitable A.E.R.A. bus operation, but this, he believes, is because the value of bus operation has not been correctly appraised. B. C. Cobb differed from this opinion. He stated, however, that bus transportation is essential and that it can be made profitable by proper adjustment of service and fares. Garrett T. Seeley spoke of the indirect advantages of bus operation, such as smaller losses than would result from car operation under the same conditions. Combination bus and car service now being tried on Jefferson Avenue in Detroit was described by N. J. Shorn.

Experience in Cleveland with gas-electric and mechanical drive was discussed by M. W. Rew. He said that the gas-electric was more expensive, but possessed certain advantages in other ways. In the opinion of H. H. Hile it is desirable to keep the bus-operating personnel independent of the railway personnel, even though the services are co-ordinated. He emphasized also the importance of keeping bus weights down to a minimum. Care of tires was discussed by L. G. Fairbanks. A demonstration of the school of the Northern Ohio Power & Light Company for training bus operators was introduced by A. C. Blinn.

Lively Interest in Safety Work

Tuesday's joint session with Claims Association brings out need for careful analysis of accidents and their causes

PREVENTION of accidents was the subject of principal interest at the joint session of the T. & T. and Claims Associations on Tuesday afternoon. C. H. Evenson, co-chairman with H. K. Bennett, presented an outline of the work done during the year by the joint committee on traffic and safety.

Referring to the section of the report dealing with accidents N. W. Funk said that separation into chargeable and non-chargeable groups encourages trainmen to make greater efforts in safety work and explained the methods followed in Louisville. A similar opinion was voiced by William Paache, who stated that this separation had reduced accidents on the Chicago Surface Lines. Various changes were suggested by G. J. Kerwin in the present classification. George B. Anderson spoke of the desirability of adopting a uniform classification of accidents to permit comparison of what is being done on different railways. Lucius S. Storrs addressed the meeting briefly and emphasized the same point. D. L. Fennell said that recommendations for standardization had been made regularly and that the time had now come to take active steps to secure it. C. T. Boynton concurred in this opinion. J. V. Sullivan, presiding at the meeting, assured the members present that this matter would be taken up by the Claims Association. More attention should be given to the human element in safety work, according to A. J. Sarre. The need for wholesouled co-operation between management and men was stressed by J. P. Brown. The viewpoint of the Amalgamated Association of Street and Electric Railway Employees was presented by P. J. McGrath.

Digitized by Google

The report of the committee on bonus and award system was presented by G. T. Hellmuth. H. V. Drown explained the bonus system used by Public Service Railway.

Discussing traffic S. E. Emmons said that enough consideration is not being given by traffic regulatory authorities to the relative number of people carried by various vehicles. The tendency is to consider a street car and a private automobile as equally important from the traffic standpoint, whereas the car is really carrying many times more passengers. Making a traffic survey is not enough, in the opinion of M. R. Boylan. The real job is to secure the adoption of effective regulations. It is doubtful, he thought, whether it is desirable for the railways to take the lead in this matter. J. B. Stewart, Jr., said that traffic regulation is not a job for amateurs, but should be attempted only by experts after careful study.

Speed Essential for Service Betterment

Higher schedule speeds can be obtained by attention to details of operation. New officers installed at closing session

METHODS of speeding up electric railway service constituted the theme of the discussion at the Thursday afternoon session of the Transportation and Traffic Association. S. E. Emmons presented a brief résumé of the report of the committee on service betterment. He emphasized the fact that increasing the speed of car operation is the greatest need today.

Mr. Emmons also said that since the report of the committee had been printed a question had arisen concerning the definition of average speed as given therein. This was defined as being the figure obtained by dividing the total passenger car-miles by the total passenger car-hours, including lay-over time. Because some members objected to this definition, he suggested that the figure so obtained might be called operating efficiency rather than average speed. He stressed the point that such figures formed a better basis of comparison between companies than figures derived without including lay-over time.

C. H. Evenson stated that lay-over time should not be included in speed calculations. He expressed doubt concerning the desirability of making more frequent stops during the middle of the day than during the rush hour, as advocated in the report of the committee.

The dictionary states that speed is a rate of movement, according to E. J. McIlraith, and the committee cannot create a new meaning where speed is determined by the length of rest taken after the trip is over. However, it is quite possible and highly desirable to create a standard practice among members in determining speed.

The standard practice should be to class operating speed as the average rate of travel while operating. It can be obtained as a comparable figure from any company that pays proper attention to its scheduling.

Much damage is being done, he said, by misunderstandings as to street railway speed. For example, in Chicago it has been customary to report to the state commission crew pay-hours as car-hours for certain standard statistics, even though more than 11 per cent of the pay time is for time allowances outside of platform and terminal time. As a result the Chicago Surface Lines has been frequently represented as operating at a speed of less than 9 m.p.h. Bus operating and manufacturing officials have stated at commission hearings, before the City Council and in publications, that the street railway speed is below 9 m.p.h. They obtained that figure by dividing car-miles operated by crew pay-hours, which is no different in principle, Mr. McIlraith said, from what the committee proposes. Such tactics may some day be used against each railway operator, and unless he has a clean record of speed of operation that truly represents the meaning of speed, it may prove very embarrassing.

A contrary opinion concerning the value of speed was expressed by L. W. Heath, who thought that the average car rider is not so much interested in speed as in frequency and regularity of service. The attention which is now being paid to betterment of service marks a new era in the electric railway transportation industry, according to F. L. Butler. Speed is of paramount importance, he said. In Atlanta increased speed has not resulted in any increase in the number of accidents.

Increasing the rates of acceleration and braking is an effective way of increasing speed, according to J. C. Thirlwall. Use of track brakes and automotive type braking equipment are possible ways of accomplishing quicker retardation. He said that from an engineering point of view there was no reason why the street car should not excel all other vehicles in rapidity of acceleration and braking. An opposing opinion was expressed by E. J. McIlraith, who pointed out that the necessity of carrying standing passengers makes it impossible to accelerate and brake street cars as rapidly as automobiles. In his opinion, much time is now lost between the movement of the motorman's brake handle and the effective application of the brakeshoes to the wheels. Design should be improved to correct this situation, he thought.

George L. Kippenberger suggested that the best way for the electric railway industry to secure betterment of service would be for it to follow the example of Henry Ford and purchase modern equipment, even though this involved scrapping much expensive equipment that is not yet entirely worn out. W. T. Rossell mentioned the use of loading platforms as an effective means of increasing the speed of cars. These also tend to increase the speed of other vehicles using the streets.

Other phases of service betterment were brought out by A. J. Manson and J. J. Moran. Mr. Manson said that courtesy and tact on the part of trainmen are nearly as vital as speed. Mr. Moran suggested that trainmen be instructed to tell passengers the reason for delays.

After the discussion of service betterment, the report of the committee on resolutions was received and adopted. This included an appreciation for the work done by the officers of the association and the manufacturers in making the convention a success and an expression of the grief felt by the association on account of the death of E. M. Walker during the past year.

Edward Dana, the incoming president of the T. & T. Association, was escorted to the chair and made a brief address. He said that a meeting of the new executive committee had already been held and work of the association for the coming year would get under way within ten days. The meeting concluded with presentation of the past-president's badge to J. V. Sullivan.

Other new officers of the T. & T. Association for the coming year are W. H. Boyce, first vice-president; Samuel Riddle, second vice-president, and Paul Wilson, third vice-president. Members of the executive committee will be George B. Anderson, R. N. Graham, F. L. Butler and Richard Meriwether.

Accountants Bend Efforts to Solve Problems in Their Field

Reports and discussion show their earnest contribution to the advancement of accountancy in the industry. Referred to as the foundation stone of their organization. Bus accounting a subject of importance. T. B. MacRae was elected president

IN THE meetings of the American Electric Railway Accountants' Association at the Cleveland convention there was an impressive note that reflected the thought and earnestness that the accountants are devoting to a subject of vital importance to the electric railway and bus industry—accountancy. This body of men, referred to at one of the meetings as the foundation stone of their organization, are contributing to the science of railway accounting and endeavoring to solve the problems that arise in their field of work. A study of the reports of the various committees indicates not only the analytical student which the accountant of today is, but shows that he must have an essential grasp of all the details of the operations of his organization.

T. B. MacRae and Mrs. MacRae

Bus accounting was the uppermost subject apparently in the minds of a number of the members of the association, although it was for the most part informally discussed. Many interesting and informative points were evolved.

At the meeting of the executive committee on Oct. 2, President L. E. Lippitt of the association, with the approval of the committee appointed E. H. Reed, third vice-president of the association and auditor of the Brooklyn City Railroad, the association's representative on the national joint committee on taxation.

The opening session was called to order on Monday afternoon in Accountants' Hall, Cleveland Auditorium, by President Lippitt and was followed immediately by his address. In this he reviewed some of the matters that had engaged the attention of the association during the past year, first calling attention to the commitees that were appointed.

"Bus operation," he stated, "is playing a very important part in the transportation field. During the past year we have been working with some of the state commissions with the view in mind of having our classification adopted as a standard, and of course have met with some opposition. Nothing, however, was very serious, and we have hopes that, generally speaking, our standard classification will be used by the principal bus operators."

He expressed the belief that a national standard was highly important. Touching upon the subject of co-operation, Mr. Lippitt said: "Our association cannot fully measure up to its responsibilities without the co-operation of all of its company members and a real personal interest must be taken by them in the association's affairs." A communication from Past-President J. J. Duck was read expressing his regret at not being able to be present.

The report of the committee representing the Accountants' Association at the annual convention of the National Association of Railroad and Utilities Commissioners, W. L. Davis chairman, was read by O. H. Bernd, and received. It gave an account of this meeting.

Prior to the reading of the report of the committee on bus accounting by M. W. Glover, the president expressed his belief that this committee was one of the most important and that bus accounting seemed to be one of the foremost subjects before the association at present. The report is presented in abstract on another page. An informal discussion followed on the best method for bringing the classification before the various state commissions, after which the report was adopted.

Mr. Glover also read the report of the committee on standard classification of account. This report, which is abstracted on another page, was approved. Tribute to the splendid work of Mr. Glover in the association was paid him by Mr. Heberle, in which President Lippitt joined. Announcement was made that a get-together luncheon would be held at the Cleveland Athletic Club on Wednesday at 1 o'clock.

The address of the afternoon was delivered by Harry Boggs of Herdrich & Boggs, certified public accountants, Indianapolis, who took for his topic "Evolution of Regulation and Accounting." This made a marked impression on the association, so much so that he was the recipient of a rising vote of thanks from the members in addition to the thanks of the chair.

Announcement was made by Mr. Lippitt of the presence in the meeting of President Willits H. Sawyer of the American Electric Railway Association. Stirring, impressional and short, sum up the characteristics of President Sawyer's talk. He told the members that he wanted them to know that he was really interested in their association. Anent the subject of why more accountants did not attend the meetings of the association, he told them that in the final analysis they were the men to whom executives must come for facts. He called their

Digitized by Google

attention to the time when a man was only a bookkeeper and pointed out the respect in which the accountant of today was held.

The following committees were appointed by the chair: On nominations, T. Kilfoyle, Cleveland; F. E. Wilkins, Youngstown, and W. A. Blasing, Glens Falls, N. Y.; on resolutions, C. E. Yost, Wilmington, Del.; J. P. Hudson, Montreal, and Walter Shroyer, Anderson, Ind.

Buses and Fares Discussed

Reports of committees received and commented on at Tuesday session. W. L. Barnhart speaks on methods for combating embezzlement

THAT bus accounting is a subject to the forefront in the minds of a number of the members of the American Electric Railway Accountants' Association was again evident at the second session of this association. Although discussed informally, it is perhaps safe to say that more interest has centered around it than any other subject during the convention. Many interesting points were brought out and reflected the clear thinking and study of men who are devoting their best efforts to an analysis of the numerous phases the question presents. That it is a subject of national import was evident. Particular attention was paid to the angle of depreciation in bus accounting.

The report of the committee to review the proceedings of the Accountants' Association was first on the program. J. E. Heberle, chairman, advised that the committee had no report to make. Attention of members was directed to the value of the bound volumes of the printed proceedings of the association and particularly the use of the index, to which ready reference could be had to find out whether a study had been made of a special subject.

E. A. Tuson stated that the committee on fare collection had no formal report to make and indicated that it was the feeling of the committee that the subject did not require an annual report but needed to be kept up to date. He suggested that the members look at the exhibits of the machines pertinent to their line of work.

An interesting discussion followed on the use and advantage of certain types of machines, in which T. H. MacRae, President Lippitt, M. W. Glover and others took part. Another interesting and informative discussion ensued on the subject of a clearing house for tokens.

The speaker of the afternoon, W. L. Barnhart, took for his subject "Combating the Present-Day Criminal," reference to which will be found elsewhere in this issue, which he illustrated with exhibits. At its conclusion President Lippitt thanked him on behalf of the association.

An informal discussion followed on bus accounting, after which the meeting was adjourned.

Graphs an Aid to Accounting

Economies effected by their use illustrated with charts at Thursday session. Resolutions adopted and officers elected

FOLLOWING the opening of the final meeting on Thursday afternoon by President Lippitt, a brief oral report was made for the committee on graphs by C. R. Mahan, chairman, comptroller Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., explaining that most of the work had been done by correspondence. J. F. Egolf, general manager Chicago, North Shore & Milwaukee Railroad, who was present at the meeting and was on the program for "Economies Effected by Use of Graphs" had appointed A. Christesen, general manager's engineer, to act in his stead. Four graphs were then shown and an analysis of them made by Mr. Christesen.

Among them was one comparing passenger car-miles by months with last year and comparison of passenger revenue obtained by months with last year and another

Welcoming Miss Anna Case to the car exhibit

Digitized by Google

on merchandise dispatch station labor summarized chart showing the cost of handling per ton by months, also M.D. car-miles tonnage and train labor. Mr. Christesen also enumerated other charts which they made.

The report of the committee on stores accounting, abstracted elsewhere in the JOURNAL, was presented by R. A. Weston, chairman, special accountant of the Connecticut Company, which was followed by the address of the afternoon, "Passenger Revenue Handling," by Horace L. Howell, consulting engineer Meyer & Wenthe, Chicago, Ill., an abstract of which appears elsewhere in this issue. Mr. Howell did not read his report verbatim, deeming it unnecessary as copies of the pamphlet had been distributed prior to the meeting, but instead he took excerpts from it, which he amplified. He also analyzed some of the average fare charts which appear in the back of the pamphlet.

This was followed by the report of the committee on nominations by T. P. Kilfoyle, chairman which recommended: For president, T. B. MacRae, general auditor Chicago Rapid Transit Company, Chicago, Ill.; first vice-president, O. H. Bernd, secretary Des Moines City Railway, Des Moines, Ia.; second vice-president, Edwin H. Reed, auditor the Brooklyn City Railroad, Brooklyn, N. Y.; third vice-president, C. E. Yost, assistant secretary-treasurer Wilmington & Philadelphia Traction Company, Wilmington, Del.; secretary-treasurer, J. W. Welsh, executive secretary American Electric Railway Association, New York. Members at large: J. E. Heberle, assistant to president the Capital Traction Company, Washington, D. C.; Edward A. Tuson, general auditor Public Service Railway, Newark, N. J.; C. R. Mahan, comptroller Chicago, North Shore & Milwaukee Railroad, Highwood, Ill.; L. T. Hixson, auditor Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.

Officers were duly elected and Lucius S. Storrs, managing director of the American Electric Railway Association, stopped in for a few minutes and expressed his pleasure at being with them.

The installation of officers followed and Mr. MacRae, the incoming president, after taking the chair, advised the members that he had always been a great believer in constructive criticism and that he would be more than glad to receive suggestions or criticisms on matters that might be done.

Get-Together Luncheon Held by Accountants

INTERSPERSING pleasure with business, the members of the Accountants' Association held a get-together luncheon at the Cleveland Athletic Club Wednesday afternoon, with 34 members present. An informal discussion took place of subjects that were of much interest and thought to the members, reflected by the responsiveness with which they participated. "Fare collections," "lost and found department" and classifications were the principal themes.

The meeting of the new executive committee was called to order by President L. E. Lippitt immediately after the luncheon. On motion of C. E. Yost, the meeting was turned over to T. B. MacRae, first vice-president. Committee chairmen were then appointed as given in the following:

Bus accounting, E. A. Tuson; standard classification of accounts, M. W. Glover; stores accounting, R. A. Weston; freight accounting, W. Shroyer; review of the proceedings of the Accountants' Association, J. E. Heberle; program, E. H. Reed; fare collections, E. A. Tuson; joint committee on engineering-accounting, L. T. Hixson; committee representing the Accountants' Association at the annual convention of the National Association of Railroad and Utilities Commissioners, W. L. Davis.

Preceding adjournment of the accountants a suggestion was made that a joint session of the purchasing agents and storekeepers and accountants be held next year.

R. H. Dalgleish

R. H. Dalgleish

New President of Engineering Association

THE Engineering Association at its meeting on Oct. 6 elected R. H. Dalgleish, a popular electric railway engineer, its president.

Mr. Dalgleish is chief engineer of the Capital Traction Company, Washington, D. C., which company he joined in 1892. Step by step he advanced until in 1919 he became chief engineer. A special honor was conferred upon him in 1922 when he was elected president of the Washington Society of Engineers, comprising in its membership most of the prominent engineers in all branches who make their headquarters at the capital.

His service with the Engineering Association has been noteworthy for his active committee work. In 1921 he served as chairman of the committee on equipment. He had previously been a member of this committee. The following year he was chairman of the committee on specification for air tanks, a line of work requiring expert engineering knowledge. His enthusiasm for company section work in the association led to his election, in 1916, as president of the Capital Traction Company section. He has also served as chairman of the Washington section, A.I.E.E.

He is a graduate of the Cochran Scientific School, now part of the George Washington University.

T. B. MacRae

Heads Accountants' Association

THE auditor of the Chicago Rapid Transit Company, T. B. MacRae, will serve as president of the Accountants' Association during the coming year. Mr. MacRae has been in the electric railway field since 1882.

His first position was with the Chicago & Northwestern Railroad in its local freight office in Cedar Rapids, Ia. Here he remained with the company about three years, when he entered the freight auditor's office of the Burlington, Cedar Rapids & Northern Railroad. After two years in this department he was appointed traveling auditor and subsequently chief accountant in the general auditor's office. In June, 1902, this company was taken over by the Chicago, Rock Island & Pacific Railway and he was transferred to Chicago to close the books and accounts of the absorbed company. He remained with the Rock Island Lines until March, 1905, when he was elected auditor of the Metropolitan West Side Elevated Railroad, at that time an independent corporation.

In September, 1911, the four elevated railroads operating in Chicago were brought under a unified management and Mr. MacRae was elected auditor of the individual companies. These four companies were consolidated on Jan. 1, 1924, under the corporate name of Chicago Rapid Transit Company and he was elected auditor of the consolidated company.

With this background of experience in electric railway accounting in its every phase, and with many years of fruitful activity with the American Electric Railway Accountants' Association, Mr. MacRae brings to his new task a combination of talents that is unusual.

Mr. MacRae was born in Jackson, La. He was educated in private schools and at the United States Military Academy.

T. B. MacRae

Edward Dana

New President Transportation & Traffic Association

EDWARD DANA, the new president of the Transportation & Traffic Association, has for many years rendered valuable assistance to that association, and has, at various times, been a member of the committee on standards, rules and schedule in addition to the executive committee.

Mr. Dana's first position in the electric railway field was in July, 1907, with the Boston Elevated Railway, where he spent four years in an apprenticeship course, starting as a conductor. He then became an inspector of service conditions, assistant to superintendent of transportation, superintendent of traffic, transportation manager, and in August, 1919, was called to fill his present position of general manager. He was born July 28, 1886, at Bernardston, Mass., and was graduated from Harvard University with an A.B. degree in 1908.

Mr. Dana's interest in education, particularly of electric railway employees, is known throughout the world. He believes every employee should have all of the education that he or she can absorb. On the Boston Elevated property all educational courses are voluntary, unless the course is put in as a means of instruction in specific duties. Every opportunity is given to employees to know what the educational program is, but beyond that it is up to the employee.

Mr. Dana is ever on the alert for new ideas, and when one comes along he asks first, does this new idea have any application on the Boston Elevated Railway? Then, what is its significance to the industry as a whole?

Mr. Dana likes to see all of the railway data tabulated and if possible put into graphical form. One of his hobbies is the little leaflet "Co-operation" which goes to all employees monthly and to a constantly enlarging mailing list.

While a strict disciplinarian, Mr. Dana never forgets his duties toward the employees as human beings.

Edward Dana

J. S. Kubu

Joseph S. Kubu

President Claims Association

THE new president of the American Electric Railway Claims Association for the coming year is Joseph S. Kubu. Mr. Kubu is superintendent of the accident department of the Cleveland Railway and his election is a graceful gesture to the city which has played host to the American Electric Railway Association for two years.

Back in 1909 Mr. Kubu joined the forces of the Cleveland Railway as an investigator-adjuster and assistant claim agent. Perhaps feeling that, like a prophet, an electric railway claims man is "without honor in his own country," Mr. Kubu left Cleveland for the Empire State in 1912 and became claim agent for the Utica Lines of the New York State Railways. His work with this property was of an order which attracted the attention of many railway executives of the East and Mr. Kubu's services were sought by several of them. He refused all offers, however, until in 1921 the Cleveland Railway called him. Then he left Utica for home fields.

Mr. Kubu's long experience in claims work, his wide acquaintance with men in this department of public utility service and his active participation in the work of the Claims Association eminently fit him to direct the important work of this group during the coming year.

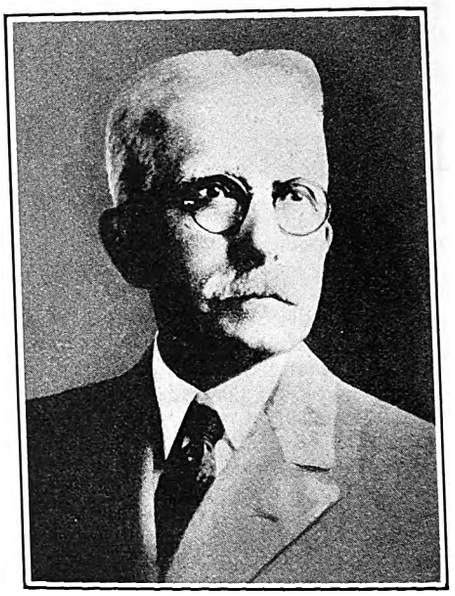
Claims Men Discuss Traffic Regulation

Uniform traffic laws strongly recommended as a means for reducing accidents. Co-operation in enactment of Hoover code urged



C. B. PROCTOR

THE opening meeting of the Claims Association was called to order on Monday by President Proctor and at his request the names and companies of all the delegates in attendance were given. A good-sized room had been provided and it was comfortably filled throughout the meetings, which were characterized by close interest.

Mr. Proctor observed, in his annual address, that the work and responsibility of claims men increase greatly year by year. He said that new and more difficult problems are continually presenting themselves. Therefore the question arises, "How can a claims agent best fit himself for his job; keep his mind fresh and alert; keep up with the times?" This cannot be done by living within oneself. The claim agent must study, read and confer with his fellows, who are tackling the same problem as the claims men.

It has been the endeavor of the Claims Association to increase the interest in the work of that body by injecting new features into the meeting. The progressive, wide-awake claims agent in the past few years has largely improved his standing with the public at large as well as with his own management.

The address of Russell A. Sears on proposed uniform traffic regulation and the Hoover conference recommendations is abstracted elsewhere in this issue. It was followed by formal discussion by John J. K. Caskie, Hubert A. Smith for Frank J. Gatrell and F. R. Cogswell for Burton W. Marsh. Mr. Caskie made the point that progress in traffic control should be aided by the claims department only in co-operation with the transportation department. He said that as the older cities of today became the newer cities of the future the opportunity is presented to direct this development so that traffic movements would be facilitated. He recommended creation of a committee including representatives from principal cities, to accumulate data on traffic legislation for the purpose of bringing about uniform regulation in conformity with the Hoover code.

Herbert A. Smith said that the public must be awakened in order to obtain proper legislation and enactment of the Hoover code regulating motor vehicle operations. He felt that the parent association should put forth its best efforts to aid in making the code effective throughout the country and advocated the adoption of a resolution so providing.

Mr. Barnes gave a most interesting talk covering his experiences in the work of the Hoover conference on street and highway safety.

In the general discussion that followed and on the motion of Wallace Muir provision was made for the presentation of resolutions addressed to the parent association and emphasizing the interest of the association in the traffic control provisions of the Hoover code.

At this point President Sawyer addressed the meeting and stated that he thought there was no single group of men in the industry that has more completely adapted itself to changing conditions than have the claims men. He spoke of their fair treatment of the public and of their care in preventing payment of fraudulent claims.

Mr. Hardin's paper was received with much interest and appears in abstract on another page. In the discussion that followed there was general agreement touching the necessity for all members reporting to their index bureaus so that fraudulent claimants and "repeaters" could be detected.

Tuesday's session of the Claims Association was held jointly with the Transportation and Traffic Association to consider questions of traffic and safety. A report of this meeting will be found in the account in this issue of the meetings of the Transportation and Traffic Association.

At 1 p.m. on Wednesday the great majority of all the claims men gathered at a strictly informal luncheon at the Hollenden Hotel.

Claims Symposium Arouses Interest

Various views on live claims topics presented by active claims men at the Thursday afternoon session

THURSDAY'S session of the Claims Association was given up partly to a symposium on claim subjects, partly to the papers secured by the medical and surgical committee and partly to the election of officers and other closing exercises.

The "symposium" comprised discussions on a great variety of topics, all having a very practical bearing on claims work. Some of the speakers had prepared extensive papers; others contented themselves with shorter presentations. Among the former, one by P. W. Klabunde on a recent campaign conducted by representative lawyers in Milwaukee against unfair legal tactics of some attorneys there, and one by J. C. Desautels of

Digitized by Google

Montreal on a card index system he had developed are published in abstract elsewhere in this issue.

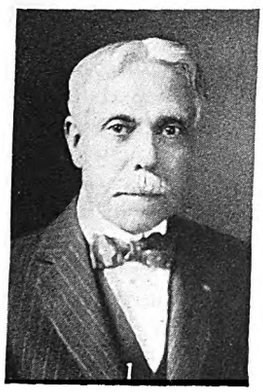
On the other topics considered, Walter E. Robinson, Cincinnati, took the position that publicity is not a proper activity of the Claims Department. The matters requiring the attention of this deparment are more or less of a confidential character. He thought that ambulance chasers had thrived on publicity in regard to accidents and claims. While heartily in favor of safety in its broadest sense, he believed that slogans could not be substituted for discipline, nor the responsibility for the safe operation of a railway property left to any one except the responsible operating official. Safety work is an obligation on all departments and should be performed without noisy campaigns, the payment of premiums for discharging a plain duty, or the effort to stampede the public and employees by cheap and ineffectual methods of advertising. Finally, he protested against the demands for affiliation with outside organizations. He considered the topics discussed by them often to be not closely related to claims work.

Augustus Baker, adjustment department, Pittsburgh Railways, spoke on "Corrective Management and Its Effect on the Accident Records," and referred particularly to the Better Traffic Committee organized in Pittsburgh to deal with street traffic congestion. It had conducted an essay contest for children on accident prevention, had dealt with automobile parkings and had assisted in the enactment of traffic laws. He also mentioned the monthly management conferences on the Pittsburgh Railways' property to bring about better operation and maintenance. Each employee is made to feel he is an integral part of the organization, and this policy has been followed by a notable decrease in "pull-ins" and accidents. Safety measures include a central safety committee, trainmen's safety meetings and competition between carhouses for low accident records.

"Friendly enemies" was the title of the talk by J. W. Giltner, Akron, Ohio, referring to the attorneys for the plaintiff in damage suits. With the reputable lawyer in such a case, the speaker said, the claims men could have no quarrel. He believes that all men are animated largely by the same motives, and with these attorneys, the claim agent gets back largely what he gives. The only fault that can be found is with the so-called ambulance-chasing attorney. The speaker then pointed out that the plaintiff's home was the company's greatest hazard and greatest opportunity. The home becomes the hazard when the claim agent fails to take proper care of the person whom the company has injured. He thereby creates a fertile field from which the "friendly enemy" reaps a bountiful harvest. The home becomes the opportunitw when the claims man takes proper relief there, for he has then proved the company worthy the confidence of its community.

The symposium on claims subjects was followed by that portion of the program devoted to the medical and surgical committee. There were nine doctors present who participated in the discussion.

Dr. H. M. Bascom, chief surgeon Illinois Traction System, submitted a paper, "Should All Accidents Have Medical Investigation, and If So, What Information Is Helpful to the Adjuster"? He took the position that all cases of injury should be looked at from a surgical as well as from a medical standpoint. He felt that there should be at all times a state of complete co-operation between the physician representing the company and the patient's family doctor.



Augustus Baker

J. C. Desautels

P. W. Klabunde

J. W. Giltner

W. E. Robinson

Abstracts of papers presented at the medical and surgical sessions by Doctors Fisher, Miller, Sibley and Leeming appear, in abstract, elsewhere in this issue.

In the discussion following the medical reports Mr. Boynton of Portland, Ore., said it would be of great help to all claims men if the doctors would make their reports in plain English. He said that he had many times found it necessary to refer to the dictionary in order to see what was wrong with the patient only to find that the case was merely one of bruises or slight skin abrasions.

President Proctor announced the appointment of a committee on resolutions on uniform traffic regulations as follows: John J. K. Caskie, Wallace Muir, John J. Reynolds, W. F. Weh and S. W. Baldwin.

The report of the nominating committee was made by Mr. Reynolds, its chairman, as follows:

For president, Joseph S. Kubu, Cleveland Railway; for first vice-president, L. F. Wynne, Georgia Power Company, Atlanta, Ga.; for second vice-president, Walter E. Robinson, the Cincinnati Street Railway; for third vice-president, C. E. Redfern, United Electric Railways, Providence, R. I. Executive committee: W. E. Foley, Third Avenue Railway, New York; B. F. Boynton, Portland Electric Power Company; S. J. Herrell, Knoxville Power & Light Company, and L. H. Butterworth, Boston Elevated Railway; convention secretary, G. T. Hellmuth.

Mr. Reynolds presented to President Proctor a past-president's badge and accompanied it with a splendid address outlining Mr. Proctor's unselfish services to the association.

Milwaukee's Ambulance Chasing Quiz*

By P. W. Klabunde
General Claims Agent
Milwaukee Electric Railway & Light Company

OVER a period of years the activities of ambulance chasers in Milwaukee and its neighboring cities grew to the point where approximately 90 per cent of personal injury litigation was in the hands of but five or six law firms. There was evidence that runners worked openly and had developed a tip-off system through newspaper reporters and others. They frequently learned of accidents and reached the homes of injured persons before their families heard about them. Contracts were frequently procured in hospitals before the injured had recovered from the first shock. Chasers were ready to remove the injured from the hospitals, sometimes before the doctors could make their examinations. The evil was discussed by the Bar Association at times, but no definite action was taken.

Several years ago an independent organization of attorneys was formed, under the name of "Lawyers' Club," one of the objectives of which was to rid the bar of this evil. This club worked quietly until March, 1927, when a committee of its directors and officers petitioned the Circuit Court to conduct a hearing or inquisition and to take such action as the facts might warrant.

The petition was presented to a judge of the Circuit Court, there being eight branches of this court, and he decided that the petitions should be heard. Two other judges of the same court joined in the hearing, the three judges sitting *en banc*.

The matter was handled entirely by the Lawyers' Club. There was no assistance from public utilities or insurance companies, either financial or by way of providing information from which to develop the facts. The Lawyers' Club caused a study to be made of cases pending in the Circuit Courts and in the Civil Courts (the jurisdiction of the latter is limited to $2,000); plaintiffs in pending cases were evidently interviewed beforehand and then subpœnaed. Lawyers and ambulance chasers, their clients and representatives of public utilities and insurance companies were also called into court.

The testimony developed instances of champertous contracts, suits filed without the knowledge or consent of claimants and suits filed between members of the same family, where, so far as the parties to the actions were concerned, the same law firm represented both sides. It also developed instances where claimants were fleeced by their attorneys not only of exorbitant fees on a percentage basis but of practically the entire proceeds of the settlement. It also was revealed that solicitation was practiced in other than personal injury matters.

In the early stages of the inquisition efforts were made on behalf of the ambulance chasers to stop the proceedings, but the Supreme Court of the state denied an application for a writ of prohibition. One individual attempted to stop the proceedings, temporarily at least, by starting an action against the committee members. He served notices for examination on them under our discovery statute, the notices being accompanied by an affidavit alleging that the entire proceeding was in the nature of a conspiracy for the purpose of destroying his good name and reputation and that it was an attempt to perpetrate a fraud upon the court.

This attorney came into court and was requested by the judges to testify under oath as to the facts relative to his charges of fraud. He refused to be sworn and was sentenced to serve a term of 30 days in the county jail for contempt. The judge of another branch of the Circuit Court issued a stay, but the Supreme Court vacated this order; however, the Supreme Court then called for the entire record of the inquisition and the matter is still under consideration.

The inquisition has not been completed, but thus far it has accomplished these results: the complete cessation, so far as we can discover, of ambulance chasing by runners from lawyers' offices; an injunction restraining all ambulance chasers and attorneys in "tainted" suits from making any disposition of cases then in their hands; where evidence of improper contracts was disclosed, attorneys have been required to relinquish their claims and the claimants authorized to engage other counsel or to handle their claims in any other manner they choose; even where the claimants expressed a desire to retain the same attorney, the court has refused in most instances to permit them to do so.

Another result is that people who have had claims handled by attorneys are now making inquiry as to how their claims were disposed of. It has been rather interesting to learn how the proceeds of settlements were divided. For example, one claimant, who signed a release for $50, was given $175 as his share, whereas two other claimants, having claims arising from the same accident and who each signed releases for $200, received $20 each.

A still further result of the inquisition is found in personal injury cases going to lawyers who never before handled such cases. They could not get them because the runners worked too fast.

Our legislature was in session during the inquisition, and the Lawyers' Club and the judges were instrumental in introducing several bills for its consideration. Briefly, these bills provide:

First, that all investigators and adjusters should be licensed.

Second, that no settlement of a personal injury claim should be valid if made within ten days of the happening of the accident, and that any settlement should be subject to review upon petition of the injured person to the Circuit Court within 90 days.

Third, that upon demand of either party upon the other the names and addresses of all witnesses must be produced; this bill did not limit the names of witnesses to those that would probably be produced on trial, but included all that the adverse party knew of or discovered prior to trial.

Fourth, that there should be no solicitation in any manner, that there should be no payment, direct or indirect, to any person for bringing a case to an attorney, and that no attorney should "split" fees with others than attorneys.

The legislature acted upon these bills and the first three were defeated; the fourth, however, was passed and is now in effect.

The members of the Lawyers' Club who were active in the conduct of the inquisition devoted many days to this work, without hope of reward other than the cleansing of the bar. Not one of these active participants, so far as our records show, has been retained in a case against us since the inquisition started.

As stated earlier, there was no active participation by public utilities or insurance companies in the entire matter. Of course, representatives of the various companies

**Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

who were subpœnaed supplied the information asked for on examination, but it was the general feeling that the companies could not take an active part without creating the impression in the public mind that the corporations were trying out a new way to reduce accident costs.

When the entire inquisition is completed, it is believed that the solicitation of personal injury cases will have been very effectually curbed, and it is not unlikely that several members of the bar will devote their time to other employment.

Cost Reducing and Simplifying Claims Office Work*

By J. C. Desautels
Acting Claims Agent Montreal Tramways

I MADE a survey recently of the many details attached to the office end of the work. We had seven books of different kinds, large and small, some easy to handle, others quite cumbersome, but all needing several unnecessary movements—entries which I thought could be eliminated.

My first attempt to reach a solution was the cards shown herewith. One was devised to show accidents only, the other to show incidents. I thought of combining the main points of the history of a claim or incident on one card as well as a foolproof follow-up to show at a glance the movements of the file and its exact location.

The principle that I had in mind and wanted in practice was "one place, one movement to get the file," and as it is human to follow the line of least resistance, the card was arranged in the exact sequence that the work progresses from inception to finish.

To avoid mistakes, it was decided that all files, documents, etc., must go first and always to the clerk having the sole and full charge of distribution.

Arrangement of Card

The name and address are at the top and bottom, so that when card is taken off the filing system, becoming what is called "dead records," the card can be filed vertically. The top part is then the guide to the card. The abbreviations used are as follows:

Emp. Record. A tick here shows that proper information has been entered in the employee's claim record.

Inv. No. Means by whom investigated.

List. A tick here shows that the crew of the car or train have been seen by investigator.

Steno. (Stenographers), Abeyance, Ready. A tick in the space reserved for any of these would show in whose hands the file is.

Same as. To show that other claims have been made for the same accident.

Train. To classify or differentiate from the next abbreviation—namely, O.M.C. (One-Man Car).

Bus. For all bus accidents.

T. For accidents at terminals.

O. C. This space is reserved for a conventional sign or mark to help in summing up or valuation of O.C. (Outstanding Claims).

The rest of the card needs no explanation. Arranged in this way, the moment a claim is filed the first entry is at the top of the card and so on until the case has passed through the courts, judgment rendered and cost entered, if any.

I do not claim to have discovered the 100 per cent per-

Report No. 193, on a card 5x8 in., has proved most useful in indexing claims records

Digitized by Google

fect card or handling classification and follow-up of a claim, but I do pretend that this system resulted in the following:

1. Cost of printing, binding, etc., of seven books eliminated.
2. An electroplate has been made which will save cost of printing when other cards are needed.
3. Going from one book to another and constant handling of them eliminated.
4. One movement and to only one place, always.
5. Nothing left to memory and checking reduced to the minimum. It is necessary simply to follow the lines and fill in as the work progresses.
6. Duplicating and sometimes triplicating of entries eliminated.
7. Records conserved clean, orderly, visible and readily accessible.

The only book used is the 60-subdivision-numerical index.

By actual stop-watch test, from 60 to as much as 200 per cent of time is saved.

All investigations outside of claims are handled in the same way but on the second card shown, so as to eliminate further unnecessary hunting up of the file.

With this system, inaugurated Jan. 1, 1927, not one of the papers and numerous files has been mislaid so far. I also believe that an appreciable amount of red tape is avoided and the equivalent time saved thus applied to constructive instead of detail work.

Possible questions will be raised in advance and answered:

Why is another numerical index necessary?

If claims were handled alphabetically, direct from the visible index, we should have to run through names on claims which have been disposed of years ago, whereas, by the present system, we have live records only to handle. Moreover, cost is reduced to minimum by using three visible index cabinets only. When they are filled, the first one will contain only records which are dead, or nearly so. We then transfer the cards into a vertical position in ordinary drawers. This explains why the name and address, etc., appear at the top as well as at the bottom of the card. In the visible index, only the lower section of the card shows, but as this part is at the bottom when filed vertically, the top part is needed for a future guide.

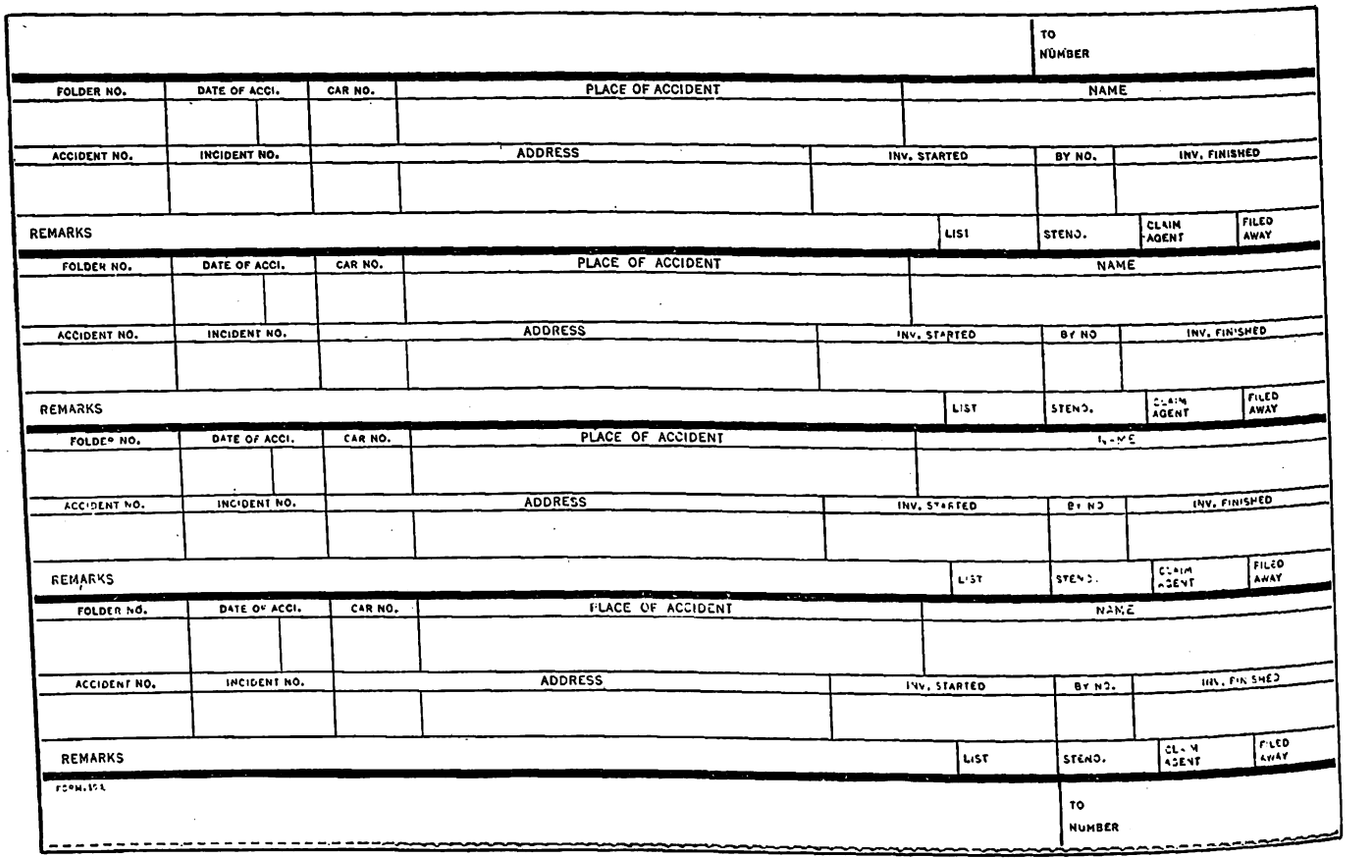
The use of numerals has several advantages over the alphabet, for when compiling statistics of all kinds, you have at a glance the number of claims made during any particular year, and taking out the cards for that year, they follow numerically, and therefore daily, monthly, etc. If, for instance, you want to figure out the number of train, one-man-car or bus accidents for a particular year, it becomes a simple addition. If they had been filed alphabetically, it would be necessary to keep other records showing those for the year 1926, etc., and sort them out. The same applies to every item shown in proper sequence on the card. Whatever statistics are required, and usually they are needed on short notice, the operation is simplicity itself, and the work of compiling can be intrusted to the least experienced clerk you have. The way I use the system I have an instant check on the progress of current claims or the past history of them, and, as the card shows, I can tell when a claim was filed, the investigator who has it, and how long.

How many cards are used per day?

Divide the number of claims received in a year by the number of days the office is open for business and you have the answer.

How is a no-report case located?

We call them blind cases. If for a claim, we give claim number, etc., following the same order as shown



Report No. 194, on card 5x8 in., has also proved useful in indexing claims records

Digitized by Google

on the card. Wherever possible, I interview the claimant personally at my office and retracing his movements minutely, I take a written version accordingly. If the party is unable to come, I send an investigator to secure the information. With this information, together with a full description of the car or crew, we locate cars for about 30 minutes before and after the time given. We then begin a systematic sifting or elimination until we narrow down the search to a few, and these men are then interviewed. With this procedure we rarely miss our objective. Once the crew has been located, versions are taken and we build up on the claim with whatever information we have, as in the ordinary claims.

If you have the date and location of an accident, but no name, how could you locate the report?

An accident book is kept containing enough pages to last a year (previously it was for six months). Each accident report is numbered and the salient facts as given on report are entered in the book. The numbers start from 1 at the beginning of each month. As many pages as needed are reserved for all accidents happening on that particular date. If we have the date, which is the quickest way to locate the report, with any other particular detail such as car number, location, name of conductor or motorman, or kind of accident, etc., all we have to do is open the accident book at the date mentioned and with one of the details just mentioned, the report is found at once by its number. Each report, being of foolscap size, is folded in four and filed upright in suitable steel filing cabinets and the number is seen at the top as in a card system. We also have "incident" books, arranged in the same way as for an accident book.

How is Form 194 (the incident card) used?

Four divisions will be noted on this form. As this form does not need as much information as the other card, I show four different cases on one card. The use of the divisions on the card, in their order, is as follows: "Folder No." This is for employees injured on duty. A folder or docket, large enough to hold a foolscap-size file, is prepared for each employee injured. On the face of the folder appears in condensed form all important details contained in the folder. "Date of acci." "Car No.," etc., do not need explanation, as the same scheme or follow-up is followed as with the claims card. It follows that Form 194 is used for anything not a claim. The argument may be advanced that, having four different cases on one card, the top or bottom one only would show in a filing cabinet. True, but it will be found in practice that incidents are of a temporary nature only, and once dealt with, it is necessary to refer to them again only on extremely rare occasions. Then we take the incident book and from it easily locate the card needed, since they are dated.

Form 193 carries two numbers. Is it first given an accident number and later a claim number?

No. I have just described the way in which the accident report book is kept. When a claim is filed against us, the card receives a claim number and the accident report being then taken out of its numerical place in the steel filing cabinet and an appropriate card being put in its place, the number of the report is entered on Form 193 at same time as claim number. Other details which can be taken from the accident report are added.

What distinction is made between "date claim started" and "date claim entered"?

Date claim entered means when or on what date the claim was filed by claimant. The other date is that when the investigator began his work on that claim.

Fifty Foremen Attend Conference

Course given twice a day during convention week. Representatives from companies in many parts of the country attend

AWAY from the rush and bustle of the main sessions of the convention, a group of men met for study in a room on the mezzanine floor of the Auditorium. They were the members of the Foreman Conference Leaders group, who were fitting themselves in the special course offered by the association committee on education to spread the lessons of better employee leadership to all parts of the country.

Intense interest was displayed by the men, according to H. H. Norris, educational adviser Boston Elevated Railway, one of those in charge of the course. Associated with Professor Norris were A. J. Sarre, superintendent of industrial relations New Orleans Public Service, Inc., and Frank Cushman, who is connected with the Federal Board for Vocational Education, Washington.

Registration for the course was limited to 50, and it was necessary to reject a number of applications so many companies wished to have representatives enrolled for the class. For the most part those taking the course were officials having under their supervision large groups of trainmen and other employees and directly in contact with personnel problems.

The class was divided into two groups, one meeting each morning and the other in the afternoons. The classes were open to the public on Friday, but the rest of the week the classes were secluded as if on a college campus, rather than within a few steps of the manifold activities of the convention.

The purpose of the course was to train the officials attending in the best methods of conducting conferences of their foremen, so as most effectively to transmit to them approved methods for training their men. The idea back of it all is that the trainmen and other workers are, in the last analysis, largely responsible for the success or failure of a company's efforts to give good service and to operate efficiently. To enable the workers to do their part, they must have the leadership of a capable supervisory force, and this supervisory force, or the foremen, must have real leaders among the executives directly over them. The course was designed to train the executives in order that they might conduct conferences of their foremen or supervisors in a way that would accomplish the results desired.

Not only did the officials receive many new ideas from those conducting the course and from each other but one of the most important elements of the training was the actual experience they had in conducting conferences. A part of each day's session was devoted to practice of this sort in which one or another of the officials conducted a conference and then received the benefit of the criticism of the others and of the instructors.

The wide interest in this new educational activity was shown also by the fact that a number of companies supplied literature for use in the course. This included instruction manuals, educational booklets, job analysis studies, etc., supplied by the Westinghouse Electric & Manufacturing Company, Boston Elevated Railway, New Orleans Public Service, Inc., Chicago, North Shore & Milwaukee Railroad, Milwaukee Electric Railway & Light Company and others.

We Must and Will Go Forward*

The lessons of the past and present are being well learned, and the electric railway industry has profited by them. The electric railway man has reason to be proud of his job and can look to the future with confidence

By W. H. Sawyer

President American Electric Railway Association
President East St. Louis & Suburban Railway

SOME of you may not have had the occasion that I have had during this year to think in terms of the industry instead of in terms of a single property or even a group of properties. Out of that experience I have had a thrill, growing in magnitude and reaching a climax here today. I have gone over this exhibit during the past few days. If you haven't, don't miss the inspiration that it will give you. You will get a new viewpoint on your own industry. You will feel thoroughly, as I feel at this minute, the romance of transportation.

W. H. Sawyer

What a myriad of changes have taken place during the past 46 years! I shall not attempt to review them. But despite all of these changes and all of the difficulties which we have encountered, we are not a dead or decadent industry! We are demonstrating our ability to meet the changed conditions brought about by the advent of the private automobile. We are proving our assertion that our industry is still a most essential industry—necessary for civic advancement and prosperity. For generations it has been a major contributing factor in our wonderful national growth and advancement. It will continue as such. Public transportation must and will go forward.

We are making progress in the program of modernizing our cars and equipment to meet the demands of this luxury-loving, fast-spending age. It needs but an inspection of this car exhibit to testify most eloquently to the truth of this statement. But we are carrying forward more than merely a program of modernizing our cars. We are carrying forward a program of modernizing our thought and our methods.

We have every right to be proud of what we have accomplished. But I say to you—and mark well these words—we have but taken a forward step. Our job is far from complete. There never was a time in the history of the industry when there was a greater demand for skill, energy and ability to carry out the task which we have only well started.

Who is there among us that has exhausted the possibilities for giving better service? I do not mean "give" in the sense of a donation. I mean it in the sense of improvement designed to bring a return, both in the form of increased patronage and in the form of public good will. I mean it in the sense of the service which a far-sighted, progressive merchant gives the customer with whom he does business. I mean it in the sense of service which is good business.

I am, of course, fully aware that some of our electric railway lines that are now operating will eventually be scrapped. One of our immediate problems is to determine which lines do not have the potential earning possibilities to justify rehabilitation. Those that cannot be made profitable must in the very nature of things be abandoned. I fully realize our duty to our community to continue service, but we also have a duty to our investors, and, moreover, unprofitable service will eventually be a liability instead of an asset to the community. Those lines which are to survive must be modernized. It requires rare courage and foresight to determine just which lines are to be eliminated. But the decision must be made, and made quickly; otherwise the entire property will continue to degenerate at a cumulative rate. The job of rehabilitating those lines which are economically justified is far from complete. There is no room today for a discussion of the necessity of clean cars and polite and courteous trainmen. There is no longer room for

**Abstract of presidential address at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

discussion regarding the need for advertising as a medium for giving our communities the facts of our business.

All this, however, is not enough. I believe that we are on the verge of fundamental and basic changes in the character of our service and of the equipment with which it is given. I have referred before to the quantity and quality of our exhibits, but this year as never before we have concrete examples of unmistakable advances in the art. I refer particularly to some six or eight exhibits among the modernized cars on the outdoor track. Some of these developments are largely experimental, in that they represent radical departures from established practice. But I believe that these changes are only forerunners of a definite trend of new developments out of which will come improved facilities that are essential to us in rendering a character of service that will meet the conditions which exist today.

Let me bring to your mind another thought here. Development such as is represented by these particular exhibits costs real money. Somebody believes in us. Somebody has faith in the electric railway industry. Somebody is willing from a hard-headed business viewpoint to spend money to demonstrate that the street car is still the most efficient passenger-carrying vehicle on the streets and can provide a class of service which will meet the tastes of an automobile-educated public. I take my hat off to those manufacturers and operators whose equipment is out there on display today. I feel confident that only a few years from now we shall look back on them as real pioneers who started us on a new period and a new era.

Even now I am willing to prophesy that the year 1927 will stand out as a year in which officially we took notice of another changed condition, and so revised our constitution as to bring it up to date. We shall still retain the name American Electric Railway Association; that is probably justified, because the electric railway still remains and will remain the backbone, the foundation stone, if you please, of the local transportation business. We shall, however, by the changes proposed in the constitution of this association, rightfully identify ourselves, not as electric railway men only, not as bus men, but as transportation men qualified to serve our communities with whatever form of transportation best fits its needs in each special situation.

There has come about in 1927 not only additional progress in the co-ordination of the bus and the electric railway car but further and more definite co-operation between the bus manufacturers and the industry. We have not yet taken full advantage of the bus and have by no means fully co-ordinated it with the electric car.

The day of the bus as a fad is gone. Some of the buses now in operation are unnecessary. The bus cannot and must not compete for the same business in the same territory with the electric car. That is inefficient and is a waste of the rider's money. High-pressure methods of salesmanship and overenthusiastic statements of fact have been detrimental to the sound development of the bus as a responsible transportation agency. But I see new developments ahead in the application of the bus as a transportation vehicle, whereby it will expand its present usefulness.

The relations which exist at any particular time between our companies and our communities are a measure of the condition of the transportation business. On the relations which exist between them and on their ability to understand each other's viewpoint and problems depend the success of the partnership which is thus effected. Two factors are directly influenced by the nature of the relations which exist between these two principal interested parties—namely, the character of the service which it is possible to maintain and the cost of giving that service.

During the last few years there has been a marked change in public opinion regarding the relative importance of these two factors. Although the memory of the old 5-cent fare which was exploited so many years by politicians still remains in some cities, much more consideration is being given today to the matter of service and less to the maintenance of a fixed or lower fare.

There is an ever-increasing appreciation of the fact that if desirable service is to be maintained, the company must be permitted to develop a financially healthy condition. Our industry is making an honest and determined effort to give better service at the lowest practicable price consistent with such service. I am confident that no community wishes to deprive itself of the advantage of such improvement to save an additional cent or two, particularly when the cost of the street-car ride is compared with that of its principal competitor, the privately owned machine.

The automobile has provided pleasure and recreation to millions of people. Its manufacture has become one of our largest industries and has contributed materially to the prosperity of the country. The automobile is, in part at least, responsible for the prosperous conditions of today. But I wonder how many of our city officials really appreciate the comparative transportation economies of the automobile and the street car. Many traffic checks in various cities have shown that the average passenger load in automobiles is less than 1.8 passengers per vehicle. The average street car carries ten or more times that number. The street car is a conserver of expensive street space, while the increased use of automobiles is dependent on making available additional street capacity at the expense of the community. In solving their traffic problems many cities are taking cognizance of these facts and are assisting in increasing the speed of the electric cars by giving them the right of way wherever practicable, thus catering to the majority without detriment to the minority.

The changed conditions of today do not admit of our industry carrying the burdens of the past. We can no longer be used as tax gatherers. Many progressive communities have eliminated the unjust and unfair paving

WE ARE carrying forward more than merely a program of modernizing our cars. We are carrying forward a program of modernizing our thought and our methods.

Our record entitles us to ask for and to receive the co-operation of the communities we serve. We are making progress, but we could move faster if our communities better understood our problems.

Nothing has been found to take the place of the electrically-propelled rail-borne car for moving masses of people rapidly and efficiently.

EXCERPTS FROM MR. SAWYER'S ADDRESS

Digitized by Google

tax, and rightfully so for the benefit of the community. There is an increasing appreciation that it is unfair to ask the car rider, who in the last analysis pays the cost, to have any considerable part of his carfare represent a tax levied by the community. Electric railways have in the past paid an unfair property tax. Capital invested in a utility is turned over very slowly in comparison with many manufacturing or commercial enterprises, which frequently turn their capital several times a year. Nevertheless the tax rate on transportation property is maintained at rates very much out of proportion to this situation.

The continued improvement of public transportation service is dependent on permitting the investor in these properties to make a fair return on a fair value. There are but few electric railway companies doing that today, and that is why we must have even greater co-operation on the part of our public to discharge more effectively our full responsibility as public servants. We are no longer asking for sympathy. We believe that our record entitles us to ask for and to receive the co-operation of the communities that we serve. We are making progress, but we could move faster if our communities better understood our problems.

Frankness compels the statement that there is always a minority who do not want to understand the facts of the transportation problem and whose selfish interests are served best by trying to make the American public think it can get something for nothing by squeezing the life out of the transportation companies. The fable of the goose that laid the golden egg has a direct application in the transportation situation. The fact that the public is beginning to understand the truth today is largely attributable to the frank and effective way in which many companies have told their story through local newspaper and other advertising. I do not believe there is a man or a company in the industry who is doing too much in this direction. There is still room for an even better and more effective job.

And so, to summarize, conditions of today are different from those under which we built and learned to operate electric railways. The methods of the past are no longer effective. The solution of our many problems requires experts—specialists.

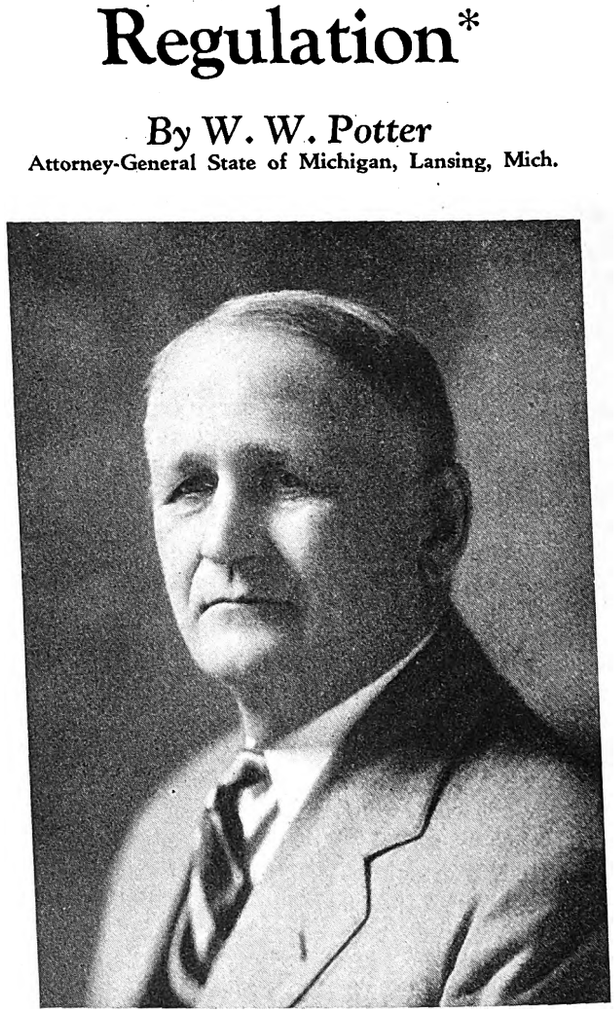
With the coming of this new day, our eyes are turned to the front and there is courage and hope in our hearts. Despite all of our difficulties, one incontrovertible fact stands out above everything else: The very life and progress of modern communities require adequate and efficient public transportation. In the foundation-shaking test to which present transportation agencies have been subjected, nothing has been found to take the place of the electrically propelled rail-borne car for moving masses of people rapidly and efficiently.

Transportation is a vital community requirement. The roots of our industry are buried deep in the foundation of community prosperity and growth. We have cause to be proud of our jobs and have every reason for throwing our spirit and our energy into the work of keeping abreast with the march of progress. Conditions are changing—yes, changing, not yearly or monthly, but daily. We are public servants in the true sense of the term. By dedicating ourselves to the community's interests, we aspire to that greatest of achievements—the service of mankind. The electric railway industry must and will go forward!

Getting the Most Out of

Public Utility Regulation*

By W. W. Potter
Attorney-General State of Michigan, Lansing, Mich.



W. W. Potter

The author traces the development of utility regulation and shows that it can be of great benefit to the utility. The electric railway, by giving the right kind of service, will have little difficulty with regulatory bodies

WHEN the balance of power and population in the United States passed from rural communities to the cities and villages, public utility problems became important. Public utility securities at that time were not regarded as sound investments, and few of them had the confidence of the general public. They were generally local in character, and in dealing with the several cities their promoters were confronted with the uncertainty of success, the question of public patronage, doubt as to the ultimate growth of the cities themselves, the crudeness of the art and excessive costs of construc-

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

tion. As a result of the general lack of scientific knowledge in relation to public utility problems, promoters provided for high franchise rates to be paid by the public in order to insure as far as possible the integrity of their original investment.

When prices fell in the United States during the early '90s, operating methods had been greatly improved and operating costs fell to a much lower level than ever before. Many public utilities insisted upon maintaining their franchise rates and capitalized, through application of water, the difference between the fair return on the fair value of the investment in the utility and the amount of income realized from the franchise rates.

The Granger cases marked the first successful assault by the general public upon what had been regarded as the sacredness of public utility franchise contracts. The rule became firmly established in the jurisprudence of the United States that when property was invested in a business charged with a public interest, it must submit to public regulation. Outside the ranks of the owners and operators of public utilities, thinking men became interested. Reasonable men everywhere recognized that rate-fixing franchises had usually been given to the utilities without consideration.

Some intelligent method was demanded to handle the ever-recurring problems resulting from the conflict of interest between the utilities and the public, and public utility commissions were called into existence as a means by which the solution of these vexatious problems might be solved. Notwithstanding all of the opposition to the creation of public service commissions, they were finally created, and with them in many cases came rate reductions. Simultaneously the conditions of operation radically changed and public utilities rose to a new standard.

With this growth and development of the scope of operation and with state regulation there has grown up a more tolerant spirit toward the regulatory bodies of the state. There always have been and probably always will be divergent views of public utility regulation. On the one hand there are those who believe that the public service commissions should prescribe with great detail the manner in which the business of the public utility corporations should be carried on. On the other hand there are those who believe that the owners of a public utility should have a right to carry on the business with the least possible interference from public authorities.

Attitude of Utilities to the Public

One of the things which public utilities should seek to avoid is being crucified by their own anxiety to obtain rates in excess of a fair return upon the fair value of their used and useful property. Smythe vs. Ames, in which the rule was first authoritatively laid down that a public utility was entitled to a fair return upon the fair present value of its property, was argued before the Supreme Court of the United States.

Some courts have held that reproduction cost new constitutes the dominant factor in the determination of the present fair value of property, but this method seems unfair to both the public and the utility investors.

Nothing has weakened the confidence of the investing public in the securities of public utilities in the past more than has watered stock. Non-existent overheads, the cost of hypothetical superintendence of unknown labor, added percentages for imaginary errors and omissions are all methods of adding fictitious value. How much more satisfactory it would be to all concerned if in rate proceedings, instead of furnishing volumes of testimony about fanciful intangibles, a fair present value could be agreed upon which would be available to the public or to the regulatory body. If the securities of public utility companies have back of them appropriate tangible assets, they will command public confidence.

The public is very apt to oppose any demand for an increase in the rates paid for transportation on street railways, but if the service is bettered, it is willing to pay for it. Subnormal operation never yet was entitled to abnormal rates. The public cares little or nothing for the question of original cost, fair value, reproduction cost new less depreciation, or any other befogging data, but it is interested in good service. If the street railways make an intelligent effort to render better service, it seems that they will receive the aid of the public and the questions of rates and revenues will take care of themselves.

One of the ways the public can help the street car companies is by relieving them of the burden of paving between their tracks, enabling the companies to improve their service.

It is contended by many that the street car is passing. However, a recent investigation revealed that last year the street railways carried more passengers than ever before. It is the most safe and economical means of transportation yet developed.

Public Utility Regulation Here to Stay

"Customer ownership" is one of the things that will make for better public relations. Public utility investments are safe and satisfactory to the customers, and in addition to creating a better public sentiment, substitute co-operation between the customer and the utility. Public utility regulation is here to stay and fighting it is effort poorly spent.

There has been a tendency in the last few years to make public utilities a means whereby a large amount of money might be raised for taxation. The street railway is assessed supposedly at the true cash value of all its real and personal property, the same as other property assessed upon an ad valorem basis. It pays its proper proportion of the highway taxes levied in the several communities in which it is assessed, and it has to stand by and see this money, paid by it through taxation, expended in the construction of hard-surfaced highways paralleling its lines, which tend to build up and strengthen competition to its own business.

The time is not far distant when these utilities which for the past ten or fifteen years have had hard times in many ways will be taken in hand, rehabilitated, their securities rendered more valuable and the revenue made sufficient to pay operating costs and a fair return upon the fair value of their property. Such adjustments may easily be made, and not only will insure the continuity of the service but will also make the service sufficiently attractive to the public actually to increase its riding habit.

If the street car companies admit they are dead, there is no reason why they ought not to be buried. The street railway, like everything else, must keep abreast of the times or fall into the discard. If the service furnished is courteous, rapid and safe, it will be patronized and profitable, and regulatory bodies will not have to spend time wresting with its problems.

Reducing Delays

to Street Car Traffic*

By Miller McClintock

Director Albert Russel Erskine Bureau for Street Traffic Research, Harvard University

CONFLICTS between rail and rubber-tired vehicles in the traffic stream are more apparent than real. The aim of sound traffic control should be the adjustment of these difficulties so that a minimum of conflict will result.

Any approach to the problem of traffic regulation which is predicated on an elimination of either rail or rubber-tired vehicles or which is based on a policy of arbitrary restriction or oppression of either group is predestined to failure. Motorists can gain no advantage on streets where street cars are blocked. Traction operators can find nothing but embarrassment on arteries of travel where restrictive legislation and arbitrary enforcement have resulted in automobile congestion. Both motorists and car riders have the common desire to move and to move with safety and convenience. On our saturated city streets this common aim can be attained only when each is willing to submit to reasonable control.

Dr. Miller McClintock

In the consideration of any street traffic problem, guesswork and opinion can be of little assistance. When all American cities recognize the street traffic problem as one requiring sound and continuing engineering consideration, much more rapid progress will be made.

A study of street-railway operation in Los Angeles in relation to general traffic conditions was conducted last month. The checks were made covering all of the principal lines operating in the central congested district, approximately one mile square with a daily entering traffic of 9,000 street cars and 200,000 motor vehicles. Results are summarized in an accompanying table. The average speed while in motion was 10.2 m.p.h. but, due to delays, the average over-all speed was reduced to 6.3 m.p.h.

Delays due to vehicular traffic on tracks cause a maximum feeling of irritation to the traction operator. The Los Angeles study indicated that this factor accounts for 5.4 per cent of the total delay. This figure is far below that anticipated, and it is believed that similar studies in other cities will indicate more favorable conditions than those estimated through casual observation.

There is obviously no perfect remedy on densely crowded streets for this type of obstruction. Had the present saturation been anticipated, streets would have been so designed as to permit a curbed-in right-of-way for traction lines and thus for an elimination of interference. This is a practice now being followed in many new developments throughout the country and deserves the fullest consideration. It is, of course, a remedy which cannot be contemplated in the crowded streets of central districts.

The attempt that has been made in a number of cities definitely to prohibit the operation of motor cars on street-car tracks along crowded thoroughfares is one which, to my knowledge, has never been successful and has resulted only in irritation and opposition. The motoring public inevitably feels that at least between the times when street cars actually utilize the roadway occupied by their tracks the space should remain available for any legitimate traffic purpose. The same objection is not felt where roadways are wide enough to accommodate the full flow of vehicular traffic in addition to the street-car load, but under such conditions there is little need for the prohibition.

The most logical regulation for a relief for the conflicts between street cars and the vehicular traffic stream is to be found in the provision now generally incorporated in city traffic ordinances which provides a right-of-way for street cars along their own tracks. It is expressed in the uniform ordinance for California cities in the following words: "It shall be unlawful for the operator of any vehicle proceeding upon any street-car track in front of a street car to fail to remove said vehicle from said track as soon as practicable after signal from the operator of the street car." This provision, adequately

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

enforced, protects the street car from unreasonable "dragging" by preceding vehicles.

A further type of vehicular interference is to be found in the standing of vehicles on the track to the left of passenger loading zones while awaiting release at the adjacent intersection. The orthodox solution for this difficulty is to require all vehicles to pass to the right of such zones, on the presumption that this rule will always make it possible for street cars to reach the loading berth over a clear track. This is undoubtedly a desirable rule on streets with a roadway of adequate width to carry the full load of vehicular traffic without the use of track space.

Where vehicular traffic is too heavy to be accommodated in the off-track space available, it should be pointed out that the rule generally has more serious effects upon traction operation than no rule at all. The space to the right of the passenger loading zone is generally less than the traffic space to the midblock. An attempt to crowd a heavy vehicular flow into this bottle neck often makes it impossible for some vehicles to clear the track. The result is that obstruction to the street car is merely transferred from a point near the loading berth to a point farther back, where it may be even more serious to operations. Indeed, it is not unusual to see this type of obstruction extend its effect back to the next intersection, interfering with cross traffic at that point.

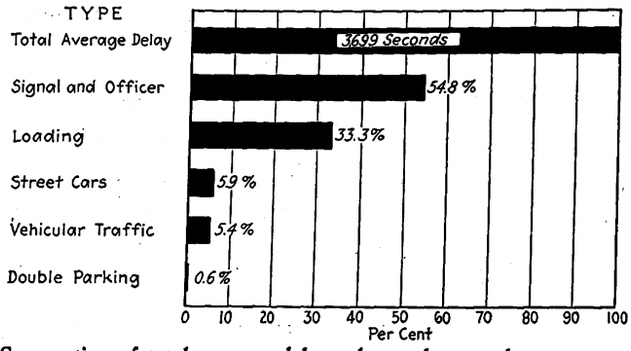
CAUSES OF DELAYS ON STREET CAR LINES IN LOS ANGELES

	Per Cent		Per Cent
Signal and officer	54.8	Vehicular traffic	5.4
Loading	33.3	Double parking	0.6
Other street cars	5.9		
			100.0

The traffic condition that is most generally accused of contributing the principal delay to street-car operation is parking. For consideration here, parking may be divided into two types: First, parking along the curb, and second, double-line parking. It is apparent that curb parking has little effect upon street-car operation except on streets with roadways so narrow that automobiles so parked obstruct the overhang of the street car. Under such conditions it is clear that parking, and even the standing of vehicles for loading and unloading, must be entirely abolished, or street-car operation abandoned.

On streets where the roadway is so narrow that there is not room for the operation of a line of automobile traffic between the street car and parked machines, it would at first appear that prohibited parking would immediately result in improved traction operation. Undoubtedly some relief would be obtained, but not to the degree frequently expected. Even with time-limit parking prohibited, provision must still be made for the loading and unloading of passengers and merchandise. Under normal traffic conditions in typical cities, this requirement will generally result in at least one such loading vehicle being found in each block. In other words, the amount of vehicular operation along the car tracks will not be substantially reduced, inasmuch as drivers will not permit themselves to be "boxed" in the lane of traffic nearest to the curb.

Such operating advantages as may come from prohibited parking are to be found primarily in the elimination of the necessity for what may be called double-line parking, which, on all streets except those of unusual width, results in a blocking of traction movement. Where time-limit parking is prohibited, double-line parking becomes unnecessary, due to the free curb space which is made available for loading and unloading activities. The question naturally arises as to whether it is possible to accommodate loading and unloading operations of vehicles without going to the extent of entirely prohibiting time-limit standing of vehicles. Except in the more congested American cities where a great percentage of the traffic is of a commercial character, it is believed that this end can be obtained by means of a regulation which has come to be known as the loading-zone rule—that is, an ordinance provision which makes possible the reservation of adequate curb space conveniently located in each block, which may be used exclusively by vehicles which are loading or unloading passengers or merchandise. This regulation has proved its effectiveness in eliminating the necessity for double-line standing. Attention is called to the accompanying illustration, indicating that the recent Los Angeles survey revealed that only 0.6 per cent of the total delay time could be attributed to parking which overhung the car clearance line.



Segregation of total average delays observed on twelve street car lines in the central traffic district of Los Angeles by the Traffic Commission of the City and County of Los Angeles

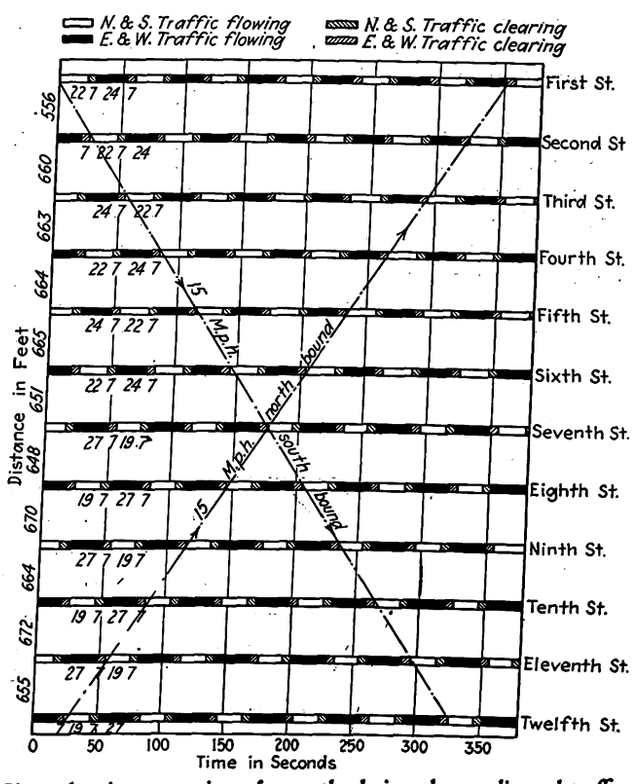


Chart showing operation of recently designed co-ordinated traffic signal system for Los Angeles

Digitized by Google

Obviously, this delay is so small as to be practically negligible. Yet three years ago a similar study indicated that 10 per cent of all parked vehicles in the central district was standing in double line, causing constant blocks and delays to traction operation. The practical elimination of this delay factor was due to a loading-zone provision incorporated in the traffic ordinance which permits the reservation of as much as 50 per cent of the entire curb space of any block for the use of vehicles during loading and unloading operations. It is needless to say that the regulation has proved of as much benefit to the general motoring public, and especially to the commercial operators of the city, as it has to the street-railway company. A similar provision has been incorporated in the Chicago Traffic Ordinance and the ordinance recently drafted for San Francisco. With double line parking eliminated, the street car operator need have little further consideration regarding parking as a delay factor, except upon streets where curb parking interferes with street car clearance.

Delay Due to Overloaded Lines

The delay due to overloaded lines is that which results from street cars offering obstruction to those following, due to overloaded lines or other operating conditions. It is one that does not result from general traffic conditions, but from operating conditions of the lines themselves. Observation leads to the belief that there is in American cities altogether too much of what may be called traditional street-car routing—that is, routes which are followed at the present time primarily because of antiquated habits on the part of the car riders and of merchants located along the lines. Recent routing studies have indicated the possibility of more evenly distributing some of the acute loads which are borne by lines at the present time and at the same time giving more economical and efficient service to the public. Any movement of this sort is a benefit not only to the traction company itself but likewise to the general traffic problem. From the standpoint of traffic relief, special attention should be given, in rerouting studies, to the possibility of eliminating right and left turns at congested intersections.

At Los Angeles 33.3 per cent of the total stopping time was attributed to loading. Methods for reducing loading time are so well known that any discussion of them is needless here. The use of raised platform zones, ground conductors, suitable car design and improved fare collection systems are all important. Observation leads to the belief that in many American cities at present much time could be saved by the use of better methods. The traction companies owe it not only to themselves but to the operators of vehicular traffic to keep their cars standing for the least possible time consistent with efficient loading. A common view of a street car at a congested intersection with a long queue of passengers boarding laboriously through a single entrance, making change and paying their fare, raises a pertinent question as to whether there is some more effective method of transacting this business. The pay-as-you-leave system as a substitute for prepayment is one which would appear to be a not illogical change under many conditions.

The efficiency of any traffic control system depends largely on its ability to maintain the intersection delay at a minimum. Reference to the Los Angeles table, shown herewith, shows that 54.8 per cent of the total delay can be attributed to waiting for a "go" signal after the loading and unloading business has been completed. This amount of delay seems entirely out of proportion when it is recalled that it exceeds the combined delay resulting from loading and all traffic interferences. Excessive delay from stop and go apparatus will be inevitable in all American cities until the controlling devices are properly co-ordinated and adjusted in timing to meet the traffic loads which the streets carry. What can be accomplished by a properly designed system of co-ordinated control is best illustrated in the Loop district of Chicago, where a co-ordinated system of signals operating under progressive timing has reduced control delay to a minimum and has resulted in a marked improvement in traffic conditions, from the standpoint of both traction and free wheel operation. E. J. McIlraith, staff engineer of the Chicago Surface Lines, is primarily responsible for the excellent design and functioning of this system. As an illustration of what may be accomplished by proper signal co-ordination, an accompanying chart shows the operation of a recently designed system for Los Angeles.

One of the most serious traffic conditions that confront traction operation, and indeed vehicular operation as well, at the present time is what may be called overcontrol. There appears to be a tendency to conclude that a traffic stop and go signal is a panacea for all traffic ills. One sees devices installed at hundreds of intersections in American cities where traffic demands do not warrant control of any type. Traffic signals properly used offer one of the brightest hopes for effective regulation, but misused they can have nothing but serious effects. No signal should be installed at any intersection until a study has indicated that its operation will reduce rather than increase congestion.

WHAT can be accomplished by a properly designed system of co-ordinated control is best illustrated in the Loop district of Chicago, where a co-ordinated system of signals operating under progressive timing has reduced control delay to a minimum and has resulted in a marked improvement in traffic conditions, from the standpoint of both traction and free wheel operation.

The Ten-Year Budget*

Electric Railways Must Plan for Years Rather than Months

By George E. Frazer

Frazer & Torbet
Certified Public Accountants
Chicago, Ill.

IN EVERY one of its branches the public utility business is preeminently a long-term business. Although certain factors have led to a great emphasis in accounting and reporting by daily and monthly periods, it is well to remind ourselves that we are in a business that of necessity covers long periods.

Every electric railway has on its books a long-term budget expressed in its capitalization. The first problem that confronts the management of an electric railway every morning is the recurring problem of fixed charges on capital. Often such fixed charges are in excess of the net income that can reasonably be estimated. There is the constant temptation before the manager of electric railways so situated to impoverish service and with forced savings from operating necessities build up sums required for interest and dividend payments. It is to the everlasting credit of your industry that this temptation, while daily recurring, is being constantly withstood in order that the public may be served first.

Ranking equally in importance with the long-term budget of capital charges is, of course, the long-term budget of capital expenditures. Let me remind you that a budget is a balance. It is a misnomer to speak of a capital expenditure budget if it is nothing but an estimate of the sums that the engineering department of your street railway would like to spend for capital account during each of, say, the next ten years. Opposed to the list of capital expenditures in sub-total and in grand total there must be a statement of proposed capital available out of which the expenditures can be met.

The long-term budget of capital expenditures leads logically to the long-term budget of capital charges. Here, again, it is idle to make a one-sided budget that merely shows the demand of capital charges that it is estimated will occur each year for a long-term period. Opposite to that demand, and balancing with it, there must be a statement of estimated income available for capital charges. Nor can we break our chain of logic at this point. We must relentlessly set down a third long-term budget. On the one hand we must state the estimate of net income that is required for capital charges and against that estimate we must state the estimated gross revenue, less expenses, that produced the net income. Lest it be said that I am getting into the realm of the higher mysticism at this point I must insist that it is possible to estimate the gross income of an electric railway for a number of years in advance, and it is possible to make this estimate with a reasonable degree of accuracy. Such estimates have been successfully made and can be successfully made, because there are more factors which can be predetermined than there are unknown factors, and because the work of the accountants, statisticians and engineers can be, and should be, tempered by the mature judgment of executives. The priceless ingredient in a long-term budget is the mature judgment of executive leadership that conservatively analyzes the figures and temperately sets down results which are obtainable and in practically all instances will be exceeded. Such figures may be of poor quality if intended for use in selling an electric railway, but should be of exactly the character I have described if they are to be used in planning ahead the successful operation of an electric railway over a term of years.

Long-Term Budgets Should Be Set Up

Certainly experience has shown that setting up long-term budgets often results in disappointing figures that must be faced if long-term success is to be had. If the capital expenditure budget for the next ten years in

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

your company results in a budget of capital charges for the next ten years that demands net income for that long-term period in excess of what the net income can conservatively be estimated, then you have very striking proof of the necessity for long-term thinking. Similarly, a disappointing long-term budget may, and often does, call attention to the necessity for cuts in operating expenses. If the long-term budget shows that present wage rates cannot be maintained, that showing of itself may stiffen the backbone of the management in insisting upon wage rates that can be lived with. It is easy to give in to solutions which make peace for today. In fact, it is altogether too easy to do that in making wage settlements where long-term budgets are not on the desks of the management compelling long-term thinking. And, of course, the long-term budget does play hob with extravagance in overhead expense accounts.

The trilogy of long-term budgets in the case of an electric railway company always emphasizes that present capital charges are so high that it is difficult to add new capital charges made necessary by needed capital expenditures. The temporary solution of some companies has been to forego current capital expenditures, with the result that service has suffered and gross revenues have declined. It is sometimes almost too easy to explain such decline of gross revenues as due to automobile competition. On each successful electric railway in the country the capital expenditures have resulted in improved service and that improved service has resulted in a sufficient increase of gross revenue to meet the capital charges arising out of the capital expenditures. To the degree that this statement is true, it follows in severe logic that the increase in capital charges is more important than the old capital charges, and that the increase in capital charges if necessary must be made, even though the old capital charges are summarily decreased.

The long-term budget tends to bring up the question of recapitalization. To my mind that is the virtue of setting up a long-term budget. Many electric railway companies in the country need recapitalization in order that present capital charges may be reduced to a point where new capital charges can be increased. Without this process the present capital charges themselves are doubtfully secured. Let me add that public financing has demonstrated that the public will buy new securities on an electric railway when satisfied that the old capital charges and new capital charges make a sum total that can be conservatively met.

A long-term budget starts with an estimate of capital expenditures for a period of years. Such an estimate brings into sharp relief the varying degrees of productivity of the properties owned by the electric railway company. If the electric railway company owns power plants and transmission lines which need improvement and betterment, it may be found practicable and desirable for a reorganization of the company to proceed under which such power plants and transmission lines are sold to electric light and power companies which, through more constant use, can better afford to pay for their renewal and expansion. Under this process, the electric railway company can secure power by lease and at the same time avoid capital expenditures which it is not in an economic position to finance.

It must not be understood that the sale of the power plants and transmission lines is indicated in all cases by merely setting up a long-term budget. Quite the contrary may result. The long-term budget may show that a great deal of capital must be spent on power plants and transmission lines and that the electric railway company must find an outlet for power in order to justify such a plant program.

The point that I am making is that the long-term budget compels the balancing of capital expenditures with capital charges in the first place, the balancing of capital charges with net income in the second place, and the balancing of net income against predetermined operating conditions in the third place. Where these three judgments are made over a period of ten years in the case of an electric railway property, there is bound to be an intensive study of the revenue-producing qualities of the assets of the electric railway. If the electric railway company owns freight lines or power houses or transmission lines or terminals that it cannot properly finance and develop, then the long-term budget will suggest the sale of these facilities to other public utilities, with advantageous leases back to the electric railway company. On the other hand, if the facilities owned by the electric railway company are capable of expansion where power or service can be sold by it to other utilities, then the long-term budget will suggest that possibility.

What I have desired to do is to call your attention to the following principles:

1. The electric railway business must be planned in units of five years or ten years rather than in units of this day or this month.

2. The electric railway business is a fundamental part of the transportation system of the country and, as such, is bound to grow and develop.

3. Each electric railway company must spend large sums on capital additions or else suffer losses in gross revenue and jeopardize present capital charges.

4. The proper budget of capital expenditures must be balanced against new capital required to make the expenditures.

5. This leads to the second budget of capital charges, both present charges and new capital charges as against probable net income during the life of the capital charges.

6. This consideration of capital charges may lead to a reorganization of present capital structure in order to secure a basis that will support the required capital structure.

7. The second budget of capital charges leads to a third budget of estimated net income as against gross revenues and expenses.

8. This long-term operating budget draws particular and intensive study to revenue-producing capacity of present and proposed assets, possibilities of increasing gross revenue and decreasing expenses through economies in plant betterments and better supervision, long-term consideration of wage levels and long-term consideration of overhead expense accounts.

9. The three long-term budgets taken as one long-term program inevitably lead to a study of the advantages of disposing of such power plants, transmission lines, terminal facilities, and the like, as can be used to better advantage by electric light and power companies than they are now being used by the electric railway company; rehabilitation of the electric railway to put it in a position to sell power to steam lines for electrification of their metropolitan services, and use of electric railways themselves in hauling city freight deliveries so as to reduce vehicular traffic congestion in the city streets.

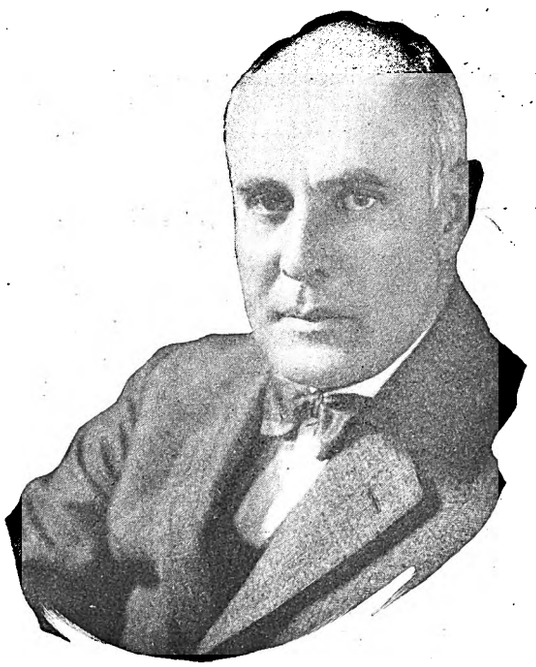
Obtaining Capital
for Electric Railways*

By Francis H. Sisson
Vice-President Guaranty Trust Company of New York



Francis H. Sisson

TO ATTRACT capital, any industry must be able to demonstrate its fundamental economic soundness—that is, its capacity to produce the better-than-any-other-agency goods or services for which there is every prospect of continued and enduring demand. From the standpoint of this basic requirement, the electric railway industry, at least in so far as it pertains to transportation in large centers of population, has abundantly proved its right to share in the investment fund of the country. Within the past ten or fifteen years several rival methods of transportation have been developed and tested, but none has proved capable of handling mass passenger traffic as cheaply and as effectively as the street railway. First there came, in the period before the war, the jitney, which, unregulated and irresponsible as it was, soon passed from the scene. During the war the electric railways were weakened by the rapid rise in operating costs, and since its close they have had, in their weakened condition, to face the widespread development of the motor bus as a transportation agency and also the rapid multiplication and diffusion of the private automobile among all classes. Out of the experience derived from this intense struggle for existence of rival means of transportation has come the definite conviction that, for the economic handling of passengers in mass in our cities, nothing has been developed which can take the place of electric cars running on steel rails.

It has become self-evident from the congestion in our streets that the private automobile is incapable of handling the large volumes of traffic which daily flow to and from the business centers of our cities. As the congestion increases, owners find that they cannot by using their automobiles save sufficient time over street car schedules to justify the very substantial additional expense involved. They are also deterred by the vexation and dangers of driving in crowded traffic and the difficulty of finding parking spaces in the vicinity of their destinations. It seems likely that further multiplication of automobiles will have little adverse effect on the volume of traffic carried by street cars in rush-hour periods in large cities, although there may be some resulting further decrease in riding during off-peak hours and on Sundays.

While the private automobile has not displaced the street car, it has admittedly modified to a profound extent the conditions under which street cars operate. For one thing, the speed of street cars has been reduced by the congestion which the automobile has produced. Another change has been the lowering of average volumes of street railway traffic as compared with peak volumes. Both of these alterations in conditions have made for increased unit operating costs on the railways. These changes, however, are of the technical variety. Broadly speaking, the most significant modification has been that of the electric railway industry from a monopolistic to a competitive business. No longer can the railways depend on traffic which comes to them as a matter of course; instead, they must adapt their operations and equipment to attract traffic.

These adverse changes in operating conditions for street cars, however, have been counterbalanced by even more adverse changes in the conditions affecting the use of automobiles and consequently have not shaken the conclusion that the electric railway industry in large centers of population is as a business economically sound. As this judgment respecting the permanence of street railways comes to be shared by investors generally, the difficulties in the way of railway financing should become much more easily surmountable.

At present, however, despite the soundness of the railway business as an economic activity, many railway companies are hard pressed to obtain additional capital for their needs. The main reasons for the plight of these companies are unsatisfactory franchises and contractual relations, top-heavy indebtedness and fixed charges, closed or otherwise inflexible mortgages and in some instances competition from other public transportation agencies, unfavorable political conditions, unsatisfactory public relations and lack of alert and efficient management.

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

Speaking very generally, the inability of these companies to do financing is due to the fact that the essentially sound business which they conduct is not clothed in sound legal and corporate forms. For the most part the existing inadequate forms which retard and prevent financing are not creations of present managements, but are rather legacies from a past in which conditions were utterly different.

Among the most common difficulties encountered in franchises are insufficient term or tenure of life and lack of flexibility in respect to fares. Either one of these conditions makes financing well nigh impossible, and a combination of the two is usually fatal. Fortunately municipal authorities and the public in general have in a number of instances been brought to see the folly of inflexible provisions in these matters, and old iron-clad franchises have been superseded by others having the flexibility that investors demand.

Unless state laws prevent, franchises should be for an unlimited or independent period, or else there should be some provision for the amortization or reduction of debt within the period of the franchise. Several states have commendable indeterminate franchise laws whereby public utilities are assured of the continuing right to operate their properties unless and until the municipalities within which the properties are located elect to purchase them at their fair value. Other states should follow suit and rid their statute books of archaic franchise laws. Where franchises must be for definite terms, the necessity for amortizing debt within the life of the franchise may be obviated if a provision is incorporated obligating the municipality to take over the property at its fair value in case the franchise is not renewed.

WITH favorable conditions in respect to franchises and corporate structure must be coupled the assurance of alert and vigorous management, for not even the best set-up as to franchises and capital issues will atone for visionless and inefficient supervision.

—FRANCIS H. SISSON.

FRANCHISES SHOULD PROVIDE FLEXIBLE FARE

Unless the regulations of fares falls within the province of some state-wide agency, there should be machinery within the franchise itself whereby the raising and lowering of fares to meet fluctuating costs is accomplished automatically and without reference to any local political body. A number of admirable "service-at-cost" franchises embodying this principle have been worked out. In such franchises changes in fares usually are regulated by a barometer fund into which go all earnings above expenses and a stipulated return on capital. The only serious criticism which may be made of such franchises—and that mainly from the standpoint of the common stock holders—is that the incentive to the management to accomplish savings in operation is somewhat dulled, since such savings redound wholely or largely to the benefit of the car rider. As a way of avoiding this difficulty, it is suggested that companies which have occasion to work out franchises in the future might give consideration to the possibility of making the raising and lowering of fares dependent upon price index numbers rather than upon barometer funds. Index numbers have proved useful in many ways, and it should not be at all impossible to construct one which would fairly measure fluctuations in the costs of conducting electric railway operations. Entering into the computation would be wage scales for various general classes of labor and prices for the principal basic commodities and materials used in the operation and maintenance of street railways. The level of the index number prevailing at the time of the adoption of the franchise would be taken as 100, and provision would be made for the increase or decrease of fares by some fraction of a cent for each 5 or 10 per cent increase or decrease in the index number. The regulation of fares in this manner would not impair in any way the incentives for increased operating efficiency.

Another common defect in franchises is the heavy burden of paving charges and taxes which they impose upon the grantee companies. The reasons for the requirements in regard to paving have been obsolete ever since the passing of the horse cars, and ordinarily there is scant justification for any special franchise or excise tax on earnings in addition to the usual property tax. In the long run the effect of such provisions is to raise the fare which the public must pay and by so doing encourage the use of private automobiles with resulting increase in street congestion.

The only remedy for unsatisfactory franchises is, of course, the securing of better ones, a process in which the confidence and good will of the public are absolutely essential. To obtain such confidence and good will a company must fully and frankly acquaint its public with its problems and aims. It must also show, not merely by words but also by actions, that it is doing its best to render good service and will make improvements as rapidly as its position will permit. The obtaining and holding of public good will is a task at which the entire staff of a company, not a part, must work, and work continuously. There is hardly ever a case of public mistrust and ill-feeling that will not yield to continued treatment of this very sort. There is in this connection a vicious circle: Additions and improvements cannot be made because of lack of capital, capital cannot be obtained because earnings are poor and earnings are poor because the inability to make additions and renewals results in high operating expenses and loss of traffic. If this circle is to be broken, it is usually by improving the relations of earnings to fixed interest requirements and in this way making possible the sale of additional securities.

WHEN NO MARKET FOR SECURITIES EXISTS

Companies which cannot at present find a market for their securities might adopt one of two courses: either plow back all surplus earnings into their properties for a period of years and by this process gradually effect such an improvement in the relation of earnings to interest charges that bonds will become salable, or else endeavor to effect a readjustment in capital structure. The first procedure should not be followed by a company unless its surplus earnings, together with such funds as it is able to secure from the sale of equipment trust certificates and similar obligations, are entirely sufficient to take care of its needs for new capital, not merely the

Digitized by Google

money required to maintain the property in its existing conditions but also that needed to revivify it with new equipment and place it in a condition to attract traffic. If a company's earnings are adequate for this purpose, however, its credit may be restored by this process much more quickly than might at first be thought, as the effect of the reinvested earnings is cumulative.

If, however, earnings are not sufficient to keep the property abreast of developments, then it is best for all concerned, security holders as well as car riders, that a readjustment should be undertaken. In some cases there should be a fair possibility of effecting such a readjustment by voluntary agreement among the holders of the various classes of securities. Almost any street railway property which has been starved for lack of capital will pay a handsome return, in the way of increased earnings, on any new money which may be introduced. For this reason it should not be impossible to persuade holders of existing securities to see that their interests are better served by taking junior securities in a situation with good prospects of growth than by preserving a technical priority on a starving property. There will be cases, however, in which voluntary action cannot be secured and where the knife of forced reorganization must be used. Even when this means the wholesale scaling of debt and the levying of assessments on stock, all classes of security holders are likely to find in the course of a few years that, as a result of the improvement in their company's credit, their new securities are worth more than those which they surrendered.

Of course, there may be more than a mere situation in respect to earnings that prevents a company from being able to do financing. In addition to being top-heavy, its funded debt may be complicated by reason of being split up into numerous separate issues and also its principal mortgages may be closed so that it has nothing resembling a first mortgage with which to go into the money market. Even in cases where mortgages are open there may be difficulty because the bonds which may be issued must bear a particular maturity date or coupon rate. Whenever opportunity offers, whether in connection with a readjustment or otherwise, a new financing medium should be set up which will be as nearly as possible a first mortgage, permitting the issuance of bonds in series varying as may be desired in respect to maturity dates, coupon rates and other provisions.

Even when a company has been placed in a position where it can do senior financing satisfactorily, it may still have a problem on its hands to raise its requirements of junior money. Few companies are able to sell stock, and recourse must therefore ordinarily be made to earnings as a source of junior money. Perhaps most companies will have to continue this practice for some time, but at the very first opportunity they should undertake the sale of stock. In preparation for such an opportunity they might, wherever legally possible, change their stock into shares without par value.

With favorable conditions in respect to franchises and corporate structure must be coupled the assurance of alert and vigorous management, for not even the best set-up as to franchises and capital issues will atone for visionless and inefficient supervision. On the other hand, it is really astounding to find how much can be effected by good management alone in the way of reducing operating expenses and working out improvements to attract traffic.

Present Situation Is Encouraging*

By B. C. Cobb
Chairman of the Advisory Council
American Electric Railway Association

B. C. Cobb

Despite increasing automobile competition, the electric railway industry is holding its own. Modernization of plant and modernization of thought are instrumental in making it progress

WE ARE again deeply appreciative of the hospitality extended to us by the city of Cleveland and its people. Ours is a great and necessary industry, as the citizens of Cleveland well know. Because of their wise action after some years of experiment, their city has today one of the best-operated and most strongly financed transportation systems in the country. Some other places would do well by emulating this example. New York, where politics and not service to the public is the order of the day, would profit by giving heed to what has been accomplished in this fair City of the Lakes. In our great metropolitan center, votes, not transportation service, seem to be the things uppermost in the

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

minds of the granting and regulating authorities. And yet here is a paradox, for if the people were properly told and understood, it seems certain that they would see that the 5-cent fare will not earn in sufficiency properly to maintain and give adequate service and would therefore vote for something different.

I think I can fairly say, without fear of contradiction, that the transportation service in New York City today is a crying shame. And why? Politics, and the desire to "fool all of the people all of the time." A unified and improved transportation system under private management, with a slightly increased fare and with proper governmental regulation, would solve the problem, and with great benefit to all concerned.

In 1926 there was no appreciable increase or decrease in the number of passengers carried by electric car and allied motor bus lines. The figure has been almost stationary for the past three years—16,000,000,000 revenue and transfer passengers. Perhaps we should feel encouraged because of this. I mean perhaps we should not become discouraged because of lack of increased traffic when we know that our country has increased in population prodigiously during the years just mentioned. I do not think we should become discouraged when we consider the tremendous increase in privately owned and operated automobiles during that time. Somewhere between 10,000,000 and 11,000,000 is the figure.

The independently operated motor bus is not now the menace that it was, for the industry itself has, to a very great extent, taken over that very necessary adjunct of the transportation service. Happily for the industry, for the bus manufacturers and for the people themselves, a better understanding of the bus situation has been arrived at. The financing of independent bus operation by manufacturers in localities already served is largely a thing of the past. This is for the common good, for ruthless competition in a business which should be a regulated monopoly can only work harm for all alike. We of the electric railway industry should not, however, complain if bus or other transportation service is given in territories needing service if we ourselves decline to give it.

Improved Service and New Methods

No one, if fair minded, can say that the electric railway industry has not in the past few years endeavored to better its service. This is the one thing it has tried to do, not because of altruistic impulse—I think no such claim has ever been made—but because if it was to live and eventually to prosper, it was necessary to renovate its viewpoint and adopt new methods and procedures. This it has very effectively done, not only by adding new and modern railway equipment but by adding motor bus auxiliary service, paying more attention to its personnel, giving the public more complete information as to its needs and necessities, and above and beyond all else, endeavoring to render a service under the most trying circumstances in a gracious and attentive way.

The industry has been courageous in the face of great difficulties. It has steadfastly maintained that it is rendering a necessary service to the people. It has tried frankly to express just what its troubles are and what it needs to make it prosperous and therefore a better servant of the public. Its efforts at salesmanship during the past few years have been noteworthy, with the result that in many instances much good has accrued not only to the industry but to the people as well. It is very gratifying to report and be able to say that, generally speaking, most of the communities—there are a few exceptions—throughout the country have rallied to the support of the industry and endeavored to help it, not only by increasing rates of fare but in many other ways. This is a good sign, for it means co-operation and team work, which in the long run must surely win.

Advisory Council Principles

Last year your advisory council laid down some fundamental principles which it was thought would be of benefit not only to the companies but to the employees and the public as well. These principles your council still stands for, and it believes if they are followed they cannot help but be of benefit to all alike. The most important of these are:

1. The companies must obtain the friendly co-operation of the public.
2. The companies must have their executives always accessible to their employees and the public. They must welcome suggestions made in the interest of the service, grant reasonable requests and have a genuine interest in the welfare and progress of the communities in which they operate.
3. The employees must realize that their interests and those of the company are the same, and make every effort to be useful public servants in an honest endeavor to make friends for themselves and their company.
4. The public must favor a just system of regulation and consent to rates of fare that will make its transportation agent a solvent industry.
5. The public must understand that the best service at the lowest cost can be obtained in a community only through the operation of all public transportation by one efficient organization.
6. The public must realize that 75 per cent of the people use the public transportation service in their daily occupations, and insist that their authorities enact and enforce such effective traffic control that the public vehicles may have a relatively unobstructed use of the streets.

Indiscriminate and unregulated parking of automobiles on business thoroughfares is an evil which still exists, and it is evident that only with the passing of time and better acquaintance with the results of such evil will it be stopped. Not only is such practice harmful to the transportation companies but it is also harmful to the merchant whose front door it clogs. It slows down traffic and because of so doing becomes a public nuisance. If continued, it can only mean additional and unnecessary taxation because of the cost of widening streets.

Government Ownership

There are some among us who are favorable to government ownership and operation of public utilities. They are not many, however, for the feeling in America, which is the outgrowth of the thought expressed in our Constitution, is still too strong for private initiative and endeavor. And yet, if the people want to continue to keep electric transportation in city and suburban service—I cannot think otherwise—it may be they will be forced, in extreme cases, to take over such operation, charging such deficits as may come about to the taxation burden. A better thing, and a more likely thing, will be for the people fairly to regulate and compensate their transportation companies so that they will earn a fair return on the fair value of the property used and useful in the public service.

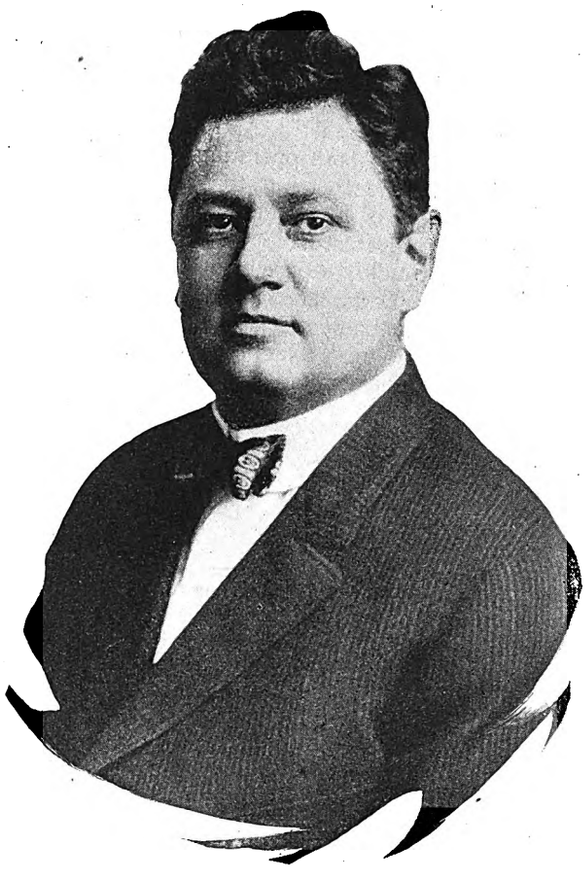
The Autobiography of a Thin Dime*

By E. F. Wickwire
Vice-President Ohio Brass Company, Mansfield, Ohio

This is one of the author's characteristic addresses, containing a wealth of philosophy with a 1928 model dress that is planned to please his auditors, much as he would have them please by dressing up their cars



E. F. Wickwire

"I am a *Dime*—Ten Cents
"I am not on speaking terms with the Butcher
"I am too small to even look at a pint of Ice Cream
"I am not large enough to purchase a good Cigar
"I am too small to buy a ticket to a Movie
"I am hardly fit for a Tip
"But, believe me, when it comes to Street Car Fare
"I am considered *Some Money.*"

PERHAPS you've heard the story of the sailor who was visiting his boyhood chum who had become a minister. The sailor had a parrot. The minister also had a parrot. The parrots were hung up side by side. They looked at each other for a minute and each was suspicious of the other. Finally the minister's parrot, in a funereal voice, said:

"What must we do to be saved?"

The sailor's parrot thought that over for a minute and then remarked:

"Pump like h——, or we'll all be lost."

I think the question asked by the minister's parrot strikes a familiar chord in the minds of all of us connected with the electric railway industry. We have been trying to work out the right answer to that question for quite a spell.

Maybe you'll agree that the answer given by the sailor's parrot to the minister's parrot pretty nearly hits the nail on the head.

The next question that perhaps naturally comes to mind is: "Are we steering the 'old boat' in the right direction to reach safe waters?"

And this is a vital question that concerns everybody connected with the industry—whether he be an operating man or a manufacturer.

Recently I noticed a card displayed throughout a manufacturing plant which read something like this:

"Who is your real boss?"
"Is it the president? No."
"Is it the superintendent? No."
"Is it the foreman? No.
"Your Real Boss is the CONSUMER of our Product—the man who buys the article that you are helping to make.
"If he is satisfied with your Product, he will continue to patronize you. If not, you will lose his patronage, perhaps without even hearing a complaint from him.
"Furthermore, the quality of your Product is the yardstick by which he measures the price he is willing to pay for it.
"It is not simply a question of satisfying yourself—you must satisfy him.
"At times you may think he's a 'Crank,' so keep this definition of a Crank before you!
"A CRANK IS A FELLOW WHO INSISTS ON CONVINCING ME, INSTEAD OF LETTING ME CONVINCE HIM."

Doesn't this same principle apply to the electric railway industry? Isn't the user of our product—the car rider—the real boss? And isn't it up to us—all of us—to satisfy him in order to progress and prosper?

And if we are really aiming to satisfy this real boss—the consumer—doesn't it stand to reason that we must constantly study his likes and dislikes; find out what appeals to his spending instinct, and do our utmost to develop our product accordingly?

You may say, "That sounds all right, but it's not such a simple matter to read the minds of the fickle public in our case." And I agree with you thoroughly. But I think you agree with me that a determined, intelligent and organized effort on the part of all of us will find ways to accomplish our purpose.

It's a good mark to shoot at—and you know Cleopatra finally "made her Marc."

We might do a lot by establishing scientific research departments. I use the term "scientific" because anything is scientific when we don't quite understand how to accomplish it.

I recently heard a man who has been prominent in so-called scientific research work for improving the automobile make this remark:

"Our constant aim is to find out what appeals to the public; what it will buy, because anything that can be sold can be manufactured."

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Isn't that a significant comment, "anything that can be sold can be manufactured?" And wouldn't we do well in our own industry, both operating man and manufacturer, to dig a little deeper into that point?

I doubt if there is any field in which the mechanical and technical problems have been more intelligently, logically or thoroughly worked out than in the electric railway industry. Hampered by low fares and working under that first fundamental law of railroading—"service must be maintained under every condition"—there is no denying that electric railway men have accomplished wonders.

The Automotive Man's Philosophy

This automotive man whom I have quoted has evidently studied people from this standpoint. To quote him further:

> Every trade in the world hates the introduction of a new idea into its routine, if the idea looks new. Therefore, be careful how you wrap it up. They award medals for a new idea only after it becomes old.
>
> So we must study that end of the thing and the business relationships, the common, every-day, work-a-day things, simply to find out whether we do it by force of habit, whether there is any sense to it or whether there isn't.
>
> So the principal way to start research in any organization is to start at your desk. Turn it 180 deg. around and see how much different things look. Just move a few things around. Go to a different restaurant to eat, or do something differently."
>
> [Suppose in our case he might suggest riding to work on a street car.]
>
> That is all that is wrong with us; we get to doing the same thing in the same way every day and all the rest of the world disappears.
>
> So we have to get out of the rut; that is the greatest problem that research has today, to get us mentally out of the rut, and the rest of the things come as a matter of course.

I have taken the time to quote these remarks from a man high up in automobile research work partly because they appeal to me as very much worth while in themselves and also because the development of the automobile has created an entirely new set of conditions in the electric railway industry.

So, whether we like it or not, the automobile seems to be our principal competition. And a little analysis of some of the ways the automobile industry has appealed to the public in motor transportation may emphasize the importance of some points as applied to our case.

For example, we all know that the "appeal of appearance" has been one of the strongest selling factors in the automobile industry.

Knowing, as we do, that the decided changes and improvements in the lines and appearance of the 1928 model motor car, as compared with, say, the 1918 model, have appealed so strongly to the public, is it reasonable to assume that it will not respond to more of the same kind of treatment, applied to the trolley car? There is a question of degree of course, and this doesn't mean that the trolley car has to look like an automobile, but it should look less like the old "5-cent" street car.

The motor car industry has not been able to get motorists to adopt the polecat's motto, "don't hurry—others will," so it has made marked improvements in recent years in the matter of quick acceleration, and you will find it featuring this point in its advertising and in its sales talk.

In the matter of comfort, the motor car manufacturer has made constant improvement, even to the point of providing, in some cases, cushions stuffed with "goofer feathers, or fuzz from peaches."

Here, again, enters the question of degree when considering the trolley car, but it doesn't stand to reason that a man is cheerfully going to transfer his pampered anatomy from a wide, comfortably cushioned automobile seat to a narrow, hard-surfaced trolley car seat.

Automotive engineers will tell you that quietness and power do not naturally go together in a gasoline engine, and yet they have spent years trying to make the motor as quiet as possible. And it stands to reason that if his nervous system suffers so much from the squeaks and rattles that develop in the motor car, he also has a sensitive ear for the grinds and howls that develop in the trolley car.

Last, but not least, we all know that the trolley car that presents a clean, bright, attractive appearance makes a strong appeal to the public.

The motor car has developed one outstanding characteristic in the American public today, and that is impatience. People won't walk, nor will they wait to ride; in fact, they can scarcely wait for a traffic signal to change.

Like the little Irishman who was hurrying along in his flivver and was stopped by the traffic officer, who said, "Wait! Pedestrians are now passing." After waiting impatiently for a minute the little Irishman yelled to the cop, "Say, when kin a Catholic get past here?"

Speed, but for What Purpose?

A big percentage of the people today are rushing madly around in motor cars, hurrying to get somewhere, and half of them don't know what to do after they get there. Nevertheless, they demand speed in the matter of transportation, and I believe that most of us have decided that we have to face that issue squarely.

There's no use trying to satisfy the car riders with what satisfies us. We must deliver the kind of a product that satisfies them, or it won't work any better than "trying to amend the Constitution without first amending the people to fit it." Their requirements may seem unreasonable, but is it easier to rebuild the public or to rebuild our product?

These truths bear much repetition; they but confirm what the sailor's parrot said about the necessity for keeping on pumping—"pumping" new ideas into the industry to keep pace with changing conditions.

Why will people willingly pay taxes to provide more and more street space for private cars and then begrudge an extra penny or two to ride on street cars, which carry five times the number of people for a given amount of street space?

At the opening of our county fair the other day police estimated that 10,000 automobiles had arrived and only 2,000 people.

One reason for all this "scotching" on street car fares is because shrewd politicians everywhere have rubbed elbows with and studied this "real boss" that we've been talking about—the consumer of our product. And they know that it's not hard to convince him that he shouldn't pay 10 cents to ride in the trolley car that he used to ride in for 5 cents—or one that even looks like the one he used to ride in for 5 cents.

Yet shopkeepers tell us that the workingman nowadays is buying silk shirts. And the working girl is wearing silk stockings—so I've heard. Cotton stockings are "on their last legs," and, by the same token, "cotton" street cars are on their last wheels. And it's a safe bet that the 1928 model shop girl will cheerfully pay 10 cents to curl her 1928 model silk stockings under the seat of a

Digitized by Google

1928 "silk stocking" model rail coach if she gets half a chance. And no wise politician would attempt for a minute to tell her that she couldn't afford it.

But most of us realize that modernized equipment alone will not solve our problem successfully. It must go hand in hand with modernized merchandising methods. And it is encouraging to note that the industry as a whole has rediscovered how to sell its service, instead of simply allowing patrons to buy it, as they did in the old "horse-and-buggy" days.

In this connection, the aim of your committee on co-operation of manufacturers is to inspire manufacturers to make a more intelligent and intensive study of the industry's needs, and so stimulate the creation of more new ideas, together with creative selling effort in presenting these ideas to operators.

Not that the manufacturers have not been making improvements. One look at the excellent car exhibit at this convention will offset any such impression. We've made a good start and will undoubtedly create and adopt improvements much faster from now on, particularly in respect to further changes in the lines and outward appearance of the car.

Long ago the automobile industry called in the artist to create new body designs, and the artist may have thought a spark plug was a horse. But he went ahead and beautified the lines of the automobile body. Then the production man was called in, and he said, "It can't be built to look like that." But the executive said, "This is not just an artistic picture; it's a commercial proposition; it must be built"—and they found a way to do it.

There is nothing like calling in the right man when you want something done. Like the Scotchman who wanted to put up a brick building—so he called in a Free Mason.

The next subject on the program this morning is entitled "How the Industry Is Progressing," the idea being to present short talks by operating executives relating to accomplishments of the year on properties in various parts of the country.

It has been well said that "the individual today counts for so little in the entire make-up of the industry that only by an exchange of ideas and finding out how little we know, do we go back home and want to learn more. We should all listen to these new ideas and give them fair consideration.

We are all pretty much alike as human beings, and every time a new idea is presented we are quite willing to tell what's wrong with it, because it's more fun to throw bricks than to lay them.

But shouldn't we go a step further and say, "Can you overcome that difficulty?" And if you do overcome that one, you may develop another. And if the project is worth while, you can go ahead and solve that difficulty—if you don't get tired too quickly.

Conservatism has its place, but progress means pioneering. It's all right to "keep both feet on the ground," but you can't walk far if you do.

So let's not be backward about presenting new ideas at these meetings for fear they may sound radical.

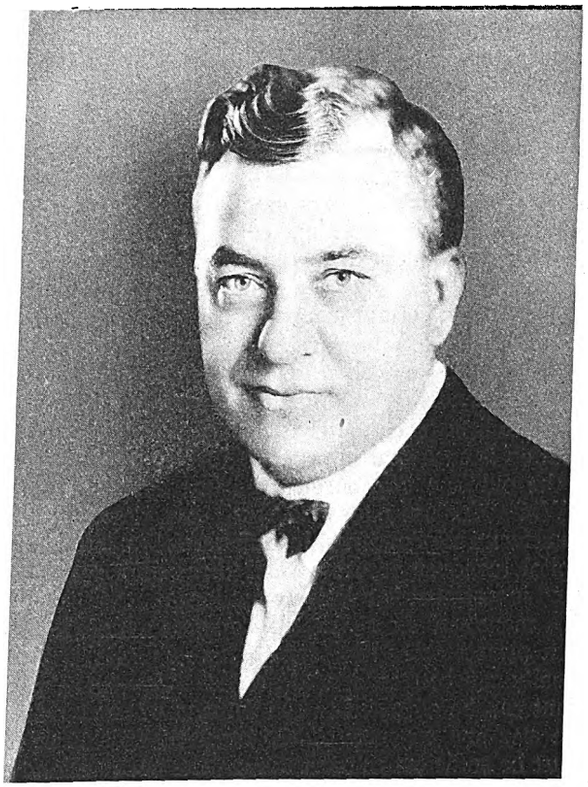
Like the Christian Science testimony meeting that I read about recently. There were many enthusiastic talks acknowledging the inspiration and help received from Mary Baker Eddy, the founder of Christian Science.

Finally, a meek-looking little woman in the audience arose and said, "I'm only a visitor here and never heard of Mary Baker Eddy before, but I just want to tell you what Lydia Pinkham has done for me."

Evolution of Regulation and Accounting*

By Harry Boggs

Herdrich & Boggs, Certified Public Accountants, Indianapolis, Ind.



Harry Boggs

EVOLUTION means the ascent from simplicity to complexity. This is the history of regulation and accounting.

As most of you are connected with an enterprise that is regulated by law, it might be interesting to know that regulation is not a recent invention or a new discovery.

The difference between private enterprise and public calling are the most salient characteristics of the law of business relations. The causes of these differences are more economic than legal.

In public callings the state imposes affirmative duties, but in private enterprise usually the duties or restrictions are negative in character.

The history of the development of this distinction between public business and private calling show clearly the legal and economic basis upon which the modern law rests. [Mr. Boggs then reviewed some of the regulations in medieval times, pointing out the economic basis.]

[After citing certain classes of business that are now usually considered as public utilities Mr. Boggs takes up the question of why they are so classified.]

The question arises, why these classes of business are

**Abstract of a paper presented at the annual convention of the American Electric Railway Accountants' Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

regarded as public utilities and subject to state regulation, when other businesses are not so regulated. The principal reason is economic. It takes comparatively little capital to open a shop or a grocery store, therefore the field of these callings is practically unlimited as to competition, and competition may be expected to regulate service and prices. But the classes of public utilities hereinbefore named require large investments. To attract the capital required for such investment it is considered necessary in most cases for the state to grant a monopoly; that is, to guarantee the company which provides this service that it shall not be subject to competition in its field and that it shall be permitted to earn a reasonable return upon the fair value of its property actually used and useful for the convenience of the public.

In return for that grant, and in order to prevent the monopoly from becoming burdensome on the public—that is, from charging exorbitant rates, or giving inadequate service—the state makes exact and rigid regulations for the conduct of the business. These are affirmative duties. The state says that the business shall be conducted in a certain manner.

Let us take, for the purpose of comparison, an electric railway utility and any typical private enterprise, such as a merchandising or a manufacturing business.

In the first place the character of a public utility corporation is such that in order to furnish adequate service to the public a very large fixed investment is required.

While this may also be true, to a degree, of some manufacturing concerns, in commercial undertakings the capital turnover occurs several times each year and the fixed investment is relatively not large.

A manufacturing plant may operate when and as long as it pleases those in charge of its affairs. Its products usually can be stored until needed. The capacity of the plant can be adjusted to the demand of the market, but the size and capacity of the plant of an electric utility must be sufficient to meet the highest peak demand made upon it, even though that demand continue but for a short time.

A utility furnishing electric current must be in constant operation and production, 24 hours a day. A utility must serve all who apply and must sell its product without discrimination in price. Those who are engaged in manufacturing and commercial enterprises are not so restricted. They may sell or not sell, as they please. On the other hand there are certain advantages and privileges which accrue to public utilities which are not shared by those engaged in private enterprise. There are certain legislative restrictions upon competition which inure to the benefit of the utility.

So we find that the determining factors with respect to these matters are economic and not legal and it is the inexorable economic law which governs and controls.

Accounting Is an Important Factor

Now that we have briefly traced the development of regulation, let us talk about the accounting department for a few minutes, to see if there has been any developments worth while and to determine, if possible, just how much importance to industry attaches to this fascinating profession.

[Attention was directed by the speaker to the early methods in vogue when trading was first indulged in by human beings and showed how transactions were recorded then.]

In years gone by many merchants viewed the accounting department as a needless expense and a nuisance. The very first thing that transpires after any new company is organized is to call for an accountant to open up a set of records, thereafter to be kept in such a manner as will correctly reflect the true condition of affairs throughout its corporate history.

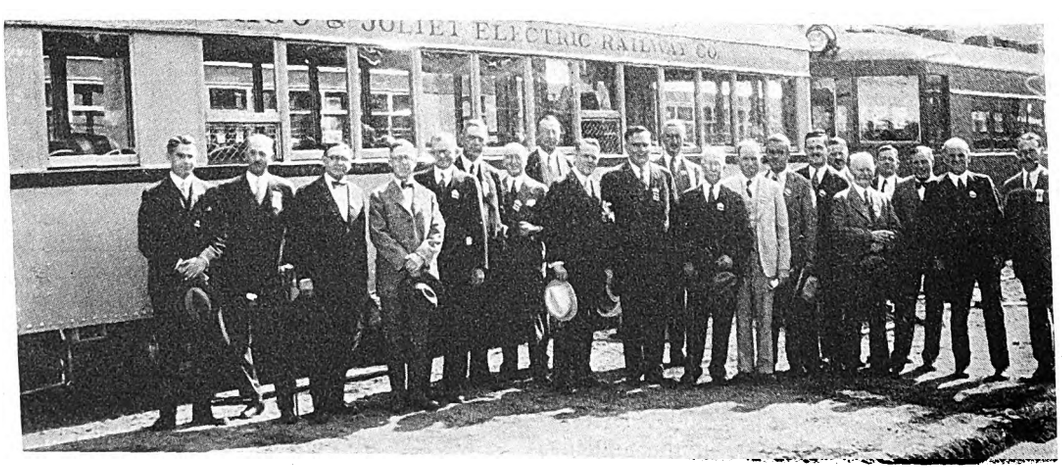
The owners of a large corporation may have a wonderful institution, but they must depend upon the accounting department to keep them posted on the trend of the business and warn them of the leaks.

I am sure that no public utility can properly function without a competent accounting department. The law prescribes just what accounts shall be kept and how and when periodical reports must be made to the commissions and the books must be accurately kept in order that the reports will tell a true story.

We all know that the income tax law has been a very important factor in bringing about a wider recognition of the indispensability of the accountant.

Some of the highest executives in our largest industries have come up through the accounting department.

May I leave with you the thought that the accounting department is rapidly mounting to its proper place in the utility field as well as in the commercial and industrial world and must eventually be recognized as the most important and vital factor in every business organization.



Members of the exhibit committee

An Informed Public Is Fair*

By George B. Cortelyou

Chairman Joint Committee of National Utility Associations

George B. Cortelyou

THE Joint Committee of National Utility Associations had its genesis in war conditions. To expedite the placing of their resources at the disposal of the government and to serve as a means of contact with the government on the larger problems created by the war, the utilities formed several joint committees. The end of the war naturally brought an end to these special duties, but it was thought best to continue some form of organization that would function in time of peace and that would facilitate common action on questions of larger import affecting the utilities. The present joint committee was the result.

The national utility associations comprise the following: the American Gas Association, the National Electric Light Association and the American Electric Railway Association.

Despite the fact that the country as a whole has accepted and indorsed the policy of private ownership, operation and management of the utilities, ardent advocates of contrary policies appear from time to time with specious plans that would involve the government in vast expenditures, whereas every practical feature of their plans—so far as they have any practical features—could be secured, at infinitely less expense, by the normal extension and development of existing private agencies. They would have us believe that government can carry on the business better than those who have grown up in it and have made it what it is today, and this in spite of the wrecks that litter the road over which government operation has traveled in the past. Many of these enthusiastic theorists are less concerned with the success of their particular project than with gaining an entering wedge for their paternalistic ideas.

The American people want to be just and fair. Of that there can be no question. They have proved it time and again both in their domestic affairs and in their external relations. Temporarily they may be misled by prejudiced and partial information, they may follow false gods for a time, but in the long run they reach sound conclusions.

The price of liberty is the freedom to make mistakes. While it is true that the people may be trusted to reach sound conclusions in the long run, if the run is too long, irreparable damage may be done before the situation can be righted. Surely we are justified, then, in attempting to avoid this by pointing out the errors and fallacies involved in many of the proposals affecting the utilities that are urged from time to time, by disseminating reliable information concerning them and by endeavoring to keep the line of progress as straight and unbroken as possible.

There is neither mystery nor hidden purpose in the program of the joint committee. Its work will be carried on openly and frankly. It seeks no favors; it asks only that its presentation of the utility situation be considered and dealt with on its merits. But that such presentation may be so dealt with, it exercises the common right of all American citizens or organizations to be heard on all matters in which they are interested that become the subject of public debate or decision, and having presented its case it will, with confidence, abide the informed judgment of the people.

We believe that an informed public is a just public. We intend, therefore, to give the public the truth about the utilities, their aims, their hopes, their difficulties, their accomplishments. We shall try, among other things, to demonstrate that the entry of government, whether national, state or local, into this field is constitutionally unsafe, politically unwise, economically unsound and competitively unfair. And this we shall do, not wholly from the selfish standpoint, but because it is the obligation of every good citizen to fight the spread of theories which, if adopted, would undermine the structure upon which our national progress is founded. We believe that we can so present the outstanding merits of utility service under private ownership that an informed public will be unwilling to abandon the solid ground of that system for the quicksands of government ownership.

Although the utilities as a class are rightly regarded as among the most stable of our industries, they are by no means exempt from the effects of changing conditions and the necessity of adapting themselves to them. Periods of readjustment are always difficult and often painful. The dislocations caused by the war, with costs far out-

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

stripping rates, were a severe trial to the utility interests, but they met the situation with faith and courage. The aftermath of the war brought its problems also, and these too are being met in the same spirit.

Among the ever-present facts of the utility situation is that of competition. In the case of the gas and electric companies, this is largely indirect, except in the great and growing industrial field. Gas, especially, must meet the competition of other fuels such as coal and oil where heat is required in industrial operations. The electric company, in its wholesale department, deals with similar conditions. Of course, both are legal monopolies in the sense that there is usually but one gas company and but one electric company serving a given territory, and to this important extent they are relieved of direct competition.

When we come to the electric railways, we find the competitive situation greatly intensified. The phenomenal increase in the use of the passenger automobile, the bus and the truck reacted with serious consequences upon the electric railways, both urban and interurban. They were faced with grave losses, many were forced into receiverships, and many miles of track was abandoned. Had they outlived their usefulness, were they about to disappear from our streets and highways and take their place among the relics of an age that had passed? To these questions many were prepared to answer in the affirmative and were getting ready to sing the "swan song" of the electric railways, just as in earlier years there were those who doomed the gas industry to extinction when it lost the major part of its lighting load to electricity. But happily in neither the one case nor the other were the prophets of evil justified by the event. Just as gas recovered from its temporary setback and marched on to triumphs undreamed of in that early day, so the electric railways, now that they are getting their "second wind," are gradually working out of their difficulties and are more than holding their own. Public opinion, which at first was inclined to be somewhat apathetic, is now awakening to their value as a means of economical mass transportation.

Much of course remains to be done. Their credit must be restored, which can be accomplished only by larger earnings, and this in turn may call for further revision of fares in some instances; equipment must be modernized, better business and accounting methods must be adopted, service must be improved, discriminatory taxes and other oppressive exactions must be abolished, and so on. All agencies of transportation, whether street railway or bus, must be so co-ordinated that unnecessary duplications of service and facilities will be avoided.

Substantial progress is being made along most of these lines. The important thing is not so much the speed at which we are traveling as the direction in which we are going. The electric railways are headed in the right direction. Their return to the place that is rightfully theirs in our transportation system will be hastened if they are protected from the type of competition that is merely destructive in its effect and that in the end benefits no one, the public least of all.

This does not mean that competition should be done away with, even if that were possible. There is no stronger incentive to effort than competition, actual or potential, and one kind or the other is present in every industry. We of the utilities do not know at what moment our products may be challenged by new discoveries, new inventions, new developments, but we must be prepared to meet the challenge whenever it comes, on the basis of service and price. If we cannot do so, we must step aside or be pushed aside. We are not passengers in the industrial boat, but working members of the crew. We must "pull our weight" and a little more. We exist to serve the public, and our contribution to the public welfare must be measured by the touchstone of service.

Progress

Is the Achievement of Many Minds and Many Hands *That Is the Glory of Life**

By Dr. Alfred W. Wishart
Pastor Fountain Street Baptist Church
Grand Rapids, Mich.

Dr. Alfred W. Wishart

IN A RECENT magazine article a writer deplores the practice of inviting ministers to address conventions of business men. He thinks the necessity to increase sales demands high-powered salesmen whose chief stock in trade is emotion. Ministers are assumed to be past-masters in the art of arousing emotions and so can render aid to salesmen. Then, again, religion, prayers and clerical co-operation lend respectability to business ventures and help to establish confidence in the mind of the

**Abstract of an address delivered at the annual convention of the American Electric Railway Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

consuming public. If that is a true explanation of the presence of ministers on convention platforms, I am out of place here for several reasons.

First, because I believe a religion or a business that exalts emotion above reason invites disaster. Confidence and good will in business must be rooted in something more substantial than sentiment. People may be swept off their feet temporarily by emotional appeals, but unless religion and business can meet the demands of our intelligence and actual needs, the whirlwind will pass away, leaving ruin in its wake. In the long run we have to face facts.

Secondly, I believe that while prayer has its proper place in life, it has its limitations. It requires something more than prayer to please the public, to deal justly with employees and to make business profitable. Piety is no substitute for hard work, efficient management, enterprise and high intelligence.

And lastly, I must frankly express a sorrowful contempt for any effort to palm off on the public cheap and shoddy goods, inefficient service of any sort and unsound financial ventures in the name of the Golden Rule or by the aid of advertising sprinkled with pious slogans. The noblest religion in business is downright honesty and square dealing, which means giving a dollar in value or service for every dollar received.

To do this in your business demands a variety of high qualities of intelligence and character. It requires you to keep pace with changing conditions, to meet new needs, to deal efficiently with the many difficult problems that confront modern traction companies. A manager who is too conservative and dull of perception to keep up with invention, new ideas, new methods, is as big a detriment to your business as outworn equipment and machinery. Both belong on the scrap heap.

Obsolete ideas and methods, refusal to change with changing conditions, sticking to old traditions that have lost their meaning and utility are causes of many failures in business and of loss of power and prestige in religion.

The disasters that overtook public utilities in the period from which we are beginning to emerge were largely the result of bad policies, corrupt or inefficient methods and stubborn refusal to face the facts of changing social, political and economic conditions. During that unhappy period there were frightful economic losses, embittered relations between the people and public utilities, strikes and corrupt political alliances. The new order of things which is gaining ground every year is the result of the labors of men of vision, courage, faith and initiative. They are the pioneers of a new era in which the street-car service has been improved and public confidence has been created through judicious appeals to reason. The old methods of protecting public utilities through corrupt political influence are being abandoned. How many are still wandering in the wilderness, unconverted and unconvinced, you know better than I.

Perhaps this is one of the reasons for my being here—to help the progressives convert the unprogressives. Eyes have they, but they will not see; ears have they, but they will not hear. May I humbly suggest that one ground of hope for the unregenerate is that most of the progressives are relatively recent converts? To a great degree the sufferings of public utilities have been brought upon them by those engaged in the business as financiers and executives. Some were the work of demagogues who took advantage of evils that should never have existed. Others were the result of failure to keep up with the march of applied science. And still others were due to a blind refusal to appeal directly, frankly and intelligently to the public.

Patience is indeed a great virtue. Rome was not built in a day. To make matters worse, we no sooner think we have solved our problem than some new idea upsets our theories and requires us to grapple with fresh problems. That is life. This modern world, especially, is no place for skeptics and cowards, the lazy or the stubbornly inefficient. Hence these conventions that inform, inspire, encourage and enlighten! No man, no corporation, no country, is sufficient unto itself alone. We need one another. Progress is the achievement of many minds and many hands. That is the glory of life. Civilization is impossible without co-operation, friendship, patience, courage and mutual confidence. There is no sharp boundary line between religion and business. Your great enterprise, the business of daily transporting millions of people in this broad land of ours, demands moral qualities of a high order as well as engineering skill and executive ability. The reason is that morality is basic to business, for business, after all, is life. Your contacts are not only with machinery but folks. Your problems are not all technical, mechanical, financial. They are problems in human relationships. And I do not see how such problems can be successfully dealt with if we ignore the moral factors of human contacts.

We exist to serve the public, and our contribution to the public welfare must be measured by the touchstone of service.

—George B. Cortelyou.

What Makes Good Track?*

By Frank B. Walker
Chief Engineer Eastern Massachusetts Street Railway

F. B. Walker

WHEN the Eastern Massachusetts Street Railway was reorganized in 1919 several hundred miles of track was in poor physical condition, and it became necessary to carry out an extensive rehabilitation program. New funds were limited, and it was a problem in economics as well as in engineering to carry out the work successfully.

The way and structures department was completely reorganized and decentralized. New track machinery was purchased, an intensive study was made of modern methods in use on other roads and some new ones were devised. A course of training on modern track construction and maintenance methods was given to supervisory and productive forces. Three hundred and ninety miles of track has been completely rehabilitated and welded. Only 10 miles of unpaved and 67 miles of paved track was laid with new rail. Thus it will be seen that 80 per cent of the rehabilitation was carried out by using the old rail. By the use of modern methods of straightening rails, repairing and welding joints, surface welding and grinding, this track has been put in good operating condition at a cost ranging from $1 to $2 per lineal foot. The total estimated saving is not less than $3,000,000.

The condition of the old rail was such that it could not be re-used without the vertical bends being removed and the joints welded. We developed a new bender consisting of a girder beam, on the center of which was a 35-ton jack with heavy yoke passing underneath the rail joint and with adjustable feet for various lengths of bends. On the rehabilitated track 150,000 joints were straightened out with this type of bender at a cost of only a few cents each. In 1921 after about 15,000 joints of various types had been welded, the metallic arc method was adopted and has been standard on this property since. Of the more than 115,000 joints of this type that have been welded, failures have been fewer than with any other method.

It was found that much of the old, lighter rails could be welded by the use of the original angle bars, with the outstanding flange cut off by an acetylene torch. Although this kind of joint had considerably less strength than the rail, many thousands of old plates were used and only a small number failed. This led to the conclusion that the actual strength of the welded joint was of not as much consequence as the quality and kind of welding. This is especially true on 7-in. T-rail and 9-in. girder rail in paved streets. Of our total of more than 130,000 welded joints none has failed by impact. Such few failures as have occurred have been on account of secondary stresses from the welding process or temperature changes, and we believe that properly welded joints will not fail on account of wheel impact. The company has recently developed a new base-plate head-bar type of rail joint, which is stronger than the fish-plate type and is cheaper. More than 2,000 of these are now in service.

Grinding joints was considered an important part of the program, and 175,000 joints have been ground out of a total of about 200,000 in the entire system. Of these 122,500 were surface welded before they were ground. Corrugations in the head of old rail to the extent of about 640,000 lineal feet, were ground out concurrently with the rehabilitation program. The pounding of cars over rail joints and corrugated rail has been practically eliminated, and noise has been reduced to a minimum.

We are trying to bring our property, and have almost succeeded, to the point where there are no bad joints or noisy tracks. We are competing with rubber-tired vehicles, and it is essential that we eliminate track noises, and particularly those track noises caused by bad joints, corrugated rails and pounding special work. In this connection it may be of interest to note that we are welding all exterior and interior rail joints of all special work, as it is believed that by the elimination of such bolted joints the life of special work will be materially lengthened and the noise from pounding joints eliminated. So far there has been no trouble due to breakage of such welded special work.

Our present standard paved track is similar to that on many other properties, consisting of either 7-in., 91-lb. T-rail or 9-in. 104-lb. girder rail, metallic arc-welded

*Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Oct. 3 to 7, 1927.

Digitized by Google

joints, tie rods on 5-ft. centers, tie plates, 6-in. x 8-in. x 8-ft. creosoted hard pine ties and 6 in. of ballast. This costs about $4.40 to $5.40 per foot of track, exclusive of paving, depending on type of rail, traffic, etc.

Particular attention has been paid to drainage, as the greatest enemy of good track is water. Most of the old tracks needed more drainage, especially on country lines where there were no side ditches. The tracks formerly were backfilled to the tops of the rails and for long distances the track area was below the highway level. One of our problems was to convince highway and municipal

EASTERN MASSACHUSETTS STREET RAILWAY. ACTUAL COSTS CITY TRACK CONSTRUCTION

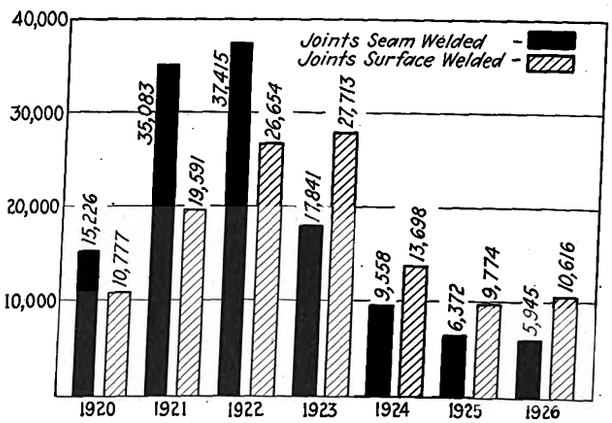
Derailments have shown a steady decrease on the Eastern Massachusetts Street Railway since the inauguration of the track rehabilitation program

authorities that we should be allowed to raise our tracks level with the shoulders of the adjacent road. An energetic campaign of education was carried on, with the result that we were permitted to raise and ditch about 235 miles of country track. As a result the tracks are more easily maintained, water is carried into the side ditches to culverts, snow is more easily removed, and much better conditions exist than heretofore. In cities the matter of drainage is different, but by placing more catchbasins and seeing that the pavement itself is sealed against the entrance of water along the rails and into the subgrade and ballast the question is largely solved.

The matter of suitable ballast for both paved and unpaved track received considerable thought. The old company had used broken stone ballast on a portion of its paved track and on one or two lines in the country. On open track broken stone is undoubtedly best. It is also the most expensive. On the major portion of our country lines a good quality of bank-run gravel was used. On heavy service country lines stone was used. On paved tracks the practice of using broken stone was adhered to for several years, but on account of its increased cost and the fact that the modern type of pavement almost effectually sealed the track area against the entrance of water, the use of screened gravel was adopted several years ago, and it has been found not only that this is less expensive but that it is as good as if not better than broken stone.

Maintenance costs of paved and unpaved track have been materially reduced in those sections of the track which have been rebuilt or rehabilitated and particularly where the rail joints have been welded. The welded unpaved track has been successful beyond our expectations. Maintenance expense has been reduced at least $300 per mile per year. Riding qualities have been materially improved. Bond renewals, formerly at the rate of about 20,000 to 25,000 per year, have gradually decreased to almost nothing on welded track and only a few hundred per year on the remainder of the system. Return circuit on all lines is in excellent condition, and very rare indeed are complaints made of electrolysis conditions. Derailments due to track defects, bad joints or special work and such other causes have decreased from about 1,000 per year to about 40 per year.

For every $100 spent on track, $44 is spent for material and $56 for labor. The human side of track work is, therefore, of more importance than the material side, if viewed from a dollar standpoint only. An engineer recently asked, "What makes good track?" To this we replied, "The hearts and muscles of the men who do the work." On this property the great need of having work performed properly and by men who knew how to do good work was early recognized. Although the methods employed must be fundamentally sound and the rails, ties, ballast and other materials must be proper for the location, the most important thing is to do the job in a workmanlike manner. We have imbued all of



Yearly record of joints welded on Eastern Massachusetts Street Railway

our men with the idea of not being satisfied with "good enough" and remembering that the best was "none too good."

It is of the utmost importance to have interested men, whether it be supervisory or productive, and it was not difficult to get those men interested. We try to have no old time "bosses" on this job. On the contrary, those of us who are in authority endeavor to be instructors rather than drivers. As a parting thought, I will say that such success as this track department has had on the Eastern Massachusetts property has been because we have considered the human element as of more importance than the material one.

Trends in

Motor Coach Engineering*

By H. D. Church

Director of Engineering White Motor Company, Cleveland, Ohio

H. D. Church

SEVERITY of the operating requirements of the modern motor coach is rapidly setting up new standards of engineering in motor coach design. Certain engineering practices that are perfectly safe on other types of vehicles have no place in a modern motor coach. The design of any piece of mechanism is determined by operating requirements. A satisfactory motor coach design must be one that either earns or saves money for its operator. The most important developments in the immediate future will probably be in the direction of refining and improving present designs to give greater safety, greater passenger comfort and, last but not least, lower operating costs.

Considering the various chassis units, the engine, clutch and transmission are those in which the greatest improvement is to be expected in the near future. In the broadest sense, the engine design is determined to a large extent by the maximum torque requirements. The engine must have a number of cylinders that gives inherent balance, and the maximum torque requirements will be an important factor in determining how many cylinders are used. With the present-day fuels a distinct limitation on the cylinder bore is imposed by the detonation characteristics of the fuel. A discussion of this phase of engine design would take too much time, but considering the factors involved, it is not likely that cylinders of larger than 4½-in. diameter will be used, owing to difficulties with detonation and cooling of piston heads. There is something to be said in favor of each of the three types of cylinder construction in use today —namely, the sleeve valve, L-head and overhead valve. Each type is being constantly improved, and actual service alone can give the ultimate answer as to which is the best.

The engine lubricating system is at the root of many troubles today. Full forced feed to all working parts is essential. Provision for properly cleaning the oil is desirable, as well as some design of oil cooler to maintain proper viscosity in hot weather. A lubricating detail that should be given more attention in design is the elimination of oil leaks. An engine or chassis unit which is covered with dirt externally as a result of oil leaks is hard to inspect for condition, and difficulties that may have developed are less likely to be discovered. Improvements in engine design as well as in lubricating systems will undoubtedly give much longer life to all the engine bearings.

The importance of rigidity on the life of the working parts cannot be overestimated. A sufficiently stiff crankcase and crankshaft design will go a long way toward the elimination of bearing troubles and the attendant expense. Stiffness of the cylinder block and head is also important. With the detachable cylinder heads almost universally used, the design should be such that the tightening of cylinder head studs does not distort the valve seats or guides.

Rapid progress is being made in exhaust valve cooling, which will greatly lengthen the periods between valve regrindings. Improvements in the induction system are coming which will give better distribution, higher mean effective pressures for the same detonation and better economy with the present-day low volatility fuels.

All engine accessories, with the possible exception of the fan, should be positively driven through inclosed and automatically lubricated chains or gears. Clutches will probably have lower unit pressures and better provision for heat dissipation in order to prolong the life of the facings. Some provision to insure a really soft and progressive engagement throughout the life of the facings is highly desirable, as it will save wear and tear on the entire driving train between the clutch and the rear wheels. It is probable that pedal pressures will be decreased in order to prevent driver fatigue. Transmission modifications are to be expected in the directions of easier gear shifting and greater silence in the geared speeds.

Chassis frames are being designed to give greater resistance to twisting, which should permit the use of lighter bodies without the sacrifice of body life. In this

**Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

connection, I think, there are interesting possibilities in the development of light-weight bodies.

There is a strong trend toward greater accelerative ability to enable the coach to keep its place in modern traffic; by the same token better brakes are needed. I believe that metal-to-metal brakes on all four wheels operated by compressed air or some other form of servo device will soon be considered indispensable. This construction utilizes the entire vehicle weight for braking traction, requires little muscular effort of the driver, is excellent from a cooling standpoint, and its action is practically unaffected by oil, water or grease on the braking surfaces.

The use of low-pressure tires should become more general, due to the demand for increased passenger comfort. In addition, there should be a distinct decrease in chassis depreciation when low-pressure tires are used, due to the added cushioning effect, which protects the entire chassis from minor road shocks. The more widespread acceptance of low-pressure tires has probably been somewhat delayed by several causes. In the first place, they have not as yet fully demonstrated their ability to give the same cost per mile as the high-pressure tires. This is because of overloading and constructional difficulties met by the manufacturers. Low-pressure tires have one other less serious drawback, in that they require a greater mechanical advantage in the steering gear.

There will probably be distinct improvements in chassis lubrication. The lubricating requirements of a motor coach chassis are exceptionally severe, due to the high mileage per day. Many of the points requiring lubrication are inaccessibly located, with the result that they are neglected or else the time required to get at them is too great. The solution may be some form of central lubrication or thoroughly housed constructions carrying a sufficient supply of lubricant for long periods.

The question of riding qualities is also due for consideration. The variation in spring load between a part-passenger load and a full-passenger load is great, and means should be provided to insure comfort under either condition.

Two very important items are body heating and ventilation. The exhaust gas-heating system which has been extensively used in the past will probably be replaced by some system using water or air. Some satisfactory provision to give adequate body ventilation without drafts is also most desirable.

Considering for a moment the more radical design possibilities, there are several promising developments in sight. The double rear axle construction, which has been used for the past few years both in this country and abroad, is attractive from the standpoint of good riding qualities, less damage to road surfaces and ability to carry the maximum loads on pneumatic tires within a limited over-all width. However, this construction involves some difficulties in taking care of the torque reactions from the driving and braking loads. From the standpoint of traffic congestion, the present-day motor coach probably has reached the limit on over-all length. It is possible that future developments may result in a complete relocation of the various chassis units in an endeavor to obtain more seating capacity within the present over-all length.

It is difficult to prophesy the future of motor coach design with any degree of accuracy. The rapid increase in motor coach use has brought about a specialized vehicle in such a short period of time that the engineering fraternity has found it difficult to keep pace with the operating requirements. It is safe to say, however, that the design of the motor coach of the future will be dictated primarily by the demand for safety, comfort and reliability, and it is certain that with close co-operation between the motor coach operators and manufacturers we can look forward to a constant improvement in design, with an attendant reduction in operating costs.

Modern Cars

Effect Economies*

Modernization and Budgetary Control of a System Will Convert a Deficit to a Surplus

By W. R. McRae

Superintendent Rolling Stock and Shops
Toronto Transportation Commission, Toronto, Canada

IT IS indisputable that attractive, comfortable and speedy rolling stock, equipped with safety devices and modern appliances for fast loading and unloading, fare collection, etc., attract the riding public. The car, being modern in itself, is not sufficient from the point of view of maintenance and operation. Modernization must not stop there. To get the best from this equipment, modernization must be carried into the office, shops and car houses in the form of design, equipment organization, system and method. The result of this is lowering maintenance and operating costs and promoting among the personnel a spirit of co-operation, a pride of accomplishment and association, in a modern electric railway system.

On Sept. 1, 1921, modernization of the Toronto Traction System commenced. The Toronto Transportation Commission unified the railway systems, taking over 838 passenger cars previously operated by the Toronto Railway Company and 70 cars operated by the Toronto Civic Railway. Delivery of new rolling stock commenced in October of the same year and continued until the orders for 575 new cars had been completed in August, 1923. These cars included two types of Witt cars and large roomy trail cars. At intervals, 491 of the Toronto Railway cars were scrapped. The remaining 347 cars were of the pay-as-you-enter type, the bodies of which were of such design and in such physical condition as to warrant reasonable expenditure to redesign and convert in a manner that would permit of their being operated under the standard operating conditions adopted on our system, which included a uniform system of front entrance for all types of motor cars.

Modernization did not stop with the redesign of bodies; storage air-brake equipment was scrapped in favor of brakes of the latest design. Obsolete fenders

**Abstract of an address delivered at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Oct. 3 to 7, 1927*

Digitized by Google

were replaced with life guards. Hand straps were replaced by hand rails. Stoves were replaced by modern heaters. Monitor windows were replaced by modern ventilators. Trolley catchers and tail lights were installed. Manually operated doors were changed to pneumatically operated. On 156 cars spur gears were discarded in favor of helical, and the ratio changed for train and trailer operation.

New shops were designed and constructed, utilizing modern methods in the progress of the work and equipped with modern machinery and appliances. Obsolete car houses were abandoned or rebuilt. Some existing car houses were redesigned and enlarged to correspond in efficiency with the new car houses that were erected.

The I.C.C. uniform system of accounts was adopted, with many subdivisions. The rolling stock department installed a complete cost system in the shops and car houses, together with a system of compiling individual and group cumulative mileage for passenger and service cars, buses and coaches, and a record system for all component parts of equipment that could be identified by numbers. Histories and maintenance costs are kept of the different groups of the modern equipments as well as individual motors, armatures, compressors, etc. Additional new systems were put into force using mileage instead of daily or weekly schedules for inspection, lubrication, etc., and standard practice cards were placed in shops and car houses covering this type of work. Mechanical labor-saving devices, such as adding and calculating machines, filing systems, etc., together with furniture of the most modern type, were installed in a newly erected office building.

W. R. McRae

Budgetary control was adopted by the commission, and it naturally followed that this system of control was applied in its fullest sense by the rolling stock department.

The Hillcrest shops have a labor budget covering each of the 24 pay periods in the year under ten separate headings of maintenance and expense—i.e., maintenance of equipment, passenger car body maintenance, truck maintenance, brake maintenance, service equipment maintenance, electric motive equipment maintenance, shop machinery maintenance, shop expense, miscellaneous equipment expense and conducting transportation.

Each of the eight shop sections, such as motor shop, truck shop, etc., has a labor budget under headings that apply to the work of each section. This requires 40 budgets, each covering 24 pay periods. Fourteen budgets are required for the seven carhouses. Maintenance of equipment and conducting transportation are the only headings used in each division. Within ten days of the end of the pay period labor distributions for each shop section and carhouses have been compared with budget, and reports issued to the chief inspector, master mechanic general foremen and foremen. Amounts are converted into dollars per thousand car-miles and analyzed for excessive expenditures. These results are curved for the purpose of records and comparisons.

The costs of each of the carhouses are based upon the actual mileage of cars operated out of each division. These costs are classified under thirteen headings—i.e., maintenance of equipment, car body maintenance, truck maintenance, brake maintenance, electric motive equipment maintenance, conducting transportation, inspection, car cleaning, car shunting and shifting, car oiling, miles per pull-in, miles per inspection and pull-ins per inspection.

The results are plotted graphically for each carhouse, together with the average costs of the six other carhouses, and blueprinted, a copy of each being sent to the senior foreman for each carhouse. The competitive nature of these graphs creates keen rivalry among the various carhouse staffs and at the same time provides cost data of a valuable nature.

Does this modernization process pay? A comparison of the records shows quite effectively the value of modernization. Over the period of 1923 to July, 1927, inclusive, the reduction in the number of pull-ins for different portions of the equipment was quite substantial, as you will note: Bodies 80 per cent, trucks 64 per cent, brakes 87 per cent and electric equipment 61 per cent. Because of these reductions it is expected that our maintenance of equipment for 1927 will cost $375,000 less than for 1922. The total reduction for the various classifications over the period from 1922 to June, 1927, inclusive, were found to be: Maintenance of equipment, 33.9 per cent; armature maintenance, 59.1 per cent; controller maintenance, 59.1 per cent; electric motive equipment maintenance, 60.8 per cent; labor charged to equipment maintenance, 53 per cent. The carhouse payroll has been reduced 10 per cent since 1924, in spite of the fact that our cars are cleaner and more attractive than at that time. The advent of new rolling stock considerably reduced the paint shop payroll, but the time arrived when repainting became a necessity to maintain the standard of appearance required.

I think that we are unanimous in the thought that modernization is the keynote of the electric railway of today. The purchase of new rolling stock when possible, modernizing old cars when warranted, budgetary control of all expenditures and standard practice throughout the department will convert a deficit to a surplus.

Automatic Substations Prove Economical*

By W. E. Bryan
Superintendent of Power
United Railways of St. Louis

W. E. Bryan

PREVIOUS comparisons of automatic and non-automatic substations have necessitated an estimate of certain operating economies obtainable with automatic stations, since actual data were not available. I shall attempt to give some actual figures covering such economies on the property with which I am connected, the United Railways of St. Louis.

In 1922, due to increases in the number of cars operated over the system as a whole, a number of our manual stations became overloaded, some to a serious degree. Two courses were open: (1) the installation of additional equipment in existing stations where this was possible, and (2) the installation of the additional equipment in automatic stations located in the districts served by the overloaded stations. We decided on automatic stations, so that we now have seven such stations aggregating 8,600 kw. in capacity. These seven stations effected a reduction in the load of nine manual stations, which indicates the widespread effect of the new stations. These stations have now been in operation for about five years.

In the studies of past years it was estimated that the cost of operation and maintenance of an automatic station, say of 1,000-kw. capacity, would be $750 to $1,000 per year. On a kilowatt basis the ratio of such costs for automatic stations as compared with manual stations varied, as shown by the 1926 report of the committee on power generation and conversion, from 7.1 per cent to 52.0 per cent, with an average of 25.4 per cent. These results proved that even during the initial period of automatic substation operation a material saving was realized on this score.

Comparative data for two 1,000-kw. manual stations and two 1,000-kw. automatic stations in St. Louis, taken from the auditor's accounts, show that the operating and maintenance costs of the two manual stations for the two-year period 1925-26 averaged $3,540, whereas the comparable figure for the automatic stations averaged $1,130. Stated in percentage, automatic operation cost 31 per cent of manual operation. The annual difference of $2,410 in favor of the automatic station on a 15 per cent fixed charge basis would justify an investment of $16,000 for automatic control equipment for the manual stations. However, certain types of manual equipment, built years ago, are not altogether suited for automatic operation, and this is true of the two manual stations referred to.

Power economy is, of course, one of the principal advantages of automatic substations. Most railways purchase power on the basis of a demand charge plus an energy charge. In any study of power questions, therefore, both of these elements must be considered. The use of automatic stations in urban districts tends to decrease the demand figure, as the improved voltage possible with automatic stations, as usually located, permits of more coasting for a given schedule speed. High voltage may increase rheostatic losses at the car, but where considerable free running is possible, the net result is improved acceleration and higher speed. In congested areas, where schedule speed is primarily dependent upon traffic congestion rather than on voltage, high voltage increases rheostatic losses without, however, an attendant improvement in schedule speed. It has actually been found in several cases that a marked improvement in trolley voltage in congested areas has resulted in a serious increase in the power demand with no improvement in operating conditions.

Probably the most satisfactory method of avoiding this condition is by the use of the shunt-wound converters. The two St. Louis stations installed in the heart of the congested district use this method, having a drooping characteristic from 600 volts at no load to 560 volts at full load and 540 volts at 150 per cent load. This arrangement has resulted in holding the voltage at the cars in this district at practically the same figure as existed formerly, so that there has been no increase in rheostatic losses or in power demand. There has been, of course, a marked decrease in the I^2R losses in the feeders. Another advantage of the use of the shunt field is that in case of overload the automatic stations "back off" from the load, which is thus shifted to adjoining stations. This arrangement, coupled with the current-limiting re-

*Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Oct. 3 to 7, 1927.

Digitized by Google

sistances at the stations, permits the moving of an abnormal number of cars at reduced voltage under emergency conditions.

As to distribution losses, a feeder section fed from a station located at one end of the feeder has a certain I^2R loss, but with a second station at the other end of the feeder section the distribution loss would be less. On the other hand, with light loads, the operation of both stations would result in light loads on the converters, with attendant decrease in efficiency. The point at which the second station should be brought on the line can be determined mathematically.

The two St. Louis stations in the congested district are roughly a mile apart, and as they are connected by heavy feeder copper, they might be considered as a single two-unit station with an unusually long bus between units. We have set the relays at these stations so that one unit operates somewhat as does the lead unit in a two-unit station, the second unit coming on when the voltage drops to 520 volts. This arrangement has been altogether satisfactory from an operating standpoint.

Another situation often found on street-railway systems where distribution losses are an exceedingly important factor is a long heavy feeder section fed from a distant station. Under normal conditions the distribution loss on such a section is serious enough, but if a blockade of cars occurs, the trouble becomes cumulative. Cars pile up in the section, further reducing the voltage and extending the time during which power must be fed over the long feeding distance. The feeding of such a section from an additional station or stations reduces the demand figure, saves energy and, what is much more important, materially improves operating conditions. It is difficult to evaluate this third benefit in dollars and cents, but no railway man needs to be told that this advantage very often outweighs, in the eyes of the management, those other advantages which involve a direct saving in energy.

Electrolysis Mitigation

All of you are familiar with the effect on electrolysis mitigation of an increase in the number of stations from which the general distribution system is fed. The 1921 report of the American Committee on Electrolysis brings this out very clearly. Our new stations being rather widely scattered, we expected and have actually realized a marked decrease in electrolysis troubles. Our greatest trouble from electrolysis has occurred on underground transmission cables, of which we own and operate 81 miles. Shortly after the first of these cables was installed, back in 1903, we experienced a great deal of trouble due to sheath corrosion where return railway current left the cable sheath. This was easily corrected by installing drain wires so as to keep the cables negative to other earth structures and lead the current safely to the negative bus. This cable was laid in tile or concrete duct.

In 1913, at the time of receipt of Keokuk water power, a large amount of duct of a somewhat porous texture was laid by the local power company, and the new cables laid at that time by the power company and ourselves largely occupied these new ducts. Although the precautions previously in use were taken from the start, serious corrosion of the sheaths developed, this corrosion occurring not in the vicinity of the substations but in those localities where the current flowed to the cables and where the current density on the sheaths was the greatest. This corrosion depended on the amount of current flowing to and along the cable sheaths, and it became necessary to reduce these currents. In 1917, in one of the districts particularly affected, which was fed by a 4,000-kw. manual substation, we installed an insulated return system, which materially bettered conditions, although damage previously done continued to show up.

The distance between substations feeding the district in question and the overloaded condition of these substations justified the installation of two automatic substations between the old manual stations, which reduced the potential gradients along rail, cable, etc., to a small proportion of their former value. The actual cable burnouts for the five years prior to the installation of the automatic substations were 63 for the system and 28 for the lines in question. For 3.7 years subsequent to the installation of these stations there have been 28 burnouts on the system, of which seven were on the lines mentioned previously. The decrease in underground cable troubles was from 12.6 per year before installing the automatics to 7.6 per year afterward. On the section principally affected the burnouts in the two periods averaged 5.6 and 1.9 per year respectively. The reason why the general decrease is not proportionately as large as the decrease in the section hitherto referred to is because the older cables were laid in non-porous duct and did not suffer to the same extent from sheath corrosion as the newer cables.

The approximate net cost to us per cable burnout is $500. The average reduction in burnouts, amounting to five per year, is due almost solely to the increase in the number of feeding points and is therefore a credit to automatic substation operation. Thus we have a credit of $2,500 per year on this score. I might add that the power company has had a comparable decrease in its cable burnouts.

As might be expected, the use of automatic substations brought a decrease in general electrolysis complaints. There was a decrease from a maximum of 51 complaints in 1919 to fifteen in 1927 (to date). For the five years just prior to the use of the automatics complaints averaged 43.8 per year, while since they have averaged 33.2 per year, a decrease of 24 per cent. Based on our average cost per electrolysis claim, this means a saving amounting to some $750 per year, and as damage claims are not particularly conducive to good feeling, this reduction has a good effect on public relations.

Improvement in Operating Voltage

The greater the number of feeding points the higher the average system voltage, and as the new stations are often placed at points of low voltage, the effect on service may be quite appreciable. This effect, because of variation in other conditions, is difficult to evaluate in dollars and cents. Improved voltage on an interurban line not only may reduce the number of cars required to maintain a given schedule but will also, because of increased schedule speed, serve as a means to meet competition of buses and private automobiles. On urban systems, while the effect may not be so marked, any improvement is applied to a greater number of units. Good voltage tends to keep cars on schedule and is particularly valuable in case of blockades. With the present method of feeder control, heavy loads of short duration on individual feeders are carried up to the limit of the safe capacity of the converter, and usually before this point is reached the cars have passed to the territory of an adjoining station.

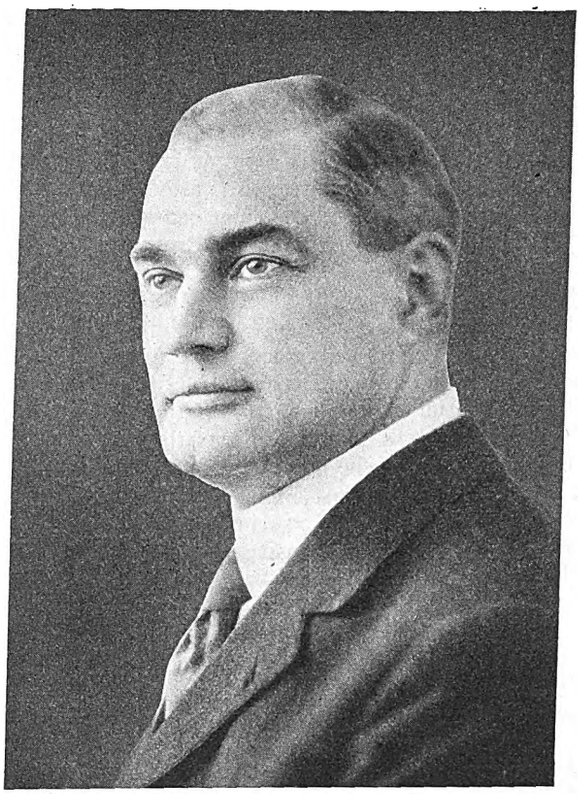
Cost of Crime

to Electric Railways Each Year Is Enormous*

By W. L. Barnhart

Resident Vice-President National Surety Company, New York, N. Y.



W. L. Barnhart

PERHAPS no statement that has appeared in public print recently created quite such widespread interest as did the article by Mark O. Prentis which appeared in the *Manufacturers' Record* a few weeks ago, estimating the cost of crime in the United States today at between fifteen and sixteen billions of dollars. This figure places crime as one of the leading industries of the United States. The annual loss through crime is shown to be greater than the entire foreign trade of the United States, which amounted to less than ten billion dollars in 1926. In fact, our annual losses through these dangerous and brainy criminals who are preying upon the business public are greater than the aggregate value of all the agricultural products grown in the United States during the past year. Crime necessitates the employment of more than half a million people who do nothing else but endeavor to combat the criminals, comprising our police forces, our sheriffs' organizations, our jailers and all the public servants whose occupations are dependent upon crime.

And who pays that gigantic loss? Who is charged with such enormous tribute to the power of the criminal? Why, you and I, and every business man—we all must pay our share. We pay it in taxes to take care of the police and the courts, we pay it in higher burglary insurance rates when criminals become especially rampant in this section or in any other portion of the country. We pay it in higher prices that other business men must charge for their products to repay themselves for their own losses through crimes, and sometimes we pay it through our own lives or the security of those nearest and dearest to us when the modern criminal gets in a corner and, to secure his own liberty, takes without hesitation a human life.

Mr. Prentis estimates the loss due to fraudulent securities at $500,000,000 per year. I dare say that there has never been a time in history when there were as many counterfeit signatures and raised and altered shares of stock on the market as exist today.

Embezzlement is the second big cause of loss. It is estimated that the amount lost annually from that cause is $150,000,000. Embezzlements have been on the increase recently not only in number but in total amounts. One of our investigators told me the other day that whereas losses of $10,000 to $15,000 were considered large five or six years ago, today embezzlements of $100,000 and $150,000 are quite common.

The electric railway field has seemed to prove an unusually fertile one for large embezzlement, probably due to the large sums handled by many utility companies, and due, in part, I think, to lax methods of auditing and checking up accounts of trusted employees. Too often the auditors, cashiers and bookkeepers are left with too few outside checks upon their operations.

The recent experience of a certain transportation company is an example of what might befall any company neglecting to audit its books carefully. When the cashier of this particular company disappeared, a complete audit of the books showed a loss of nearly $70,000. It was learned upon the cashier's arrest that, being successful in covering up a paltry $350 which was stolen from him, he had carried out the practice to the extent of $67,000, all for his own use.

Still another case may be cited—this, in way of contrast, being a quickly negotiated fraud. The paymaster of the traction company involved, with a payroll amounting to $41,000 in his care, slipped away with the entire sum instead of returning to his office, as he had done so faithfully for many years. Craving a part in a speedy gambling affair, he met up with the "type," eager to prey upon his desires. One week was the time required to extract the entire $41,000 from the paymaster.

What were the mental processes of this man who thus in an instant reversed his record of fifty years of blameless living? Who knows? I confess it's too deep for me. But it may be that for years he had suppressed desires for just this sort of thing, for years he had day dreams and night dreams of being able to do it some day —to sit in and play for big stakes. Perhaps that payroll fascinated him and it may have often figured in his dreams as a way of helping him make a big winning. Maybe these suppressed longings, these inhibited desires just backed up in his brain, like water backs up behind

**Abstract of a paper presented at the annual convention of the American Electric Railway Accountants' Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

a dam in the spring freshet, and suddenly when the pressure gets too great the dam goes out, and all that has been held back all these years goes out with a rush, carrying the traction company's $41,000 with it.

Causes of Crime

In investigating hundreds of cases of embezzlement and defalcation, we find the chief causes of crime to be:

1. Speculation and gambling. Probably 60 to 70 per cent of all embezzlers have lost most of their stealings through gambling—on the stock market, through bucket shops or by playing the races. The gold digger type of woman has seemed to become more numerous and more insistent in her demands for jewels, fur coats and all the things that take money to buy. And seldom does she seem to care how her victim gets the money to satisfy her whim, just so she gets it.

2. High cost of fast living and fast women. High life as practiced these days in the large cities is an expensive process. Expensive liquor, high night club charges, speculators' prices on seats for popular shows and so forth, have been a factor in many a defalcation.

3. Liquor and drugs. Those who investigate our claims tell me that there is no question that high cost and poor quality of liquor and the growth of the drug habit have had a great deal to do with increases in crime today.

4. "Keeping up with the Joneses." Extravagant living is unquestionably responsible for a great deal of embezzlement and crime today. Installment sales and long retail credits have made it easy for the average American family to live beyond its income, and the spirit of "keeping up with the Joneses" is in the air. Things go along so far, then bills accumulate and creditors get ugly, and the temptation to steal from the employer may be very strong.

5. Finally, the factor responsible for the least of all our embezzlement crime is actual family needs. Sickness or death or trouble of children or parents may put an unusual burden on an employee and he may steal because that seems to him to be the only way out.

Such are the five chief reasons upon the employee's part. But there are yet three causes of crime for which you must accept actual responsibility and I am not sure that, after all, they are more vital causes of embezzlement losses than anything the employee may be responsible for.

The Railway Company's Responsibilities

Here are your responsibilities for the growth of crime:

1. The employee steals from you because he is able to find a way of doing so without fear of being detected. In other words, your employee, an expert in figures, finds a vulnerable spot in your armor. If he couldn't find a way to steal without fear of prompt detection, he would not become an embezzler.

I should be foolish to attempt to tell you folks, who are professional auditors, how to establish checks and counter-checks on your accounts. Let it suffice to say that every case of loss reveals that somewhere a treasurer or auditor has fallen down in his duty of knowing what is going on. Some loophole has been left unguarded and through it your bank account has been attacked.

Have frequent outside audits made. Get the best talent you can and pay for the best and most complete check-up. It may save you many thousands in losses. Devote some of your thought and energy to finding out yourself what's going on. Go over the books occasionally and draw off some figures for comparison. Any auditor or treasurer worthy of the name should have some sort of personal checking figures that would tell him very quickly that something was wrong when several thousand dollars had been extracted from the bank balance in a week.

Another duty no treasurer should ever intrust to a subordinate is that of going to the bank to get the canceled vouchers and then checking them up with the check-book stubs. We know of many cases where employees raised or forged checks, got the money, and then went to the bank for canceled vouchers and destroyed the evidences of their guilt before they got back to the office.

2. The second way in which you employers encourage crime is by not knowing enough about the home life of your employees. If more employers had an idea of what their employees were doing after hours, hundreds of embezzlements would be nipped in the bud. In fact, I suppose quite as many defalcations are discovered through the employer accidentally finding out his employee's scale of living or his night dissipations as from any other cause.

We recommend that every employer of labor should have one or more "assistant managers" whose chief duty it would be to mingle with the employees, especially those handling money, and find out as much as possible about them. He should be a man of tact so that employees would never suspect his duties, and he should also have some actual work to do about the place, but his chief function should be to mingle with the men, to go around with them at nights, to learn anything that might be of interest to his employer.

3. Third and last, don't put too much trust in anybody. It sounds wonderfully noble and altruistic to trust everybody, to proceed on the basis that all men are honest. But to believe in everyone has proved costly to many.

Remember this: Only the trusted men can steal. It was that very trust placed in him which gave him the opportunity to steal. And who shall say that it was doing him a kind act to trust him so implicitly? That very trust made him a criminal, an outlaw, despised in the eyes of the world, a betrayer of the faith of his family and his employer, the wrecker of the hopes of his wife and children.

No, my dear men, you are really handing your employees a curse instead of a blessing when you trust them too far. If you won't do so for your own sake, if you won't do it for the safety and security of your own money, you owe it to your employees to insist that they have the added protection, the added stiffening of their moral backbones, that comes through the knowledge that they are bonded by a large surety company that will relentlessly pursue and prosecute them if they do wrong. And if you should decide upon this course, be sure to secure adequate protection. Little $5,000 and $10,000 bonds are hardly a drop in the bucket as compared with the $50,000, the $100,000 and the $150,000 fidelity losses that are so common today.

Wouldn't it have been infinitely better from the standpoint of the employee, from the standpoint of society as a whole and from the standpoint of his employer's bank account to put a strong restraining influence upon the employee, such a restraining influence, for example, as comes from the knowledge upon the part of the employee that he is under heavy bond, that his every act will be checked up by competent auditors and that if he does steal the long arm of organized surety prosecution will follow him, and will bring him to justice sooner or later, no matter how far away he goes or how long he seems to escape immunity from punishment?

Maintenance of a Large Overhead System*

By M. W. Cooke
Superintendent of Power and Inclines Pittsburgh Railways, Pittsburgh, Pa.

Mass production methods can be applied to the construction as well as to the repair of overhead lines

DISCUSSION of any broad maintenance problem is naturally divided into two parts. First, and most important, are the principles involved and their method of application. Second are the practices that develop as the result of the application of the principles.

Generally speaking, maintenance work is a tinkering sort of operation, with different pieces of equipment, more or less widely apart in location, requiring repairs at the same time and with no apparent connection between the causes or the times of failure. The problem is further complicated by the wide variety of things a maintenance mechanic is expected to be able to do.

M. W. Cooke

It is small wonder, therefore, that construction work is much more efficiently organized and handled than maintenance work. The desire to build things or to be mixed up in construction is common to all of us. Even as children we got pleasure out of building things, but few of us took care of our blocks when the game of building was over.

The development of the building or production instinct has resulted also in the development of a production technique. Relatively small numbers of men now produce vast quantities of material as the result of that technique. The technique is the combination of such principles as standardization, specialization, functional organization, and so forth, and the final result is mass production.

If this sketchily drawn contrast between the tinkering methods of maintenance and the production methods of construction really exists, it is obvious that maintenance work can be vastly improved and simplified.

A large railway system covers so much territory that the natural tendency has been to break the line maintenance crew up into small units and place the units at different parts of the system, in much the same way that the cars are housed at different parts of the system. This is the so-called district or division form of organization. The number of men is small and the variety of the jobs large, so that there is little opportunity to put the work on a functional basis and secure the benefits of specialization.

If it were possible to pick the entire railway system up and put it on a conveyor, it would also be possible to have repairs made as the several parts passed the men whose specialty it was to repair each of them. The problem of having an adequate supply of machinery and tools would be greatly reduced, because it would be necessary to have them at only the one place. The problem of supplying material with which to make repairs would be reduced for the same reason. Supervision would be made so simple that instead of the supervisor spending his time and energy locating the men out on the system he could spend them studying and organizing the work so as to secure ever-increasing efficiency.

It is, of course, not possible to put the railway on a conveyor, but it is possible to run the equivalent of a conveyor past the railway. By consolidating men, machinery, material and supervision and moving the combination over the system as a unit it is obvious that repairs can be made more efficiently than by having the component parts of the consolidation working at widely separated places. After the method has been in effect long enough, it is reasonable to expect either a higher standard of maintenance for the same cost, or the same

**Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

standard at a lower cost, or both higher maintenance standards and reduced costs. Human nature being what it is, a reduction in costs and a better standard of maintenance will both be secured. The psychological basis for that statement is well known.

The adoption of this method will involve some difficulty, and it is to be expected that troubles will develop which will result in pressure tending to break it down, especially during the transition period. Undoubtedly more failures will occur while the tinkering process is being tapered off and the mass method is not fully in effect. However, unless both methods can be afforded simultaneously, there will be nothing to do but grin and wait for better results to follow.

The organization of the line department to secure the best results by using mass production methods will vary somewhat with local conditions. It is essential that it be organized on a functional basis, so as to secure the benefit of specialization. The work can be divided on the basis of routine and emergency, or usual and unusual, or, in more familiar language, repair and construction. These jobs that have to be done over and over again, are to be assigned to the group doing the routine, usual or repair type. The other jobs are to be assigned to the group doing the emergency, unusual or construction type of work. To illustrate, the changing of ears or of span wires is a routine job, while the stringing of long renewal sections of trolley wire is a construction job. Another way of looking at this division of work is to consider it from the standpoint of size. A small job will fall in the repair classification, a big job in the construction classification; the whole point being that the work assigned to the floating mass production crew is such as not to delay it unduly, and thus interfere with its prime advantage, which is its rapid rate of movement over the property.

The rate at which the crew moves will depend on the amount of work which has to be done. This rate can be varied to suit the requirements of the job by varying the size of the crew and the amount of equipment assigned. It is to be expected that it will take longer to go around the first time or two than it will on later trips, because the first few trips will plow into the system a backlog of material the renewal rate of which is low.

Careful judgment will have to be exercised on the initial overhaul trips not to renew material which might reasonably last until the next time around. If there is any doubt about a given piece of material, it should be changed as a matter of course.

Since the schedule is set up on the basis of the length of time the most rapidly wearing part will last, it is obvious that a fine sense of judgment will have to be exercised with reference to the parts that wear longer. Some will last two or three times as long and in the interest of economy should not be renewed. In order to preserve the efficiency value of the grouping of men and machinery, the work to be done should be laid out for the crews, so that no time will be lost inspecting and debating about the renewal of a given piece of material. This laying out can be done by having the line inspected in advance of the arrival of the crew, and the parts for renewal marked, or a list made of their kind and location. Such a list from a compenent inspector will enable the supervisor in charge of the crew to assign the work in advance to each unit, and the whole job can then proceed without delay.

The schedules being set up on the basis of the life of the most rapidly wearing part, that part now assumes a value not before recognized. Obviously, if by substituting another type in its place, or by redesign, the life can be increased, the overhaul period can be lengthened and further economy achieved.

It is to be expected that as a further result of this method the ratio of labor to material in the cost of line maintenance will change—that is, it will be necessary to spend less money for labor—although in fairness the rate of compensation per man should be increased, while the amount of money spent for material should decrease. Generally speaking, the cost of labor in line maintenance work is greater than the cost of material. If the method advocated here were successful, the spread between these two items should narrow and probably closely approach.

Just where the two should stand with reference to each other is probably impossible to determine accurately and will vary with the cost of both labor and material, but it is certain that as the spread between the two is narrowed the condition of the plant should improve.

Lack of time prevents the carrying of the discussion over into the construction phase of the maintenance problem, but it would appear that by suitable modification the same mass production method might be applied.

Development of methods of this kind not only should prove economical to the railways company but should at the same time improve the quality of the service to the public and the condition of the men who do the work.

Handling Passenger Revenue*

By Horace L. Howell
Consulting Engineer, Meyer & Wenthe, Chicago, Ill.

RELATIVE merits and the possible economies that may be effected in the accounting and auditing of passenger revenue, based upon the use of metal fare tokens, versus the use of paper tickets, in transacting fare payments, are of interest.

The first economic value gained with the use of metal tokens, as compared with the use of paper tickets, is in the initial or investment cost. The initial cost of the tokens is chargeable to capital account, since tokens are indestructible and therefore are a part of the company's physical inventory. On the other hand, the cost of paper tickets is an operating charge, the paper ticket being used but once to transact the single fare payment.

On most properties it is found that the single token is put into circulation about 50 times, or once each week, during the year; this means that the cost of the average paper ticket will be materially greater than the initial cost of the metal token over a given period.

The amount of the second economic phase resulting from the use of metal tokens depends primarily on the physical arrangements of the property—that is, the system of fare collection employed; the rates of fare; the provisions at receiver's or main office, and the size of the company.

The important and vital work of checking through the earnings can be accomplished more economically, faster

**Abstract of a paper presented at the annual convention of the American Electric Railway Accountants' Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

H. L. Howell

and with a greater degree of positiveness through the use of "all metal" fares and mechanical auditing methods than with paper tickets, regardless of what provisions are made to separate and count the latter.

The labor cost incident to manual sorting, auditing and destruction of paper tickets is considerable. The process is slow and involves added handling and detail, whereas the metal tokens can be sorted and counted with approved accounting machines more rapidly and with less handling, thereby effecting a saving in the labor payroll.

The question frequently arises as to whether or not it is necessary to obtain a new supply of metal tokens with the inauguration of a change in the commutation fare rate. This is a matter of importance and is worthy of comment. When a change in fare becomes effective, there will naturally be a quantity of tokens in the possession of the riding public, representing tokens previously sold but not as yet collected in fare payments. This condition will prevail whether the change in fare rate is increased or decreased. At no time, however, will the actual turn-in of these unredeemed or unused tokens ever approximate their full 100 per cent book value, since there will be a considerable number of these outstanding tokens either lost or carried away. In the event of a reduction in the commutation rate of fare, the probable gain from this transaction would offset the probable loss that might occur with the inauguration of an increased fare rate.

In connection with the operation of any property having a commutation or reduced fare rate, there will undoubtedly be a collection of a number of foreign tokens. The amount of volume of such collection of foreign tokens will vary somewhat in proportion to the size of the operation, the number of reduced fares in daily circulation and the proximity of the railway system to other reduced fare operations.

I am advised that our association now has this matter in hand and is concerned as to what should be done to best take care of exchange settlements for foreign tokens between member companies.

The writer avails himself of this opportunity to state that he is an ardent advocate of the establishment of but two adult rates of fare—that is, a cash and a commutation rate of fare. The differential between the cash rate of fare and the commutation or token fare should be as wide as possible, since it would then tend to re-establish the single coin unit form of fare payment and facilitate platform transactions and permit of economies in the accounting and auditing of the passenger revenue. This system of fares would also expedite passenger platform movements and would in turn be reflected in the car schedules.

In conclusion, it may prove of interest to note briefly the relative advantages and disadvantages of the use of both paper tickets and metal tokens as follows:

Paper Ticket Fare

Advantages—Good for handling in large quantity sale lots. Useful for clearly stating fare rates and privileges. Good for hand collection, since canceling with punch is obvious by inspection.

Disadvantages—Can be counterfeited without great effort or expense. When sold in strips, can be torn short and thereby obtain more tickets than to which entitled. Can be split, thus making two tickets from one. Not conducive to good accounting—thus affording opportunity to peculate, holdout and resale. The printing charge is a recurring operating expense. Requires considerable labor for sorting, counting, destroying, etc. Makes for slow auditing. Less sanitary.

Metal Token Fare

Advantages—One investment in tokens will suffice for years, since they are indestructible. They lend themselves to mechanical accounting because of uniformity of size and shape. Difficult to reproduce. Metal basis gives them a greater intrinsic value. Speedy for transacting fares on platform with changers. All fares are metal. Makes for quicker and better mechanical auditing, thus reducing labor cost.

Disadvantages—Bulky in weight for large quantity sales. Limited at present to but four distinctive size diameters, other than those of standard coins.

The noblest religion in business is downright honesty and square dealing, which means giving a dollar in value or service for every dollar received.

—Dr. Alfred W. Wishart.

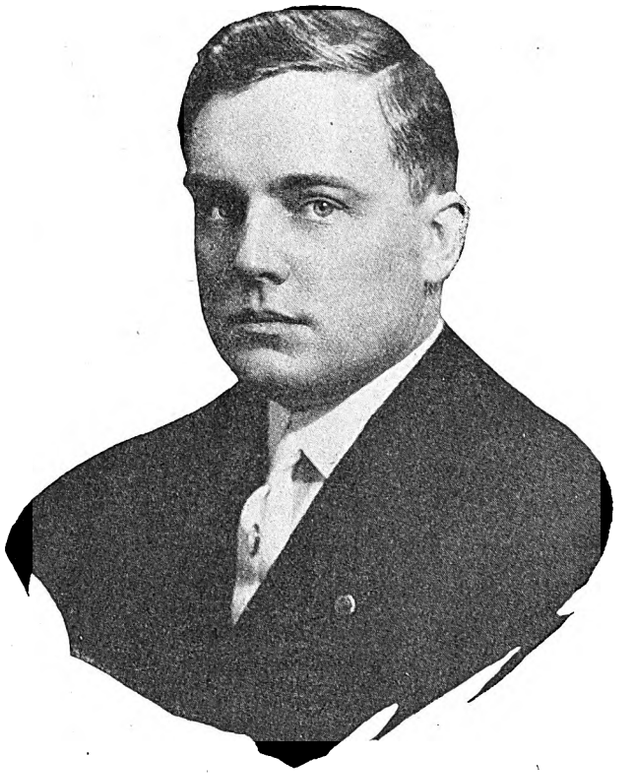
"The Claimant's Doctor"*

How May He Be Convinced of the Company's Fairness and His Friendly Co-operation Enlisted?

By *Hart E. Fisher, M.D.*
Chief Surgeon Chicago Rapid Transit Company,
Chicago, North Shore & Milwaukee Railroad and Other Companies

THIS subject is primarily one of public relations between a transportation company and its customers, the traveling public. The successful claims man and his assistants can make more true and loyal friends for his company by cordial business intercourse with claimants, than can any other official or department. High-handed, high-pressure, critical and gruff tactics can make more and lasting enemies than all other employees combined can counteract.



Dr. Hart E. Fisher

When a person is injured, be it trivial or serious, he may be so mentally disturbed that he will do and say things that he never would have done or said in calmer moments. Many people are ignorant of the methods of big business and its routines, and when under stress of an accident they are afraid if they say anything regarding their injuries that their words will be misconstrued and used against them in suit. The past performances of unscrupulous employees in claims work in making small settlements of cases, the rough treatment that many claimants experienced at the time of making settlements, the suspicion evidenced on the part of the claims men that claimants are malingering, have all been magnified by the average claimant, with the result that the old, obsolete claims methods are the ones that he has in mind when he is injured. It is up to each one of you as executives in our industry to eliminate from your personnel those employees who do not have the milk of human kindness and the business finesse essential to successful claims men. A settlement, made with a claimant who goes away dissatisfied and settles his claim in a frame of mind that it is the best he can do under the circumstances, is a costly investment, many times over what a satisfactory settlement of a few more dollars would cost, besides losing a friend to the company in future contact.

It may be asked, what has this got to do with the confidence and co-operation of the claimant's doctor? The answer is—if we secure the confidence of claimants in our honesty, fairness and good intentions, this mutual understanding will very quickly be inculcated in the claimant's doctor and he, in turn, will have confidence in the fairness of the claims men and the company we represent. You cannot convince a claimant's doctor of our honest intentions if his patient tells him of unpleasant contact with other employees of the company. This confidence grows by the speed with which medical aid is secured, the dispatch with which the patient is removed to his home or a hospital, the attitude on the part of the medical man summoned by the company, the thoroughness with which an examination and treatment is instituted and the speed with which the claims men get on the job to be solicitous as to the comfort and needs of the patient. There is plenty of time for a settlement later, if we gain the claimant's confidence in the heat and excitement of the accident, or soon afterward. The time to prepare the patient for settlement is when he is comfortable and calm.

The claimant's doctor now enters the scene, either by request of the claimant or the company itself. If you secure the name of the claimant's doctor at the time of injury and then invite him on the case at once, you will show by this action that you have nothing to cover up and that you value his aid. In most cases this places the claimant in a more receptive and confident mood as to your real intentions. If it is a liability case, it is best to have your own surgeon working in harmonious union with the claimant's doctor. Do not quibble about the doctor's expenses and the hospital bills, but give free rein, just as you yourself would expect to be treated and cared for if some other company was liable for your being

*Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Oct. 3 to 7, 1927.

Digitized by Google

injured. Keep claim adjusters away from the patient until he is discharged, cured or healed as far as medical and surgical science can do. If the patient is turned over to his family physician, keep your interest up in the case, but do not belittle the doctor by sending so-called experts or examiners out to check up on him, under the guise of securing an examination. Untactful, pompous doctors, feeling their importance, having an attitude of suspicion as to the patient's real injuries, who are sent by the company to consult with the claimant's doctor, have done more to cause a feeling of distrust and resentment on the part of the doctor than anything I can think of. Treat the physician on the case in an ethical manner, value his opinions and you will get his co-operation. Do not permit claim adjusters to call up the claimant's doctor promiscuously, making suggestions, asking for information as to treatment, or asking him when the claimant is ready to settle. This may seem a trivial matter to you, but is resented by the attending physician as a transgression on his professional rights.

See That the Physician Is Paid

When the company calls a physician to an accident or sends the case to a hospital it should guarantee the doctor and the hospital that all bills will be paid up to the time they are notified to the contrary. Failure to pay initial expenses after it is found that there is no liability makes a doctor belligerent, and hard feelings arise that bode no good for the company in future contact and co-operation will be found lacking. You hate to lose a dollar, so why should you expect the doctor or hospital to hold the bag and lose by your transaction when, by nature of their profession, a great deal of their work is done without compensation. Furthermore, each hospital has on its staff doctors who are located in the vicinity, and they are as a large family. When the hospital or one of the staff has difficulty with a claims man or a surgeon sent by the company, it will be spread over the entire hospital. One doctor's grievance becomes the grievance of the others, until sentiment in that hospital is antagonistic toward the company and your cases are not wanted. Your next claimant's doctor may be on the staff of some hospital that has had unpleasant relations with your company, and you will suffer in securing his co-operation. If the doctor is antagonistic you can be sure that the patient he is treating will look upon your efforts with suspicion.

Many times a claimant is not honest with his or her doctor, and after a settlement is made for a stated sum plus the doctor's bill, the claimant does not pay the doctor. You say that is no concern of yours as you have paid the full sum to the claimant. That doctor's advice and treatment have made it possible for you to make a settlement economically, and you want to hold his good will against the day when he might again be a claimant's doctor. How easy it is to ascertain if the physician has been paid when you settle with the claimant. Get in touch with him so that he knows you are at least trying to safeguard his interests. He will appreciate your efforts and be glad to assist you in the future. Another good practice is to assure the claimant's doctor that you will take care of his bill when the case is settled, so he will not have worked in vain, should the claimant fail to pay him for his services.

I have purposely refrained from mentioning claimants and doctors who are not honest with the company or have what is known as "blind" cases, but you can secure even their co-operation if your attitude is right. No matter how guilty a man may be, he does not relish being considered a crook or a fraud. If he can be made to look at your side of the case and if you have the services of competent surgeons, he will, of necessity, modify if not retract his claims as to injury. The fault most common in handling these cases is to permit this class of doctor to see that you believe they are frauds. They assume the rôle of a discredited doctor and so confide this to their clients.

When a claimant's doctor sends his bill to you for services that have been rendered a claimant, do not take the attitude that his charges are exorbitant. This puts the doctor in the light of having wilfully padded his bill. If he reduces the bill in order to secure the money without suit, he will remember this the next time he has contact with one of your company's claimants.

When a claimant makes a settlement under stress, which is unsatisfactory to him, be careful, as he may be the relative of some physician and in the future you may have the unpleasant sensation of having this doctor attend a claimant. Most likely, he will recall the poor settlement or inadequate services rendered by your personnel and advise his patient of the fact, thereby creating antagonism in an otherwise fair and honest claimant.

Spread your medical and surgical cases among the general medical profession in your locality and do not depend upon the services of a chosen few who are given the bulk of the work out of friendship, or because they make calls at a low figure. This makes the future claimant's doctor feel that he is slighted. Make as many friends as you can in the entire medical profession. It is better to have too many doctors making calls for you than to have one doctor disgruntled because favoritism is shown to a few of the elect.

Very often, in all sincerity a doctor advises a claimant to settle with the company as he believes the patient has recovered or that there is no possibility of any future disability resulting from the injury. The claimant settles in good faith. In a short time some unforeseen condition arises resulting from the injury, and the patient is forced to undergo further medical attention and asks for further aid. If you call in his doctor, offering assistance toward putting the patient in good health, you make lasting friends of both the claimant and his medical advisor, and the return in friendly public relations for your company is tenfold over the additional money spent by you after the case was settled.

Treat the Claimant's Doctor with Consideration in Court Examination

Testifying in court is an event that no physician relishes and he consents to appear as a witness only on account of his obligation as the claimant's doctor. This is where many an otherwise friendly and open-minded physician becomes antagonistic and resentful against your company, which in turn means your claim department, by the fact that you permit a so-called expert medical witness to place the claimant's doctor in the position of telling an untruth, and the trial attorney attempts to make a monkey out of him before a jury, by his confusion. Remember, the jurymen are each forming an opinion, and it is human nature to be on the side of the under dog. Sympathy for an honest but confused doctor on the stand at the mercy of superior cleverness and legal intelligence has been the deciding factor in a verdict for the plaintiff, and at the same time a life-

Digitized by Google

long enemy is made for your company. A little more tolerance and consideration should be shown the claimant's doctor on the witness stand.

I believe all men have open minds, and will co-operate when they know all parties concerned are acting in a fair and honest manner; but allow discord to creep into this harmonious circle by some suspicious or untactful error, and then there is cause for lack of confidence and co-operation. I believe that the friendly public relations existing today will make the settlement of claims easier in the future, and claims men will experience the satisfaction of knowing that each settlement has been the means of making many new friends for their company.

Co-operation

Among Public Utilities in Local Territory*

By C. B. Hardin
General Claim Agent
United Railways of St. Louis

NEVER has there been a time within my experience when the active co-operation of men in our line of business was so imperative. The alignment of the crooked doctor with the crooked lawyer has stimulated the presentation of exaggerated and fraudulent claims against public service companies, automobile owners and industrial plants, sometimes of claims against several different companies by the same parties. The passage of a workmen's compensation law in our state lately has increased the activity of the ambulance chaser in the solicitation of public liability cases. The growing indifference to perjury by those in charge of our law-enforcing agencies is quite noticeable, and the increasing political power exerted by the ambulance chaser and his henchmen has given more power to him in the courts and over judges.

There are other important reasons for our co-operation. The claimant of no unusual prominence collects from some local company for a bona fide injury. Later he has another accident in which my company alone is involved. He does not publish to the world his former claim experience nor the injuries sustained therein, and I may pay him again for some former injuries certified to by his physician working hand and glove with his attorney. I am next confronted with a "No Report" claim. No amount of investigation has developed any information from our employees. If I could go to a properly functioning central bureau, I might find that he has had a previous claim against some insurance companies' assured, or against the city on account of some sidewalk case, or against some other public service company—all "No Reports." If so, I should be in a much stronger position either to decline the claim or to make a cheap settlement.

Then a central bureau is a splendid check on your own business. Handling 10,000 new claims a year does not permit you or the members of your staff to remember the repeaters nor the experience you have had with persons in the same block or immediate neighborhood. A proper filing of your record cards both as to name and address gives you this information at a glance. We know we often have to combat the bad influence of an improvident settlement in a neighborhood, yet if fully informed, we may sometimes be in a position to invoke the aid of a satisfactory settlement or the satisfactory ending of some litigation, to our advantage.

So far we have been unable to get the co-operation of some of the other public utility companies in reporting their personal injury claimants, and none of the insurance company adjusters seems to be interested. I could cite from my files a number of instances where money could have been saved for my company had the records of the claimants with other local companies been available. You may say, "Well, why didn't you dig up such records?" In reply, I say, "Unless such records are voluntarily sent to a central bureau, you cannot cover by one-half the local field. You cannot obtain authority to employ sufficient help to do this and it would be impracticable to have personal calls made on each other company on every personal injury claim."

Means of Getting Co-operation

In what way can co-operation be best accomplished?

First, by the organization of a central index bureau to which all the liability insurance companies and public service companies in the local territory report the name and address of every personal injury claimant. Such a bureau could be operated for $200 per month. In a small city the expense would be lower. It should be consulted by the various companies on every personal injury claim. My company has maintained such an index for many years at its own expense, furnishing free information to anyone who will promise to report personal injury claimants. We put everything in it: personal injury claimants, divorces, newspaper clippings, damage suits against others as well as our own, unusual happenings, adverse witnesses, including doctors, jurors who serve on our cases, property claims declined, inquiries from other cities and records of any crooks.

Second, by frequent informal meetings of the local adjusters of insurance companies, the chief representatives of the claims departments of the public service companies and anyone else who might be interested in our work. The acquaintances made and friendships formed through the meetings are most valuable.

Why do we have to work so hard to get this co-operation? In the first place, the insurance companies have not the same incentive to keep the cost of their settlements down, for if their claim experience with an insured is bad, up goes his rate. Adjusters of many insurance companies are permitted to take outside business, so do not hesitate to represent any of their assured and their guests or their employees against other insurance companies or public service companies. Then the adjusters of some of the small public service companies have only a few claims to look after and are not impressed with the seriousness of the situation that now confronts us. For the last two years I have paid out for my company nearly 7 per cent of its gross earnings in the investigation, adjustment and defense of claims of every character, and this year it will not be much better. Some measure of relief will have to be found.

The Company Doctor and the Professional Medical Witness*

By John A. Leeming, M.D.
Medical Counsel Chicago Surface Lines

IN DISCUSSING "The Company Doctor and Litigation," I shall make some reference also to "The Claimant's Doctor." Consider briefly an injury which may develop into a case of neurosis: A woman is hurt in a street-car accident. No bones are broken, but she is bruised, scared and shaken up. She calls her family doctor. Suppose he makes little of the injury and its effects; he uses appropriate measures to relieve the pain and soothe the bruises. He discourages any suggestion of a claim for damages, encouraging his patient to believe that the company will treat her with perfect fairness. It is safe to say that under these circumstances the outcome of the case would be just the same as if the injury had occurred by the patient falling on her own kitchen floor, which means in all probability that in two to four weeks the whole incident would be a thing of the past.

But suppose the family doctor is hostile to the company's interests, even at the expense of his patient's speedy recovery. Such a medical man usually has but little difficulty in bringing about in his patient's mind a condition of introspection which leads her to dwell upon and magnify her symptoms. He makes it known that he has had cases of this kind which were followed by serious and permanent after-effects. He drops the remark that, as he understands it, the company is absolutely liable, and he sees no reason why it should not be made to pay for its carelessness. In such an atmosphere this type of claimant's doctor has much to do with the progress and outcome of the case.

The company doctor must also be considered, but his connection with the case will be considered later.

Then we have "The Professional Medical Witness." I wonder whether we all have the same understanding of what is meant by a professional medical witness. A marked distinction should be made between a professional witness and an expert witness, not only in the medical but in any other learned profession.

The true professional medical witness as a medical man who is ready to sell his evidence for money. To be a success in this line he must necessarily adapt his goods to the purchaser. In other words, he must please his customer if he is looking for more business from the same source. Let us look into this matter and see how it works. I have medical men in mind who correspond to each one of my fingertips. If necessary, I could name them and describe fairly accurately their individual methods, but they are practically alike in all essential particulars. They all "stand in" with one or more plaintiff's personal injury lawyers.

A close relation exists between such lawyers and medical men. They refer cases to each other, and it is well understood between them that while the doctor does no business on a contingent basis and he must be prepared so to swear on the witness-stand, yet he never thinks of sending a bill for services unless a verdict is returned against the defendant. The usual setting is something like this: Take the case described above. The case gets into the hands of a lawyer. He listens to her story and makes arrangements for her to present herself to the doctor who is later to appear in her behalf as a professional medical witness.

The doctor proceeds to examine her, and listens patiently and encouragingly to the list of subjective symptoms, even though he knows full well he will not be permitted to testify to them in court but will be, or should be, limited strictly to objective findings. Why does he favor the relating of all the subjective stuff? He will not say, though he has his reasons. A certain plaintiff on cross-examination, when asked if she had told the whole story of her sufferings to the doctor who had examined her a few days before trial at the request of her lawyer, replied, "Yes, the doctor said I should go over the story as often as possible so that I would have it down 'pat' for the witness stand." But there are other reasons. The professional medical witness writes a report to the lawyer, but before doing so he tells him over the phone that he finds very little objectively—increased reflexes and an appearance of nervousness—but he says she tells a fine story of her pain and suffering, and if this story can be presented to him in the form of a hypothetical question embodying also his few objective findings, he would be able to answer the question and express the opinion that the hypothetical individual was suffering from traumatic neurasthenia.

Cross-Examination of the Right Kind

How are you going to nullify the effects of such evidence? There may be various ways, but the first step in this direction is by the right kind of cross-examination. I advocate showing the close relationship between the witness and the plaintiff's counsel; that the case was sent to him by the lawyer for the express purpose of preparing himself to take the witness stand and testify in her behalf; that he has done the same thing in other cases for the same attorney. I recommend next that he be examined closely on the hypothetical question, making him admit that in his replies he did not take anything into consideration which was not contained in the question, that in answering it he was not influenced in any way by what the plaintiff told him and that his responses referred to the hypothetical person only and

*Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio. Oct. 3 to 7, 1927.

Digitized by Google

not to the plaintiff, that he assumed to be true everything stated in the hypothesis, that if the assumed facts were not correctly stated in any essential particular it might change his answer, that he assumed as stated in the question that until the time of the accident the hypothetical individual was a perfectly healthy woman.

In reference to his examination, I would ask him if he had sent a written report of his examination to the lawyer, whether he has a copy of it with him and, if so, would he object to producing it. When this is evaded or declined, I like to hear defendant's attorney inquire whether the witness has described everything he did in his examination, if he has told everything he found objectively, whether he learned while taking the history that the plaintiff was well until this accident occurred, and then follow this line of cross-examination by directing attention to the objective evidences described. In the sample case under consideration these evidences were an increase in the reflexes and an appearance of nervousness. There may be given other alleged objective signs such as limping, muscular rigidity, rapid pulse and heart action, etc.

It is a difficult and somewhat risky task properly and safely to question a real professional on these symptoms. Let me suggest a rule which I have presented to my class in law school for many years: Never question an adverse witness unless you are satisfied that his answer cannot hurt you but may help you. Some of you will say, "That is an easy rule to state, but a difficult one to put into practice." I am willing to agree with this, but if men engaged in this line of work should fall down because of this or other difficulties daily encountered, they would be prostrate most of their time.

Let me suggest the following line of questions and invite your criticism as to whether they would be safe or whether the answers thereto could hurt your case.

Doctor, what is an objective symptom?

Do you agree with this definition, an objective symptom is one which the examining doctor can discover without the aid of the patient and which cannot be simulated by the patient?

Do you think "an appearance of nervousness" is purely objective?

Have you not seen "an appearance of nervousness" with somewhat increased reflexes in women who have never been injured?

In such cases will you name some of the various causes which might produce it—not too many, on account of the time required—but give the jury about a dozen of the most common ones.

In answering the hypothetical question, did you exclude all such possible causes?

In making your examination of the plaintiff did you make a careful investigation that enables you to exclude all such causes in her case?

Did you examine the pelvic organs, the rectum, the urine, the blood or take the blood pressure?

Do you know whether this woman has any local foci of infection in her teeth cavities, tonsils, accessory sinuses of the upper air passages, appendix, fallopian tubes or gall bladder?

[If on direct testimony the doctor has omitted to mention a pelvic examination and upon cross-examination he says he has described everything he did and all he found:]

Do you know whether this woman has any local pelvic irritation resulting from laceration of the cervix, endometritis, anteflexion, retroflexion, uterine prolapse, salpingitis or ovarian displacement?

In your experience as a medical man have you ever come across cases in women who suffered from backache, headache, increased pulse, excessive reflexes and an "appearance of nervousness" that was due to or might have resulted from any of the pelvic disorders above named?

Suppose the plaintiff in court has concluded the presentation of evidence and announces, "We rest." And suppose further that as a doctor acting in the capacity of the company's adviser you feel convinced that the plaintiff's medical case is vulnerable and can be successfully attacked, how do you proceed? My method, after studying carefully the plaintiff's case during its presentation and deciding what I believe to be a more plausible and accurate explanation of her physical condition, is to recommend putting on a strong medical defense based upon defendant's theory. Do not be satisfied by simply offsetting plaintiff's doctor with a medical man who will offer a counter-opinion. Back up your judgment by opposing plaintiff's medical theory with two medical expert witnesses to her one, or three to her two, as the case may require. Prove this part of your case by a preponderance of the evidence. If properly done, this should be convincing to a fair-minded jury, and if it fails, your record is in much better shape for a reviewing court. In addition you should use your best efforts to outdo the plaintiff in the quality, standing and experience of your medical witnesses. Confer freely with the company's trial attorney; assure him that the theory you have outlined is confirmed and borne out by the experience of the best men in your profession, and if he so desires, make full notes for his use while questioning your doctors. Your final step in preparation is to consult with competent, high-class and skilled specialists—surgeon, internist, gynecologist or neurologist—and in this way back up your contention by presenting to the court and jury convincing evidence by real medical expert witnesses.

I think I am safe in saying that in compensation cases in our state 50 to 60 per cent of the reversals by the Supreme Court are based upon the medical theory introduced by the respondent as being more plausible and reasonable, the language of the court in substance being: "We cannot confirm an award based on speculation, conjecture or doubt."

THE accident cost to the street railways of the country growing out of motor vehicle operation is not far from $20,000,000 annually, to say nothing of the cost resulting from collisions with persons on foot who use the highways, or the loss of lives and limbs to individuals.

—RUSSELL A. SEARS.

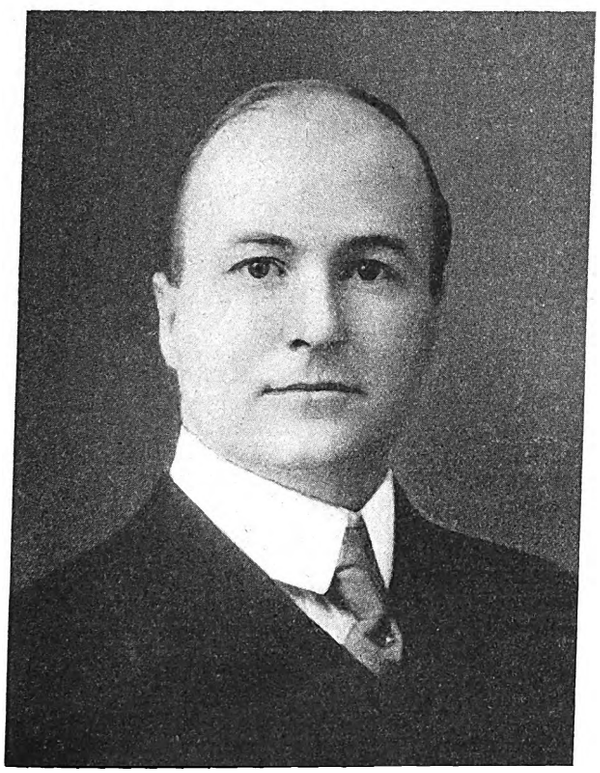
The Company Doctor and Litigation*

By Benjamin E. Sibley, M.D.
Surgeon Boston Elevated Railroad



Dr. B. E. Sibley

MY EXPERIENCE indicates that a standard form of accident report is of great value, since its main divisions may be made comprehensive enough to cover all cases and by following the form the examiner will always be reminded to secure and record data relative to every phase of each case. Such a skeleton report may well express the views both of the company doctor and the company attorney on what information the doctor's report should contain. A blank form I am using, at present, is as follows:

Name, address, occupation, age, date of injury, date of examination, place of examination, those present at examination, claimant's physician, physician's statement, claimant's story of injury, past history of claimant, physical examination, conclusion and opinion.

Without attempting to discuss each of these headings, let us consider first the physician's statement.

The statement of the claimant's physician is important, because it gives us the first information about the nature and severity of the injuries sustained. The sooner after the accident it is secured the better. Furthermore, getting definite statements about what the physician found soon after injury puts him on record, before his impressions are changed or modified by the afterthought of the claimant, his friends or his attorney. Such an opinion, given early in the history of a case, will more nearly represent the doctor's real views than one obtained later or given for the first time at trial.

After the doctor's statement I get the claimant's story of how his injuries were sustained. This inquiry should be painstaking, to bring out clearly just how the injuries were received, the direction of forces operating to produce trauma, the force of blows, etc. It is very important to quote the claimant's own words on many points.

With this story in mind, the examiner will quickly note whether the injuries he finds are reasonable results of the accident or whether the alleged injuries are not of such character as to be caused in the manner described.

Here again an early history is important and the exact quotation of the claimant's words most valuable. His exact words, describing his injuries, incorporated in the original report help to prevent enlarged claims later and convey to judge and jury a strong impression that the claimant actually did say just what the doctor's report states and not that the doctor got a wrong impression or only part of what the claimant meant to say.

It is well, however, for the examiner to be on his guard, in taking down the story given, not to present in his report a picture which the claimant or his lawyer is drawing for him. I mean that a clever attorney may coach his client in the kind of a story to tell and the latter may get the examiner unwittingly to overload his report with tales unfairly favorable to the claimant.

I conclude this portion of my report with a concise list of the claimant's present complaints. This group has a tendency to grow and at trial may hardly be recognized, so that the list made at examination may serve as a valuable check.

I also make a brief inquiry into the past history of the individual. Even if the past history seems to have no vital bearing on claims made at time of examnation, it may have a vital bearing on claims made at the trial.

Former injuries or diseases may be noted, which are caused by pathological conditions, alleged to be the results of recent injury. Or, if such happenings are denied, information from hospital records or other sources may establish the fact of former injury as the cause of present disabilities, and this will weaken or destroy the claimant's credibility.

Physical Examination

The physical examination should be comprehensive and include more than the parts alleged to be injured. A brief but adequate picture of the entire patient should be given, with a careful, detailed description of the parts injured. The doctor should record conditions just as he finds them. He should not try to minimize them but endeavor to give them their true value. Upon his statement of injuries found the claims agent depends in settling cases and paying damages, and the company's attorney depends in deciding whether to fight the case or not. As important, also, as a true picture of injuries found is the doctor's opinion of their importance and their probable after effects. I find it advisable many times to give a supplementary, confidential report, not embodied in the formal one. This document may contain views which could not wisely be put in a report that might appear in court.

For example I might wish to state that certain symp-

**Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Oct. 3 to 7, 1927.*

Digitized by Google

toms following injuries, such as dizziness, headaches, etc., often persist for long periods. It is manifest that for the company doctor to include such remote possibilities in his report of a particular case where there was no actual likelihood of them being true, might prove unfairly damaging, but he might like to call attention to that possibility. The formal report should therefore reflect the doctor's true personal estimate and not contain extraneous impressions, which might be construed to give an inaccurate view of the case.

The value of the doctor's testimony in court rests largely on his general intelligence and honesty. On the witness stand he should establish a reputation for honesty by giving his real opinion on questions asked, whether that opinion seems primarily to favor the company's interest or not.

Doctors who will not make an admission which might be detrimental to their side do not render as valuable services to their company as those who give honest answers, whatever they may be. But in giving these answers the doctor's general intelligence must come into play. He should not allow himself to be led into a discussion of subjects not relative to the case. When asked his opinion on irrelevant matters or on subjects with which he is not familiar, he should not hesitate to say "I don't know." He should remember that he is not expected to know everything, even in his own profession.

The more the doctor tries to express opinions on subjects on which he is not well posted, the more trouble he will have. The real issue may be so befogged that the value of his testimony on subjects he did know about will be lessened or lost.

Should the Company Doctor Attend the Claimant?*

By Dr. Ernest W. Miller
Milwaukee Electric Railway & Light Company

SHOULD the company doctor attend the claimant? Emphatically, no. The company doctor, as such, has no place in the medical world. The term "company doctor" or "company physician" has long enough suffered the stigma of criticism and has long enough carried with it some unfavorable application.

But the surgeon of the industry has a worthy profession and a dignified one and he should attend the claimant.

For many years past and on every occasion possible I have attempted to elevate the plane of the surgeon of industry above that to which the old title has carried it. It is only by constant endeavor along these lines that we shall be able in the future to bring to this field the acknowledgment it deserves.

Last year, in this section, a paper was presented offering many points in favor of non-attendance upon the claimant. Such a policy may be entirely applicable in a community with which the writer was familiar. The problems of the various railways are local, and it is quite impossible to apply any fixed plan to all operating properties. My opinion is based upon my experiences of attending the injured as a surgeon of the industries for the past sixteen years.

Dr. E. W. Miller

The policy of the organization involved may be to treat: (1) Cases of liability only; (2) cases of all injured patrons; (3) cases of liability plus some protection settlements. After experience with each I believe the most desirable is the one we follow—namely, the first, or treatment of claimants where definite liability exists.

To do so satisfactorily, a thoroughly organized medical staff and staff of competent first-aid men are essential. This means also one or more men qualified to do all kinds of major surgery, traumatic and general. There must also be a close co-operation between the medical and claims departments.

In the event of injury, major or minor, the patient is assured not only of first aid but of complete treatment of the highest character. This certainly is to his material advantage. The advantage to the company cannot be overestimated. The contact of a competent, respected surgeon of a community alleviates many of the conditions which naturally arise between the individual claimant and the adjuster. Disability, if any, is reduced to the minimum, and the returns to the company are definite.

The surgeon of the industries should be equipped to the last word in his profession. He must put forth his best efforts, as any successful professional man must do. My experience forces the conclusion that it is possible for an organized medical service to treat practically all of the injured patrons where liability exists.

The patient who is imbued with the idea that he or she is receiving the best possible medical attention must have confidence in the physician, which leads to successful treatment of the patient. With recovery, both mental and physical, a sane approach is laid for adjustment.

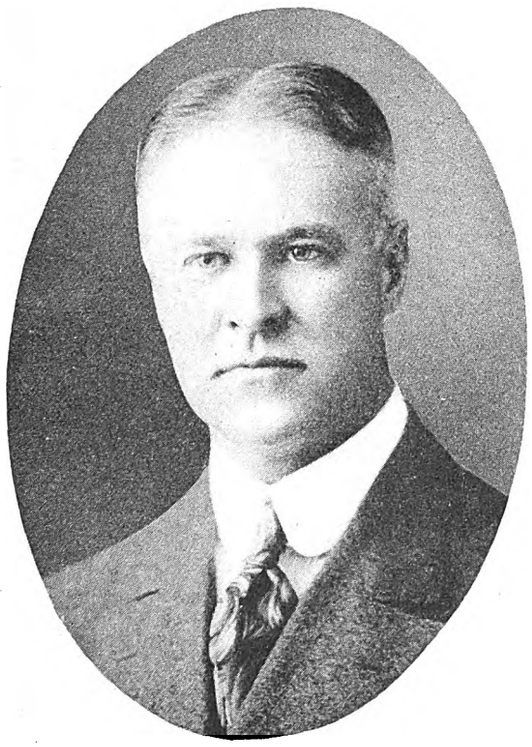
Uniform Traffic Regulation*

By Russell A. Sears
General Claims Attorney, Boston Elevated Railway

Its advantages are set forth, together with the applicability of the Hoover Conference recommendations



R. A. Sears

CONFERENCES concerning motor vehicle operation held at Washington, the first in 1925, the second in 1926, popularly and appropriately known as the Hoover Conferences, may be considered as important epochs in the history of the development of the nation.

In no national conference since the Constitutional convention was there displayed a greater, more whole-souled and unselfish intention to prevent or reduce the great loss than was shown by the delegates in those conferences. Every state in the Union was represented, and the personnel of the conferences was a cross-section of the citizenship of the country. More than a dozen committees composed of eminent and able men had met preceding the two convention meetings and prepared the way for action without loss of time. After a full and free discussion the work of the convention was embodied in the "uniform vehicle code," with which you are more or less familiar.

That the electric street car is a very important factor in the safe regulation of traffic needs no comment. In all probability the accident cost to the street railways of the country growing out of motor vehicle operation is not far from $20,000,000 annually, to say nothing of the cost resulting from collisions with persons on foot who use the highways, without mentioning the loss of lives and limbs to individuals. Hence as an economical problem alone, anything or any means that will reduce these losses is worthy of consideration.

There isn't a recommendation made by the Washington conference or in the uniform vehicle code to which the street railways can object concerning rules for the safe operation of vehicles. Hence we should interest ourselves in the observance and practice of those recommendations, and we have a further reason for our interest in the recommendations in that many of the railways are at present operating motor-driven buses. A study of the conference reports will also prove of help. Without going into the relative importance of street cars and motor vehicles in the transportation of the public, this much we are sure of: Both street cars and automobiles are here to stay, at least for the present, and any advice as to the operation of both should be welcomed by us.

Each delegate attending the conference should carry to his own state its message and advice. As the subjects dealt with in the conferences are of the highest importance to street railways, should we not ally ourselves with those carrying on this work? This would seem to be simply intelligent self-interest. As many other conferences are being held, at least in the eastern part of the country, of automobilists to promote safety on the highways active association with such bodies would seem to be appropriate for a street railway man so that the association may have the benefit of his experience and he share theirs.

If there is no body corresponding to an automobile safety association near by, then it is desirable to sit in with any neighboring safety association. Whatever be its function, the subject of automobile accidents is always pertinent and the reports of the Hoover conference constitute the best chart in existence from which one can always find his position and the direction in which to proceed.

At least we in Massachusetts think so, and we try to think and do in practical terms. As this is written the Governor of Massachusetts, prompted by the recommendation of the Hoover conferences and the two state conferences called by him, has offered valuable trophies to the three cities and towns having the best record concerning highway accidents for the six months beginning June 1, 1927.

What does this mean—an offer to award distinction on the residents of the city or town excelling in care on the highway? Isn't it apparent that care of persons in the streets and highways has a tendency to reduce highway accidents—and who would profit more as a class than the street railways? Finally, may I recommend this? Send to the Secretary of Commerce for a complete set of the committee and conference reports and recommendations concerning highway accidents, read them carefully and then deny, if you can, that you are more informed than before and hence better equipped to carry on your own work.

*Abstract of a paper presented at the annual convention of the American Electric Railway Claims Association, Cleveland, Ohio, Act. 3 to 7, 1927.

American Committees Continue Research

Important changes in constitution the feature of reports this year. Other reports on motor vehicle information, education, insurance, rapid transit and taxation presented

CHIEF among the reports of committees of the American Association this year is the one on revision of the constitution and by-laws, which was adopted in its entirety at the convention of the association held this week. The changes provide for the admission of independent bus operators under certain restrictions, revision of the financial structure of the Advisory Council and a change in the dues.

Continuing the custom of the past two years, these reports were not read at the convention, and this year for the first time, except for the constitution changes, they were not made the subject of special mention. Abstracts of the reports follow.

Rapid Transit

IT WAS the opinion of the committee on rapid transit that the most important problem this year was to present an authoritative analysis, from the viewpoint of an economist with adequate training, experience and standing, as to the proper allocation of the burden of cost in building rapid transit.

For some years the committee has been collecting all the available data on this subject, but felt the need of obtaining a study from a purely economic point of view. For this task it obtained the services of Leslie Vickers, economist of the association. He was given an entirely free hand in the preparation of a review of the economics of rapid transit which accompanies the report.

Mr. Vickers' study does not present exact formulas or specific detailed plans applicable generally, but advances principles on which the procedure in each city should be based. In his treatment he considers rapid transit as a special phase of general urban transportation by common carriers. The rights of the latter have been recognized in our commercial and industrial scheme for many generations.

Mr. Vickers says that the need for rapid transit has grown with the economic development of our cities into residence and business districts widely separated, which in turn is caused by the high degree of specialization reached within industry and commerce. The study points out that although few cities have any rapid transit facilities today, many are calling for them on account of street congestion. New surface routes are possible only in the smaller cities, where land values are low. In the larger cities new street facilities must be either elevated roads or subways.

New thoroughfares confer benefits on four distinct groups, according to Mr. Vickers. These are (*a*) the city as a whole; (*b*) the property owner; (*c*) the car rider, and (*d*) the automobile owner. He concludes that new thoroughfares should be paid for by all who benefit by them and not only by the group that uses them.

The study further points out that the city's share of construction and equipment can be met by taxation, the property owners by assessment, the car riders by taxation and the automobile owners by license fees and special taxation, without inflicting hardship on any one group.

No rule is laid down applicable universally as to the proportions of these payments or the means of collecting them. In each city where rapid transit is proposed, a local survey, free from the influence of politics, is recommended.

G. A. Richardson

In an appendix to the report the committee presented extracts from reports and documents relating to the consideration of plans for financing rapid transit in Philadelphia and Boston, together with some extracts of suggested procedure on the physical development of rapid transit in Boston.

Combined with the reviews and extracts of opinions included in previous reports of this committee, the 1927 rapid transit report concluded the survey which the committee has conducted for several years and which has resulted in bringing together an exhaustive analysis of the fundamentals of rapid transit as reflected by men of various schools of opinion interested in the subject.

The report was signed by H. L. Andrews, W. B. Bennett, Edward Dana, J. S. Doyle, S. E. Emmons, H. E. Ehlers, B. J. Fallon, Thomas Fitzgerald, R. F. Kelker, Jr., E. J. McIlraith, W. S. Menden, D. W. Pontius, F. H. Shepard, C. E. Smith, J. B. Stewart, Jr., D. L. Turner, James Walker, J. H. Alexander and G. A. Richardson, chairman.

Revision of Constitution and Bylaws

CHANGES proposed in the constitution of the American Electric Railway Association, as outlined by the committee, were made necessary mainly for the following purposes: (1) To broaden the statement of the objects of the association to accord more nearly with actual practice; (2) to make it possible for the executive committee to admit, with proper restrictions, companies operating any form of urban or interurban transportation systems; (3) to correlate more effectively the relation between the national association and the geographical railway associations throughout the country; (4) to provide for "plural voting" when demanded; (5) to consolidate the finances of the advisory council with the finances of the main association; (6) to revise the schedule of dues to the association.

In the discussion of the reasons for these proposed changes the committee pointed out that the actual work of the association involves discussion of all forms of urban and interurban transportation—not only electric railway but every other form, including buses. It was felt desirable that the statement of objects should be indicative of the broad function of the electric rail industry, which is to provide transportation in the community by whatever agency is best fitted to the particular task at hand.

Regarding the second reason for the changes, the committee explained that some of the present members of the association in smaller communities represent companies which have abandoned rail operation and have turned to buses but which have continued membership under the old constitution. There are, the committee pointed out, similar companies which have not gone through the rail stage and which under the old con-

Digitized by Google

stitution cannot join the association. There are also dependable bus companies operating in conformity with the association standards but not technically coming under the definition of subsidiary or affiliated companies of rail organizations, which the association might desire to admit as members. In the proposed constitution effective safeguards have been thrown around the election of such companies so that the membership may be protected against the admission of companies the interests and practices of which might be inimical to those of the association or of any of its members.

Since the American association does not have geographical sections, it was considered desirable to provide a class of membership for the existing sectional railway organizations, as such, in order

C. D. Emmons

to tie together the work of all the various organizations in the industry.

The reasons for the provision of "plural voting" are, first, to make it possible to give proportional voting weight, on such matters as the adoption of engineering standards, to those companies whose purchases represent a large part of the equipment manufactured for the industry. In other words, a company that buys several thousands of a certain piece of equipment per year should have more to say, according to the committee, about the standards adopted to that equipment than a company that buys only fifteen or twenty pieces a year. The second reason advanced for the provision for "plural voting" was that under the amended constitution permitting admission by the executive committee of bus companies, "plural voting" would provide a check against the possibility of a large number of such small companies becoming a deciding factor in determining the policy of the association. Accordingly, it was provided in the new draft of the constitution that in case a member demands it, plural voting may be invoked and companies will have one or more votes depending on the dues paid.

The last two objects listed by the committee—namely, the consolidation of the finances of the advisory council with the finances of the main association, and the revision of the schedule of dues—are very closely related. Since the organization of the advisory council, its expenses were supported by contributions from member companies separate from dues. This made double machinery for the collection of funds from the industry in supporting what is essentially one activity and it was felt by all those concerned with the matter that it would be much more equitable in the long run to readjust the schedule of dues so that the financial side of all American Electric Railway Association activities would be consolidated. Careful studies were made by a subcommittee thoroughly representative of the various classes of membership, and the schedule of dues was arrived at as a more equitable method than the old system of dealing with the various classes of members.

The report was signed by J. G. Barry, H. V. Bozell, H. L. Brown, H. C. Clark, F. W. Doolittle, J. E. Hutcheson, M. B. Lambert, E. B. Meissner, L. H. Palmer, Harry Reid, G. A. Richardson, Paul Shoup, R. P. Stevens, J. H. McGraw and C. D. Emmons, chairman.

Insurance

COLLECTION of a two-year history of insurance experience was continued. The number of companies reporting this year was 35 more than a year ago, with $68,000,000 more insurance and $145,000 more premium. Tables which accompany the report show for the 279 companies allocating insurance to types of property covered, insurance carried, premiums paid, rate, losses and amount recovered, also the same data for 60 companies which do not allocate their premiums to the types of insurance carried. The committee also points out that the loss ratio is declining.

At President Sawyer's request the committee appointed a subcommittee to give the subject of fire prevention special attention. The conclusions in brief follow:

Too much emphasis can hardly be laid on fire prevention for street railways. It often appears that where several methods of reducing a particular fire hazard possess equal merit, one is accepted by the insurance authorities as the best and if followed, a maximum insurance credit will be obtained. The Engineering Manual Section B-100-23 contains some very helpful suggestions and recommendations on this subject. The Crosby-Fiske-Forster Handbook of Fire Protection is a nationally recognized authority on all matters of this sort, as are the various pamphlets published by the National Fire Protection Association.

It is advisable to submit plans of all new construction to the local rating bureau, or your insurance broker if he is in a position to furnish insurance engineering service, before the work is started, to obtain their suggestions regarding details of construction and fire-extinguishing equipment. Where automatic sprinklers are to be provided, the plans should provide that the work be done so as to conform to the bureau requirements.

In the effort to cut down expense on new construction, it is easy to allow fire hazards to creep in when, if fire prevention were properly considered, the additional expense involved would save a great deal more than its annual carrying cost in lower insurance rates.

Safety and fire prevention go hand in hand, and safety committees should be encouraged to give suggestions which will help to improve the condition of the property. If this places too great a burden on the safety committee, the work may be given to a separate committee organized to follow fire prevention work alone. Such a committee should be drafted from different parts of the organization. The inspections by this committee should embrace all phases of fire protection, including housekeeping, storage of combustible

P. E. Wilson

material and extinguishing equipment. Inspection work will be greatly aided if the employees feel that the management is personally interested in the work. The reports of inspection should be followed closely to see that defects are corrected as soon as possible.

Excellent results have been secured by many member companies in engaging the services of firm whose specialty is fire prevention. This is applying in a larger way the advantage derived in forming fire prevention committees among our own staff and our own employees.

It is essential that all employees be carefully instructed as to what they should do in the event of fire. This includes giving the fire alarm, use of fire extinguishers, running out of hose, the removal of essential records and property, etc. From time to time fire drills should take place to be sure that each person not only understands what he is to do but knows exactly how to do it.

Good housekeeping is largely the result of a habit of mind. There is nothing that so influences a clean mind as a dirty workshop or a dirty street car. Therefore street railway managements should lay great emphasis on the subject of good housekeeping, the result of which will be not allowing waste to accumulate about the plant. Any infraction of fire prevention rules should be followed up as strenuously as infractions of rules for operation of cars, the handling of revenue and all of

Digitized by Google

the other ramifications of our business.

The committee recommends that it be continued another year with authorization to negotiate with insurance rating authorities for a reduction in the rates applying to street-railway properties. Such negotiations, naturally, will require the closest co-operation of the membership. The data collected indicate such rate negotiations are warranted.

The association statistician, Mr. Murphy, has again been invaluable to the committee.

The report is signed by O. H. Bernd, Edward J. Blair, A. C. Blinn, Granville H. Bourne, C. E. Brown, W. C. Campbell, N. H. Daniels, Samuel W. Greenland, F. M. Hamilton, L. R. King, A. D. Knox, F. H. Miller, John H. Moran, A. B. Paterson, F. J. Petura, B. L. Tomes, Edward A. West, H. B. Potter, vice-chairman, and Paul E. Wilson, chairman.

Education

IN LAYING out its program for the past year the committee decided not to try to cover too much ground, but to confine attention prncipally to continuing the work of last year along lines that seemed most promising.

The advisability of conducting another demonstration conference was considered, but the committee concluded that the purpose of that demonstration had been accomplished as far as it could be by that means. This purpose was to arouse interest in the conference form of instruction and to stimulate the holding of such conferences on as many railway properties as possible.

Omitting numerous intervening details, the outcome of the committee's discussion and correspondence was a plan for a "Training Course for Foreign-Conference Leaders" to be held in connection with the Cleveland convention. The conferences will be conducted by A. J. Sarré, of the New Orleans Public Service, Inc., and Henry H. Norris, of the Boston Elevated Railway, with the assistance and co-operation of Frank Cushman, of the Federal Board for Vocational Education, Washington, D. C.
